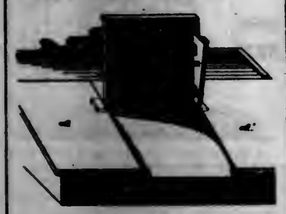
169,649. BLACKBOARD ATTACHMENTS. H. B. Marshall, Kingston, assignor to G. H. Allen, Ayer, Mass. [Filed Apr. 12, 1875.]

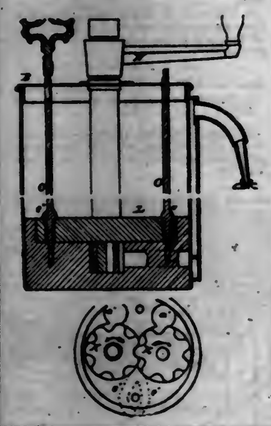
Brief.—A wire grating serves to allow the dust from both crayons and blackboard-cleaner to fall through.

In combination with a blackboard-trough the netting B, to form a receiver for crayons and a cleaner for erasers, substantially as described, and for the purposes set forth.



169,650. TAG-FASTENERS. T. P. Marston, New York, N. Y., assignor to Phillip Hahn. [Filed Aug. 10, 1875.]

Brief.—The oil or other liquid is contained in the tank, and the required amount, determined by adjusting the cover, is carried from the recessed chambers by the gear-wheels, and forced through the tube and out of the nozzle into a vessel placed to receive it. A nozzle-stopper is placed upon a yielding arm attached to the side of the tank, for the purpose of closing the mouth of the nozzle.



The improved tag-hook described, having an extension or arm, 3, and catch 4 formed on the wire beyond the loop 1, and having both the loop and hook elastic, and adapted to engage and hold each other, as herein specified.

169,651. DESKS. Joseph McClurg, Pittsburg, Pa. [Filed Mar. 20, 1875.]

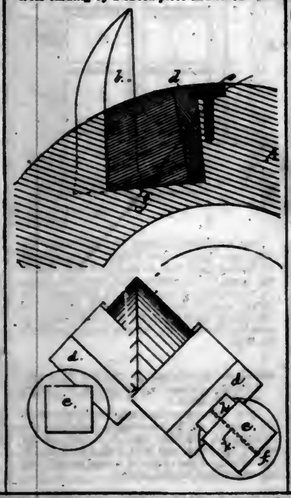
The leaf B hinged to the slide E and provided with the drops D D, the whole constructed and operating in combination with the desk A A', substantially as described, and for the purpose set forth.

169,652. LOADING-MACHINES. Charles G. Morgan, Bristol Station, Ill. [Filed Aug. 12, 1875.]

1. In an oil tank or measurer, consisting of a force-pump arranged within an outer vessel, the adjustable lid or cover L, constituting a part of the forcing apparatus, whereby a greater or less quantity of oil, after having been drawn from the said vessel into the pump may be returned from the latter into the former before being discharged through the nozzle D, substantially as specified.

2. In combination the tank A, provided with an ejection-tube and nozzle, C D, the recessed block J, the adjustable lid L, the spar-wheels K K, the shaft M, and the screw-rods O O, provided with the collars o^{x} o^{x}, all constructed and arranged for operation together, substantially as and for the purposes specified.

3. The stopper E, mounted on the yielding arm E', in combination with the nozzle D, substantially as and for the purposes specified.



169,653. TOE-WEIGHTS. Lucius W. Moore, Indianapolis, Ind. [Filed June 26, 1875.]

In combination with a band or boot formed of rubber or other elastic material, a toe-weight, all constructed and operated substantially as and for the purpose herein before set forth.

169,654. TOOTHED ROLLERS FOR COAL BREAKERS OR CRACKERS. William Mannan, Scranton, Pa., assignee of one-third his right to S. D. Kingsley, same place. [Filed Sept. 29, 1875.]

Brief.—The breaking-cylinder is cast with sockets, which do not extend through the shell, into which the teeth are locked from the outside by means of a block, a wedge, and a screw with square head, which is prevented from turning by a check-piece and rivet.

1. The described cast-iron roller for a coal-breaking machine, having in its outer surface the sockets or cavities described, and for the purposes set forth.

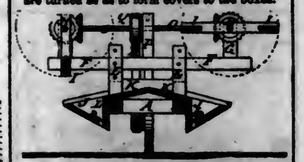
2. The combination, with the cavity in the roller, of a tooth or tooth, the block c, wedge d, and the fastening-screw e, substantially as and for the purpose set forth.

3. The combination, with the block c, wedge d, and set-screw e, of the check-piece h, as and for the purpose set forth.

169,655. GRATE-BARS. Thomas Murphy, Detroit, Mich. [Filed Apr. 17, 1875.]

169,658.

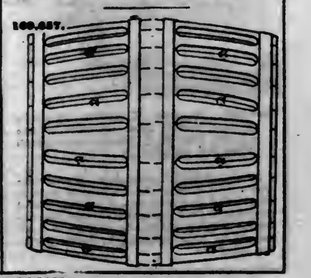
1. The combination of two sets of alternating and inclined bars, D D', with a supporting-frame, A, and a feathered rock-shaft, C, adapted to vibrate the bars D' of each set, substantially as described



2. The combination of the toothed cylinder B with the frame A and stationary and vibrating bars D D', substantially as described and shown.

3. The combination, with the frames A, of the triangular grate-frames E E', in an alternating series, the said frames E' being susceptible of a lateral vibration from the rock-shaft C, hung in the frames E, substantially as and for the purpose set forth.

4. In a furnace or fire-box, the combination of two sets of transverse grate-bars, inclined from the sides of the fire-box toward each other, and revolving toothed cylinders, substantially as described.

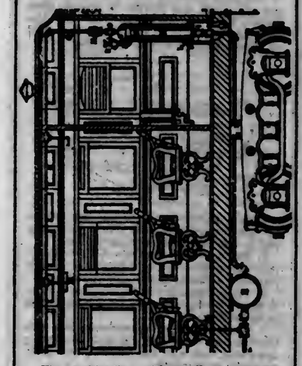


169,656. MACHINES FOR CATCHING COLORADO BUGS. John Noy, Jr., Illico, assignor to himself and Aaron Hoy, Berlin, Canada. [Filed Dec. 12, 1874.]

Brief.—The machine is mounted upon a single wheel, like a wheelbarrow. Revolving wings are placed upon each side, and beneath are two troughs, the covers of which, when turned back, meet in the center, forming an apron between the troughs. When the machine is brought to a state of rest, the aprons are turned so as to form covers to the boxes.

The combination, on a wheeled frame with winged and revolving shafts H I, of the boxes J, having hinged covers K, turning back, meeting on the center, and forming inclined aprons, as and for the purpose specified.

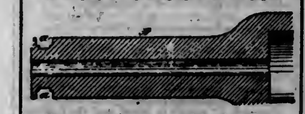
169,657.



169,657. CONSTRUCTION OF BEEHIVE-RACKS. Charles C. Post, Philadelphia, Pa. [Filed Aug. 10, 1874.]

A barrel having, near the contracted ends, openings a, formed by recesses made in the edges of adjoining staves, as set forth.

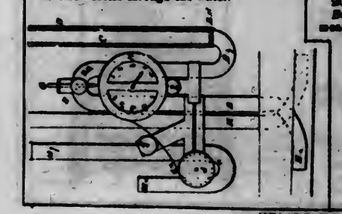
169,658. APPARATUS FOR LIGHTING RAILWAY-CARS. Ira F. Randolph, Indianapolis, Ind. [Filed Jan. 20, 1875.]



Brief.—The safety-cock is provided with a weighted arm, which operates to cut off the supply of air when the car is upset.

The combination, with an oil-gas generator for a railway-car, of the safety-cock H and reservoir B, for compressed air, substantially as and for the purpose set forth.

169,659. GOLD-PACKED PIPE-JOINTS. A. M. Rankin, New York, N. Y. [Filed Feb. 9, 1875.]

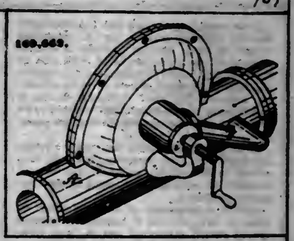


Brief.—Consists in providing the end of the ordinary straight male pipe with the groove, and shrinking the packing thereto, thus securing the packing, and in packing the male end into a straight bored or calibered female end, thus preventing leakage by the longitudinal play and pulling apart of the pipes.

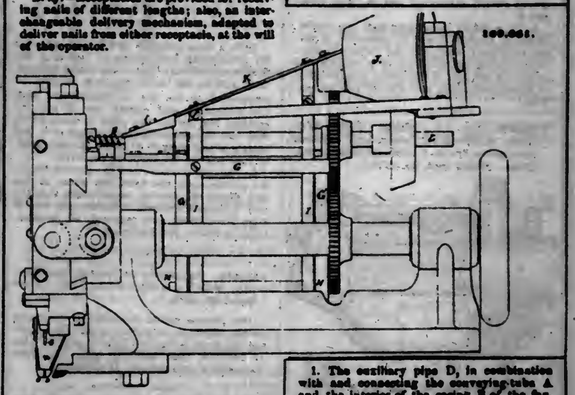
The pipe-joint, constructed in the manner herein described and represented in the drawings, consisting of the pipe A, formed or constructed at its male end with a groove, a, into which a ring of soft-metal packing, B, is shrunk, and an enlarged or straight-bore female end A' into which the male end of an adjacent section of pipe is inserted, as and for the purposes described.

169,660. MEPS' LOOM. Thos. C. Robinson, Boston, Mass. [Filed Jan. 2, 1875.]

Brief.—Combination of the stationary pipe, with the lower end submerged and turned toward the bow of the vessel, open and exposed to the pressure of the water, with the movable tube, and its pencil, cloak-work, and graduated paper, for the purpose of recording the progress of vessels through the water.



The combination of the pipe B, with the lower end submerged, turned toward the bow of the vessel, open and exposed to the pressure of the water, with the movable connected tube F and its pencil, the clock-work and case H, and the graduated strip of paper H', when fitted for use for the purpose of measuring and recording the progress of vessels through the water, all substantially as shown and described.



169,661. MACHINES FOR NAILING BOOTS AND SHOES. Francis M. Shaw, Brockton, assignor to David Whittemore, Wollaston, Mass. [Filed Feb. 5, 1875.]

Brief.—Receptacles are provided for receiving nails of different lengths; also, an interchangeable delivery mechanism, adapted to deliver nails from either receptacle, at the will of the operator.

169,662.

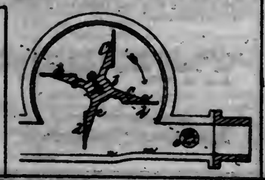
169,661.

1. In a machine for nailing boots and shoes, the combination, with the ways K K and K' K', of the reservoirs J J, each provided with one or more shelves and an elastic discharging-head, e, substantially as and for the purpose set forth.

2. In combination with the inclined ways f f, the screw-transferrers g g', for conveying and discharging the nails singly into the nail-tube M or passage r of the toe n, substantially as and for the purpose set forth.

3. The combination, with the frame G', provided with the stationary ways f f of the rocking frame I, having two sets of inclined ways and nail-reservoirs, substantially as and for two purposes set forth.

4. In combination with the reservoirs J J, or either of them, the friction-wheel M, as and for the purpose set forth.



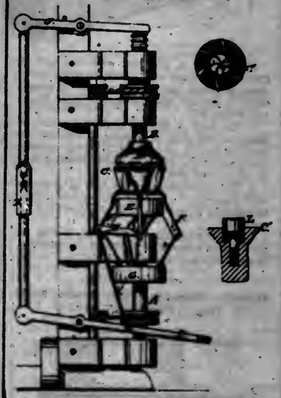
5. In a machine for nailing boots and shoes, the combination, with an inclined way for receiving and guiding the nails, of a rotary nail-reservoir, provided with an elastic discharging-head, as and for the purpose set forth.

6. In a machine for nailing boots and shoes, the screw-transferrers g g', for receiving, conveying, and discharging the nails singly into the nail-tube, substantially as set forth.

7. In combination with suitable receptacles for receiving the nails in bulk, an interchangeable delivering mechanism, adapted to deliver from either receptacle according to the length of nails desired, substantially as specified.

169,662. CONVEYERS FOR GRAIN. Nathaniel G. Simonds, Boston, Mass. [Filed July 20, 1875.]

Brief.—A device for conveying grain by means of a fan-blower and tube-sections.



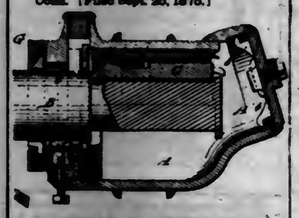
1. The auxiliary pipe D, in combination with and connecting the conveying-tube A and the interior of the casing E of the fan-blower, substantially as described, for the purpose set forth.

2. The conveying-tube A, when its bottom is composed of two horizontal portions, m and n p, connected by a curved portion, o s, substantially as and for the purpose described.

169,663. MACHINES FOR STRETCHING HAT-BODIES. James B. Wells, New Milford, Conn. [Filed Apr. 10, 1875.]

Brief.—The tip of the hat-body is stretched by being placed between the rotary disks, which are provided upon their faces with curved ribs, intersecting at the center of the disks, and having one or more through furrows or channels between the ribs.

1. The rotary hat-stretching disk or disks, having curved ribs X extending across the face or faces thereof, forming a central intersection, and provided with one or more through furrows or grooves, Z, for the purpose described.



2. In combination with the hat-stretching disk D, having curved ribs X extending across its face, forming thereby a central point of contact, and provided with one or more through furrows or channels, Z, a stretching-disk, constructed of two or more concentric sections, the "tip" or central section of which being spring-seated, and adapted to be flush with the outer section while under pressure.

3. In combination with the rotary stretching-disks D C, the stretching-arms F, connected to the sliding collar E and links *i*, whereby an outward movement in their ascent is produced.

4. The combination of arms F, collar G, links *i*, lever H, rod *t*, treadle I, centional spring-seated connected rod K, and rock-arm *y*.

5. In a rotary stretching-disk, the combination of sections L and C', operating in unison with each other, and the former susceptible of being distended above or compressed flush with the face of the latter, substantially as herein described, and for the purpose set forth.

160,664. Car-Axle Boxes. George Williams, Mystic River, assignor of one-half his right to Fredk. A. Holmes, Stonington, Conn. [Filed Sept. 20, 1875.]

The combination, with the box A and journal B, of the collar G with slotted ears *d d*, interior collar G', square headed screws *f*, and springs *e*, substantially as and for the purpose herein set forth.

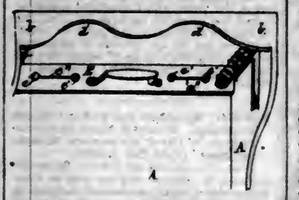
160,665. Permanent Letter-Files. John P. Adams, Irvington, N. Y. [Filed Sept. 27, 1875.]

1. The part A, provided with a groove or grooves, C, at one end, in combination with a sheet or sheets having a projection or projections, L, at one end, substantially as shown and described.

2. The part A, having projections and recesses on the ends of its sides, in combination with the part Q, provided with similar recesses and projections upon its sides, substantially as shown and described.

3. The combination of the part Q, provided with a spring, P, with the part A and adjustable sheets K, substantially as shown and described.

4. The combination of the part Q with the part A and adjustable sheets K, substantially as shown and described.



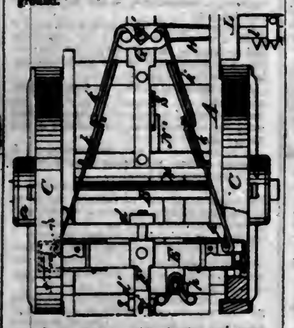
160,666. Shingles. David Altman, Nashville, Tenn. [Filed Oct. 7, 1875.]

A shingle beveled but a part of its length and provided with grooved and tongued edges, substantially as shown, and for the purpose set forth.

160,667. Temporary Binders. W. A. Amberg, Chicago, Ill. [Filed June 19, 1875.]

Brief.—Improvement on Patent No. 92,141.

1. In a temporary file and binder, adapted for puncturing and wiring or fastening the filed papers through the punctures and through their holding-bar before they are released or removed from the file, in combination with the perforated and slotted bar E and its springs, the narrow top piece *b*, constructed with the cut-out portions *d* located over the holes *c' c'* and slots *c' c'* in the bar, all as described and for the purposes set forth.



2. The combination, with the pressure-bar E, its springs, and the fixed top piece, of the side pieces A, having, respectively, straight and L-shaped grooves, whereby the bar E may be adjusted and removed, all substantially as shown and described.

160,668. Processes of Preserving Caviar. Max Ams, New York, N. Y. [Filed Sept. 25, 1875.]

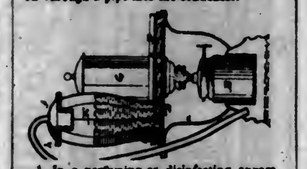
The process herein described of preparing caviar, after the admixture of salt, by exposing the same in air-tight cans to gradual heat of not less than 140° nor more than 200° Fahrenheit, substantially as specified.

160,669. Mowing-Machines. Jacob Ashcraft, Pressysburg, Ohio. [Filed July 10, 1875.]

Brief.—A draft-tongue, in combination with a check-pin, connected to a rock-shaft, and designed to actuate a convolute spring, for the purpose of pressing the cutter-bar upon the ground.

1. In a mowing-machine having two transporting-wheels, C C, and two cam-wheels, D D, the vibrating bar E, pivoted to an endwise-adjustable bar, F, in combination with rods *h h'*, vibrating heads G G', and pitman-rods H H, connected to the sickle-bars, substantially as described.

2. The draft-tongue N, secured to a rock-shaft, N', in combination with the arm N', spring S, and with the check-pin *p*, substantially as described.



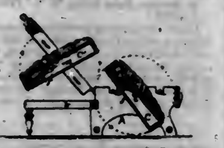
160,670. Anti-Sucking Bits for Calves, &c. John H. Bailey, Toledo, Iowa. [Filed Aug. 26, 1875.]

A tubular section-bit, open at each end, closed in front, and on the inside provided with hole *a'*, as shown and described, to allow the air ingress and egress from each end, and the animal to eat without clogging the tube with food.

160,671. Perfuming and Disinfecting Apparatus. Carl L. C. Bastmann, Hoboken, N. J. [Filed Oct. 16, 1875.]

Brief.—The hollow pan contains water fed from the reservoir, and is situated immediately over the flame of a lamp. The perfuming-powder to be decomposed is spread upon the top of this hollow pan, so that the water in the pan, on which the powder is placed, when heated, will evaporate the essential oils. The steam generated in the reservoir is carried off through a pipe into the condenser.

1. In a perfuming or disinfecting apparatus, the combination of the hollow perfuming-pan D with the reservoir C, as set forth.

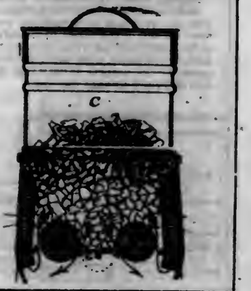


2. The combination of the hollow pan D, reservoir E, pipe *h*, and hollow base A, substantially as herein shown and described.

3. The combination of the support A, lamp B, arms *a a*, ring *b*, and hollow perfuming-pan D, as set forth.

4. The combination of the receptacle G with the frame *a b* of a perfuming and disinfecting apparatus, and with the hollow pan D, substantially as specified.

5. The combined base, condenser, and lamp-support A of a perfuming apparatus, substantially as specified.



160,672. Sofa-Bedsteads. Simon Bendit, San Francisco, Cal. [Filed July 21, 1875.]

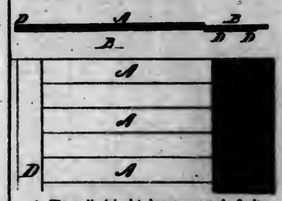
The bed-lounge described, consisting of the seat A and back B, hinged together, the frames C C', pivoted at each end in the seat and back, and capable of an entire revolution therein, the sliding catches *e f*, for holding the frames C C' rigidly in place, and the folding legs *h*, when the several parts are constructed, arranged, and combined substantially as described and shown.

160,673. Tyrrell's Furnaces. L. P. Bonn, Chicago, Ill. [Filed Sept. 20, 1875.]

Brief.—The ovens and the flat bar support the fuel. The ovens can be rotated to expose new surfaces to the direct impact of the products of combustion. The draft is downward through the fuel.

---

1. A tinman's furnace, provided with a fuel-magazine, and with draft-inlets at or near its base, but above the fuel on the grate, and a smoke-outlet below the grate to produce a downward draft through the fuel, combined with open-end tubes to receive the soldering-irons and heat the same without contact with the burning fuel.

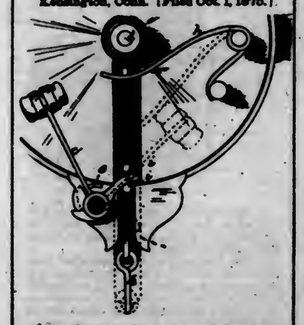


2. A tinman's furnace, A, provided with the tubes or ovens F to receive the soldering-irons, located at the bottom to support the fuel, combined with air-inlets at the top, and compartment D below said tubes and at the sides, substantially as described, so that the flame passes around the exposed surfaces of said ovens, and heats them uniformly, as set forth.

3. A tinman's furnace, A, provided with the tubes or ovens F, at the bottom of the fuel, to support the same, combined with the shaking-plate G, between said tubes, as set forth.

4. The cylindrical tube or oven F, constructed with a flange extending laterally around its open end, and an axial stud at its closed end, substantially as specified, so that it may be readily inserted or removed, securely held in place, and rotated as often as may be required to expose fresh surfaces to the action of the burning fuel.

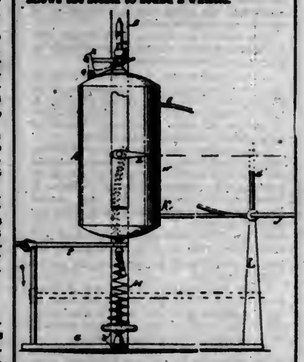
160,674. Pipes. Richard M. C. Bross, Jersey City, N. J., assignor of three-fourth his right to Jacob Kohlberg and Thaddeus H. Walsh, New York city, and Jno. P. Culver, Jersey City, N. J. [Filed Oct. 20, 1875.]



Brief.—The pipe is composed of alternate layers of wood and fabric arranged in spirals. The veneers are treated with asphalt in a fluid state, in order to cement them to the fabric. The inner and outer surfaces of the pipe, by the process described, will be covered with cloth, thus protecting the veneers from soaking, &c.

1. The cylindrical tubes composed of alternating spiral layers of wood and cloth cemented together by asphalt, substantially as specified.

2. The form for tubes consisting of a woven fabric, B, the longitudinal veneers A, and the transverse veneers D, alternately on one side and on the other of the fabric, cemented together by asphaltum, substantially as specified.

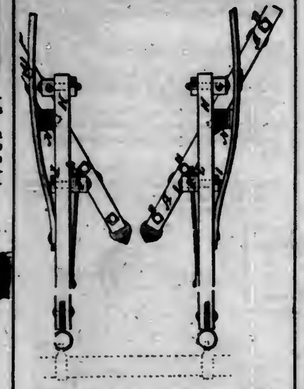


160,675. Door-Bells. John P. Connell, Kensington, Conn. [Filed Oct. 1, 1875.]

In combination, the pivoted hammer *e*, bearing the arm *f*, the reciprocating bar *f'*, bearing the pins *i i'* and the spring *h*, all arranged and operating substantially as shown and described.

160,676. Water-Regulators and Indicators for Steam-Boilers. Dexter Cook, Elmira, Ohio. [Filed Sept. 4, 1875.]

Brief.—When the water gets low in the boiler, the tank rises, trips a spring-valve, and allows the steam to sound a whistle.

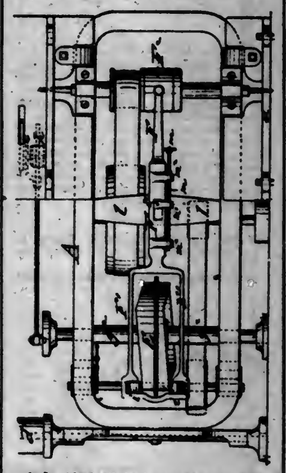


1. The combination, with wrench-lever P, of the spring-supported tank A, connected with steam-space of boiler by piping G G', and with water-space by piping I J, as and for the purpose specified.

2. The valve-lever Q, hook R, spring T, and tripping-rod S, for the purposes described.

160,677. Combined Cultivators and Harrows. Geo. Croll, Tuscogany, Ohio. [Filed Aug. 23, 1875.]

Brief.—Two beams are loosely swiveled to a common draft-bar. Beneath is an oblique bar for each, pointing forward and inward. These bars are attached to the beam by slotted standards and brace for vertical adjustment. Handles are attached in the usual manner. The shovels are secured to the diagonal bars.



The combination of the beams A, the slotted uprights F and G, the pivoted draft-bars H, and the braces K with each other, in substantially the manner herein shown and described.

160,678. Coulters. Freeman Culver and Jefferson H. Culver, West Oneonta, N. Y. [Filed Sept. 4, 1875.]

Brief.—A coiter with one flat and one convex side, and two cutting-edges, designed to turn and look, so as to present the flat surface to the land-side.

1. In a reversible or hill-side plow, the coiter C, having shank *g* and collar *h*, and adapted to be rotated axially, or vibrated vertically, and to be locked with its curved surfaces toward the mold-board side, substantially as specified.

160,679. Machines for Boring Blind-Stiles. Freeland H. Dan, St. Cloud, Minn. [Filed June 6, 1874.]

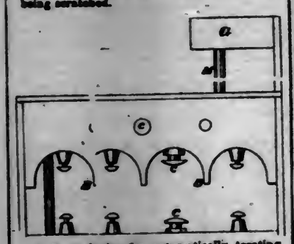
1. In a blind-stile-boring machine, the single spindle G carrying a tool at each end and receiving a continuous rotary motion, and an alternate endwise motion in opposite directions, in combination with the stile-feeding bars C receiving an alternate progressive movement, as and for the purpose herein described.

2. The combination of the cam-wheel E, pivoted forked lever F, and loose collar or sleeve F', with the tool-spindle G and the fixed mechanism, as and for the purpose specified.

3. The stile-feeding rack, provided with slotted end and pivoted double catch-piece for fastening into mortise of stiles at either side thereof, substantially as specified.

4. The combination of the fulcrumed lever F, double cam-wheel E for giving reciprocating motion to boring-spindle, fulcrum-block *f'*, and adjusting-screw mechanism *a m' m'* for producing the accurate depth of the holes required, substantially as and for the purpose described.

160,680. Sign-Plates. Hiram T. Dewey, Brooklyn, N. Y. [Filed Sept. 13, 1875.]



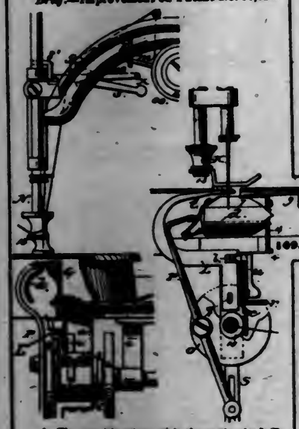
The sign or name plate composed of a sheet of metal, with the letters or numbers cut therein, and a plate of mica, connected together by a surrounding frame of folded sheet metal, as set forth.

169,660.

5TH AVE

169,661. SHEEP-SCRATCH BOXES. Ira B. Dillon, Visalia, Cal. [Filed May 3, 1875.]

Brief.—A part of a tank containing medicaments passes over the back of the sheep, and a part comes up under the belly. Valves project from the tank, so that the sheep, in rubbing, forces the valves in, and allows the liquid to flow upon the diseased parts which are being scratched.



1. In a device for automatically treating sheep, the tank C, elevated as shown, for the purpose of supplying a liquid to the boxes A and E under pressure, substantially as and for the purpose herein described.

2. In combination with the box A, the valves c, having the heads d fitting closely over the openings through which the stems pass, said stems being hollow, and having perforations just beneath the head to admit the liquid to the interior when the valve is raised, substantially as herein described.

169,662. SEWING-MACHINE. George L. Du Laney, New York, N. Y. [Filed June 2, 1875.]

Brief.—Improvement on Patent No. 56,699.

169,663.

1. The combination, with the main shaft E, and with the needle-operating mechanism and a looper, of the disks 1 and 2, provided with radial slots, the crank-a and crank-pins 3 3, the shaft H' above the shaft E, and the shaft H below it, or on the opposite side, as and for the purpose set forth.

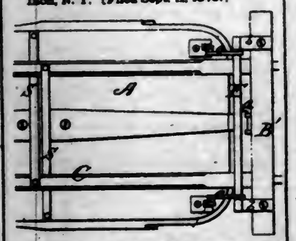
2. The spool-case holder G, constructed as described, and provided with the jaw d, having a thread projection, 7, located on its upper edge at a point slightly in advance of the path of the needle, substantially as and for the purpose specified.

3. The shield or guard f, in combination with the jaw d, as shown, and for the purpose set forth.

4. In combination with the hard-rubber spool-case M, the spool-guard 13, constructed with the rearward extension, as shown, and applied to the spool case, and operating as and for the purpose set forth.

5. A sewing-machine needle provided with a shoulder-groove, 21 22, substantially as shown, and for the purpose specified.

6. The combination, for joint operation, of the following devices, viz: the tension-wheel O', ring O O, lever m m, spring m², lifter s, spur e, adjusting-lever 3, graduating-lever 60, and yoke 9', these parts being constructed substantially as shown and set forth.

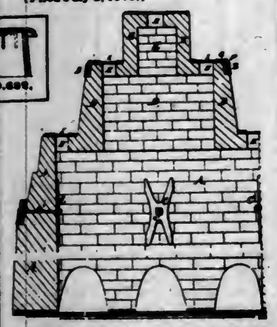


7. In a sewing-machine, the combination, with a thread tension device adapted to feed out automatically the quantity of thread for a stitch, and with the needle, of the disks 8, when used for controlling the slack thread above the eye of the needle, as and for the purpose specified.

8. The adjustable slotted thread-guard 9, in combination with the jaw d, provided with the point 6, substantially as described, and for the purpose set forth.

9. The combination of the wheel O', lever m m', spring m², lifter s, spur e, adjusting-lever 3, graduating-lever 60, yoke 8, and bar X, the several parts being constructed substantially as and for the purpose specified.

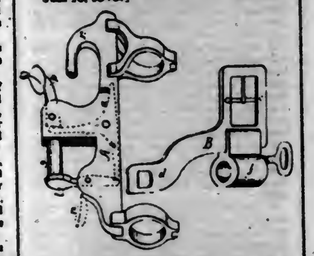
10. The combination, with the feed-dog L, of the eccentric 10, the pendent lever e, adjustable fulcrum-slide r, and bracket a, substantially as set forth.



169,664. CARRIAGE-SPRINGS. W. H. Elliot, Ilion, N. Y. [Filed Sept. 11, 1875.]

1. The centrally-arranged reach-spring D, in combination with the equaliser E e d, substantially as specified.

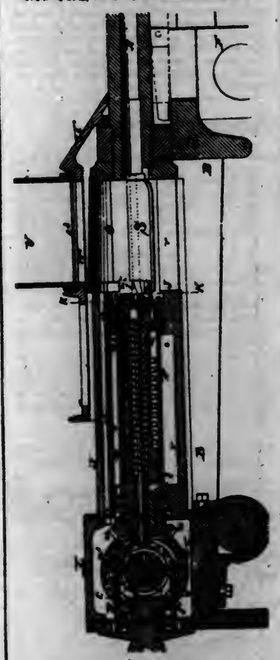
2. In combination with the central reach-spring D, wagon-body A, reaches C, and an equaliser, the straps S, substantially as specified.



169,665. BRICK-KILNS. Holland B. Evans and Barnett G. Kemper, St. Charles, Mo. [Filed July 3, 1875.]

169,666.

In a brick-kiln, the combination of main and top compartments A D E, the same being graduated in size, and the floor H formed in the ledges or horizontal top portion of each of said compartments, and provided with slides I, as shown and described, for the purpose specified.



169,666. APPARATUS FOR DETACHING HORSES FROM CARRIAGES. Isaac L. Fallis, Dayton, Ohio, assignor of one-half his right to Ferdinand Stephan, same place. [Filed Jan. 16, 1875.]

1. In apparatus for detaching horses from vehicles, the part A consisting of the collars a b, latch l, trigger p, bent hook r, and stud g.

2. In combination with the tug or part A, as described, the part B, composed of the buckles or rings c, d, and e, and sleeve f, substantially as and for the purpose specified.

169,667. MACHINE-GUNS. W. S. Farwell, New York, N. Y. [Filed May 7, 1875.]

1. The tail-screw G, combined with the pivoted nut b and by ball-and-socket joint with the traversing-nut H, substantially as herein shown and described.

2. The traversing-worm I, combined with the beveled wheels j m and, by gearing, with the transverse operating-shaft M, and provided with a clutch, n, by which its motion can be reversed, substantially as herein shown and described.

3. In combination with the transverse operating shaft M, that gears into the traversing-worm I, the beveled wheels j m, clutch n, and gearings, by which the traverse can be changed from an automatic to a hand traverse, substantially as herein shown and described.

4. The reciprocating breech-closer Q, provided with an external screw-thread to receive its motion from the rotating embracing-tube P having an internal screw-thread, substantially as specified.

5. The combination of the barrel A with the rearwardly-extending breech-chamber J, transverse box L, and with the escapet g, which is applied to said box, substantially as specified.

6. The combination of the firing-pin w, tubular breech-closer Q, embracing tube P, and cylindrical breech-chamber J, all of said parts being concentric and operating substantially as specified.

7. The tubular screw P, connected rigidly with the beveled wheel c and gear-wheel v, and combined with the breech-closer Q and cartridge dipper-shaft f^3, substantially as specified.

8. In combination with two or more barrels, A A, which are placed on the same plane, in a machine-gun, the operating-shaft M, carrying two or more sliding clutches, b^3, and two or more loose wheels, c^3 c^3, all arranged so that each of the barrels A will have its interior mechanism actuated by the same shaft M, but independently from the other barrels through the intervention of the clutches and wheels c^3 c^3, substantially as specified.

9. The sliding clutch b^3, made with a projecting pin, b^5, for the purpose of imparting intermittent rotary motion to the toothed wheel c^3, substantially as described.

10. The rotating-wheel c^3, provided with a cam, c^5, and combined with the claw and lever R, for operating the clutch and effecting the firing-pin of the machine-gun, substantially as specified.

11. The clutch b^3, combined with the lever R, which carries the pin g^5 into a groove of the clutch and with intermediate mechanism, whereby the rotation of the clutch serves to vibrate the lever R and to move the clutch lengthwise, as specified.

12. The cancelled plate q, carrying on its inner face the plate q^1, which serves as a pivot for the lever R, and as support for the wheel c^5, substantially as specified.

13. The firing-pin w, combined with the vibrating claw R, by which it is locked and released, substantially as herein shown and described.

14. In combination with the shank of the claw R, the ring q^2 and rod f^5, said ring carrying two pins on opposite sides of the actuating-wheel c^5 to be affected by the cam c^5, substantially as herein shown and described.

15. The vibrating cartridge-extractor s, pivoted in a slot of the tubular reciprocating breech-closer Q beneath the firing-pin w, and combined with said firing-pin to be locked by the head or enlargement thereof, substantially as herein shown and described.

16. In combination with the front bearing o of the rotating tube P, the spring y, which is interposed between the end of the tube P and the bearings, to operate in conjunction with the reciprocating breech-closer Q, substantially as specified.

17. The vibrating cartridge-dipper O, fitted within a recess of the breech-chamber J, and attached removably to the operating-shaft f^3, substantially as herein shown and described.

18. The gear-wheel v, mounted on the rotary tube P and combined with the toothed segment f^4 on the shaft f^3 of the vibrating dipper, substantially as herein specified.

19. The vibrating jaws S S, arranged in the cartridge-receiving chamber beneath the vibrating dipper O, substantially as and for the purpose specified.

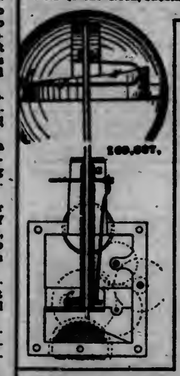
20. In combination with the vibrating jaws S S, the twisted stems F and the sliding yoke m^2 for the purpose of operating said jaws, as specified.

21. The double pawl y^2, combined with the toothed wheel y^3 and with the operating-crank rf on the sleeve r^3, substantially as specified.

22. In combination with the cam-wheel N and reciprocating rod C^2, the pawl y^2, wheel y^3, crank z^2, and operating-pawl w^2, all arranged substantially as specified.

23. The wheel y^3, made with coarse-tooth deeper than the remaining teeth, and combined with the actuating-pawl y^2 and notched crank z^2 to throw said pawl in connection with said crank once only during the rotation of said wheel, as specified.

24. The combination of the spring-rod y^4 and connecting-rod w^2 with the pawl y^2, for the purpose of being acted upon by the magazine, in the manner specified.



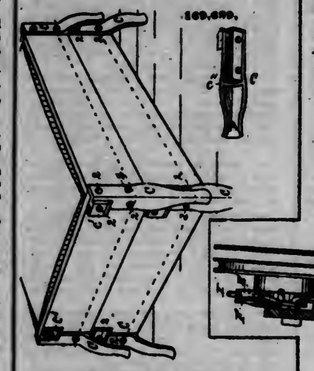
25. The sliding magazine-support T, made with three transverse ribs, which form its surface into two shallow receivers for two magazines, substantially as and for the purpose specified.

26. In combination with a machine-gun having a series of parallel barrels, the laterally-movable magazine s and the longitudinally-movable magazine-support T, substantially as described.

27. The combination of the dipper O with the breech-chambers J and their relative arrangement, whereby the dipper will be enabled to support a cartridge, which will be clear of the charging-magazine, substantially as and for the purpose specified.

169,667. GLOBE ATTACHMENTS TO CLOCKS. Henry Fick, New York, N. Y. [Filed Oct. 23, 1875.]

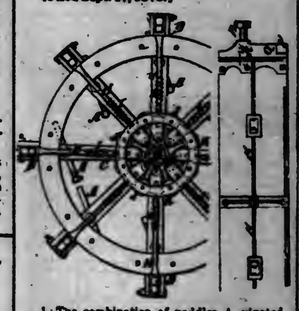
The globe-shaft B, connected to the shaft geared to the clock by a spring, and a cam, arranged for automatically returning the globe to its true position, relatively to the time-train of the clock, substantially as specified.



169,668.

169,668. HORSE HAY-FORKS. James H. Fletcher, Wayne Township, Montgomery County, assignor of one-half his right to M. L. Bass, Crawfordsville, Ind. [Filed Feb. 13, 1875.]

The combination, with the pivoted prongs A and staple G, of the locking-bar D, provided with shoulder H, for adjusting and securing the prongs in position, substantially in the manner shown and described.



169,669. FOLDING BEDSTEADS. John Flinn, Philadelphia, Pa. [Filed Sept. 9, 1875.]

169,669.

In a cot-bedstead, the leg C, consisting of a plate bent longitudinally to an angle of ninety degrees, or so as correspond with the silent angle of the body of the cot, and provided with the stop-plate c^2, the lower part of the leg being bent outward, as and for the purpose described.

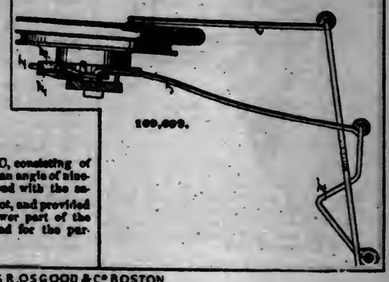
169,670. FEATHERING PADDLE-WHEELS. Peter Gregersen, Wauzeka, Wis., assignor to himself and Phillip Miller, same place. [Filed Sept. 17, 1875.]

1. The combination of paddles A, pivoted above the center, the rods having stops D, the cam G, and the springs I, all arranged substantially as and for the purpose specified.

2. The cam G and slotted disk N^1, combined with the paddle-wheel and the stop-rods, in the manner described, for changing as the wheel turns forward or backward.

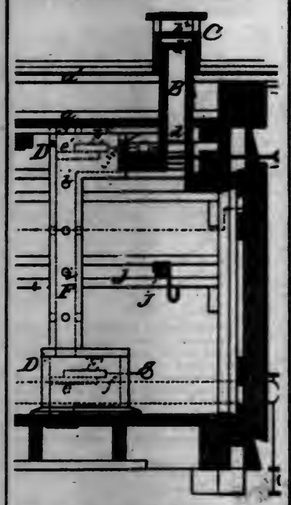
3. The combination of adjusting-slide O with the shifting-cam and disk N^1, substantially as specified.

4. The metal heads Q, having pivot B and tension-rod connections, in combination with a paddle, substantially as specified.



169,671. REGISTERS. Friedrich Grosbeck and Eugen Mullendorff, Detroit, Mich. [Filed June 16, 1875.]

The register having the casing with the handle attached, and the aperture f, as shown, and provided with the rod e, passing down through an aperture in the said handle, and the pawl g attached thereto, in combination with the spring h, ratchet-wheels B and C, and dial D upon the shaft d, and the detent $f f^1$, all being constructed as shown, for the purposes set forth.

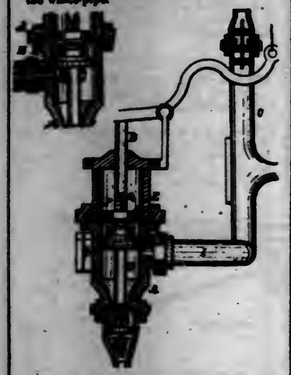


169,672. TREADLES FOR MACHINERY. Andrew N. Haguety, West Alexander, Pa. [Filed May 1, 1875.]

The combination of the auxiliary treadle K, connecting-rod J, pawl-lever F, pawl E, and a spring, I, with the ordinary treadle and connecting-rod of a sewing-machine, substantially as specified.

169,672.

160,695. Smoke-House. Calvin D. Earl, Andover, Ind. (Filed Aug. 14, 1875.)



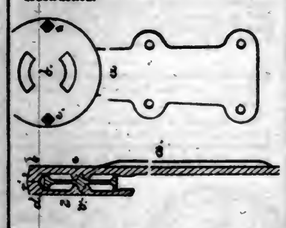
1. The perforated ventilating-tubes F, and boxes D^1 D^2, provided with cut-off valves B B', in combination with a smoke-house having openings d' in its floor, substantially as specified.

2. The combination, with a smoke-house, of the conduits B B', having wire-cloth diaphragm d, and overlapping spaced shelves b^1 b^2, substantially as specified.

3. The combination, with a smoke-house, of the perforated tubes F, valved boxes D^1 D^2, valved conduits B B', having caps C, and diaphragms d, substantially as specified.

160,696. Anti-Freezing Cocks. Samuel T. Harker, Milwaukee, Wis. (Filed Mar. 22, 1875.)

Brief.—When the diaphragm is depressed, the valve which controls the supply is opened, and the waste-pipe closed by its valve. The pipes are filled and the air-valve closed by pressure of water. When the diaphragm is released, the action of the valves is reversed, and the water in the pipes will escape through the waste-pipe.



1. Cock-case A, valve C, valve-stem D, diaphragm E, washers I, and valve H, all in combination, substantially as described.

2. The pipe O, valve N, in combination with waste-pipe I and valve H, substantially as and for the purpose set forth.

160,697. Door-Hangers. Thomas Harris, Fayetteville, N.Y., assignor of one-half his right to Beach C. Beard and Huntington Beard, same place. (Filed Jan. 15, 1875.)

Brief.—Sole novelty consists in cooie pivots cast upon the wheel, combined with details of construction.

The improved door-hanger herein described, consisting of the strap or plate a, cast with circular head b, having inside V-shaped ring or hub c, and projecting rim e, the cap-piece d, cast with corresponding rim and V-shaped ring, the wheel b, cast with cooie pivots to serve as journals, and the two connecting-bolts a a passing through the rim, all substantially as described and shown, for the purpose set forth.

160,698. Knife-Heads for Harvesters. Geo. W. Harrison, Lansing, Mich. (Filed Sept. 20, 1875.)

1. In combination with the knife A, the base or heel plate B, secured to the knife by rivets a, and constructed at its top rear edge with undercut varied projections or joints B^1 B^2 B^3, and for the purposes described.

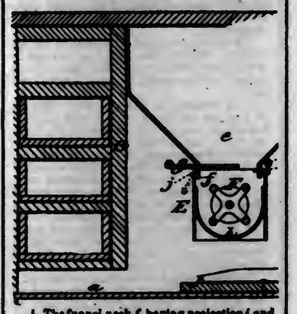
2. In combination with the plate B, constructed with projections and recesses B^1 B^2 B^3, the coupling-head C, constructed with varied recessed and notched base C^1 C^2 C^3 fitting thereto, as and for the purposes described.

3. A coupling-head or pitman-connection for harvesters, made in two separate and distinct parts, whereby the head may be removed from the base-plate, by which it is secured to the heel of the knife and applied to different blades of different harvesters, substantially as and for the purposes described.

4. The coupling-head or pitman-connection for harvesters, composed of separate and removable head C and base plate B, the two united by a joint between the two and bolt B^1, and to the knife by rivets or bolts passing through the knife and plate, substantially as and for the purposes described.

5. The hollow coupling-head C, constructed with varied notched base C^1, and provided at each end with screw-plugs D D, as and for the purposes described.

6. In combination with the hollow coupling-head C, constructed with varied notched base C^1, and screw-plugs D D at each end, the rubber packing E E, and metal bosing F F, placed at each side of the pitman-arm and adapted to be adjusted independently of each other by the screw-heads D D, as and for the purposes described.



7. In combination with the hollow head C and screw-heads D D, the rubber packing E^2 fitted within the head C and adapted to be adjusted at either end by the plugs D D, as and for the purposes described.

8. In combination with the head C and packing E F, the heel arm H, entering the cylinder through oblong opening D^2, and connected to pitman by screw-coupling H^1, as and for the purposes described.

9. The combination of knife A, cylinder C, base-plate B, made separate therewith, and pitman-arm H, entering the cylinder only at one side, as and for the purpose described.

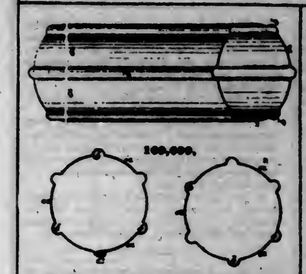
10. The pitman-connection for harvesters, composed of separate base-plate B and cylinder C, screw-heads D D, rubber packing E E, metal bosing F F, and pitman-arm H, all constructed and united substantially as and for the purposes described.

160,699. Kitchen-Safes. J. B. Harrison, St. Joseph, Mo. (Filed Aug. 14, 1875.)

1. The funnel-rest f, having projection f and eye l, in combination with the detachable sieve-box E, having perforations f^1, hook h, and crank-arm H on the inside of the safe, as described, and for the purpose set forth.

2. The kneading-board J, provided with hinged wing n, adapted to be unfolded for the purpose of extending the said board entirely across the front of the safe, substantially as specified.

160,700. Hominy-Mills. Benjamin Harvey, Sulphur Springs, Ind. (Filed Aug. 14, 1875.)



Brief.—Grain is beaten and broken up in cylinder, and passes through perforations in bottom, upon a perforated discharging-screen, which is shaken by a rod in connection with lug on fan-shaft. Grain is subjected to blast of air as it escapes from end of discharging-screen.

1. In combination with the beaters g, the perforated concave B of case A, and the discharging-screen H, the blast-case C, fan J, and spouts h i, substantially as described.

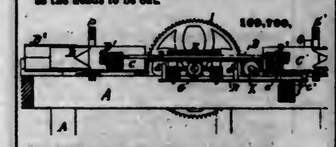
2. In the machine herein described, the shaking-rod j, actuated by shaft d and a spring, a, in combination with the screen H and blast-spouts h i, substantially as described.

160,690. Tubes for Railroad, Posts, &c. Dwight W. Hamilton, Philadelphia, Pa. (Filed Mar. 1, 1875.)

A new article of manufacture suitable for architectural purposes, consisting of a galvanized or coated iron tube provided with ribs or bands and intermediate heads, substantially as set forth.

160,699.

160,700.



A combined ground-glass and plate holder, provided with grooved insulating bottom holders, top buttons, and side gage or support, and with a fastening spring top plate, for securing either the ground glass or sensitized plate in exact focused position, constructed and arranged substantially as set forth.

160,702. Fluid-Meters. Berthold Huber, Brooklyn, N. Y. (Filed Apr. 24, 1875.)

Brief.—The tube is made flat and the base level, the inlet being introduced under the outlet, and the tube being not allowed to rise for a short distance beyond the inlet. The axis of the roller w connected to the center stud by an eye, and actuates the registering mechanism by engaging with a crank-pin 4 depending from the latter.

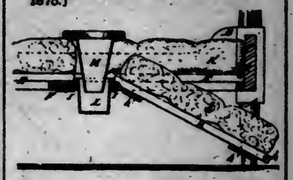
160,703. Machines for Making Heads of Wooden Boxes. Edmund Hervey, Hingham, Mass. (Filed Sept. 20, 1875.)

Brief.—A reciprocating bar is provided with plungers at each end, which force the material through hollow cutters of the same shape as the heads to be cut.

160,703.

1. The combination and arrangement of the knives B and B^1, the toothed rack D, having secured to its opposite ends the plungers D^1 and D^2, and the pinion F, arranged to be intermittently rotated in opposite directions, and thereby impart a reciprocating motion to the rack D and plungers D^1 and D^2, as and for the purposes described.

2. The combination of the knives B and B^1, formed as set forth, the plungers D^1 and D^2, rack D, pinion F, gear I, pinion J, sliding shaft K, bevel-wheels L, L^1, and P, and shipper-lever Q, all arranged to operate substantially as described.



3. The combination of the reciprocating plungers D^1 and D^2, the shipper-lever Q, catch g, the shipper-bar R, provided with the pins a, a^1, d, and d^1, and the pointed lug e, and the double-inclined upper surface of the girt f, arranged to operate substantially as described.

4. In combination with the knives B and B^1, one or both, the safety-guards S or S^1, arranged substantially as described, for the purposes specified.

160,704. Mechanical Movements. John Hughes, New Berne, N. C. (Filed Apr. 10, 1875.)

The combination of the rocking seat H, cogged segment G, pinions a, shafts A, and wheels C C, the said seat being located above said segment and gear-wheels, and the device adapted to be operated by a person sitting on the seat, as set forth.

160,705. Invalid-Bedsteads. William Huntress, Richmond, Va. (Filed Sept. 17, 1875.)

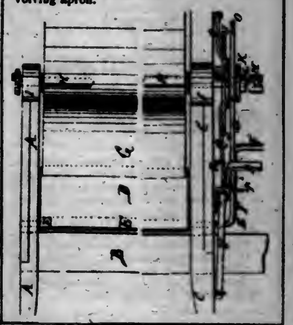
1. The hinged drop-frame I and the drop-plate H, provided with the connecting-plates h^1 and the guard pins h^2, in combination with the long slats E, the cross slat F, and the frame of the bedstead, substantially as herein shown and described.

2. The mattress K, having the middle portion of its foot part cut away, and replaced by a separate piece, k^2, to correspond with the drop-frame I and the drop-slats H of the bed-bottom, substantially as herein shown and described.

3. The combination of the vessel L and the chute M with the hinged drop-frame I and the mattress K, substantially as herein shown and described.

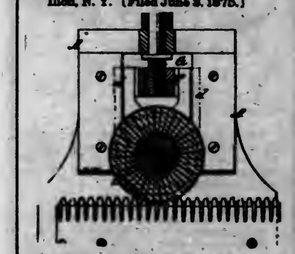
160,706. Covers for Tumbling-Rods. J. B. Hutchinson, Spring Valley, Minn. (Filed Oct. 16, 1875.)

Brief.—The tumbling-shaft is inclosed in tabular sections, having guard-rings applied at the joints.



160,706.

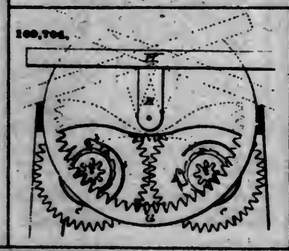
1. Tapering covering sections C and joint-guards a, combined with a shaft, A, substantially in the manner and for the purpose described.



2. The packing b, combined with the covering sections C and tumbling-shaft A, substantially as and for the purpose described.

160,707. Revolving Dropsyrs. J. Johnson, Perry, Ill., assignor to himself, W. T. Smith, and T. H. Ward, same place. (Filed July 10, 1875.)

Brief.—The depression of a crank rigid with the vibrating apron allows the revolving apron to describe a semi-revolution, which apron is revolved by means of a lever, rack-frame, and pinion fixed to the axis of the revolving apron.

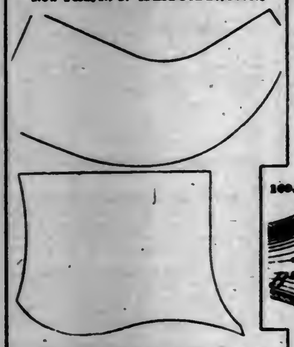


160,701. Type-Machines. A. M. Howard, Ilion, N. Y. (Filed June 3, 1875.)

1. The clamping-wheel for confining single type or monogram-type, in combination with the clamp formed of three plates for confining the gage-feeding rack, and single pieces of metal for writing or monogram type, substantially as and for the purposes described.

2. The combination of a toothed gage and feeding-wheel, a type-clamping wheel, a toothed and vertically-yielding or spring gage and feet-rack, and the clamp for the blank type-metal, and spring and gage feeding rack, substantially as and for the purposes described.

160,708. Photographic-Plate Holders. Frank A. Howson and Wm. S. Howson, Brooklyn, N. Y. (Filed Sept. 20, 1875.)



160,708.

1. The combination of the vibrating apron D, the revolving double apron G, and any suitable operating mechanism, substantially as herein shown and described.

2. The combination of the crank F, levers P and Q, rack-bar O, gear-wheel K, clutch L M N, disk J, projections f and f', sliding bar S, and springs T U with each other, and with the vibrating apron D and the revolving double apron G, substantially as herein shown and described.

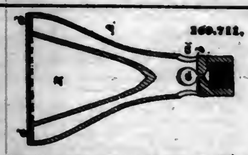
160,708. Button-Gaiters. Arthur Kenny, New York, N. Y. (Filed Oct. 27, 1875.)

1. As a new article of manufacture, the improved button-gaiter, having the vamp, one quarter, the button-flap, and facing or lower part of the other quarter in one and the same piece, substantially as described.

2. The pattern for a button-gaiter, having the outside quarter, button-flap, vamp, and facing, or lower part of inside quarter in one and the same piece, substantially as described.

160,709. Toy Building-Blocks. Ernest U. Kinney, Passaic N. J. (Filed Oct. 6, 1875.)

The toy building-block, with the grooves a and tongues b placed around a square block at the angles thereof, as as to interlock, substantially as set forth.

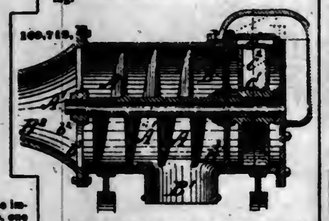


160,710. Locks for Fire-Arms. David Kirkwood and Henry Mortimer, Boston, Mass. (Filed Oct. 21, 1875.)

The lever E, with or without a projection, h, in combination with the mainspring D, tumbler C, and hammer B, operating substantially in the manner and for the purpose set forth.

160,711. Ammo-Gas Burners. John E. Knights, Boston, Mass., assignor to Caleb G. Wadsworth, same place. (Filed Apr. 28, 1875.)

Brief.—The air and gas commingle as they strike against the inverted cone.



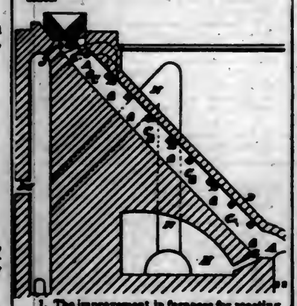
160,712.

The improved aero-gas burner, consisting of the cone A, the inverted cone B, the series of air inlets *a a*, the perforated diaphragm *b*, and series of ejection-orifices *d d*, the whole being constructed, combined, and arranged in manner as shown and described.

160,713. Elevators for Saccharine Liquids. Eugene P. Larve, Philadelphia, Pa., assignor of one-half his right to Raymond Cope, same place. (Filed Oct. 14, 1875.)

Brief.—The screw-conveyer and rotary engine are secured to a hollow shaft. The exhaust steam passes through the hollow shaft, and assists in ejecting the liquid from the casing.

160,713.



1. The combination of a screw-conveyer, an ejecting-casing, and an ejector, substantially as set forth.

2. The combination of a screw-conveyer and a rotary engine, both secured upon a hollow shaft, which receives the exhaust steam at one end and discharges it from the other, into a casing inclosing the conveyer and engine, substantially as set forth.

3. The combination of the casing, divided into two compartments, the exhaust-passage, and the exhaust-valve, substantially as set forth.

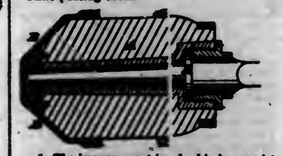
160,715. Ore-Roasting Furnaces. H. G. Livermore, San Francisco, Cal. (Filed Aug. 11, 1875.)

Brief.—Ore passes downward in the longitudinal channels and beneath the transverse partitions. While heaped up against the latter it is struck by escaping products of combustion reverberated from the abutments of the roof. Vapors from the waste-chamber and from the smoke and fire flue pass into a rear chamber in communication with the condenser. Ore previous to insertion is dried in pan on furnace. May be stirring-holes ranged in sides.

1. The improvement in furnaces for roasting ores, consisting of inclined chamber A, having a longitudinally-channeled floor and a roof with abutments B, wherein the ore may move downward by gravitation, and the heat and flame pass upward and be deflected on the ore, substantially as and for the purpose set forth.

2. The shallow furnace-chamber A, with its floor standing at such an angle that the ore will move down by gravitation alone, in combination with the transverse dams or abutments *a*, by which the ore is retained upon the floor-surface in a thin sheet, and is at the same time stirred as it moves downward, substantially as herein described.

3. The angular chamber H, leading from the waste-chamber H, above the inclined ore-chamber, and thence to the condenser, for the purpose of utilizing any heat and fumes which may have passed into the waste-chamber, substantially as described.



4. The receiving-chamber L, for the fumes, having the openings J and K from the ore-chamber, and the channels N from the waste-chamber, substantially as herein described.

160,714. Compositions for Varnish. S. W. Mayer, L. Loewenstein, and B. Mayer, New York, N. Y. (Filed Sept. 24, 1875.)

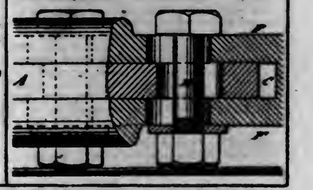
An improved varnish, consisting of gum-copal, alcohol, benzine, gum-gamboge, and orange aniline, substantially in the proportions and for the purposes set forth.

160,716. Wheel-Hubs. W. H. Masterman, San Leandro, Cal. (Filed July 13, 1875.)

Brief.—Outer end of hub is made conical, to prevent interlocking with other vehicles while passing them.

1. The improvement in wheel-hubs, consisting in forming the outer or projecting ends of the hub in a circular, conical, or tapering form, substantially as and for the purpose above described.

2. The cap B, constructed to fit the outer or projecting end of the hub A, and having the ring or band C on its inner rim, which also serves as a band for the hub, substantially as and for the purpose described.



160,716. Plows. Wm. H. McOuat, Pittsburg, Pa., assignor to the Pittsburg Steel-Casting Company, same place. (Filed Sept. 28, 1875.)

A plow share or plate, A, having perforated lug *a'*, with sloping edge *a'*, in combination with frog or standard B, having slot *c*, with sloping edge *c*, substantially as and for the purpose set forth.

160,717. Rail-Joints. George A. Mead, Salem Centre, N. Y. (Filed Sept. 11, 1875.)

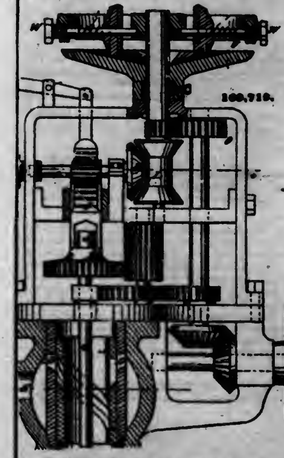
Brief.—A rail-joint in which a tension or tongue of one rail fits into a slot made in the thickened end of the adjacent rail, and both secured by bolts.

A rail-joint in which a tenon or tongue of one rail fits in a slot in the other rail, and the tenon and the slotted portion are bolted together, substantially in the manner described.

160,718. Shingle-Bits. Basil Miller, Coshocton, Ohio. (Filed Apr. 20, 1875.)

1. The bit described, having the bars *a a*, lever side pieces *a' a'*, and removable cars *a' a'*, constructed and arranged as described.

2. The combination of the bit-rings, having projecting studs *b*, and rein-plate C, having the transverse openings *c*, for the purpose described.



3. The combination of the lever-arms *a'* with the bridle-straps D, the latter being applied by the movement of the arms, substantially as described.

160,719. Governors and Cut-Offs for Steam-Engines. Martin D. Miller, Oswego, Kans., assignor to himself and Jas. T. Pierson, same place. (Filed July 31, 1875.)

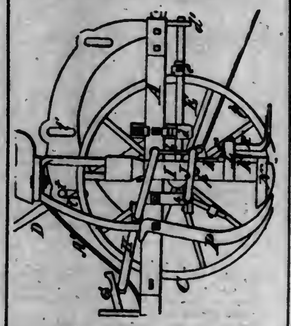
Brief.—When the speed of the engine increases the rollers are thrown out on the concave plate, by which the governor-spindle is raised, and the wheel thereon brought in contact with the friction-wheel, which raises the valve and cuts off the supply of steam.

1. The disengaging friction-wheel, in combination with valve and casing, the weight of valve and fittings being balanced by ball and lever, as set forth, to enable the governor to regulate the speed with accuracy.

2. The rotary hollow valve A, having spiral ports, in combination with a case having spiral ports, the said valve having its weight counterbalanced, and being geared with the governor-pinion K by a toothed rack, I, substantially as specified.

160,719.

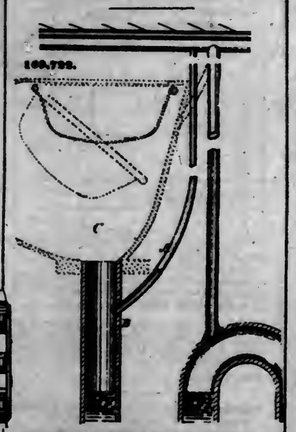
3. The combination, in a governor, of concave plate Q, rollers R, spindles S, springs U, and adjusting-screws W, substantially in the manner described.



160,720. Car-Couplings. Jas. C. Mitchell, Lancaster, N. H. (Filed Sept. 4, 1875.)

The combination of draw-bar, having shoulders *a'* and detachable top plate *a'*, and a coupling-plate, having the pivots *c'*, as and for the purpose specified.

160,721. Corn-Planters. John G. Mole, Sarpy Centre, Nebr., assignor of one-half his right to Byron Huff, same place. (Filed June 11, 1875.)

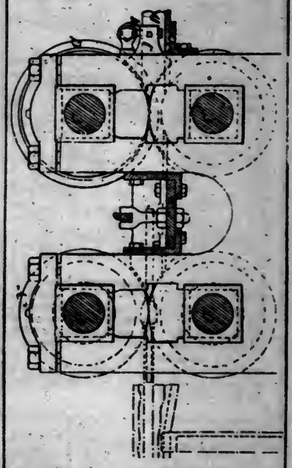


Brief.—The axle of the bearing-wheels is mounted on crank-arms, and adjustable in hangers. The arms carrying the scrapers are attached to the axle, and play in loops depending from the rear cross-bar.

1. The axle C' of connected wheels C C, having its bearing in crank-arms *c*, and an angular lever, *c'*, adjustable in hangers *d*, in combination with levers D D', and the slotted arc F, substantially as described.

2. The arms E E, attached to the axle C', and provided with scrapers *e e*, in combination with the guiding-loops *d'* depending from the rear cross-bar of the frame A, substantially as described, and for the purpose set forth.

160,722.



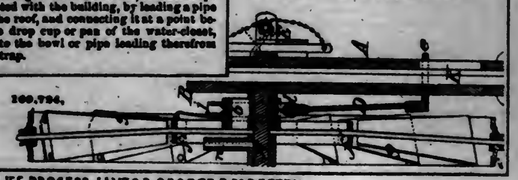
160,722. Water Supplies and Vents for Traps. John E. Morrell, New York, N. Y. (Filed Oct. 1, 1875.)

Brief.—Water is conducted from the roof of a building to the water-closet, or other traps connected with the building, by leading a pipe from the roof, and connecting it at a point below the drop cup or pan of the water-closet, either to the bowl or pipe leading therefrom to the trap.

The pipe A, opening through the roof of a building, and serving the double purpose of conducting off the foul air from the closet, and conducting thereinto from the roof water for supplying the trap, in combination with the bowl C and pipe B, as and for the purpose specified.

160,723. Machines for Making Tubing. George Henri Marc Muntz, Church Hill House, Handsworth, England. (Filed May 22, 1875.)

Brief.—A pair of rolls for beveling the edges and partly bending the strip, and a second pair for finishing the tube, (the pair N placed after and running at a greater surface-speed than the pair G, and having a mandrel between them,) having in front of the first pair guides for introducing the blank, and between the two pair a bending-guide, M, of particular construction.



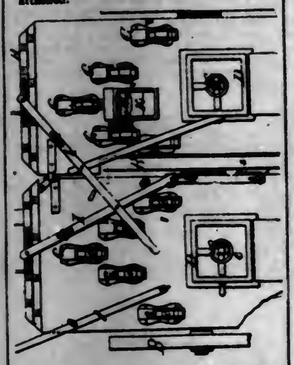
1. The combination of beveling and scarfing rolls G G, bending-guide M, and rolls N, driven at a quicker surface-speed than the rolls G and with a mandrel between them, substantially as herein described.

2. The combination of guides D J, beveling and scarfing rolls G G, bending-guide M, and rolls N driven at a quicker surface-speed than the rolls G and with a mandrel between them, substantially as herein described.

160,724. Windmills. William C. Nelson, Sacramento, Cal. (Filed July 24, 1875.)

Brief.—An upright tubular post, on the upper end of which is a revolving tubular cap, to which is attached a horizontal shaft, that receives the hub of the windmill. On the rear end of the hub an eccentric is keyed, which is embraced by a yoke, to which a pitman is attached by a pivot-joint. The lower end of the pitman-rod has a ring secured to it, which encircles loosely the hollow post, and receives vertical motion when rotated.

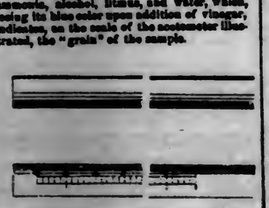
1. The hollow rod G, carrying the vane J and wind-blade I, bent as described, in combination with step-pins *h h*, chain *i*, and rod K, the latter passing through hollow cap *e* and hollow shaft A, for the purpose described.



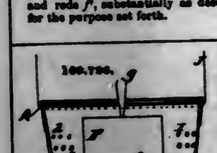
160,724.

2. The pitman-rod D, having a ring, c, which encircles the post A, and pivoted at d to the yoke e of eccentric b, for the purpose set forth.
3. The blades g, riveted to rim f, and secured to ring f' by means of screw-stems f and tightening-nuts, for the purpose set forth.

160,726. Grass-Platforms. William Nevins, Titusville, Pa. [Filed July 8, 1875.]



Brief.—The shovel-standards are adjustably pivoted in metal sockets fastened to the upper side of the platform. The standards are all simultaneously adjusted at the front by cross-bends, to which one end of the brace-rods are attached.



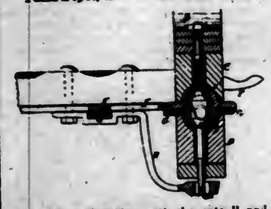
1. The adjustable shovel-standards E, pivoted in sockets G, attached to the platform, in combination with the rods f', bent H, bolts h h, and levers I I, having their fulcra in upright standards on the platform, substantially as described, and for the purpose set forth.
2. The perforated cast-metal socket G, in combination with the perforated standard E and rods f', substantially as described, and for the purpose set forth.

160,727. Reagents for Testing the Strength of Vinegar. Charles Peters, Mechanicsville, Va., assignor to Charles Bonn & Co., New York, N. Y. [Filed Sept. 4, 1875.]

Brief.—A standard liquid consisting of ammonia, alcohol, litmus, and water, which, losing its blue color upon addition of vinegar, indicates, on the scale of the acetometer illustrated, the "grain" of the sample.

160,728.

160,729.



160,730. Fire-Rakes for Horses. Asa Nye, Jr., Boston, Mass. [Filed Apr. 20, 1875.]

The telescopic bag C, with oval hole d, ring e, and cock F, with loops g g, in combination with cock B, ring A, air-holes I, and elastic string J, substantially as described.

The composition of lizzus, concentrated ammonia, alcohol, and water, substantially in the proportions set forth, for the purpose specified.

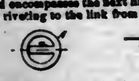
160,732. King-Bolts. A. G. Pickett, Jr., Yuma Depot, Ariz. [Filed Apr. 3, 1875.]

1. The combination, with the axle B and bolster C, of the king-bolt E, composed of two parts, having U-shaped eyes, forming universal joint, all substantially as and for the purpose set forth.
2. The combination, with the axle B, bolster C, and king-bolt E, of the friction-plates F G, having rounded sockets, all substantially as set forth.

160,733. Hot-Air Furnaces. Charles L. Pierce and Horace A. Pinkham, Boston, Mass., assignors to Geo. F. Pinkham, same place. [Filed June 26, 1875.]

Brief.—The plate supports the fuel in the clinker-cleaning space. It is removable to allow removal and replacement of the grate.

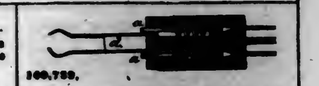
The removable plate c, provided with a loop, f, for supporting the handle of the grate, in combination with the ring b, constructed to form a space, d, between them, through which the clinkers can be withdrawn, substantially as set forth.



160,734. Picture-Nails. T. C. Richards, New York, N. Y. [Filed Dec. 30, 1874.]

Brief.—A soft-metal body cast upon a screw, and having an ornamental cap connected to it by a sheet-metal band.

The knob for pictures, &c., constructed as herein shown and described, composed of the screw A, soft-metal knob B, ornamental cap C, and sheet-metal band f, as and for the purpose specified.



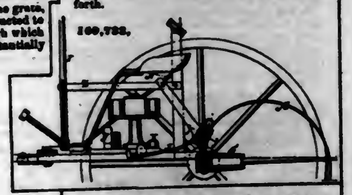
160,735. Chain-Links. William Rosmer, Newark, N. J. [Filed Oct. 16, 1875.]

Brief.—The lip or projection is folded over and encompasses the next link, being fastened by riveting to the link from which it projects.

A chain-link, A, made in one piece with the projecting strip a, which forms the eye for joining the contiguous link, substantially as described.

160,736. Couplings for Train-Telegraphs. Andrew Ryder, Oakland, Cal. [Filed Aug. 30, 1875.]

160,739.



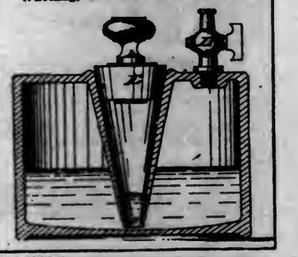
1. An electric coupling for train-telegraphs, consisting of two hollow cones, A, containing two coiled electrodes, a, insulated from the cone and from each other, and each having one coil projecting through the cone, and the other secured to the ends of the conducting-wires, substantially as described.
2. The circuit-closing tap E, having a spring-arm, d, and sleeve c, and adapted to be attached to the last coupling on the train, and provided with a smooth conducting-face, which is brought in contact with the electrodes of the said coupling when the several parts are attached and operated, as and for the purpose set forth.
3. The combination, with the case A and wires b, of the rod f, when the several parts operate as described.

160,738. Horse Hay-Rakes. William H. Eyer, Margaretville, N. Y. [Filed May 18, 1875.]

Brief.—Buffer for tilting-lever connection; brace for the clearer-teeth.

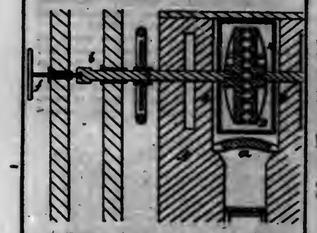
1. The clearer-teeth A, provided with brass O, through the middle of which passes the tooth, and whose ends are then bent over and made fast to axle, one above and the other below, as and for the purpose specified.
2. A bar secured to rake-platform and carrying an elastic block, operating in combination with the lever I, connection Z, and vibratory rake-head B, as and for the purpose set forth.

160,739.



160,740. Water for Rifled Guns. George Schalck, Pottsville, Pa. [Filed Oct. 6, 1875.]

The hollow ball A, provided with ribs a a, in combination with the wad or patch B, constructed of non-expansive material, having projection b projecting into the hole a of the ball, and having projections fitting the ribs in the ball, the said ball being a trifle smaller than the bore, and the patch fitting the bore closely, whereby rotary motion is imparted to the ball by the patch, which also acts as a wiper to the gun, all constructed substantially as and for the purpose set forth.



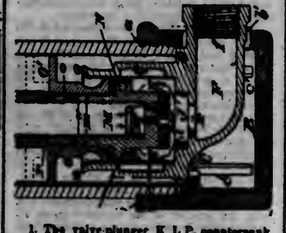
160,741. Implements. Herman Schirmer, Wheeling, W. Va. [Filed Sept. 17, 1875.]

The combination, with an ink-vessel having tapering part open at top and bottom, of an air tube and stop-cock attached to the vessel for introducing or withdrawing the required quantity of air to regulate the height of the ink in the tapering part.

160,736. Tempering and Forming Articles of Steel. Geo. F. Simonds, Fitchburg, Mass., assignor to Simonds Manufacturing Company, same place. [Filed Aug. 26, 1875.]

Brief.—Subjects steel saws to compression in a closed chamber exteriorly heated. May revolve the formers.

1. Formers c c, constructed with a cross-grooved face, substantially as described, and for the purposes set forth.
2. The combination of formers for holding articles to any required position with an air-tight oven, D, substantially as and for the purpose set forth.
3. The combination of formers for holding articles to any required position with an air-tight oven, D, inclosed in a heating-furnace, substantially as and for the purpose set forth.
4. The combination of formers c c and revolving shaft b with oven D inclosed in heating-furnace, substantially as and for the purpose set forth.
5. The combination of formers c c, revolving shafts b V, and screws f f with oven D, inclosed in heating-furnace, substantially as and for the purpose set forth.
6. In combination with a tempering-oven, revolving vertical formers, substantially as and for the purpose set forth.
7. The improved process, herein described, of tempering and straightening saws by means of heat and pressure, and without hammering, the saw being protected from atmospheric currents, substantially as and for the purpose set forth.



160,737. Washing-Machines. Andrew Smith and John S. Roy, Sheridan, Nev. [Filed Aug. 11, 1875.]

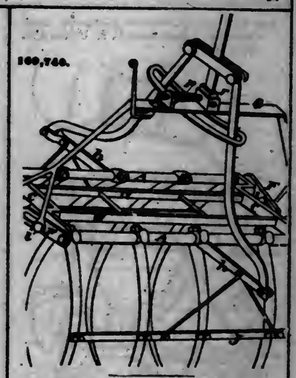
Brief.—Vertical rubbing-boards are operated by pulleys and cams, in connection with a tank and tub.

1. In combination with the vertical rubbing-boards B B, as shown, the cam-yokes I, with their guides J, and the triangular operating-cams K, when constructed to operate substantially as herein described.
2. A washing-machine, consisting of the vertical flaring rubbing-boards B B, guided and adjusted as shown, and operated by the cams K, together with the water-tank O, with its pipe P and the receiving-box Q, the whole arranged to operate substantially as herein described.

160,742. Hydrants. John A. Story and Saml. W. Lewis, Cincinnati, Ohio. [Filed Aug. 26, 1875.]

Brief.—Comprises an arrangement of inlet-valve, countersunk seat, waste-channel, downturned cup-shaped leather plunger, and a containing-chamber, which devices, by their peculiar construction and location with relation to each other, prevent any discharge through the wasteway while the hydrant is open, the elevation of the plunger operating to close said waste before the opening of the hydrant, and the depression of the plunger operating to close the hydrant before opening the wasteway.

1. The valve-plunger K L P, countersunk inlet-seat J, and wasteway Q, so arranged and combined as to insure complete closure of the wasteway before opening of the inlet-passage, and complete closure of the inlet-passage before opening of the wasteway, substantially as set forth.
2. The provision, on the plunger of waterway pipe, of the flanged nut or collar O O', of greater diameter than the mouth of the inlet-valve chamber, to guide the said plunger or pipe into the said chamber, and to keep out sand and other extraneous matters.
3. A coupling tube or pipe having right and left screw-threaded ends, and a middle portion of each relatively reduced diameter so as to break before either the valve-chamber or supply pipe can be injured from the effects of frost-heaving or otherwise, and so as to be easily replaceable without liability to burn the inlet-packing in securing the solder-tail.

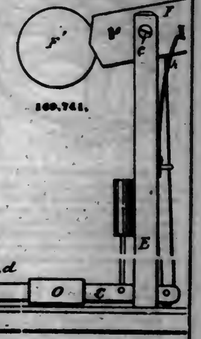


160,739. Picture-Nails. J. P. Stockton, Jr., New York, N. Y. [Filed Aug. 6, 1875.]

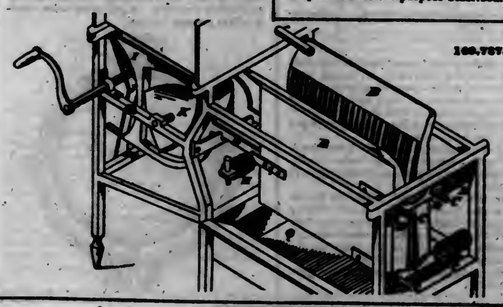
An improved picture or cord nail formed by the combination of the nail or spike A, the stationary disk or flange B, and the knob C D, made in two parts, the inner part or neck C being loose, and the outer part D stationary, with each other, substantially as herein shown and described.

160,740. Horse Hay-Forks. Orrin Taber, Santa Clara, Cal. [Filed July 28, 1875.]

1. The fork-heads A A, with their slotted crank-arms F F, in combination with the lifting-bar H, with its bifurcated ends, substantially as and for the purpose described.
2. A horse hay-fork consisting of the rake-heads A, with their fingers b b b, slotted crank-arms F F, and lever L, in combination with the frame c c d d, lifting-bar G, with its slotted guide-pins f and socket e, bars J J, united at the upper ends by the bar M, bar N, and spring-bolt p, operated by the trip-lever q, all combined and arranged to operate substantially as and for the purpose described.

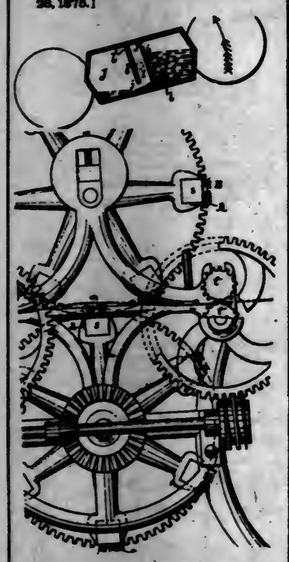


160,743. Time-Signals for Railroads. Joseph A. Talpey, Somerville, assignor of one-half his right to E. Hammond Graves, Boston, Mass. [Filed Oct. 6, 1875.]



160,739.

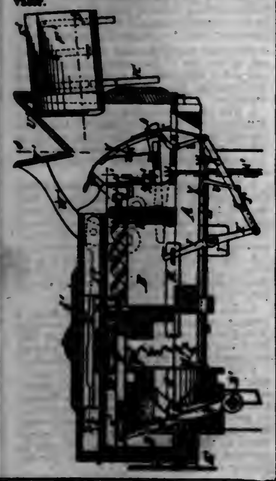
160,741.



160,737.

1. A pivoted railway signal-arm, having formed therein a chamber or chambers, and containing a quantity of alcohol, quicksilver, or other non-freezing liquid, and adapted to be set in a position slightly inclined from a horizontal line either by hand or automatically by a passing train, and to be automatically tilted to a perpendicular position, at a given and predetermined time after being set, by the flow of the contained liquid from one end of said chamber to the other, or from one chamber into another, substantially as described.
2. The chambered signal-arm F, provided with the abutments or partitions f and f', extending from opposite sides of said arm, as shown, and having the vent-holes f and F, all arranged to operate as and for the purpose described.
3. The pivoted signal-arm F, provided with the projecting pins f f, in combination with the rod D, adapted to be reciprocated vertically, and to engage with one of said pins at each upward movement thereof, to vibrate or oscillate the arm F, substantially as described.
4. The combination of the signal-arm F, pins f f, rod D, and levers B and C, all arranged and adapted to operate as and for the purposes described.
5. The hollow signal-arm F, containing a quantity of non-freezing liquid, and provided with the pins or lugs p p, in combination with the spring-support h, all arranged and adapted to operate as and for the purposes described.
6. In combination with the levers B and C, and rod D, adapted to set a pivoted signal-arm by the action of the drivers of a locomotive upon the lever B, the piston n, connected, by a suitable piston-rod, to one of said levers, and fitted to and adapted to be operated by said lever in the stationary or fixed cylinder I, provided with the orifice m, as and for the purpose described.

160,742. Cloth-Napping Machine. Benj. Theokrah, Amsterdam, N. Y. [Filed Apr. 26, 1875.]



1. A cloth-napping cylinder having bars provided each with a comb, A, and brushes B, as and for the purposes described.

2. The combination of two sectional cylinders provided with bars having combs A and brushes B, arranged as described, whereby the said bars shall intersect each other at equal distances apart, substantially as shown.

160,743. Machine for Reeding Chairs. Argyle W. Tenbyr, Waxahachie, Tex., assignor to himself and L. J. Stroop, same place. [Filed Feb. 12, 1875.]

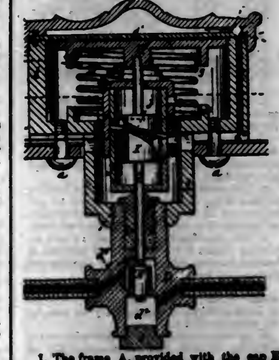
Brief.—The straw from which the band is made is carried in a receptacle for that purpose, and is drawn therefrom by a reciprocating clamp, in sufficient quantity to bind a gavel which is dropped upon it from the elevator.

1. The band-rods A, in combination with sliding and swinging chest-rods A', jointed by a pivot-clamp, a, for the purposes described.

2. The combination of band-rods A, having sliding hip-indicator b, with the waist-rods C and the fastening-pin d, for securing fixed position of the rods, as set forth.

3. The combination of band-rods A and chest-rods A' with waist-rods B and waist-rods C, having clasp ends *f f*, as and for the purposes described.

4. The waist-rods B and waist-rods C, attached to the front-rods D by double sliding and swinging clasps *f f*, in combination with the back-rods A and swinging chest-rods A', to allow the adjustment of the rods on the pivot-points *e* of the double clasps and of the chest-rods, substantially as and for the purposes set forth.



5. The end points of the apparatus, provided with fastening spring-pins *c c*, for securing same in fixed position after adjustment, as specified.

6. A sliding indicator, with pivot-pin, in combination with the perforated construction-rule, for facilitating the drawing of the construction-lines of the patterns, as set forth.

7. The neck-rule B, provided with swinging slide-piece L, for determining neck-points, as set forth.

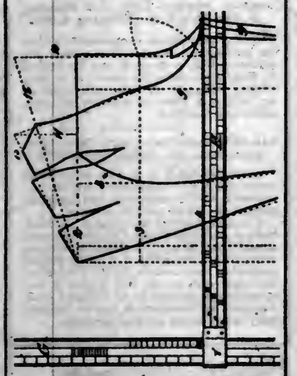
160,744. Combined Pressure-Gages and Heat-Regulators. Theophilus Van Kannel and Lovica D. Townley, Cincinnati, Ohio; said Van Kannel assignor to said Townley. [Filed Aug. 31, 1875.]

Brief.—The pressure of steam above the diaphragm moves the disk and its stem, and by means of the spiral attached to the stem it rotates the sleeve and the connected indicator-finger. The vertical movement of the stem regulates the flow of gas by means of an attached cut-off provided with a wedge-shaped gas-passage.

1. The frame A, provided with the cap E and the groove *d'*, communicating with the groove *b*, in combination with the diaphragm O', having the perforation *a*, substantially as and for the purpose hereinbefore described and set forth.

2. The combination and arrangement of the disk G', stem G, spiral I, engaging the sleeve J through the pin *f*, the index J', dial K, and spring L, substantially as and for the purpose described.

3. The stem G, with adjustable cut-off B, wedge-shaped notch *a*, in combination with the rest *S*, constituting the regulating device for the supply of gas to the heating-burners, as herein described.



4. The combination of the pressure-gage herein described with the cut-off B, substantially as herein described and set forth.

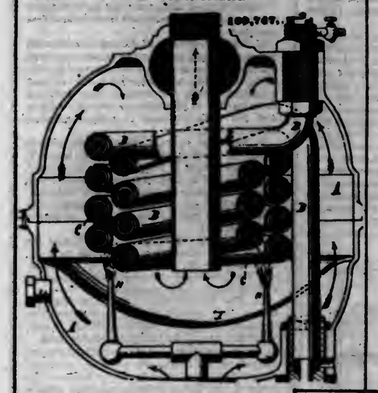
160,745. Automatic Check-Valves for Gas-Machines. Theophilus Van Kannel and Lovica D. Townley, Cincinnati, Ohio; said Van Kannel assignor to said Townley. [Filed Aug. 31, 1875.]

Brief.—Any liquid rising under the float tends to carry it up and close the valve above, preventing overflow. At all other times there is a free passage for gas.

160,746. Apparatus for Drafting Tailors' Patterns. Friedrich H. Ullrich, New York, N. Y. [Filed Aug. 6, 1875.]

1. The bust-rule A, in combination with sliding and swinging chest-rule A', jointed by a pivot-clamp, *a*, for the purposes described.

2. The combination of bust-rule A, having sliding hip-indicator *b*, with the waist-rule C and the fastening-pin *d*, for securing fixed position of the rules, as set forth.



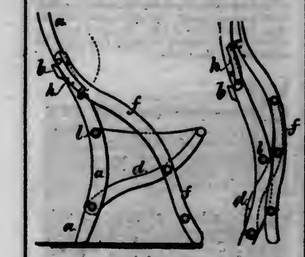
3. The combination of bust-rule A and chest-rule A' with neck-rule B and waist-rule C, having clasp ends *f f*, as and for the purpose described.

4. The neck-rule B and waist-rule C, attached to the front-rule D by double sliding and swinging clasps *f f*, in combination with the bust-rule A and swinging chest-rule A', to allow the adjustment of the rules on the pivot-points *e* of the double clasps and of the chest-rule, substantially as and for the purpose set forth.

A float, D, carrying the valve *d'* to and from the seat *s'*, all being inclosed in the shell A A', for checking a fluid and permitting the same to escape in a gaseous state, as and for the purpose herein set forth.

160,747. Gas-Machine Retorts. T. Van Kannel and L. D. Townley, Cincinnati, Ohio; said Van Kannel assignor to said Townley. [Filed Aug. 31, 1875.]

Brief.—Oil is vaporized in the lower coil of pipe through the medium of water heated in the outer surrounding coil. A pipe having a sliding cylindrical sleeve extends from the top of the case centrally to near a dividing-disk, for the purposes of conducting away the products of combustion from the burners.

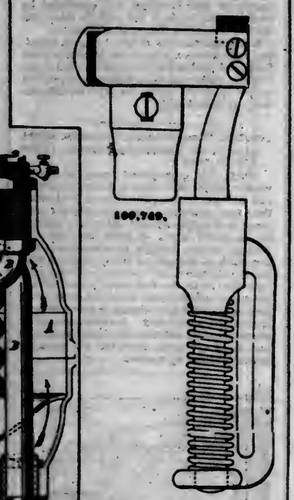


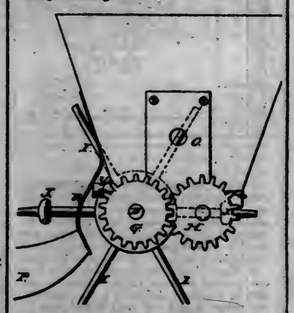
1. In gas-machine retorts, the combination of the coiled pipes B and C with a water-space between, the latter communicating with the oil-reservoir and injecting apparatus, substantially as described.

2. The concave disk I, having perforations to supply pure air to the burners H H, in combination with the jacket A and coils B C, substantially as described.

3. The cylindrical damper-sleeve F, in combination with the disk I, as and for the purpose set forth.

160,748. Folding Chairs. John R. Wakefield, Worcester, Mass., assignor to R. W. Vaill, same place. [Filed Apr. 6, 1875.]





1. The folding chair composed of the back-frame a *b*, swinging seat-braces *d*, front legs *f*, and links A, pivoted to the back and to the upper portions of the front legs *f* that extend up and form the arms, as and for the purposes specified.

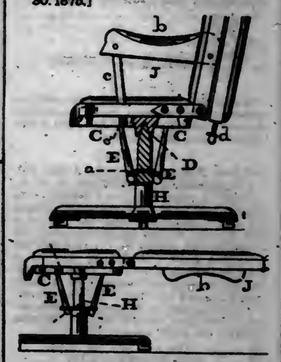
2. In combination with a folding chair, the links A, pivoted to the back and to the arm-pieces, and constructed and arranged substantially as set forth, so that the links swing upon both of the pivots, and fold between the back and arm pieces, as specified.

160,749. Seed Planters and Drills. W. C. Walker, Glasgow, Ky. [Filed Apr. 21, 1875.]

Brief.—To the under side of the seed-box, which is attached to the plow-beam, is pivoted a frame, in which the axle of the driving-wheel is journaled. Depending from the rear of the seed box is a spring-arm, in which are journaled cutting-disks, for covering the seed and pulverizing the soil.

1. The adjustable frame C C, constructed to form bearings for the shaft D, in combination with feed-wheel E, gears G H, and wheel I, and operating substantially as and for the purpose set forth.

2. The drag P P, secured to the hopper by a spring-arm, and provided with the cutting-disks Q Q, for covering the seed and pulverizing the soil, substantially as specified.



3. The shaft B, operated by the marking and driving wheel I, and carrying the feed-wheel E, said shaft also constituting a bearing for the adjustable frame C, substantially as specified.

160,751. Monument. John N. Wallis, Fleming, and Theodore Wallis, Seipio, assignors to themselves and Jas. A. Moore, Auburn, N. Y. [Filed Sept. 17, 1875.]

A monument consisting of the stone base A B, posts C, glass panels D, connected by cross-pieces E, cap F, glass shaft G, detachable cap H, and ball I, as shown and described.

160,752. Convertible Chairs. Frederick H. Waste, Philadelphia, Pa. [Filed July 30, 1875.]

1. The back B, hinged to the seat A, and a frame, K, hinged to the back, in combination with the arm-rests J, removably connected to the seat, and folding within the back, substantially as and for the purpose set forth.

2. The combination, with the seat A, of the arms or plate C with top step D, lower socket F, the descending rods E, connecting the socket and arms or plate, and the standard H with the pin or collar *a*, substantially as and for the purpose set forth.

3. The combination, with the chair, of the arm-rests J, formed of parts *b c*, folding within each other, and folding within the frame of the back or seat, substantially as and for the purpose set forth.

4. The combination, with the hinged back B, of the frame K, hinged to the upper portion thereof, and having a folding leg, L, substantially as and for the purpose set forth.

160,753. Dental Polishing-Tools. Samuel S. White, Philadelphia, Pa. [Filed July 9, 1875.]

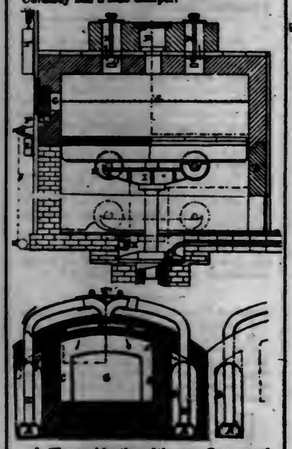
Brief.—A dental tool for polishing is given both a longitudinal and lateral reciprocal motion, through a pitman longitudinally slotted, and attached at one end to a crank, which is rotated by a dental-engine.

In a polishing-tool, the combination, substantially as hereinbefore set forth, of the casing or hand-piece, the crank-shaft, the longitudinally-slotted pitman or tool-holder, and the pin on which the pitman slides and rocks, whereby a compound longitudinal and lateral reciprocation is imparted to the tool.

169,754. Screw-Propulsion. J. B. Wilson, Brazoria, Tex. [Filed Oct. 15, 1875.]

In combination with a screw-propeller having a gradually-enlarged or spread pitch or thread from front to rear, the chamber *a* having increased clearance of water-way from front to rear, as and for the purpose described and represented.

169,755. Pump-Handle Lever. Calvin Adams, Pittsburg, Pa., assignor to Stephn. Jarvis and S. J. Adams, same place. [Filed Sept. 28, 1875.]



Brief.—The head-piece has the ears formed on either side, to project through and fit into the holes of the side pieces, thus dispensing with the bolt usually cast into the head.

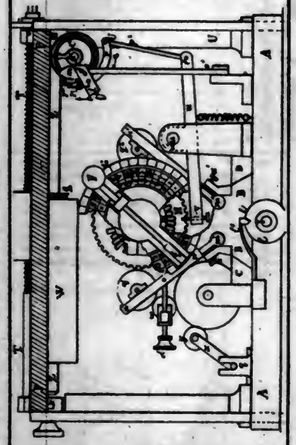
A link for pump-handles, made with an opening, into or through which the connecting-bolt is passed, substantially as and for the purpose shown and described.

169,756. Coke-Ovens. Henry Aitken, Falkirk, North Britain. [Filed Nov. 20, 1874.]

Brief.—A natural or forced current of air enters zigzag tubes in a chamber surrounding the oven, passes thence either into a chamber over the oven, or pipes alongside the oven, and thence through orifices into the oven over the coal. The gases of combustion pass out at the tops of the sides into the chambers holding the air-pipes, and thence to the chimney. Safety-stoppers are hung alongside the oven. The bottom may be lowered to receive successive charges of coal into the coke just made. Chimney has a side damper.

1. The combination of the oven C, surrounding passage B, and heating-pipes, arranged in the passage B and communicating with chambers or tuyeres *x* leading to the oven, all substantially as and for the purpose set forth.

2. The dampers I I', combined with the orifices, as and for the purpose set forth.



3. The combination of the pipes E, detachable heads *a a*, and removable covers J, as set forth.

4. The combination of the oven, having openings at the sides, and stoppers D, fitted loosely to said openings, and connected by chains to the walls of the oven, or other permanent object, for the purpose set forth.

5. The combination of the oven, its outlet-flue and tuyeres *x*, a movable bottom or platform, and mechanism for lowering the bottom to bring each successive charge to a position within the oven below the tuyeres, substantially as described.

169,757. Type-Writing Machines. Michl. Allenoff, St. Petersburg, Russia. [Filed Apr. 10, 1875.]

Brief.—The type-cylinder, carrying rows of various styles of letters, is moved backward and forward, to bring the desired kind under the paper-cylinder. The type-cylinder is rotated to bring the desired letter into position by the index-lever. A muff provided with pins of varying lengths to correspond with the width of the several letters revolves with the type-cylinder, and operates against a lever connected with the feed-pawl, which rotates the paper-cylinder, and when the latter is depressed to make the impression, the pins regulate the amount of feed. An index and alarm are attached to indicate the completion of the line, when the paper is moved the space between the lines by a crank.

1. The type cylinder or drum H, having a series of grooves formed therein longitudinally of the axis, said cylinder having at both ends slightly-projecting rims h^2, covered with india-rubber or its equivalent, in combination with the flat rings or disks h^3 and the set-screws h^4, substantially as and for the purposes specified.

2. The type-cylinder H and index-dial G, in combination with the sliding frame B, operated by means of the screw J and sleeve K, the index L, and the fixed index-plate L', notched disk *i*, and spring *l*, all constructed to operate substantially as and for the purposes specified.

3. The sliding frame B, index-plate L', index L, type-cylinder H, index-dial G, and index-hand F, in combination with the paper-cylinder W, mounted upon an axis lying in a horizontal plane, and at right angles to the type-cylinder, substantially as and for the purposes set forth.

4. The paper-cylinder W, provided at one end with a spring-hook, and at the other end with a grooved disk, *f*, and mounted upon an axis having a longitudinal groove, *b*, formed therein, for the purposes described, in combination with the endless screw T, carrying a notched disk, D', and a spring disk or catch, *c*, the thread-sleeve V, hook *f*, rod *a*, and sleeve *b*, provided with a spring, *f*, all arranged to operate substantially as described.

5. The rocking frame P, operated as set forth, and provided with the set-screws U U, in combination with the columns U, having projecting studs *s*, for controlling and adjusting the rocking or vibrating motion of said frame, substantially as specified.

6. The type-cylinder H, in combination with the paper-cylinder W, constructed and arranged as described, the endless screw T, sleeves V A, hook *f*, and the rocking or vibrating frame P, all arranged to operate substantially as described, and for the purposes set forth.

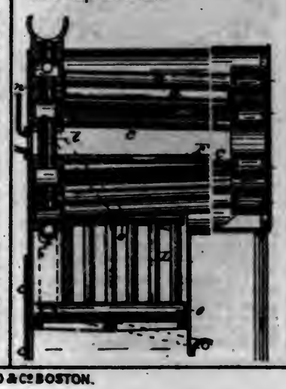
7. The muff M, provided with a series of pins, corresponding in number to the number of types in the type-cylinder, the length of said pins varying according to the width of the type, in combination with the adjustable screw *v*, whereby the spaces occupied by said types on the paper are adjusted, substantially as specified.

8. The type-cylinder H, in combination with the muff M and the spacing mechanism, consisting of the axle A, constructed substantially as shown and described, the ratchet-wheel *m*, disk *n*, the arm *p p'*, pawl *r r'*, arm P, index-dial O, connecting-rods *o p'*, lever *u*, and pin *o*, all arranged to operate substantially as set forth.

9. The type-cylinder H, muff M, sliding frame B, paper-cylinder W, endless screw T, rod N, sleeves V A, hook *f*, pinion K, axle A', ratchet-wheel *m*, disk *n*, pawl *r r'*, arms *P p p'*, connecting-rods *o p'*, lever *u*, pin *o*, and rocking frame P, all arranged, constructed, and combined to operate substantially as shown and described.

10. The paper-cylinder W, axis Z, and the pinion K, in combination with the axle A', disk D, tooth D', the signal-bell E', and hammer I, all arranged to operate substantially as and for the purposes specified.

11. The lut-rollers q^1 q^2, mounted upon the frames *v' v''*, the shafts *m'*, and set-screws S^2, in combination with the sliding frame B, substantially as and for the purposes set forth.



12. In combination with the rollers q^1 q^2, arranged as set forth, the roller *w*, arranged with capability of adjustment by means of the screw *d*, the disk *z*, roller *y*, mounted upon a tilting axle or frame, *x*, and the sliding frame *g*, all arranged and constructed substantially as shown, and for the purposes specified.

13. The equalizing-roller q^3, arranged as described, in combination with the sliding frame B and type-cylinder H, substantially as and for the purposes set forth.

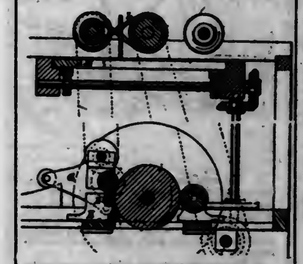
14. The type-cylinder H, constructed substantially as described, in combination with the inking mechanism, arranged as set forth, and the sliding frame B and the milled wheels *e e*, all arranged to operate substantially as specified.

169,758. Sectional Steam-Boilers. V. D. Anderson, Springfield, Ohio. [Filed Oct. 20, 1875.]

Brief.—One boiler is concentrically arranged within the other, the boiler-heads having concentric water-spaces, and connected together with wrought-iron tubes. The feed-water is heated and circulates through side pipes located within the furnace.

---

1. A steam-boiler composed of a series of wrought-iron tubes, united at their opposite ends to eccentric cast-iron heads, substantially as shown and described.



2. In combination with the circularly-arranged series of tubes and their heads, as described, the series of tubes L O, arranged at opposite sides of the fire-chamber, as set forth.

3. The semicircular cast-iron heads T O, united by the tubes I n, for use in steam-boilers, as set forth.

4. The circular and eccentric heads G E, two or more in number, for use in boilers, as described.

169,759. Veneer-Cutting Machines. J. B. Austin and J. A. Nutt, Rochester, assignors to E. J. Granger, Brooklyn, N. Y. [Filed Apr. 17, 1875.]

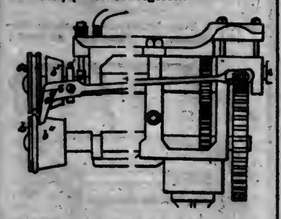
Brief.—The additional roll, placed in advance of the cutters, is provided with mechanism for regulating its speed to accord with that of the periphery of the log, and also with devices for keeping the line of pressure of the roll in a radial direction to the gradually-diminishing log from which the veneers are cut.

1. In a machine for cutting compressed veneers from a revolving cylinder of wood, the combination, with the cutting-instrument, of a roller having its bearing upon the cylinder of wood in advance of the line of cut, as shown, for the purpose of resisting the thrust of the cutting-instrument, and preventing the splitting of segments of wood from the revolving cylinder during the operation of cutting compressed veneers therefrom.

2. The combination of the roller F, mounted in the frame G, with the cam-guides I, for the purpose of maintaining the engagement of the roller F with the cylinder of wood, as the latter is gradually diminished in diameter by the cutting of the veneer from it.

3. The combination of the cutting-instrument C and the compression-roller D with the driving-roller F, mounted in the rocking frame G, and rotated positively with a regular decrement of speed, as the log is reduced in diameter by the cutting of the veneer.

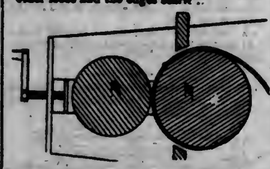
169,760. Water-Proof Hose. Seth W. Baker, Providence, R. I. [Filed Mar. 24, 1875.]



1. In hydraulic hose constructed as hereinbefore described, the improved seam or joint, formed by the union of the edges D D with the elastic rubber packing I, having indented sides, within which said edges D D are forced, and secured thereto, substantially as described and shown.

2. In hydraulic hose, the improved packing I, having indented sides, in which the edges D D are forced, and secured thereto within the parts are subjected to compression by mechanical means, substantially as described.

169,761. Manufacture of Stove-Pipes. Lafayette Bancroft, Springfield, Ohio. [Filed Mar. 16, 1874.]

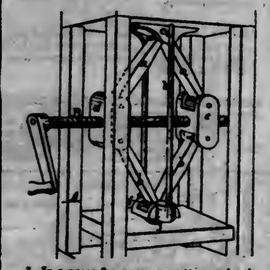


Brief.—Gages or bolding devices are attached to an ordinary beading machine, to secure the pipe-sections together.

In combination with the beading-machine A, with its heads *a b*, the gages *a' a''*, with their jaws *a''' a''*, slots *b*, screws *c* and *c'*, and collar *c''*, arranged and operated in the manner specified, as and for the purpose hereinbefore set forth.

169,762. Mandrels. Andrew B. Barnard, Worcester, Mass. [Filed Sept. 4, 1875.]

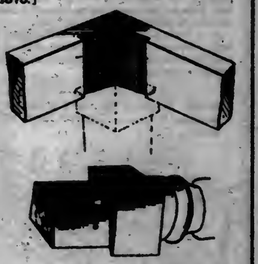
Brief.—The upper roll has a hard polished surface, the other a yielding periphery formed of leather—one end attached to the roll, the other loose and the edges scarfed.



1. A roll for a mangle, having a covering, B', composed of leather or other compressively yielding material, scarfed at its edges, and attached to the roll at one of said scarfed edges only, substantially as and for the purpose described.

2. In a mangle, the combination of two rolls, one having a hard polished periphery, and the other having a yielding periphery, when said yielding periphery has its opposite edges scarfed, and is attached to the roll at one of said scarfed edges only, substantially as and for the purposes specified.

169,763. Cotton-Pressers. L. S. Reeves, Houston, Tex. [Filed Nov. 2, 1875.]

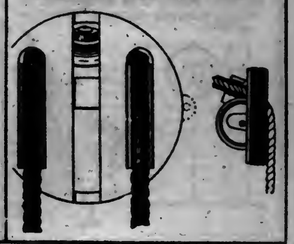


Brief.—The toggle-jointed levers are arranged to admit of a "diamond shape" by their hanging on an upper joint or pivot, and being connected at their lower point therein by a single pivot. The knuckle-piece, to which the lower arms are thus pivoted, has guide-rods attached thereto, and sliding in the upper cross-piece of the frame.

1. In a press for pressing cotton and other substances, the combination, with toggle levers or arms, and a right-and-left screw, arranged together substantially as described, of a platen connected with the toggle-arms by a ball-and-socket or equivalent joint, substantially as and for the purposes set forth.

2. The combination of the toggle levers or arms and right-and-left screw, arranged together as described, the sliding guide rods or bars, and the platen, connected with the toggle-levers by a ball-and-socket or equivalent joint, substantially as set forth.

169,764. Knock-Down Tables. Profit P. Beever, Dayton, Ohio. [Filed Aug. 24, 1875.]



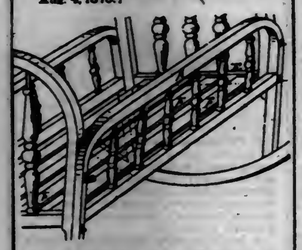
1. The combination, in a knock-down table, of the rails having horizontal dovetailed recesses formed at their adjacent lower edges, and the legs of said table formed with dovetailed shoulders, adapted to fit into the dovetailed recesses and relieve the screws or attaching devices of a portion of the strain, substantially as described.

2. In a knock-down table, the combination, in adjoining rails, of the recesses on the lower sides thereof, and the chest of the table-leg.

169,765. Heating and Ventilating Stoves. Charles S. Bell, Hillsborough, Ohio. [Filed Nov. 26, 1874.]

The air-chamber B, surrounding the fire-pot A, in combination with the inlet-pipe F, register E, opening F, and damper G, all constructed, arranged, and operating substantially in the manner and for the purposes specified.

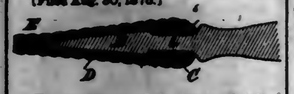
169,766. Sash-Pulleys. W. H. Bicknell, Boston, Mass. [Filed Sept. 29, 1875.]



---

1. A sash-pulley frame, provided with openings for the passage of a single rope or cord, and with an intermediate opening or groove for the reception of the sash-separating bead, in combination with the two pulleys or guides to control the vertical portions of the same cord, and with a pulley to sustain the bight of the sash-cord, substantially as described.

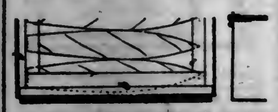
2. A sash-pulley frame, provided with openings for the passage of a single rope or cord, and with an intermediate opening for the reception of the sash-separating bead.



3. A sash-pulley, provided with three pulleys, arranged as shown, a screw-thread, and ears for bearings for the pulleys, all substantially as described.

160,767. CRADLES. Martin V Borgman and William F. Lamson, Detroit, Mich. [Filed Aug. 4, 1875.]

In a cradle, substantially as described, the bent side rails having their ends secured to the rockers, and the combination therewith of the bent end frames, substantially as shown and set forth.

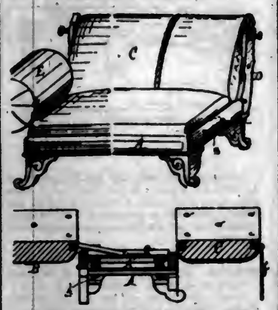


160,768. WHIPS. Thomas J. Bronson and Thomas N. Jewsbury, Jacksonville, Ill. [Filed Aug. 20, 1875.]

The combination of the fastener C, belly-piece D, and lash E, substantially as and for the purpose shown and specified.

160,769. CIGAR-BOXES. Charles S. Brown, Baltimore, Md. [Filed Oct. 7, 1875.]

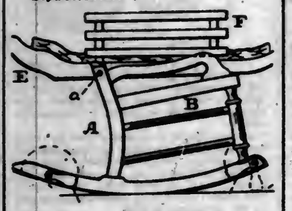
Brief.—The main box has raised ends, so that the hinged cover can shut down flush with the upper surfaces of the same. The box is of tin and the cover glass, held by a tin frame, whereby the cigars can be inspected without opening the box.



A sheet-metal box provided with raised end bands, in combination with a glass cover contained within a suitable frame, as and for the purpose described.

160,770. FENCE-WIRE STRETCHERS. Nathaniel Burnham, Amboy, Ill. [Filed June 16, 1875.]

A wire tightener or stretcher, consisting of the flanged disk or wheel A, provided with laterally-projecting teeth or ratchets C, and with projection F, the slotted shaft B, and the handle B', substantially as and for the purpose hereinbefore set forth.

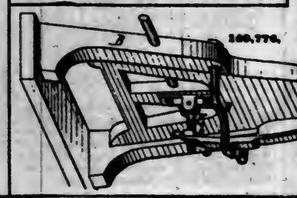


160,771. SOFA-BEDSTEADS. Christian Berzinn, Chicago, Ill. [Filed Sept. 20, 1875.]

1. The combination of the cushions B C, bars *b b*, legs *d f*, straps *e*, and brackets D D, with the frame A, substantially as and for the purpose set forth.

2. The divided pillow E and bracket-hooks *f*, in combination with a sofa-bed, substantially as described.

160,772. CONVERTIBLE CHAIRS. Charles M. Cadwallader, Philadelphia, Pa. [Filed Sept. 16, 1875.]

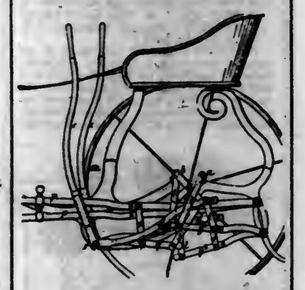


1. The combined rocking-chair and rocking-cradle, the same consisting of a rocking-chair, A, having hinged back L, which has an extension, E, below the axis *a*, and a space or below in its rear face, substantially as and for the purpose set forth.

2. The combination, with the hinged back of a chair, of guards F at the side of said back, substantially as and for the purpose set forth.

3. The springs *c*, in combination with the side guards F, substantially as and for the purpose set forth.

160,773. FIRE-KINDLERS. Friderikha Boolcom, St. Louis, Mo., assignor of one-half her right to Chas. H. Vandewater, same place. [Filed Sept. 20, 1875.]



160,774.

---

1. As a new article of manufacture, the herein described fire kindler, consisting of the foundation-piece A, shavings B, wrapper C, and faget D D D, substantially as described and shown.

2. The combination of the faget D D D with a bundle or mass of more combustible material, the ends of the faget projecting beyond the base and the whole being dipped in liquid resin or its equivalent, as and for the purpose shown and described.

160,775. VELOCIPEDES. Louis G. Bodel, Jacques Mazas, and Wm. Webster, Paris, France. [Filed July 12, 1875.]

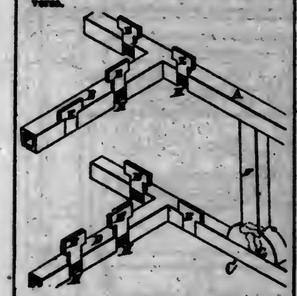
1. The combination of the treadles *g g*, connected through levers *g' g'* and rods *e e*, and *f f* to cranks *b b*, on the axle with the head-levers *c c*, connected through levers *g' g'* and rods *f f* and *i i*, with their respective cranks *a a*, on the axle, substantially as described.

2. The combination of the guiding-wheel n, forked rod *i*, and arm *h* projecting therefrom, the segmental bar *h'*, and spiral springs *f f* thereon, substantially as described.

160,776. CLICKS FOR BRACELETS. John S. Carrow, Philadelphia, Pa. [Filed Aug. 10, 1875.]

1. A bracelet-click, having two spring-prongs terminating in hooks, and formed of one and the same piece of metal, substantially as described.

2. The click C, having the prongs *c c*, hooks *c' c'*, and cross-piece *c''*, substantially as shown and described.



160,778. WAGON-TONGUE SUPPORTS. Geo. B. Clow and Parlee E. Webster, Chicago, Ill. [Filed July 9, 1875.]

Brief.—The tongue rests upon one end of a spring, the other end of which engages a nut upon a bolt projecting below the wagon, the central part of the spring being fastened to a yoke.

The spring C, yoke D, screw E, and nut *b*, in combination with the tongue and bounds of a wagon, substantially as and for the purpose set forth.

160,777. ART OF CURING TOBACCO. James D. Culp, San Felipe, Cal. [Filed Oct. 20, 1875.]

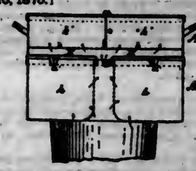
Brief.—Air can be transferred from the upper part of the room to the lower, and vice versa.

1. The combination, in a tobacco-drying apparatus, of a hollow tube, arranged at or near the top of the drying-room, a hollow tube at or near the bottom thereof, a vertical hollow pipe connecting the upper and lower tubes, and a blower interposed between said upper and lower tubes, whereby the temperature of the room may be made uniform, substantially as set forth.

2. The combination of the upper tube A, having orifices E and slides F, the lower tube C, having similar orifices and slides, the vertical pipe F and interposed blower G, all substantially as set forth.

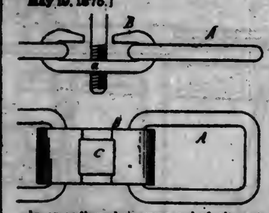
3. The branch pipes B D, having orifices and slides, in combination with the horizontal pipes A C, vertical pipe F, and blower G, all substantially as set forth.

160,779. CIGAR-MOLDS. James D. Culp, Gilroy, Cal. [Filed Aug. 4, 1875.]



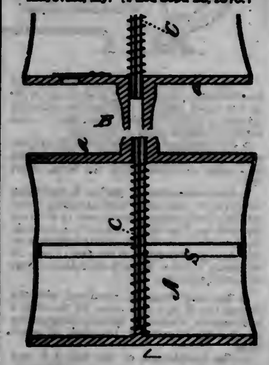
Brief.—The mold forms the bunch into an oval in cross-section, and the many to make crosser in passing on the ultimate wrapper, to loosen the cigar-filler and make the cigar free smoking.

1. The process herein described of making cigar-fillers, under pressure, in a mold that is arrested in its closing before attaining to a perfect circle, and then giving to the cigar a circular tapering form in applying the wrapper, as and for the purpose set forth.



2. The cigar-mold A C and *a b*, limited in closing by the stops B, whereby the vertical is in excess of the horizontal diameter of the cigar-forming space, as and for the purpose described.

160,780. VEGETABLE-STEAMERS. Phebe D. Damon, Fayetteville, N. Y. [Filed Aug. 16, 1875.]



The combination, in a vegetable-steamer, of the pan A, provided with chambers *b b* and passage D, with the vessel A', having its bottom divided to form the central opening *c*, and provided with the false bottom *b*, partition *a*, and lid *d*, substantially as and for the purpose set forth.

160,780. BRIDLE-CHAINS FOR HORSE-POWERS. B. W. Davis, Brasher, N. Y. [Filed May 19, 1875.]

In an endless chain composed of alternate links A and double hook-bars B, the nut *a*, formed in the center of the hook-bar, and the bolt C, screwed through said nut, and projecting far enough between the hooks to hook the links, substantially as herein set forth.

160,781. LIFE-PRESERVERS. H. G. Dayton, Marysville, Ky. [Filed Sept. 20, 1875.]

1. In a life-preserver, the automatically-expanding air-floats A A', in combination with the tubular connecting-bar B, substantially as specified.

2. In combination with the automatically-expanding air-floats A A' and their connecting-rod B, the rods C, working in the hollow of rod B, and secured to the outer head *a* of the floats, substantially as specified.

3. The combination, with the automatically-expanding floats A A' and hollow rod B, of the compression-strap D, substantially as specified.

160,782. VENT-FASTENER. Christian Dahlinger, Buffalo, N. Y., assignor of one-half his right to Frank Dahlinger, same place. [Filed Oct. 18, 1875.]

Brief.—When the spigot is turned to draw it, the hook engages with the cam and opens the vent.

1. In an automatically-venting beer-faucet, the combination, with the plug B, having the downwardly-projecting hook H, of the cam C, substantially as described.

2. The combination, with the faucet A, of the plug B, having the hook H, cam C, having the check C', socket D, and the guide-pulley I, substantially as described, for the use and purpose set forth.

160,783. TEMPERING GLASS AND FURNACES THEREFOR. F. B. A. Royer de la Bastie, Paris, France. [Filed Oct. 6, 1875.]

Brief.—The glass is placed in the auxiliary heating-chamber, upon a metallic apron, and conducted into the adjacent compartment, where it is heated to a malleable state, and transferred into the tempering-bath.

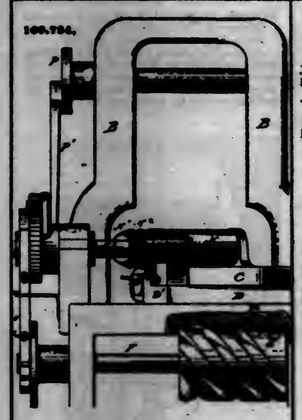
1. In a glass-tempering furnace, substantially such as described, the combination of the principal heating-room A with its endless apron *a*, operating substantially as described, to partially heat and present the plate before the opening B in the principal furnace.

2. In a glass-tempering furnace, substantially such as described, the tempering-receiving-carriage *c'*, substantially as described.

3. In combination, in a glass-tempering furnace, of the reciprocating receiving-carriage *c'*, the oscillating table E, and the receiving-grate in the bath, the said oscillating table arranged and operating to receive the sheet from the carriage and carry it to the bath, substantially as described.

4. The combination of the oscillating or transferring table E, the vertical slide K, and the lever I, in connection with and so as to operate both the table and the slide, substantially as and for the purpose described.

5. The combination, in a glass-tempering bath, of the skimmer B and receiver *i*, substantially as and for the purpose described.



6. The combination of the receiving-grate L, in the bath of a glass-tempering furnace, with the receptacle P, constructed with several independent compartments, and hung at the rear end, and provided with a lever, *s'*, whereby either of the said compartments may be presented to receive the tempered sheets, substantially as described.

7. In combination with the receiving-grate in a glass-tempering bath, the rolls *a*, arranged in a frame hinged to the principal grate, substantially as and for the purpose set forth.

160,784. FEEDING DEVICES FOR FURNISHING-MACHINES. Ferdinand Deming, Waterbury, Conn. [Filed Sept. 28, 1875.]

Brief.—Improvement on Patent No. 162,672, July 27, 1875. The cam is provided with differential spiral grooves, for the purpose of supplementing the adjustable pawls by which its shaft is rotated in making nicer adjustments. The auxiliary slide extends to the right and left of the carriage, to provide best motion, the extent of which is adjustable, so that the carriage may remain still during the forward feed of the metal.

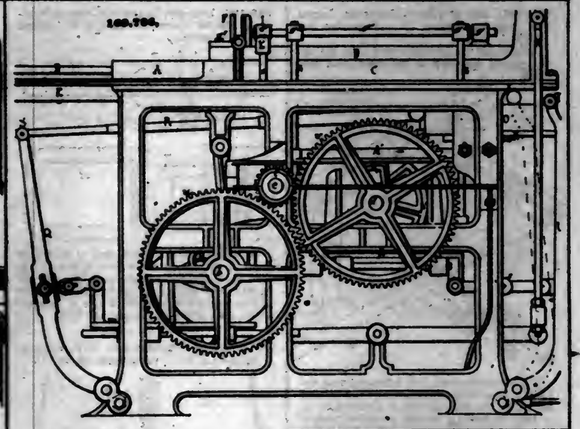
No. 169,704.

1. The combination, in a power-press, of the diagonal carriage C, having a reciprocating movement parallel with the press, the cam E, toothed wheel G, the two pawls *d d'*, with their respective dogs and hooks *h h'* and *e e'* on the said toothed wheel, substantially as specified.

2. The combination, in a power-press, of the diagonal carriage C, having a reciprocating movement parallel with the press, the shaft F, arranged to impart such reciprocating motion to the said carriage C, and with an intermittent rotating feed for said shaft, the shaft F', in connection with the feeding mechanism on the said carriage, the pawl and ratchet F^6 F^7, the slide R, and adjustable studs F^8 F^9 on the shaft F, operating to engage or disengage the pawl F^7 with its ratchet, substantially as specified.

3. The combination, in a power-press, of a diagonal carriage, having a reciprocating movement parallel with the press, a cam with differential spiral grooves for imparting such reciprocating movement to the carriage, and a ratchet-feed to rotate the said cam, substantially as set forth.

4. The combination, in a power-press, of the diagonal carriage, having a reciprocating movement parallel with the press, the auxiliary slide *D'*, with its adjusting-screws *n*, and a cam, in connection with said auxiliary slide, whereby the movement of the said auxiliary slide causes before the said cam will act directly upon the carriage, substantially as set forth.



No. 169,705. LAMP-TRIMMERS. H. L. De Zeng, Geneva, N. Y. (Filed Apr. 20, 1875.)

The lamp-trimmer made with the scraping-edge *a* opposite to the receptacle *b*, and nearly parallel with the same, the scraper and receptacle being connected by arms that extend above the wick when in use, substantially as set forth.

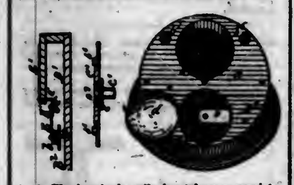
No. 169,706. CIGAR-MACHINES. Ferdinand A. H. Demuth and Carl B. F. Jaeger, Dresden, Saxony. (Filed Feb. 12, 1875.)

Brief.—The release to feel forward automatically and intermittingly to a cutter, which, as it cuts off a sufficient quantity for a cigar-branch, feeds it onto an apron beneath, where the wrapper is wound upon it.

No. 169,708.

1. The bar D, reciprocating vertically and longitudinally, and having a series of teeth at the lower side, in combination with the stationary gutter C, sliding feed-trough A, and cutter K, substantially as set forth.

2. The combination of the board O, its operating-lever Q, and the slide *m*, having an adjustable connection with the lever, as set forth.



3. The combination of the bar E, feed-block D, levers *f'*, and cam *f*, for imparting a longitudinal reciprocating movement to both the bar and the feed-block, and devices, substantially as described, for imparting a vertical reciprocating movement to the feed-block, all operating together to carry the tobacco to the cutter, as specified.

4. The feed-block D, combined with the sliding bar E, and with cams on the shaft *d* and rods *h h'*, whereby a vertical reciprocating movement is imparted to the block, all as set forth.

5. The combination of the rods *h h'* and bars *g'*, to which a vertical reciprocating movement is imparted by cams on the shaft *d*, and the feed-block D, provided with rods *g'*, sliding in the bars *g'*, as specified.

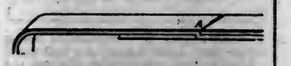
No. 169,707. WATCH-PLATES. Victor Doriot, Bristol, Penn. (Filed Sept. 16, 1875.)

Brief.—A top plate made in removable sections, with flange rigidly attached thereto, forming the dust-cap, the movement being arranged in recesses formed in the top plate.

1. The herein-described watch-case, consisting of a lower plate, A, and an upper plate, made in sections B B' B^2, each of these sections having a portion of the flange rigidly attached thereto, substantially as set forth.

2. The indicator F^2, above section B^1, and provided with the pivot *e'* and the heel-extension *e* below the plate of section B^2 for operating the regulator, substantially as set forth.

3. The sections B^2, having the arm *b* provided with a bearing for the staff of the balance-wheel, and having the hair-spring attached, and the regulator E arranged upon the upper side, the toothed quadrant F^2 being arranged upon the upper side of the heel-extension F of the indicator, whereby the balance-wheel and regulator can be removed with the section B^2, substantially as set forth.



4. The barrel-bridge C, provided with bosses *b'*, in combination with the section B, provided with the recesses *b'*, substantially as set forth.

No. 169,709. BURGLAR-ALARMS. Levi F. Drake, Brooklyn, N. Y., assignor of one-half his right to Saml. Hughan, same place. (Filed Sept. 28, 1875.)

A burglar-alarm consisting of a conical weight having a flat or rounded bottom, to which is attached on the outside, by means of adhesive material, a pellet of fulminate, and provided at its upper end with an eye, by which it may be secured to a string and fastened to a door or window in such position as to drop and fall, with the fulminate down, when the door or window is opened, and discharge the fulminate, substantially as described.

No. 169,710. BALE-TIES. Simeon N. Drake, Galveston, Tex. (Filed July 13, 1875.)

The bale-tie having the shoulder A near each end of the hoop and on a line with the slots C, whereby each face of the slots rests against the corresponding shoulder of the opposite end, the ends being on the inside, forming a double lock and brace, as specified, and for the purpose set forth.

No. 169,711. SOLE-LINING MECHANISMS FOR BOOTS AND SHOES. Robert Dwyer, Weymouth, Mass. (Filed Oct. 26, 1875.)

Brief.—The lining is held upon the end of a stationary heel-post by means of projecting pins, from which it is released at the proper time by a stripper-plate. The toe portion is carried forward by an automatic reciprocating toe-carrier, followed by an expansible roller, for spreading the lining properly over the face of the insole.

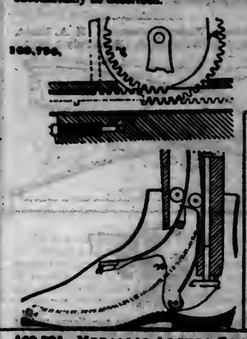
1. In a machine for lining boots and shoes, a heel-holder and a movable toe-holder for the lining, adapted to carry the toe of the lining forward into the shoe, substantially as described.

2. A heel-holder and a movable toe-holder for the lining, in combination with a movable presser adapted to lay the lining against the bottom of the insole of the shoe, substantially as described.

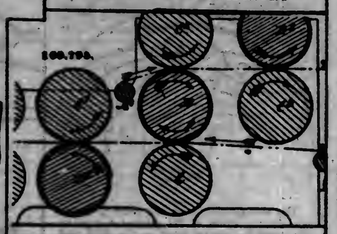
3. In a machine for lining shoes or boots, an expansible roller adapted to fit the varying width of the bottom of the shoe, and to be projected along the bottom, and into the toe of the shoe, substantially as described.

4. The post, in combination with the toe and heel holding devices, substantially as described.

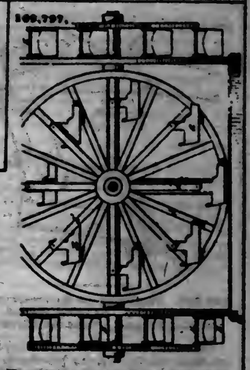
5. The combination of the post and holder for the heel of the lining, with a stripping-plate, to operate substantially as described.



6. The rods *c* and *p*, and toe-holder and presser, in combination with the centers *d h*, and spring or equivalent to operate the bars, substantially as described.



No. 169,704.



2. In an ice-boat, the combination of the paddle-wheels D and D and cylinders C and C, each provided with radial spurs *c c*, journaled in front of said wheels, and adapted for operation when the boat A is moved forward

No. 169,705.

No. 169,707.

1. The swing-frame herein before described, consisting of the combination of the wheel, the long bar, the short supplementary spokes radiating from the hub parallel with the main spokes, and the rods fitted at their ends to the spokes, as set forth

2. The combination, substantially as herein-before set forth, of the bars, the retaining skeleton-frame, the swing-frame mounted thereon, and bearing upon and running around the bars, and the swings suspended in the frames.

3. The combination, substantially as herein-before set forth, of the bars, the shaft turning in the center thereof, the skeleton-frame turning with the central shaft, the wheels turning on the arms of the skeleton-frame and bearing upon the bars, the supplementary spokes, and the suspended swings.

No. 169,708. HARROWS. Wm. Frank, Mound Station, Ill. (Filed Sept. 28, 1875.)

Brief.—The harrow consists of equilateral-triangular sections, three of which are united by links and blocks, with shifting draft attachment, which can be changed to either angle.

No. 169,721. METALLIC ARCHED TRUSS-BRIDGES. James B. Eads, St. Louis, Mo. (Filed Oct. 21, 1875.)

Brief.—Short recessed extensions are jointed to the half-span arches, and, resting on short columns, form the abutments, thereby reducing the quantity of masonry on which the thrust of the arches is received.

The combination of the arch-extensions A' A' with the columns E E, the joints *a a*, and the half-span arches A A, substantially as and for the purposes set forth.

No. 169,722. CAR-AXLE BOXES. James Boden, Philadelphia, Pa., assignor of one-half his right to Saml. Boden, Jr., Baltimore, Md. (Filed Aug. 10, 1875.)

1. The combination of the bar D, and the springs interposed between the bar and the frame, with the axle-boxes G and the yoke H.

2. The combination of the axle-box and its lugs *n* with the yoke H.

No. 169,723. MANUFACTURE OF SPIEGELEISEN. James H. Etheridge, Chicago, Ill. (Filed Oct. 1, 1875.)

The process of producing spiegeleisen, with a definite per centum of manganese and carbon, by fusion of iron and manganese in the presence of carbon, and in flux in a chamber closed against the admission of atmospheric oxygen, substantially as described.

No. 169,724. ICE-BOATS. William H. Fairbank, Allerton, Md., assignor of one-half his right to H. B. Holton, same place. (Filed Apr. 20, 1875.)

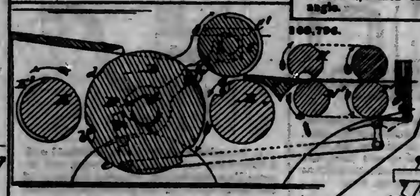
1. In an ice-boat, the combination, with the bow thereof, of the cylinder C, journaled beneath and in front of the same, provided with radial spurs *c* and *c*, and capable of being rotated forward as said boat is advanced, so as to tend to draw the same upon the ice when the latter is too thick to be broken by the downward movement of said spurs, substantially as is specified.

No. 169,725. ROTARY PERFECTING-PRESSES. J. L. Firm, New York, N. Y., assignor of one-half his right to O. B. Cottrell and N. Babcock, Westerly, R. I. (Filed Aug. 12, 1875.)

The combination and arrangement of two pairs of cylinders or rollers, the one pair of which is composed of one form-cylinder, B^1, and an impression-cylinder, O^1, while the other pair is composed of one form-cylinder, B^2, and an impression-cylinder, O^2, and an interposed series of cylinders consisting of two impression-cylinders, OO, and one intermediate form-cylinder, B, for operation on two independent webs fed in opposite directions from the press, substantially as shown and described.

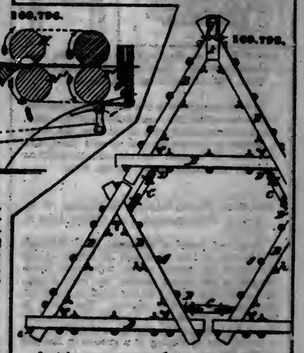
No. 169,726. ROTARY PERFECTING-PRESSES. J. L. Firm, New York, N. Y., assignor of one-half his right to O. B. Cottrell and N. Babcock, Westerly, R. I. (Filed Sept. 7, 1875.)

Brief.—The web has intermitting feed, which permits the type-cylinders to revolve twice, and receive ink between the impressions. The sheets are cut from the web by a knife, which makes a direct cut for most of their width, and perforates the remaining distance.



1. The impression-cylinder B and type-cylinder C, either of which is made to rise and fall, as described, in combination with the enlarged impression-cylinder D and its reduced type-cylinder E, whereby the forces of both type-cylinders are doubly inked in or during the printing of the paper on its opposite sides, substantially as described.

2. The combination, with a paper-cutting or printing machine, of the knife O, having the greater portion of its edge straight, but having portions of its edge serrated, substantially as and for the purpose herein described.



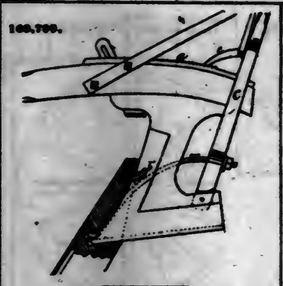
No. 169,727. ROTARY SPRINGS. I. N. Forrester, Baltimore, Md. (Filed Oct. 6, 1875.)

Brief.—Four wheels at the ends of two crossed axles revolve about a fixed center. The wheels are double, carrying between them pendulous cams, the swinger moving in a certain epicloid, and in a circular plane projected at right angles thereto.

No. 169,728.

No. 169,729.

1. A harrow composed of detachable equilateral-triangular sections, which are adapted to be used either singly or collectively, and with either center for the front, as and for the purpose described.



2. The draft attachment consisting of the link *i*, loop *g*, wedge-block *h*, provided with a hole, the divergent ends of the bars B, and the front teeth, combined and arranged as shown and described.

3. The center-couplings consisting of the open links *a*, blocks *b*, and pins *c*, combined and arranged as shown and described.

No. 169,730. PLOWS. Irvin Freeman, Corpus Christi, Tex. (Filed Sept. 11, 1875.)

The combination, with hook-rod K, holding shovel or subsoil plow in skeleton frame, of the lever O, having pawl *e*, working in the beam-rack *c*, as and for the purpose specified.

160,799.

160,800. PROCESSES OF MANUFACTURING CAUSTIC SODA. Holbrook Gaskell, Jr., Widnes, England. [Filed Oct. 20, 1875.]

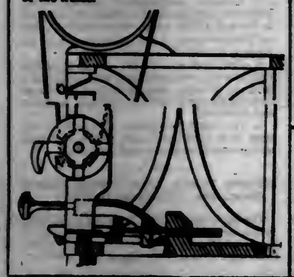
The process of manufacturing what is known as black ash, in revolving furnaces, by first charging a heated revolving furnace with salt cake, or with salt cake and black or small coal, and when the salt cake has become fluxed, or has softened and shrunk, adding thereto the chalk, lime or limestone, and the remaining portion of black or small coal, if any, substantially as hereinbefore described.

160,801. CORDAGE-FIXTURE. Wm. Gates, New Haven, Conn., assignor to C. Cowles & Co., same place. [Filed Sept. 28, 1875.]

In a cordage-fixture, the combination of the head of the roll, the frictional disk constructed with a screw-threaded shank, a correspondingly-threaded bracket, and means for rotating said disk, whereby the said screw draws the disk from and releases the roll, and a spring the tendency of which is to return and force the disk as a bearing against the roll, substantially as specified.

160,801.

160,802.



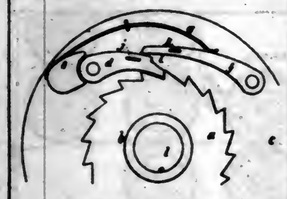
160,802. AIR-BLOWING APPARATUS FOR CARBURETORS. Charles M. Gearing, Pittsburg, Pa. [Filed Aug. 11, 1875.]

In combination with the bent pipe D secured to the outside of the vessel B on top of the same, and communicating with its interior, the valve I, seated in the conical end of said tube, and the stop K secured thereto, substantially as and for the purposes herein set forth.

160,803. PANEL-RAISING MACHINES. F. D Green, Williamsport, Pa. [Filed June 8, 1875.]

Brief.—A panel of the same or of different widths on its two sides can be raised at one operation by means of an adjustable beam hinged to the upper part of the main frame, and provided with a cutter-head at its front end, having suitable cutters. The beam is raised or lowered by a vertical screw-rod or lever, and secured in any desired position by a thumb-nut operating in a groove in the end of the frame.

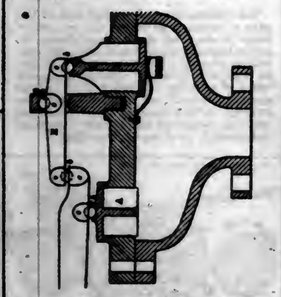
160,804. ASH-SIFTER. Wm. Gates, New Haven, Conn., assignor to C. Cowles & Co., same place. [Filed Sept. 28, 1875.]



In a combination of a grate, a hopper, and a rotary sifting-cylinder, the combination with the cylinder of a shaft, a screw-thread on the shaft, and a bracket, substantially as described.

160,805. CARTRIDGE-SHELL. Wm. Gates, New Haven, Conn., assignor to C. Cowles & Co., same place. [Filed Sept. 28, 1875.]

In a cartridge-shell, the combination of the head, the frictional disk constructed with a screw-threaded shank, a correspondingly-threaded bracket, and means for rotating said disk, whereby the said screw draws the disk from and releases the roll, and a spring the tendency of which is to return and force the disk as a bearing against the roll, substantially as specified.



160,806. PAWL-AND-RATCHET MECHANISM. Gideon D. Hamblin, Deering, Me. [Filed Aug. 10, 1875.]

Brief.—The pawl has a notch or shoulder, into which the end of the pawl-holder fits, which is provided with a spring to hold the pawl either in contact with or away from the ratchet.

The combination, with the shaft *b*, having one driving-wheel, of the ratchet *c*, rigid on the shaft, the gear *e*, loose on the shaft, and carrying the pawl *d*, socket *e*, holder *f*, spring *g*, handles *h i*, and shoulder *l*, as described.

160,807. SLIDE-VALVES. Saml. Harrison, Baltimore, Md. [Filed Oct. 15, 1875.]

1. An auxiliary safety-valve, combined with a downward-moving auxiliary valve and intermediate mechanism, whereby the lever of the safety-valve, on being overloaded, tends to depress the said auxiliary valve, and thus relieves the pressure in the generator, substantially as herein specified.

2. The safety-valve chamber C, valve A, and weighted lever D, combined with the fulcrum or auxiliary lever B and valve B, substantially as and for the purposes specified.

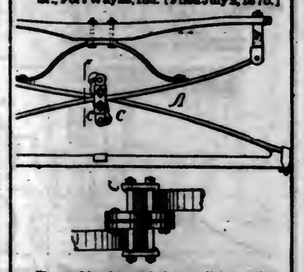
3. In a combination of safety-valves with their respective levers, the balls *h*, resting in or entering complemental concavities formed in the opposing surfaces or points of contact in said valves and levers, substantially as and for the purposes herein specified.

160,808. CARTRIDGES. Geo. B. Hart, Newark, N. J. [Filed May 6, 1875.]

A metallic cartridge-shell with a thickened breech-piece, constructed substantially as described, uniting with the inverted flange of the cylinder at its base, substantially in the manner and for the purposes set forth.

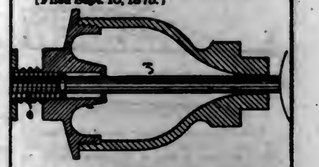
160,807.

160,808.



160,807. CARTRIDGES. Geo. B. Hart, Newark, N. J. [Filed May 6, 1875.]

1. A cartridge-shell, provided with a curved flange, substantially as shown and described, and a thickened breech-piece, having a curve-moulding or an open seat, into which the said flange is compressed and held by an inner ring, substantially as and for the purposes described.

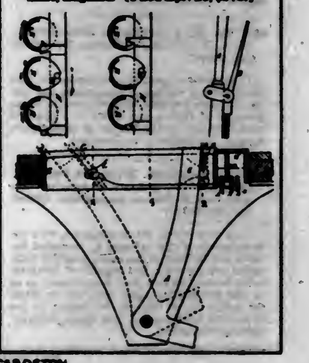


2. A cartridge-shell, provided with a gasket or other non-corrosive metallic anvil, as and for the purposes set forth.

160,809. VEHICLE-SPRINGS. H. A. Hight, Sr., Fort Wayne, Ind. [Filed July 2, 1875.]

The combination, with the equalizing spring bars or plates A A, of the double coupling C C, arranged as described, and the two parts pivoted together, as and for the purposes herein set forth.

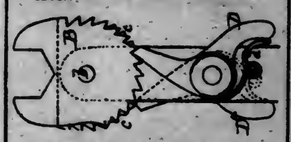
160,809. LUBRICATORS. Isaac W. Hoagland, Newark, N. J., assignor to Richard J. Chard and Wm. Howe, New York, N. Y. [Filed Sept. 10, 1875.]



In an automatic lubricator for shafting, the combination, with the oil-cup, of a rod, A, provided with a spring, *a*, and adjustable screw-cap B, said rod extending through and above the screw-cap, substantially in the manner and for the purposes set forth and described.

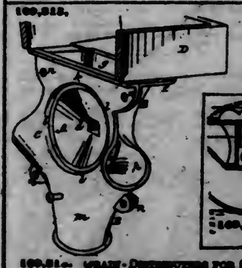
160,810. ALLOYS FOR PREVENTING INCRUSTATION UPON METALS. Oliver Holden, New York, N. Y. [Filed Mar. 11, 1874.]

An alloy for preventing incrustation upon metals, consisting of zinc and tin, lead, bismuth, and antimony, in the proportions set forth.



160,811. SWITCH-SIGNALS. John Imray, No. 20 Southampton Buildings, Chancery Lane, England. [Filed Apr. 26, 1875.]

1. The slotted rocking shaft E, with the lateral recesses G G' and E, H' at each end of its slot, by the partial rotation of which shaft a point or signal lever is held or released at either end of its stroke, substantially as herein described.



2. The combination of the rocking shafts E with the sliding bars E, provided with stops O F, for the purpose of reciprocally locking and unlocking point and signal levers, substantially as herein described.

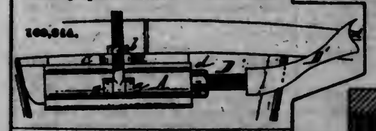
160,812. WRENCHES. Robert Jack, Jersey City, N. J., assignor to himself and Thos. Gannon, same place. [Filed Aug. 30, 1875.]

The head B, divided below the jaws to form two branches or arms which are provided with ratchet-teeth *a*, projecting in reverse directions, in combination with the handle A, pivoted between the branching arms of the head and the pawls D' D', pivoted upon opposite sides of the handle, and springs *d*, acting upon said pawls to keep them in mesh with the ratchet-teeth, substantially as and for the purpose described.

160,813.

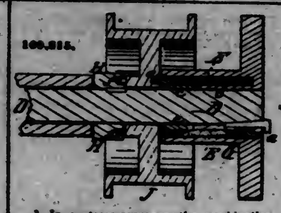
160,813. CRANK-DISPENSERS FOR SEED-DRILLS. Charles F. Johnson, Jr., Owego, N. Y. [Filed June 17, 1875.]

Brief.—The casing is made in two parts for the reception of a bevel-shaped seed-wheel, having eccentric grooves or lugs on its cover surface, for feeding out the seed.



In a seed-distributer for grain-drills, the combination of the seed-distributing wheel A, with its fastenings *a*, and a flange, *c*, extending high up into the auxiliary hopper *g*, with the casings B C, for forming a support for the wheel, and, with said wheel, constituting the auxiliary hopper above, and the curb *f*, and terminating in a seed-conductor below, as and for the purposes described and represented.

160,814. TIRE-TIGHTENERS. Wm. O. Johnson, Alma, Mich. [Filed Aug. 27, 1875.]



Brief.—The tightener presses apart the fellies by the nut and screw.

The socket A, having the bolts B B hinged to its sides, the clamp-plate C, the nuts *b b*, the screw D, terminating in a fork, D', and provided with the nut *d*, substantially as and for the purpose set forth.

160,814.

160,815.

1. In a steam governor, the combination, with the counter-shaft D and pulley J, of a spring, E, connected at its ends, respectively, with the shaft and pulley, and operating in connection with the governor-balls A A and regulating-valve C, to prevent impulses or jerks on the pulley from being transmitted to the valve, said balls and valve being entirely independent of the spring in their governing action, as herein shown and described.

2. The combination, with the spring E, of the ring or collar *e*, resting within the spring and loosely upon the shaft, as and for the purpose specified.

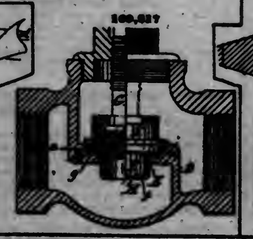
3. The combination, with a governor, of the pulley J, spring E, shaft D, slot *g*, and pin *f*, constructed and operated substantially as described, for the purpose specified.

160,816. GAS-PROPELLERS. Edward H. Lovekin, Brook Green, Hammersmith, England. [Filed Sept. 20, 1875.]

Brief.—Springs on car wound at regular intervals by stationary engines. Their expansion propels the car.

1. In combination with a carriage provided with, motive-power springs for propelling the same, a series of stationary engines set at given distances apart along the route to be traversed, each engine being coupled with under-

160,816.



grooved shafting M, fitted with a spur-wheel, G, in gear with a spur-wheel, F, carried by the mitre-wheel C, and fitted with a sliding sleeve for engaging with the second end of the winding-shaft O of the carriage, substantially as and for the purposes described.

2. In combination with a tramway-carriage, the groups of spring-barrels *a a' a² a³*, with their coiled springs 1 2 3 4 5 6, connected at their opposite ends, as described, each group being coupled together by spur-gearing *d* and *d'*, and connected at one end by gearing to the winding-shaft O, and at the opposite end with a friction-strap, all as and for the purpose above described.

3. The arrangement of gearing *e f f' f² f³ f⁴ f⁵ f⁶* and *g'*, with their sliding sockets *f'*, sliding rod *f⁷*, and reversing-lever *g'*, for transmitting motion from the barrel *a'* to the axle G of the running-wheels of the carriage, in the manner above described.

160,817. GLOBE-VALVES. Nathaniel G. Locke, Salem, Mass., assignor to himself and Alpheus G. Locke, same place. [Filed Apr. 6, 1875.]

160,817

1. The prolongation or extension H to valve-stem nut *b*, constructed and formed to closely fit within and to continuously surround the valve-opening M, substantially as described, for the purpose specified.

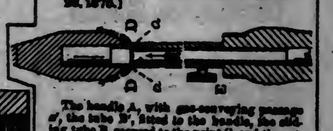
2. The combination, with the prolongation or extension H of valve-stem nut *b*, constructed to closely fit within and to continuously surround the valve-opening M, of the nut *c*, located relatively to the valve-opening M, all substantially as and for the purpose described.

3. The nut *f* of the prolongation H to valve-stem nut *b*, bevelled as and for the purpose specified.

4. The combination of the nut *c* of the valve-case, constructed with a recess, *g*, with the nut *b* of the valve-stem, all as set to leave the recess *g* open and clear when the nut *b* of the valve-stem is closed against the nut *c*, substantially as described, for the purpose specified.

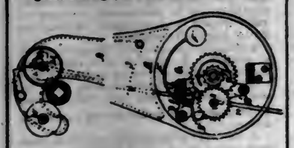
160,818. EXTRACTS OF BEER OR OTHER FERMENTED BEVERAGES. Philip H. Lockwood, London, England. [Filed July 12, 1875.]

Brief.—Takes beer or any other fermented beverage at any stage of fermentation, but preferably when it is ripe and fit for drinking, and evaporates it until it is reduced to a thick fluid. The thick fluid is put into cans, and the proper proportion of alcohol may be mixed with it. Converted into beer by mixing with water or aerated water.



As a new article of manufacture, the within-described condensed extract of fermented beverage.

160,819. ELEVATED RAILWAYS. Alfred B. Lester, New York, N. Y. [Filed Sept. 20, 1875.]

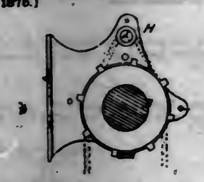


The described elevated-railway structure, consisting of the supporting-columns, surmounted by transverse bed-plates of cast or composite iron resting on the capitals of the columns and supported by bracket-work, in combination with longitudinal spans formed of double wrought-iron beams, between which are clamped the track-rails, and with side bulwarks, and arches, said parts being arranged together as shown and set forth.

160,820. SCRAPERS-HOOLS. William S. Macqueen, Philadelphia, Pa. [Filed Jan. 20, 1875.]

The handle A, with gas-conveying passage *a'*, the tube B', fitted to the handle, the sliding tube B, secured to the point C, and the set-screw E, the tubes B B' fitting each other telescopically and communicating with the passage *a'* of the handle and the outlets *a a''* of the bit or point C, all constructed and combined as set forth, and forming a hand-tool adapted to be heated either by gas or in the fire, as stated.

160,891. SUBSOIL-ALARMS. C. O. Malmgren, Chicago, Ill. [Filed Oct. 11, 1875.]



1. In combination with the system of gearing for operating the hammer, the rock shaft O, provided with arms *d* and *d'*, arm *d* adapted to engage step pin *f*, as specified.

2. In combination with rock shaft O, provided with arms *d* and *d'*, the adjusting-rod H, as specified.

3. In combination with the adjusting-rod H, provided with lug L, the clog-wheel M and cam *m*, as specified.

4. The wheels M M', so arranged as the same with relation to each other as to serve as supports in suspending the case A from the spindle of the door, and by which the wheel M is adapted to operate the alarm upon turning said spindle, as set forth.

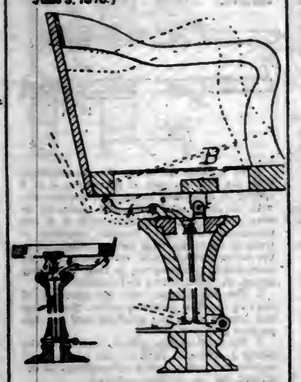
160,892. CURTAIN-FIXTURES. George O. Mathers, Louisville, Ky. [Filed Aug. 12, 1875.]

As an improvement in curtain-fixtures above described, the combination, with the notched disk and the bracket, provided with a detent, and having the vertical slot, of the cord-wheels H, arranged above said disk, and both mounted on the same axis, as and for the purposes set forth.

160,893. PROCESSES OF REFINING SUGAR. Frank O. Matthiessen, Irvington, N. Y. [Filed Sept. 4, 1875.]

Brief.—The "washings" are deodorized and purified previous to evaporation.

The improved process of refining raw sugar herein described, which consists in washing the raw sugar, and then clarifying its coloring matters, as heretofore practiced, and in then deodorizing and filtering the washing preparatory to introducing the washing into the vacuum-pan for evaporation, and subsequent treatment in the ordinary ways.



160,894. METALLIC CASES. Geo. W. McKim, Martin's Ferry, Ohio. [Filed May 21, 1875.]

1. The sheet-metal cask above described, having the two terminals of the body of the cask constructed with spiral grooves, so as to be adjustably screwed together, substantially in the manner and for the purposes set forth.

2. The sheet-metal cask having the ends of its body folded over inwardly, and the cover-groove formed in the double thickness of metal, for the purpose of strengthening said groove, as set forth.

3. The fourfold chine, having the edge of the double fold turned over and bearing against the head, substantially as set forth.

160,895. DENTAL AND BARBERS' CHAIRS. Sabring, C. Megill, Chicago, Ill. [Filed June 3, 1875.]

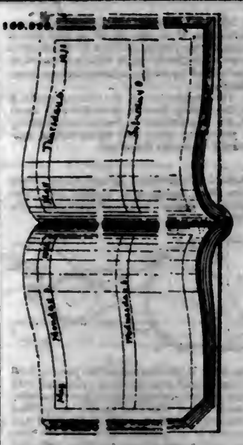
1. In a chair rotating upon a fixed standard, substantially as described, the lever, rod, and pedal, combined with a fulcrum upon the turn-table for tilting the chair, substantially as set forth.

2. In a chair rotating upon a fixed standard, substantially as described, a fulcrum upon the turn-table, the lever, rod, and pedal, combined with a device for locking the chair at various angles of inclination, substantially as set forth.

160,896. SCHOOL-SEATS. S. L. Melhorn, Hanover, Pa. [Filed Oct. 4, 1875.]

The plate B, having at its outer end a central socket and a quadrantal recess open at the top, as described, in combination with the seat-arm having a barrel upon its side to fit the socket of said plate, the two being confined together by a bolt, as is herein set forth.

160,897. ENAMEL FOR TOBACCO-PIPES. P. G. Merriam, Akron, Ohio. [Filed Oct. 16, 1875.]



1. A composition enamel for enameling the bowls or stems of pipes composed of clay, earthenware, or other aluminous or vitrifiable material, consisting of linseed-oil, burnt umber, asphaltum, gum-copal, black oxide of manganese, and Prussian blue, combined in about the proportions substantially as set forth.

2. In combination with the body or ground enamel for coating the stems and bodies of pipes composed of earthenware or other aluminous or vitrified materials, the colored enamel compounds, as set forth, applied over said body enamel, substantially as described.

160,898. ACCOUNT-BOOKS. Robert Mott and Charles Carroll, New Orleans, La. [Filed May 21, 1875.]

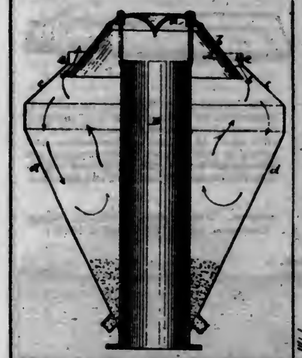
Brief.—Forms a line of perforations across the lower corner of the leaves, for the purpose of facilitating the removal of said corner on the last writing or entry in the book is filled by writing on each consecutive page in turn, and in which each new entry is placed directly after the preceding writing or entry.

160,899.

As a new article of manufacture, a diary or other book perforated across one corner, or other suitable portion of each leaf, to facilitate the removal of a refuse fragment thereof, without separating any portion of the leaf which is prepared or adapted for use.

160,900. TOOL-GRINDING MACHINES. M. L. Monroe, Dayton, Ohio. [Filed June 28, 1875.]

Brief.—The adjustable slotted angle-plate is provided with a series of teeth, in which one end of the tool is adapted to set.

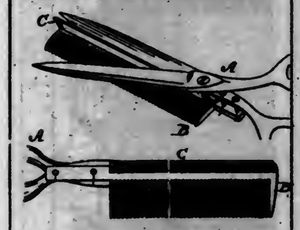


In combination with the frame A and wheel C, the adjustable slotted angle-plate G, and the screw-rod and nut H, said angle-plate being provided with a series of angle-teeth in which one end of the tool is adapted to set in such position as to present its other end to the stone O at any desired angle, substantially as described.

160,901. TREATING HIDES AND OTHER LEATHER. Friedrich C. Mengeling and Robert W. Schaefer, Jersey City Heights, N. J. [Filed Oct. 20, 1875.]

Brief.—Lumps of bicarbonate of soda are dropped into the beer-vat, and being heavier than the liquid, they fall to the bottom. Then the gas generated stays in the beer. With these lumps may be used others, made of tartaric or other suitable acid. The powdered alkali or acid is mixed with cement, such as solution of dextrine, and then compressed to the desired size.

The process of treating beer, and other liquids of a similar nature, with lumps of bicarbonate of soda, or other alkali, either alone or in connection with a suitable acid, the specific gravity of each lump being greater than that of the liquid to be treated, substantially as set forth.



160,902. SPARE-ARRANGEMENT. J. Wellington Nesmith, Golden, Colo. [Filed Oct. 6, 1875.]

The hollow cone A, arranged to project above the lower edge of the upper reduced portion *a* of the cloak-head C, but with its mouth arranged to project within or below said upper reduced portion *a*, leaving a contracted opening, *c*, between it and said head, and with its sides *b* inclining in a reverse direction to the sides or portion *d* of the head, in combination with the flue B, arranged to enter up and open within the mouth of the cone A, substantially as shown and described.

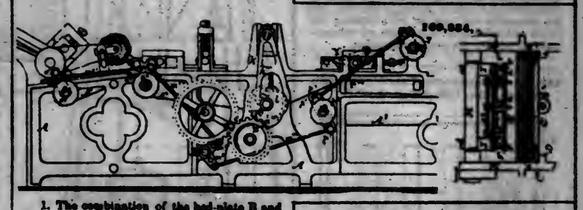
160,903. RAZORS'-EDGE SHEARS. S. Nicholson, Gallatin, Tenn. [Filed June 24, 1875.]

Brief.—A pair of barbers' shears, having a comb secured to the side of one of the blades, is provided with a guard or shield, interposed between the comb and the blade, in such manner, and so shaped, as to govern the length at which the hair is cut, and to present the same properly to the blade of the shears.

The combination of the shears A, comb B, and guard-plate C, substantially as and for the purpose described.

160,904. TROUSERS. Frederick Norris and Clayton B. Green, Wappinger's Falls, N. Y. [Filed Oct. 6, 1875.]

Brief.—The pad is hinged to one of the metal bands, and adjusted at any required angle by a peculiarly-arranged pawl and ratchet, expanded within a hollow in the pad underneath its plate.



1. The combination of the band or bed plate B, the pad-plate D, the hinge-joints *f f'*, the spring-jewel J, and the ratchet I, all arranged and operating as herein shown and described.

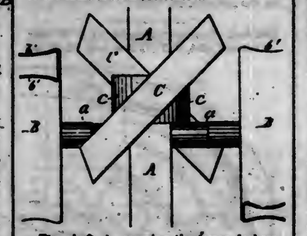
2. The combination, with the pad and pad-plate and the pawl and ratchet, of the releasing-lever M, substantially as herein described.

3. The combination, with the pad E and its plate D, of the band composed of the plates B U and adjustable flexible strap F, the hook U on the plate B, and the slot *g* in the plate U, as herein shown and described.

160,905. CRACKER-MACHINES. Joe Pratt, New York, N. Y., assignor to Lydia Ann McCollum, executrix of the estate of John McCollum, deceased. [Filed July 1, 1875.]

Brief.—The bed-plate rests on rubber strips, and is supported by a sliding cross-head, by which it may be moved or lowered, the under surface of the cross-head being inclined, and resting on side pieces of the frame, on which it may be moved by a screw. The feed-rolls are driven by bevel-gear actuated by shafts receiving motion through a series of shafts and pinions connected with the main shaft. The crimping-roll is set in adjustable bearings between the feeding-rolls and the roll moving the apron. A roller is laid upon the scrap-apron, to prevent the scrap from slipping back, and is connected with the frame by independent links set in open bearings at their lower ends.

1. The combination of the bed-plate B and bed-supporting plate B', provided with the interposed strips *a a*, the inclined pieces C' D, bar C, and screw E, for raising and lowering the bed-plate, substantially as described.



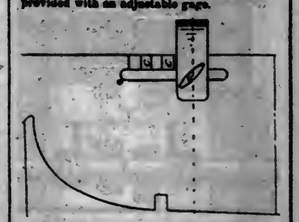
2. The combination of the main shaft I, gearing B' B'' B''', shafts S S', and bevel-gearing *d' d''*, F, and *i*, for driving the rolls T T', the whole arranged as herein shown and described.

3. The arrangement of the crimping-roll W in adjustable bearings between the dough-roller T and apron-roller O', as shown and described, for the purpose specified.

4. The scrap-roll Z, attached to the finger-shaft *y* by independent links or rods *z*, which allow its ends to rise independently of each other, substantially as described.

160,906. ROTARY CUTTERS. Morgan Payne, Cardington, Ohio, assignor to himself and Thomas H. Davis, Collinsville, Ill. [Filed Sept. 6, 1875.]

Brief.—Tapering fluted tubes are attached to the shaft to form the beaters.

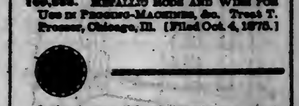


The shaft A, carrying the lower dashers, consisting of tubes B B, having fluted cutters *b*, and, further, made tapering from top to bottom, in combination with the upper dashers C C, similarly constructed to those of B B aforesaid, said parts being arranged to operate with relation to each other in the manner and for the purpose set forth.

160,907. SHUTTLES FOR LOOMS. R. W. Porter, Nashua, N. H. [Filed May 10, 1875.]

160,908. SHINGLING-HATCHETS. Henry K. W. Perry, Braintree, Mass., assignor of one-half his right to Martin L. Tupper, same place. [Filed Feb. 27, 1875.]

Brief.—The blade of a shingling hatchet is provided with an adjustable gage.



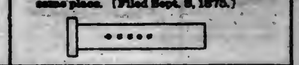
The shingling hatchet provided with a gage, carried by and adjustable upon its blade, substantially as shown and set forth.

160,909. SHUTTLE-BODY AND SPINDLE-HEAD. Trust T. Prosser, Chicago, Ill. [Filed Oct. 4, 1875.]

In combination with the shuttle-body A, the metallic box or shell C and spring D formed from a single piece of metal, as shown in Fig. 3, and the spindle and spindle-head B *b* inserted within the shell and held by the pin *a*, which holds both the spindle and the shell to the shuttle-body, substantially as and for the purposes herein set forth.

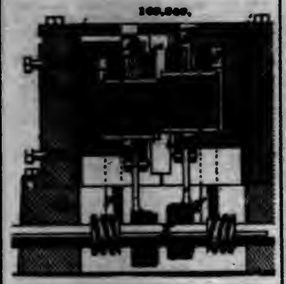
160,910. METALLIC RODS AND WIRES FOR USE IN FREEING-MACHINES, &c. Trust T. Prosser, Chicago, Ill. [Filed Oct. 4, 1875.]

1. As a new article of manufacture, metal rods or wire having a honeycombed or cellulated surface, substantially as and for the purpose specified.



2. Honeycombed or cellulated wire, the cells of which are arranged in parallel (whether straight or spiral) longitudinal rows, divided by continuous longitudinal ribs and connecting transverse ribs, substantially as and for the purpose specified.

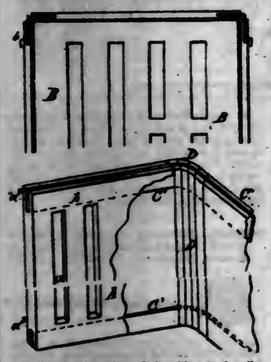
160,911. SHOE PEGS OR NAILS. Trust T. Prosser, Chicago, Ill. [Filed Oct. 4, 1875.]



A peg or nail having a slightly-oblique chisel-edge and a notch near the point, transverse to the chisel-edge and across the longest side, substantially as and for the purpose specified.

160,912. MACHINES FOR INDENTING THE SURFACE OF WIRE. Trust T. Prosser, Chicago, Ill., assignor to himself, O. L. Noble, Winslow Bushnell, and Allen C. Calkins, same place. [Filed Sept. 6, 1875.]

169,839.

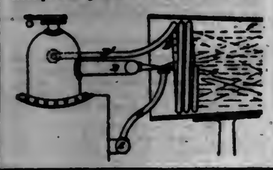


1. The combination, with the both rotating and reciprocating rolls, of guides for confining the wire so as to compel it to pass in a straight line through between the rolls, substantially as specified.

2. The combination, with the rotating rolls, of the boxes supporting them, and eccentrics and rods for reciprocating the boxes and rolls in the manner and for the purpose substantially as specified.

3. The combination, with the driving-shaft, the rolls, and their supporting-boxes, of the worm-wheels for imparting, through intermediate gearing, a rotary motion to the rolls, and the eccentrics and rods for reciprocating the boxes and rolls at the same time, all substantially as and for the purpose specified.

169,841. Piston-Boxes. Daniel Protzmann, Canton, Ohio. [Filed Sept. 9, 1875.]

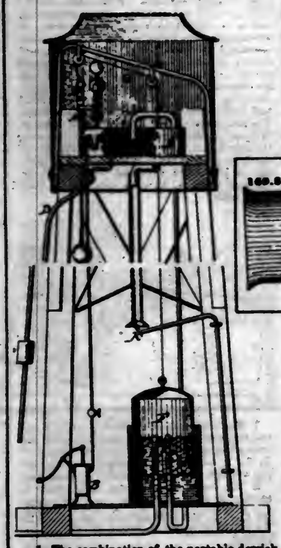


1. The combination of the sides A, the ribs C', seated in grooves c', and the corner-pieces D, substantially as and for the purpose set forth.

2. In a packing-box, the sides A, provided with the slots c, having lateral extensions c', substantially as set forth.

3. The bottom B, having cars b and the curved ribs b', in combination with the sides A, having the slots c c', substantially as set forth.

169,842. Hydrocarbon-Furnaces. John C. Snowdon, Lightcliffe, England. [Filed Apr. 10, 1875.]

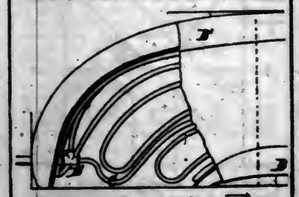


Brief.—Oil is drawn from a reservoir by the vacuum produced by a jet of steam issuing in close proximity to the mouth of the oil-pipe.

The combination of the steam-pipes B and capillary tubes or pipes C with the perforated steam-pipes D and the short straight cylinder F, substantially as and for the purposes specified.

169,843. Carbureting Apparatus. A. C. Reed, Minneapolis, Minn. [Filed Oct. 4, 1875.]

Brief.—The carburetor is located in the top of a portable derrick, and an oil-pump and heater are located in the bottom of it. The gas-holder is counterbalanced by cord and weight playing over a pulley, and as it reaches its upper limits, tappets on the cord tilt a weighted lever, which closes the valve admitting air to the carburetor.

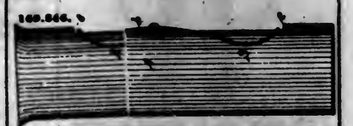


1. The combination of the portable derrick F, provided with a carburetor, A, on its top, the gas-holder F, and pump E on the bottom of the derrick, all constructed and arranged substantially as set forth.

2. In combination with the carburetor A on top of the derrick F, the overflow-pipe D, provided with the enlargement E, and connected with the tank C, whereby the desired quantity of gasoline pumped into the carburetor is indicated, substantially as set forth.

3. The combination of the carburetor A, elevated upon derrick F, pump E, tank C, holder F, pipes c, b, and D', lever G', valve J, air-pipe I, and cord G and weight, all constructed and arranged to operate substantially as and for the purposes set forth.

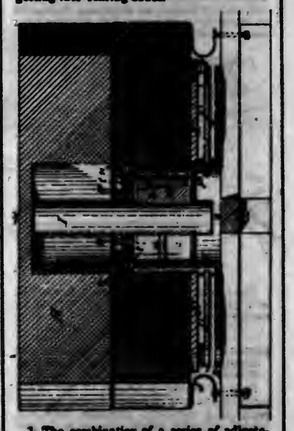
169,844. Track-Clearers. G. P. W. Bay, College Point, N. Y. [Filed Aug. 26, 1875.]



In a snow-plow, the combination of an inclined curved scoop, the mouth of which rests closely to, and extends at right angles across, the track, the rear opening to one side, said scoop being constructed with double walls, and an interposed steam-coil traversing the space between said walls, and being mounted upon a truck, B, substantially as and for the purposes herein described.

169,845. Vehicle-Axles. C. W. Richardson, Flushing, assignor to the Davis Metallic-Wheel-Manufacturing Company, New York, N. Y. [Filed Aug. 20, 1875.]

The journal-pieces B, having the collars b, constructed with the grooves c, in combination with the truss-piece A, consisting of a metallic shell, U shaped in cross-section, and having its ends bent around the shanks of the journals and fitted within the grooves c in the collars b, substantially as shown and described.



169,846. Whip-Sockets. Geo. M. Rising, Cherokee, Iowa. [Filed Oct. 11, 1875.]

A whip-socket, provided with the angle C and slot c c, as described, in combination with the double spring S, seated and held in place by the bar b, as and for the purposes set forth.

169,847. Mill-Spindles. Gardner B. Root and William W. Robinson, Ripon, Wis. [Filed Sept. 1, 1875.]

Brief.—Adjustable bent springs under outer edge of oscillating bed-stone assist in balancing it. A horizontal rib around the sides of the packing-chamber causes the meal to bear evenly against the spindle in its lateral oscillations. A flexible gasket is fitted between spindle and stone, its outer edge secured by clamping-rings, in order to prevent dirt, &c., getting into bearing-boxes.

1. The combination of a series of adjustable springs with the oscillating bed-stone, for the purpose of leveling and balancing the same without interfering with its oscillations, substantially as described.

2. The adjustable bent springs J J, arranged under the edge of the bed-stone, substantially as described, for the purposes specified.

3. The chambers of the box, formed with a horizontal rib, m, around its sides, substantially as described, for the purposes specified.

4. The combination of the chamber-rim m, convex wedges O, and beveled bearing-boxes I, with the bush and spindle, substantially as described, for the purposes specified.

5. The combination of a flexible gasket with the runner-spindle and oscillating bed-stone, substantially as described, for the purposes specified.

6. The combination of a flexible gasket with the runner-spindle, the oscillating bed-stone, and the banking, for the purpose of holding the center support of the gasket in place around the spindle, substantially as described.

7. The rabbeted disk or bush cover S and the clamping-rings U U, combined with the flexible gasket, for securing it to the bush around the spindle and to the eye of the bed-stone, substantially as described.

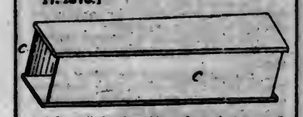
8. The dust-packing, consisting of the packing material w, held within a recess of the disk S around the spindle, by means of the cap X, substantially as described, for the purpose specified.

169,848. Revolving Fire-Arms. Jacob Reporter, Philadelphia, Pa. [Filed Aug. 16, 1875.]

1. The combination, in a revolver, of the cylinder E, notched at its rear edge, the cylinder-stop G, and the hammer A, with its projection b, all substantially as herein set forth.

2. The combination of the hammer A, cylinder-stop G, spring H, and projection a on the trigger.

3. The notches a, each of which is adapted to the nose of the hammer and continued on a curve to suit the nose of the stop G, as set forth.



4. In combination with the cylinder of a revolver, a center-pin split throughout the length of the cylinder, and restricted in its expansion by the same, all as set forth.

169,849. Processes of Preserving Meat. Frederick H. L. C. Sisco, Neufchatel, Switzerland. [Filed Oct. 20, 1875.]

Brief.—Places the meat and acetate of soda in alternate layers, in the proportions of one hundred of the former to twenty-five of the latter, for forty-eight hours, and then afterward packed in their own brine, or a brine formed of acetate of soda one part, and water three parts. To prepare the meat for use it is to be soaked in a solution of cal-ammoniac.

The process of preserving butcher's meat, game, fish, molluska, &c., in a fresh or uncooked condition by means of acetate of soda, either alone or in connection with other ingredients, applied in the proportions and in the manner substantially as hereinbefore set forth.

169,850. Box-Pegs. Edward G. Scovil, St. John, New Brunswick. [Filed Sept. 17, 1875.]

A box-pin having sides c formed of one and the same piece of metal, substantially as described.

169,851. Spring Bed-Bottoms. Charles T. Sager, Union, N. Y., assignor of one-half his right to Henry P. Mallory, same place. [Filed July 28, 1875.]

A bed-bottom constructed with a series of top strips, C, connected together at their ends by means of metallic stripe D, and at equal distances apart between each stripe C by means of series of metallic springs E, the said springs E being arranged at their upper ends to connect the stripe C alternately, and at their lower ends to rest upon sill-pieces A, the whole being constructed in the manner and for the purpose substantially as described.

169,852. Construction of Fire-Proof Buildings. Thos. Sharp, U. S. A. [Filed Sept. 20, 1875.]

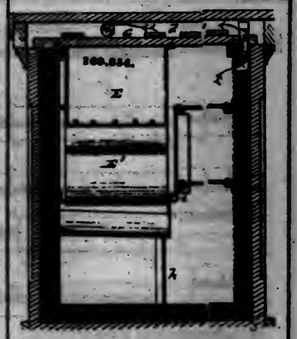
Brief.—The improved metal compartment-plates form a water-tight separation between the several floors of a building, and prevent damage by water in case of fire.

1. The combination, with the joist, of the series of compartments forming plates C C' C'', the adjacent ends of two of which extend upward along the same joist, and are secured thereto, substantially as and for the purpose set forth.

2. The hose-directing pipe D, projecting through the floor, and operating in the manner and for the purpose set forth.

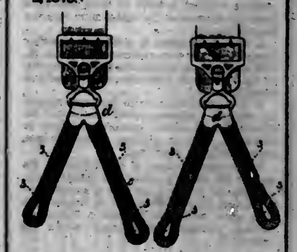
3. The hatchway consisting of metal plates d d, secured to each other and to the joist, in combination with the compartment-forming metal plates extending upward along the sides of said plates d, substantially as and for the purpose set forth.

4. The compartment-forming plates C, inlet-pipe F, communicating passages G, projecting pipe D, and metallic hatchway E, combined and operating substantially as and for the purpose set forth.



169,853. Horse Hay-Rakes. D. P. Sharp, Ithaca, N. Y. [Filed Apr. 2, 1875.]

The combination of the rake-teeth B, formed at their upper ends with bends a and hooks b, with axle A, grooved as shown, to receive the said bends, rod d, and bar C, arranged to permit the teeth to rise and fall without becoming detached, as and for the purpose set forth.



169,854. Refrigerators. Mathew Shaw, St. Louis, Mo. [Filed Sept. 13, 1875.]

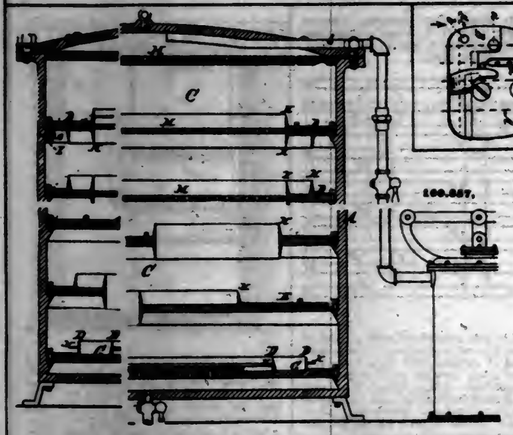
Brief.—The condensation follows the inclined bottom of ice-box and side of cooler into trough, while the cool air likewise descends, and drives warm air outside through the hollow cover.

The combination, with refrigerator-body A B C, of the ice-chamber E and water-tank F, with closed bottom, and suspended to form a continuous air-space, a, around the same, and the ventilating-pipes b b in the walls farthest from the ice-chamber and air-exits c, whereby a current of cold air passes downward from the ice-chamber, driving the warm and foul air through the flues b b and out the exits in the lid, all substantially as and for the purposes herein set forth.

169,855. Suspender Button-Straps. A. Shenfield, New York, N. Y. [Filed Aug. 2, 1875.]

The suspender-end made of a flat cord or strip of fibrous material, bent into a loop, laid flatwise, united at the inner edges 3, and connected to the attaching-pieces 2, as set forth.

169,856. Carriage-Axles. Wm. W. Simmons, Derby, Conn. [Filed Sept. 9, 1875.]



The carriage-axle, constructed with the combined annular and longitudinal grooves, filled with an absorbing material, substantially as and for the purpose described.

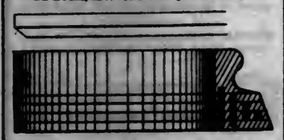
169,857. Apparatus for Filtering Liquids. Thos. B. Sinclaire, Brooklyn, N. Y. [Filed Aug. 10, 1875.]

Brief.—To the inner surfaces of the walls of a filter are attached ledges or deflectors, which are pliable, flexible, or adjustable, and which may be provided with counter-ledges. The filter has also diaphragms provided with eccentric passages. The liquid, by above means, is caused to percolate the mass of filtering material.

1. The combination of adjustable, pliable, or flexible ledges D D, one or more, with the interior surfaces of a filtering chamber or vessel, substantially as described.

2. The combination of counter or supplementary ledges H F, one or more, whether the same are adjustable, pliable, flexible, or rigid, with one or more adjustable, pliable, flexible, or rigid ledges or diaphragms, substantially as described.

3. The combination of one or more diaphragms or ledges, E, having eccentric passages, with a filtering chamber or vessel, substantially as described.



4. The combination, with a filtering-vessel constructed to filter liquid under pressure, of a ledge or shelf projecting from the interior of the vessel at or near the top of the same, with or without a ledge or shelf projecting from the interior of the vessel at or near the bottom thereof.

5. The combination, in a filtering chamber or vessel, of one or more separating-plates, M, with one or more adjustable, pliable, flexible, or rigid ledges or deflectors, substantially as described.

6. The combination, with the tapering side or walls of a filtering-vessel constructed for filtering liquid under pressure, of ledges or deflectors, with or without counter-ledges, substantially as described.

7. The combination of the following elements: the filtering-vessel A B, ledges D, diaphragms or ledges E, counter or supplementary ledges E, movable plates M, diaphragms G H, pipes or orifices F b, and a forcing apparatus, substantially as herein shown and described.

160,856. MELLENTUBE-STAFFS. G. T. Smith, St. Louis, Mo. [Filed Sept. 1, 1875.]

The herein-described method of moving or determining the face of a mellotube by the use, first, of a distance staff, Fig. 1, which is employed to level the object, and, second, of a long staff, Fig. 2, to establish the height or plane of the eye or central part of the stone relative to the object, said staff serving as a guide for the ends of the long staff, substantially as set forth.

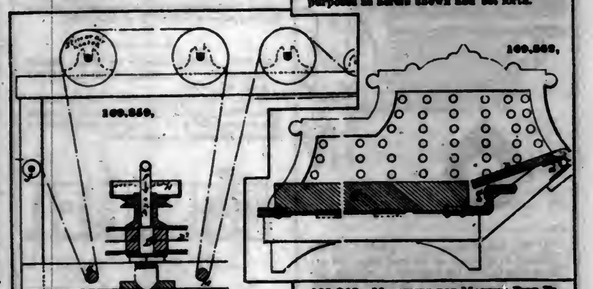
160,858. DYEING APPARATUS. Samuel M. Smith and Oliver T. Smith, Bradford, England. [Filed July 23, 1875.]

Brief.—The dye is admitted into a vertical revolving cylinder, wherein it passes, by centrifugal force, through perforations filled with bristles and between green disks, against the material to be opened or covered with said color.

1. In an apparatus for dyeing fabrics, yarns, &c., the hollow perforated cylinder D, in combination with the surrounding wire-cloth D' and a series of bristles, operated substantially as and for the purposes described.

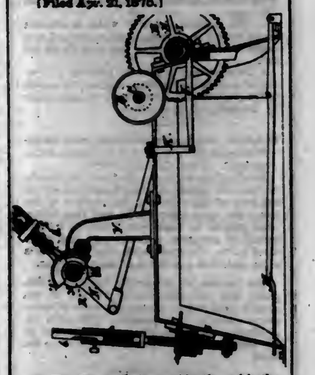
2. The cylinder D, constructed substantially as specified, in combination with a series of fixed and conducting rollers, J K M Q, and the steam or hot-air heated rollers A A' A', all arranged and operating as and for the purposes set forth.

3. The cylinder D, constructed and operating as described, in combination with the cistern or receptacle H and a feed-pipe, when arranged to operate substantially as and for the purposes set forth.



160,859. SELF-ADJUSTING GUIDES FOR SEWING LAP-SEAMS IN SEWING-MACHINES. W. A. Springer, Marlborough, Mass. [Filed July 10, 1875.]

Brief.—The guide consists of an upper and lower plate, the latter being secured rigidly to the rest of the sewing-machine, and the upper plate, being free to move vertically, is provided with two pins, which enter holes in the under plate. In making a lap-seam, one part of the material passes over the movable plate, with its edge against the guide, and the other portion passes under the said plate with its edge against one of the pins, and the two pieces are fed under the needle, and united by a seam near one of the edges. The material is then reversed, and the stitched edge passed along close to the guide upon the upper plate, and another seam formed near the other edge.



1. The combination, with the stationary part A of the guide, of the movable part B, substantially as and for the purposes set forth.

2. The combination, with the parts A and B, of the guide-pin a, and guide shoulder 4, substantially as and for the purposes set forth.

3. In machinery for sewing a lap-seam in the manufacture of boots and shoes, a guide-plate, having on its upper side a guide for the upper part of the work, and on its under side a guide for the lower part of the work, said guide-piece being open on three sides for the passage of the lower part of the work, and self-adjusting to conform to the inequalities thereof, substantially as set forth.

160,860. MACHINES FOR MAKING PIPE-BENDS. Andrew Syverson, Chicago, Ill. [Filed Apr. 21, 1875.]

1. The former T, in combination with the pressure-die S, for pressing the pipe upon the outer surface, as specified.

2. The combination of the concave disc Y, former T, and pipe-holder 6, for carrying the pipe and bending it, as specified.

3. The vibrating arms F, eccentric shaft P, and pressure-die S, as and for the purposes specified.

4. The combination of the former T and former-carrier U, for adjusting the former relative to the shaft R, upon which the operative parts vibrate, as specified.

5. The sliding lever-rod 3, the cam 4, and pipe-holder 6, and rocking shaft 1, as and for the purposes specified.

160,861. PROCESSES OF FORMING BLACKBOARDS OR SLATES. Hugh B. Stewart, Mercer, Pa. [Filed Oct. 18, 1875.]

The within-described process for forming a blackboard or slate, consisting of first coating a Manilla paper base with alcohol, shellac, dropblack, extract logwood, blue vitriol, emery, pumice, and umber, and then recoating the same after being dried with the same composition excepting the emery, all substantially as set forth.

160,862. SOFA-BEDSTEADS. Jas. K. Stockton and Miss L. Stockton, Brooklyn, N. Y. [Filed June 30, 1875.]

1. In a sofa-bedstead or lounge-bed, having a reversible seat, the automatic head-sections D, arranged and operated substantially as and for the purposes as herein shown and described.

2. The combination, in a bed-lounge, of the seat B, revolving mattress C, crank *p*, and head-mattress D, arranged and operating in combination with each other, as and for the purposes as herein shown and set forth.

160,863. MACHINES FOR MAKING CUT-NAILS. Thomas Perkins, Wheeling, W. Va. [Filed Aug. 30, 1875.]

1. The combination of the feed-rolls E E', the cutting-blade F, and the gripping-jaws G G', substantially as described.

2. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', and the heading-die H, substantially as described.

3. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, and the ejector I, substantially as described.

4. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, and the adjustable gage J, substantially as described.

5. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, and the adjustable nail-guide K, substantially as described.

6. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, and the adjustable nail-guide L, substantially as described.

7. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, and the adjustable nail-guide M, substantially as described.

8. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, and the adjustable nail-guide N, substantially as described.

9. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, and the adjustable nail-guide O, substantially as described.

10. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, and the adjustable nail-guide P, substantially as described.

11. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, and the adjustable nail-guide Q, substantially as described.

12. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, and the adjustable nail-guide R, substantially as described.

13. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, and the adjustable nail-guide S, substantially as described.

14. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, and the adjustable nail-guide T, substantially as described.

15. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, and the adjustable nail-guide U, substantially as described.

16. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, and the adjustable nail-guide V, substantially as described.

17. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, and the adjustable nail-guide W, substantially as described.

18. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, and the adjustable nail-guide X, substantially as described.

19. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, and the adjustable nail-guide Y, substantially as described.

20. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, and the adjustable nail-guide Z, substantially as described.

21. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, and the adjustable nail-guide A', substantially as described.

22. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', and the adjustable nail-guide B', substantially as described.

23. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', and the adjustable nail-guide C', substantially as described.

24. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', and the adjustable nail-guide D', substantially as described.

25. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', and the adjustable nail-guide E', substantially as described.

26. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', and the adjustable nail-guide F', substantially as described.

27. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', and the adjustable nail-guide G', substantially as described.

28. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', and the adjustable nail-guide H', substantially as described.

29. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', and the adjustable nail-guide I', substantially as described.

30. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', and the adjustable nail-guide J', substantially as described.

31. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', and the adjustable nail-guide K', substantially as described.

32. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', and the adjustable nail-guide L', substantially as described.

33. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', and the adjustable nail-guide M', substantially as described.

34. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', the adjustable nail-guide M', and the adjustable nail-guide N', substantially as described.

35. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', the adjustable nail-guide M', the adjustable nail-guide N', and the adjustable nail-guide O', substantially as described.

36. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', the adjustable nail-guide M', the adjustable nail-guide N', the adjustable nail-guide O', and the adjustable nail-guide P', substantially as described.

37. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', the adjustable nail-guide M', the adjustable nail-guide N', the adjustable nail-guide O', the adjustable nail-guide P', and the adjustable nail-guide Q', substantially as described.

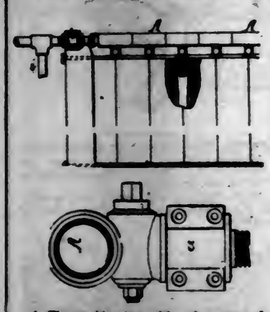
38. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', the adjustable nail-guide M', the adjustable nail-guide N', the adjustable nail-guide O', the adjustable nail-guide P', the adjustable nail-guide Q', and the adjustable nail-guide R', substantially as described.

39. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', the adjustable nail-guide M', the adjustable nail-guide N', the adjustable nail-guide O', the adjustable nail-guide P', the adjustable nail-guide Q', the adjustable nail-guide R', and the adjustable nail-guide S', substantially as described.

40. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', the adjustable nail-guide M', the adjustable nail-guide N', the adjustable nail-guide O', the adjustable nail-guide P', the adjustable nail-guide Q', the adjustable nail-guide R', the adjustable nail-guide S', and the adjustable nail-guide T', substantially as described.

41. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', the adjustable nail-guide M', the adjustable nail-guide N', the adjustable nail-guide O', the adjustable nail-guide P', the adjustable nail-guide Q', the adjustable nail-guide R', the adjustable nail-guide S', the adjustable nail-guide T', and the adjustable nail-guide U', substantially as described.

42. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', the adjustable nail-guide M', the adjustable nail-guide N', the adjustable nail-guide O', the adjustable nail-guide P', the adjustable nail-guide Q', the adjustable nail-guide R', the adjustable nail-guide S', the adjustable nail-guide T', the adjustable nail-guide U', and the adjustable nail-guide V', substantially as described.



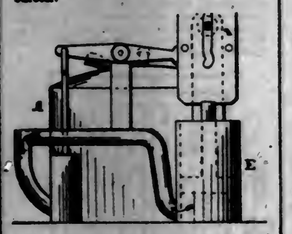
43. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', the adjustable nail-guide M', the adjustable nail-guide N', the adjustable nail-guide O', the adjustable nail-guide P', the adjustable nail-guide Q', the adjustable nail-guide R', the adjustable nail-guide S', the adjustable nail-guide T', the adjustable nail-guide U', the adjustable nail-guide V', and the adjustable nail-guide W', substantially as described.

44. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', the adjustable nail-guide M', the adjustable nail-guide N', the adjustable nail-guide O', the adjustable nail-guide P', the adjustable nail-guide Q', the adjustable nail-guide R', the adjustable nail-guide S', the adjustable nail-guide T', the adjustable nail-guide U', the adjustable nail-guide V', the adjustable nail-guide W', and the adjustable nail-guide X', substantially as described.

45. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail-guide B', the adjustable nail-guide C', the adjustable nail-guide D', the adjustable nail-guide E', the adjustable nail-guide F', the adjustable nail-guide G', the adjustable nail-guide H', the adjustable nail-guide I', the adjustable nail-guide J', the adjustable nail-guide K', the adjustable nail-guide L', the adjustable nail-guide M', the adjustable nail-guide N', the adjustable nail-guide O', the adjustable nail-guide P', the adjustable nail-guide Q', the adjustable nail-guide R', the adjustable nail-guide S', the adjustable nail-guide T', the adjustable nail-guide U', the adjustable nail-guide V', the adjustable nail-guide W', the adjustable nail-guide X', and the adjustable nail-guide Y', substantially as described.

46. The combination of the feed-rolls E E', the cutting-blade F, the gripping-jaws G G', the heading-die H, the ejector I, the adjustable gage J, the adjustable nail-guide K, the adjustable nail-guide L, the adjustable nail-guide M, the adjustable nail-guide N, the adjustable nail-guide O, the adjustable nail-guide P, the adjustable nail-guide Q, the adjustable nail-guide R, the adjustable nail-guide S, the adjustable nail-guide T, the adjustable nail-guide U, the adjustable nail-guide V, the adjustable nail-guide W, the adjustable nail-guide X, the adjustable nail-guide Y, the adjustable nail-guide Z, the adjustable nail-guide A', the adjustable nail

169,971. Clay-Presses. John Watson Trenton, N. J. (Filed Oct. 8, 1875.)

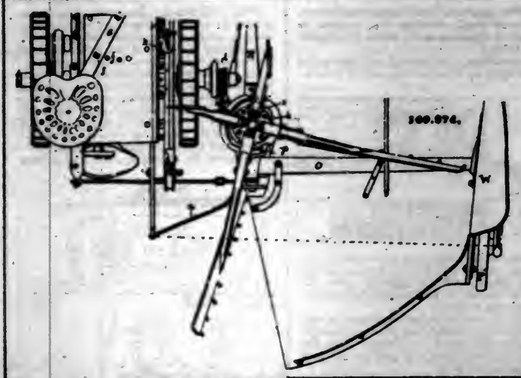


1. The combination, with a clay-press, of a main pipe, A, made in detachable sections, each section having a branch, a, and being constructed for attachment to one of the leaves of the press, all substantially as set forth.

2. The combination of the main pipe A of the press with an escape-pipe, f, as and for the purpose set forth.

169,972. Carburetting Apparatus. Peleg Wersi, Philadelphia, Pa., assignor of one-half his right to H. Lucien Richie, same place. (Filed Apr. 13, 1875.)

Brief.—A small pump, that works with the air-pump, returns oil from the lower chamber, then has filtered through the absorbent of sponge and excelsior, to the top of the carburetor.



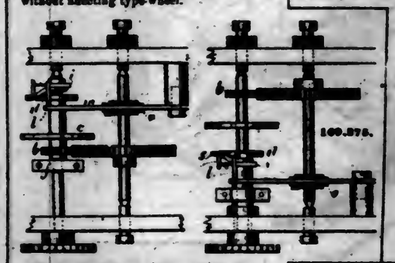
In a gas-machine, the combination of an air-receiving chamber, C, carbureting-chamber D, distributing-chamber, air-forcing pump E, and pump H, the latter provided with a pipe, J, conducting therefrom to the chamber D, substantially as and for the purpose described.

169,973. Compression-Cocks. F. White, St. Louis, Mo. (Filed Sept. 13, 1875.)

Brief.—The thumb-handles are attached to a threaded collar, which is fitted to the valve-case. The valve-stem is secured to the collar, and is actuated by the same.

The center-piece C, having shoulder c^1, upper shoulder c^2, lower necking c^3, upper packing c^4, bushing c^5, the stem E, having shoulder e, journal e^1, top cover F, the cap H, fitted to revolve on the center-piece, all said parts being combined, with relation to a globe, A, to operate in manner and for the purpose set forth.

169,974.



169,974. Harvesters. Wm. N. Whiteley, Springfield, Ohio. (Filed Apr. 3, 1874.)

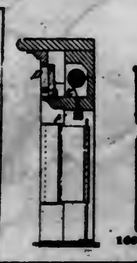
1. In combination with the bars of the rectangular main frame A, the continuous tubular master-wheel axle-box E, which protects and affords a bearing for the main axle F, and, at the same time, ties the frame together, as set forth.

2. The rock-shaft a, substantially as described, combined with the latch-lever m, and notched segment n, at one end, and the crank and pitman at the other, to actuate and control the front end of the drag-bar R.

169,975. Printing-Telegraphs. Charles J. Wiley, New York, N. Y. (Filed Oct. 12, 1875.)

Brief.—Type-wheel locked to shaft by a stutch, which is released by action of unison-stop, allowing motor to continue revolving without affecting type-wheel.

1. The combination, with the type-wheel and a unison-stop, of a frictional connection to the motive power, and a ratchet-wheel and pawl that connects and disconnects the type-wheel and its motor, substantially as set forth.

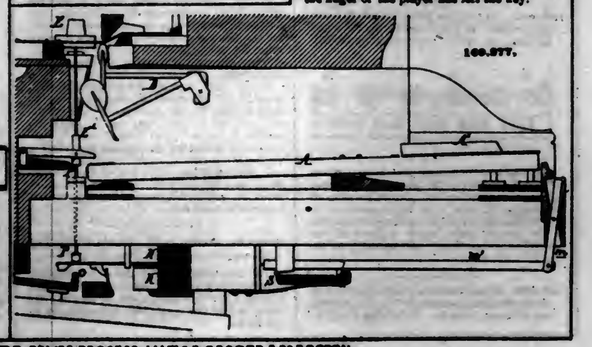


2. The lever w, pin l, and hanging cam o, in combination with the unison-stop t, pawl e, ratchet-wheel d, and type-wheel, substantially as set forth.

3. In a printing telegraph instrument, the combination of a locking mechanism with the type-wheel and escapement for connecting and disconnecting such type-wheel from the escapement.

169,976. Fire-Place Screens. Wm. C. Williamson, Newbern, Tenn. (Filed May 8, 1875.)

Brief.—The extension-piece can be drawn out when the screen is to be rolled up. The bottom piece of the screen closes the aperture through which the screen passes.

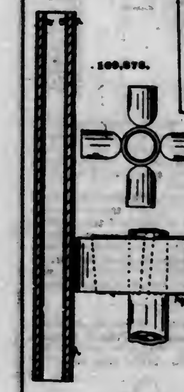


A flexible screen, E, having slotted handle-shaft F and bottom rod F, as and for the purpose specified.

169,976.

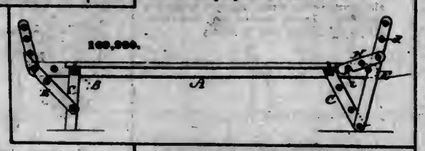
169,977. Piano Attachments. Auguste D. R. Wolff, Paris, France. (Filed June 18, 1875.)

Brief.—A device for holding the dampers of any single key and its octaves raised after the finger of the player has left the key.



169,977.

1. The combination of the damper-rods B' of a piano with rods P, hinged bar O under the control of a pedal, and pads n' with mechanism for interposing the latter between the said bar O and rods P, as and for the purpose set forth.



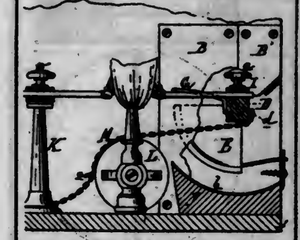
2. The combination of the hinged bar S, having an inclined portion, z, with the rods n and their teeth r, arranged to operate as set forth.

1. The combination of the frame A B, hinged legs O C, arms E E, and foot-rest G, all substantially as and for the purposes herein set forth.

2. The combination of the frame A B, hinged legs O C, extended arms E' E' provided with rounds d, forming the head-rest, and the hooked arms H H, all substantially as and for the purposes herein set forth.

169,978.

169,980.



169,978. Manufacture of Metal Tubing. Stephen W. Wood, Cornwall, N. Y. (Filed Oct. 26, 1875.)

1. The method of forming internally-coated tubing or pipe by electro-deposition of the metals composing it, depositing first upon a suitable mandrel or form a coating or lining of one metal, and depositing thereon an exterior covering of a different metal, forming the main body, substantially as herein set forth.

2. The method of fabricating tubing or pipe by electro-depositing metal or metals for the same upon a metal mandrel or form, and rolling or burnishing the same to facilitate its removal, substantially in the manner herein set forth.

S. W. WOOD.

169,979. Apparatus for Lighting Gas, &c. Zachary Woodworth, Springwells, Mich. (Filed Oct. 19, 1875.)

1. The rock-shaft D, quadrant E, spring F, bale G, cord H, clamp I, and rubbing-block J, in combination with the shelf A, bracket-back B, and a gas-burner, lamp, or candle, substantially as and for the purpose set forth.

2. The match-holding post and clamp E K', in combination with the primary match-lighting apparatus, as and for the purpose set forth.

3. The pulley L and chain M, in combination with the rock-shaft and the key of a gas-burner, as and for the purpose set forth.

169,980. Cop-Bobbins. Leonard Worcester, West Brattleborough, and Joshua B. Howe, Readsborough, Vt. (Filed Mar. 17, 1875.)

169,980.

169,981. Sewing-Machines. Wm. Wormald and Edmund Dobson, Leeds, England. (Filed Feb. 13, 1875.)

Brief.—The machine is capable of making the lock, cable, and chain stitches. The spool-case holder is provided with a removable bar-shaped piece of metal, whereby the passage of the thread to the rest of the needle is facilitated, and the lock-stitch produced. In making the cable-stitch, the bar-shaped piece is removed; the upper thread then makes a chain-stitch, through the loops of which the under thread is passed, resulting in the cable-stitch. To make the chain-stitch, the under thread is dispensed with. The spool-case is prevented from leaving the holder by a locking-bolt, which is adjustable for different-sized threads, and is provided with a retaining-screw.

1. The combination of the spool-case holder T and spool-case E with the adjustable bolt 4, all constructed and operating substantially as and for the purposes specified.

2. In a sewing-machine capable of producing the lock-stitch, cable-stitch, and loop or chain stitch, the combination of the spool-case holder T, curved metal plate c, the conical spool-case E, constructed substantially as described, and the adjustable locking-bolt 4, with the removable bar-shaped piece V, all constructed to operate as set forth.

REISSUES.

6,726. Wood-Screws. Allen Cummings, New York, N. Y., assignor to the New York Screw Company, same place. Patent No. 161,200, dated Mar. 30, 1875. [Filed Aug. 4, 1875.]

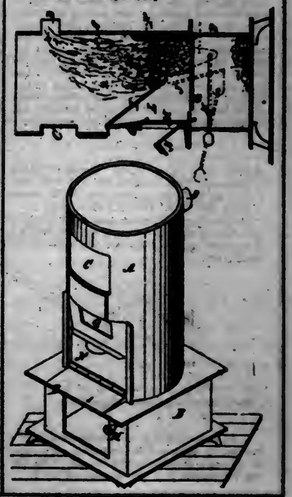
A screw the head of which, at its center, is provided with an angular cavity in lieu of the usual slot or nick, substantially as and for the purposes as herein shown and described.

6,726. Wood-Screws. Allen Cummings, New York, N. Y., assignor to the New York Screw Company, same place. Patent No. 161,200, dated Mar. 30, 1875. [Filed Aug. 4, 1875.]

A screw the head of which, at its center, is provided with an angular cavity in addition to the usual slot or nick, substantially as and for the purposes as herein shown and described.

6,727. Brush-Holders. Charles B. Clark, Buffalo, N. Y., assignor to Clark & Co., same place. Patent No. 30,468, dated July 28, 1860. [Filed Oct. 20, 1875.]

Brief.—The screw-shank and stationary jaw are integral. In the shank is a mortise, which receives the pivoted jaw, which is operated by the screw-nut on the screw-shank.



1. The combination of the fixed jaw C, the movable jaw H, swinging in a mortise in the shank of the fixed jaw, and the nut E on the threaded shank of the fixed jaw, substantially as described.

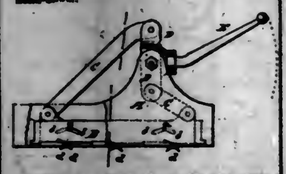
2. The combination of a screw-shank, F, having a slot, I, with a stationary jaw, C, and a vibrating jaw, H, said jaw H having an arm arranged in said slot of the screw-shank, substantially as described.

3. The thumb-nut E and vibrating jaw H, having a slot, K, in combination with the flange G and stationary jaw C.

6,728. Heating-Stoves. George B. Moore, Philadelphia, Pa., assignor, by mesne assignments, to John S. Perry, Albany, N. Y. Patent No. 54,982, dated May 22, 1866. [Filed June 10, 1875.]

1. The combination of a fire pot or chamber, K, which forms, with the outer case A, an expansion-chamber, L, between the two below their point of intersection, the window Q for illumination, placed in the said outer case A opposite said expansion-chamber, the open space J between the base of the front wall of the fire pot or chamber and the top surface of the grate or fire-bed G, and the doorway or opening M in said outer case opposite the said open space, all for the purposes as described and set forth.

2. The combination of a fire pot or chamber, K, the front wall of which forms, with the outer case A, an expansion-chamber, L, between the two below their point of intersection, the window Q for illumination, placed in the said outer case A opposite said expansion-chamber, and the open space J between the base of the front wall of the fire pot or chamber and the top surface of the grate or fire-bed G, all for the purposes as described and set forth.

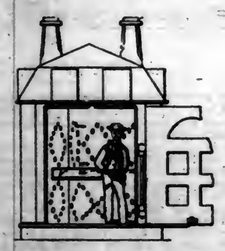


3. The combination of a fire pot or chamber, K, the front wall of which forms, with the outer case A, an expansion-chamber, L, between the two below their point of intersection, the doorway or opening M in said outer case opposite said expansion-chamber, and the open space J between the base of the front wall of the fire pot or chamber and the top surface of the grate or fire-bed G, all for the purposes described and set forth.

4. The combination of a fire pot or chamber, K, which is contracted toward its base, the expansion-chamber L, formed between the front sloping wall I of the said fire pot or chamber and the outer case A, and below the point at which the two intersect, the window Q for illumination in said outer case opposite said expansion-chamber, the open space J between the base of the front wall of the fire pot or chamber and the top surface of the grate or fire-bed G, the doorway or opening M in said outer case, and the grate or fire-bed, the area of which at the front is greater than the area of the inside of the base of the said fire pot or chamber, all for the purposes as described and set forth.

5. The combination of a fire pot or chamber, K, which is contracted toward its base, the expansion-chamber L, formed between the front sloping wall I of the said fire pot or chamber and the outer case A, and below the point at which the two intersect, the window Q for illumination in said outer case opposite said expansion-chamber, the open space J between the base of the front wall of the fire pot or chamber and the top surface of the grate or fire-bed G, the area of which at the front is greater than the area of the inside of the base of the said fire pot or chamber, all for the purposes as described and set forth.

6,730. SAW-MILL DOGS. Henry D. Dana, Oshkosh, Wis. Patent No. 124,068, dated Jan. 7, 1872; reissue No. 6,071, dated Sept. 29, 1874. [Filed Feb. 9, 1876.]



Brief.—The dogs enter the wood in opposite directions, thus drawing up and holding the timber securely against the knee of the head-block.

1. In a saw-mill dog, the combination of the knives *d d*, arranged to move past each other in opposite directions and engage with the log, substantially in the manner set forth.

2. The combination of the box or case A, bars B B, with interlocking knives *d d*, inclined slots *b b*, pins *a a*, connecting-bars C C, cross-head D, and lever E, all constructed and arranged substantially as and for the purposes herein set forth.

6,731. TOY MONEY-BOXES. Chas. C. Johnson, Somerville, Mass., assignor to Horace Partridge. Patent No. 144,103, dated Oct. 28, 1873. [Filed Feb. 8, 1876.]

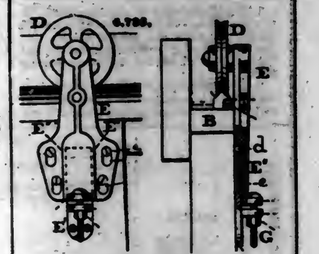
1. The combination of a toy bank, its outwardly-opening door, and slotted partition, with an image and horizontal plate, connected with the door and operated by the movement thereof to present the image and plate in the open doorway, substantially as for the purpose described.

2. The combination, with a toy bank and slotted partition, of an image and receiving-plate, and a pivoted spring-governed plate on which the image stands, substantially as described.

3. In combination, a toy bank, its slotted partition and hinged door, and a pivoted plate carrying image, a spring, and a link, all operating substantially as described, to move the image by the act of opening and closing the door, to receive and deposit money through the slotted partition, as set forth.

4. The combination, with the movable door and the image, of the wire link, connecting the door and the image, and arranged to move the image as the door is opened or closed, substantially as described.

5. The combination, with the hinged door, and with image controlled by a spring, of the link connecting the door and image, all arranged to operate substantially as and for the purposes set forth.



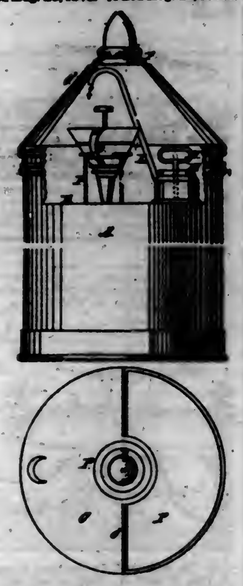
6. The combination, with the toy bank, of the rods *g* and the bottom piece provided with the inclines *h*, substantially as shown and described.

7. In combination with a cast-metal reticulated money-box, provided with a slot and with flanges *e* projecting within the money-receiving apartment, a flanged vibrating money-receiver to receive and deposit the money within the reticulated money-apartment, substantially as described.

8. The combination, with a toy bank and its movable door, of an image mounted on a supporting-plate connected with the floor of the bank, and connected with the door through a link, so as to appear at the open door, or move away from the door as the door is opened or closed, substantially as described.

6,732. DOOR-HANGERS. Joseph Lambert, Wilbraham, Mass. Patent No. 161,610, dated Apr. 6, 1875. [Filed July 21, 1875.]

Brief.—The hanger adjusts both vertically and laterally, and is kept from jumping the rail by a leg.



1. The sheave-bracket, consisting of two parts, E' E'', connected by a guiding-tongue, *c*, and groove, *d*, the fastening-screws *e*, and an adjusting screw-bolt, G, thereby giving vertical adjustability, substantially as and for the purpose set forth.

2. The combination, with the sheave D, of the supporting-rail C, made transversely-adjustable by means of slots, and the screws *f*, substantially as and for the purpose set forth.

3. The combination, with the sheave-bracket and rail, of a projection or lug on one part engaging with a shoulder on the other part, substantially as and for the purpose set forth.

6,733. OIL-TANKS. Walter C. Strickler, Chicago, Ill., assignor to John C. Breeden and F. C. Wilcox. Patent No. 130,702, dated Aug. 20, 1872. [Filed Aug. 26, 1876.]

1. The combination of an oil-tank, A, and a hood, F, rigidly attached thereto, the latter projecting above and partly extending over the top of the tank, so as to form a chamber thereon, substantially as and for the purpose set forth.

2. The combination, substantially as described, of an oil-tank, A, fixed or stationary hood F, and movable piece or door O, for the purpose set forth.

3. The combination of an oil-tank, A, the fixed hood F, extending over the top of the oil-tank to form a chamber thereon, and a sliding door or cover, O, which divides said the hood to open the chamber, as specified and shown.

HELIOTYPE RELIEF PROCESS, JAMES R. OSGOOD & Co. BOSTON.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 20. TUESDAY, NOVEMBER 16, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time.

R. H. DUELL, *Commissioner.*

COMMISSIONER'S DECISIONS.

HEIDE AND WIRTZ.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the application of Henry Heide and Charles Wirtz, for Letters Patent for a* "PRESERVE COMPOSITION FOR MACAROONS," *filed January 29, 1875.—Decided November 15, 1875.*]

A preserve compound consisting of old ingredients arranged in a new manner, and possessing the superior qualities of transportability, cheapness, economy, and convenience in use, and imperishability: *Held*, to be patentable.

DUELL, *Commissioner:*

Applicants claim:

The preserve composition for macaroons, composed of almonds, dried white of egg, sugar, and water, in the proportions specified, the proportion of water being less than necessary for baking, substantially as set forth.

The object they had in view in making this preparation was the production of an article that could be put up in suitable packages for transporting, that could be used at all times and places for the making of macaroons when and where fresh eggs or almonds could not be procured, that would be more convenient for use than the separated ingredients, and, finally, that would be more economical than the usual preparation by the substitution of dry albumen for the whites of fresh eggs, thus obviating the necessity of discarding the yolks or using them for other purposes. Again, the usual preparation is a perishable one, and must be used at once, while this is a preserve compound. In short, they present a commodity having the superior qualities of transportability, cheapness, economy and convenience in use, and imperishability. Surely these are objects which often call for the exercise of inventive genius for their accomplishment.

This application was rejected by the Principal Examiner upon reference to the definition of the word macaroon in Webster's Dictionary, and the recipes for the making of that article in one or two cook-books. Webster's definition and the recipes alluded to make no mention of the preserve composition in question. They simply describe a macaroon as it is generally made.

The application under consideration is not for the finished article known as a macaroon, but for a novel arrangement of ingredients from which that article can be produced.

In his answer to the reasons of appeal, the Examiner remarks that "applicant's claim is for the composition, but the sole object of their invention is to put up this composition in small merchantable packages of commerce." He then cites the recent decision of the United States Supreme Court in the *Milligan and Higgins Glue Co.* vs. *Upton*, (6 OFFICIAL GAZETTE, 837,) and the Commissioner's decisions therein adverted to in support of the position that no invention is exercised in the mere putting up of articles in a convenient shape.

If the present combination of ingredients claimed had ever before been used for the purpose mentioned, of course the mere putting it up in any kind of packages would not be invention; but the Examiner adduces no evidence of the former fact. The courts or the Office have never gone to the extent of saying that the production of a new article of commerce, *per se*, is not patentable.

It is distinctly held in the decision mentioned that an article of commerce, an article of manufacture, or a composition of matter, or improvements thereon, are

all patentable if the exercise of invention or discovery is shown in their production, and the result is new and useful.

To comminute flakes of glue, when the same thing had been done before, and when the comminution of various articles for commercial purposes was a common device; to make a hydrant in four sections, when a pump had been constructed in the same way; to merely substitute a sheet-metal face-plate for one of cast-iron; to pack pulverized hops in an air-tight package; to attach an ornamental paper tablet to a clock-front, when similar tablets had been attached to picture-frames in the same way; to etch figures upon sheet-iron plates for stoves when other articles of iron or steel have been etched—all these examples (and they are the principal ones relied upon by the Examiner, involving no invention or discovery whatever, but sought to be maintained by calling the same "new articles of manufacture,") are not analogous to a case like the present one, in which old elements are so combined that the result is an improvement of great practical importance in the particular art to which it relates, and which supplies a want that, so far as the evidence shows, has never before been filled.

Says Judge Story, in *Ryan* vs. *Goodwin*, (3 Sumner, 318:)

> It is certainly not necessary that every ingredient, or, *indeed, that any one ingredient* used by the patentee in his invention, should be new or unused before for the purpose of making matches. *The true question is, whether the combination of materials by the patentee is substantially new.* Each of these ingredients may have been in the most extensive and common use, and some of them may have been used for matches, or combined with other materials for other purposes. But if they have never been combined together in the manner stated in the patent, but the combination is new, then, I take it, the invention of the combination is patentable. So far as the evidence goes, it does not appear to me that any such combination was known or in use before Phillip's invention.

In regard to whether invention has been exercised in the production of this apparently simple combination, the remarks of the same learned judge in the above connection are also appropriate here. He says:

> The combination is apparently very simple; but the simplicity of an invention, so far from being an objection to it, may constitute its great excellence and value. Indeed, to produce a great result by very simple means, before unknown or unthought of, is not unfrequently the peculiar characteristic of the very highest class of minds.

Also in the recent case of *Pennock ex parte*, (1 McArthur, 531, Supreme Court of this District,) it was held:

> Whether the inventive faculty has been exercised is mostly a question of evidence, and is always to be considered in reference to the condition of the art, and the results accomplished, and where the combination is confessedly new and the benefit great, the presumption is strongly in its favor. It is not always safe to consider that there has been no invention because it appears obvious and simple, for simplicity is often the chief merit of a patent. Nor is it material whether Mr. Pennock spent much or little time in elaborating his enterprise. If the thought was original, and can be employed with substantial advantage, it becomes a meritorious invention within the meaning of the patent law.

It was in accordance with these principles that Judge Grier, in the case of the *Pennsylvania Salt Company* vs. *Gugenheim*, (3 Fish., 423,) sustained the patent of George Thompson, who claimed—

> Caustic alkali incased or enveloped in a tight metallic integument or metallic casing.

The state of the art prior to that invention is described as follows:

> Prior to the invention of George Thompson the manufacture of soap was carried on at large establishments, like my own, by purchasing the soda-ash of commerce, making it caustic by boiling with lime, and then treating the solution of caustic soda with fat and making soap of it. Throughout the country the farmers used to keep their wood-ashes and leach them down, and use lime to make caustic potash, and then boil this fat. This was a very troublesome and uncertain operation, and could not be applied where wood-ashes were not used. The great bulk of soap was manufactured at soap-works from soda-ash, as above described. The manufacture of soap from soda-ash was a nice chemical operation, which could not be carried on with success generally in families.

This troublesome and difficult operation was simplified by Thompson's invention, which consisted in wrapping cakes of caustic soda in paper impregnated by a preparation of bees-wax and rosin, by which said paper was rendered impervious, so as to protect the soda from the action of the atmosphere, or in incasing caustic soda in small metallic boxes, and in the process of putting up the alkali in such boxes by pouring it in a melted state into the same.

The court held—

> Caustic alkali was not a new substance, nor was it a new composition of matter, nor its manufacture a new art, yet the fact was clear that the patentee had made a very important improvement in the art, and one of great practical value.

This was among the cases especially distinguished by the court from the matter of comminuted glue in the adjudication heretofore cited. It is the case also that was relied upon by my predecessor in sustaining the application of the Horlicks, (7 OFFICIAL GAZETTE, 828,) for a patent, which consisted in putting a preparation of food for infants, substantially given in a formula of Baron Liebig, in a marketable form, available to the general public.

In view of the principles laid down in the various cases cited, I am of opinion that applicants have made such an invention as entitles them to the protection of the patent law.

The decision of the Board of Examiners-in-Chief is therefore reversed.

WARREN NOYES.—*Interlocutory appeal.*

[*Appeal from the Primary Examiner in the matter of the application of Warren Noyes, for letters patent for a* "DEVICE FOR CHARGING CARTRIDGE-CASES."—*Decided August* 30, 1875.]

Where the subject-matter of an application consisted of a set of devices for charging cartridge-cases, and the first claim was for a cartridge-shell holder, and the second for a canister: *Held*, that as the devices covered by these claims were in their operation especially adapted to each other, belonged to the same class of inventions, and were used in connection to subserve a common end, they formed an exception to the general rule that separate inventions should form the subject of separate applications.

The third claim was for the combination of the shell-holder, the canister, and a ramming device. As these also were especially adapted to each other, all co-operated to produce a certain result, and the use of each was necessary to that result: *Held*, that they constituted a legitimate combination.

SPEAR, *Acting Commissioner:*

The applicant declares his invention to be the production of a convenient set of devices for charging cartridge-cases, consisting of a cartridge-shell holder, a ramming or packing device, and two canisters, one to contain powder and the other shot.

He makes three claims—the first, for the cartridge-shell holder; the second, for the canister, and third is for the combination of the shell-holder, the canister, and the ramming device.

The first and second claims were refused on the ground that the subject-matter thereof involved two separate inventions, which were not so inseparably connected with each other as to entitle them to be claimed in the same application, and the third for the reason that a patentable combination was not there set forth.

The cartridge-shell holder consists of a block of wood with perforations or cells for holding the shells. These cells have shoulders on their inner sides, near the top, of equal thickness with the cartridge-shell, to allow the rammer to be inserted in the shell without pressing upon its rim. The block has a hinged bottom, with sockets corresponding in position to the holes in the block to receive the butt-ends of the shell. The canister is of any ordinary form, with a convenient number of chargers projecting from the top for charging the shells with powder or shot. These chargers are so spaced as to fit the holes in the block. The flask also has the cut off valves and gage device for regulating the amount of the charge generally possessed by powder and shot flasks. The rammer consists of a handle and stock, and, projecting from the latter, four rods, arranged apart to correspond with the distances between the holes in the block.

The method of employing these devices is as follows: The cartridge-shells are placed in the cells in the block, and the hinged bottom is then shut down to keep the shells in place. The nozzles of a canister are then inserted into the mouths of the cells and the shells charged with powder. A wad is applied and the rammer then used. Then follows the charge of shot.

It is thus seen that in their operation these separate devices are especially adapted to each other. They belong to the same class, and are used in connection to subserve a common end. It is such devices that expressly form the exception to the general rule that separate inventions should form the subjects of separate applications. (See Commissioner's Decisions in cases of *Linus Yale*, 1869, p. 110; *L. Lehmann*, 1870, p. 70; and *Abel Combs*, 1871, p. 209.)

In the third claim the three devices, the shell-holder, the ramming device, and the canister, are claimed in combination. As already stated, they are especially adapted to each other, they all co-operate to produce the result, and the use of each device, or its equivalent, is necessary to that result. This certainly constitutes a legitimate combination. (*Birdsell* vs. *McDonald*, 6 OFFICIAL GAZETTE, 682.)

The action of the Examiner on both points is therefore reversed.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date November 16, 1875.]

8,793.—Stoves.—JOHN J. BONNET, Quincy, Ill. Application filed November 5, 1875. Term of patent 3½ years.

8,794.—Buttons.—JOHN R. FARRELL, Boston, Mass. Application filed July 9, 1875. Term of patent 7 years.

8,795.—Embroidery-Patterns.—EMIL CRIBAND, New Haven, Conn., assignor to HENRY ST. JOHN, same place.—JJ. Application filed November 10, 1875. Term of patent 3½ years.

8,796 and **8,797.—The Casing of a Soda-Water Apparatus.**—FRANK H. SHEPHERD, Boston, assignor to JAMES W. TUFTS, Medford, Mass.—Cases D, C. Applications filed November 3, 1875. Term of patents 14 years.

8,798.—Carpets.—THOMAS J. STEARNS, Boston, Mass., assignor to THE ROXBURY CARPET COMPANY, same place. Application filed November 5, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date November 16, 1875.]

3,129.—Pumps.—CHARLES G. BLATCHLEY, Philadelphia, Pa. (Re-registration.) Application filed February 23, 1871.

"The letter 'B' inclosed within a circle."

3,130.—India-Rubber Boots and Shoes.—THE L. CANDEE & CO., New Haven, Conn. Application filed October 19, 1875.

"words 'STANDARD PURE.'"

3,131.—Hats, Caps, and Hatters' Supplies.—FREDERICK DODD, Philadelphia, Pa. Application filed October 30, 1875.

"the figures of three men, standing behind a table or bench."

3,132.—Smoking-Tobacco.—CHARLES DUWEL, Cincinnati, Ohio. Application filed October 23, 1875.

"the representation of a planter on horseback, riding in a field in which a number of tobacco-plants is seen. Under the picture occurs my name, 'Charles Duwel,' as manufacturer. The whole is inclosed within a border, to the left of which are seen my initials 'C. D.,' and to the right a seal bearing my name 'C. Duwel.'"

3,133.—Rubber Erasers.—EBERHARD FABER, Port Richmond, N. Y. Application filed November 4, 1875.

"words 'CRESCENT RUBBER.'"

3,134.—Printing-Presses.—GRIFFITH & BYRNE, New York, N. Y. Application filed October 19, 1875.

"letters 'CAXON' arranged in a horizontal line in the order named, and the letter T considerably larger than any of the others, the shaft of which passes vertically through the center of the X."

3,135.—Medicine.—HOSTETTER & SMITH, Pittsburg, Pa. (Re-registration.) Application filed March 29, 1871.

"a drawing, engraving, or picture representing the mythical battle of St. George and the Dragon, a shield-shaped figure in dark background, the engraving or bust of a venerable appearing man with white flowing beard, and fac-similes of our signature in two places."

3,136.—Canned Goods.—J. G. KRAFT & CO., Baltimore, Md. Application filed September 13, 1875.

"a symbolic 'figure of Justice' and the words 'Justice Brand.'"

3,137.—Door Lock and Latches.—MALLORY, WHEELER & CO., New Haven, Conn. Application filed October 19, 1875.

"word 'Centennial.'"

3,138.—Wagons, Carriages, and other Vehicles.—BENJAMIN F. MOORE, Fond du Lac, Wis. Application filed October 27, 1875.

"words 'LA BELLE.'"

3,139.—Blasting-Powder.—J. R. RAND & CO., New York, N. Y. Application filed October 21, 1875.

"word 'RENDROCK.'"

3,140.—Medical Compound.—WILLIAM SWAIM, Philadelphia, Pa. No. 1. Application filed October 23, 1875.

"a figure bounded by convex curved lines top and bottom, and by concave lines on the ends, bearing white letters on a black or other dark ground, the word 'SWAIM'S,' and the lower part in similar letters, the word 'PANACEA,' and between said parts the word 'CELEBRATED,' in a horizontal line in black, or other dark letters."

3,141.—Medical Compound.—WILLIAM SWAIM, Philadelphia, Pa. No. 2. Application filed October 23, 1875.

"The representation of a bottle, upon which are the words 'SWAIM'S PANACEA' in two places, and a fanciful label, upon which is a portrait and ornamental bank-note work, the whole forming one device."

3,142.—Medical Compound.—WILLIAM SWAIM, Philadelphia, Pa. No. 3. Application filed October 23, 1875.

"The representation of three bottles in a row, the one on the left hand bearing the word 'Swaim's;' that in the middle bearing the word 'Panacea,' and that on the right hand the word 'Philada.' and above the bottles is the word 'SWAIM'S,' and beneath them the word 'PANACEA.'"

3,143.—Medical Compound.—WILLIAM SWAIM, Philadelphia, Pa. No. 4. Application filed October 23, 1875.

"a device engraved on a steel plate in ornamental, engine-turned bank-note work, the form being a parallelogram with a

curved cap-piece. The said parallogram bears at its top the word 'SWAIM'S,' and at the foot the word 'Panacea,' and in its central part is a finely-engraved portrait of William Swaim."

3,144.—Boots and Shoes.—P. WARE, JR., & CO., Boston, Mass. Application filed October 14, 1875.

"words 'WALKING SLOW BOOTS. FOUR MILES AN HOUR.'"

3,145.—Kid Gloves.—R. H. WHITE & CO., Boston, Mass. Application filed October 26, 1875.

"word 'VOGEL.'"

3,146.—Kid Gloves.—R. H. WHITE & CO., Boston, Mass. Application filed October 26, 1875.

"words 'LA REISE.'"

3,147.—Soap.—SCHULTZ & CO., Zanesville, Ohio. Application filed November 10, 1875.

"marks or lines which are made to cross or intersect each other in such a manner as to present a netted or checkered surface."

LABELS REGISTERED DURING THE WEEK.

(Each certificate bearing date November 16, 1875.)

379.—Title: "Conlin's Shooting Gallery, 930 Broadway."—JAMES S. COLLIN, New York, N. Y. Application filed November 3, 1875.

380.—Title: "For Single Box $1.00.—This Irish Salve is warranted to cure," &c.—JOHN L. FITZGERALD, Spencer, Mass. Application filed November 5, 1875.

381.—Title: "Mitchell's Centennial Cologne."—GEORGE E. MITCHELL, Lowell, Mass. Application filed November 10, 1875.

382.—Title: "Mosher's Historical National Photographic Art Gallery."—CHARLES D. MOSHER, Chicago, Ill. Application filed November 11, 1875.

383.—Title: "Wm. Meissner, Proprietor of the Palace Royal Cigars."—WILLIAM MEISSNER, Detroit, Mich. Application filed November 8, 1875.

384.—Title: "Old Crow Distillery Whisky, W. A. Gaines, Distiller, Woodford Co., Ky."—PARIS, ALLEN & Co., New York, N. Y. Application filed October 27, 1875.

385.—Title: "Richardson & Robbins, Extra Yellow Peaches."—RICHARDSON & ROBBINS, Dover, Del. Application filed November 2, 1875.

386.—Title: "Mist, Limonis Comp."—RELIEF MANUFACTURING CO., New York, N. Y. Application filed August 28, 1875.

387.—Title: "Reichardt's Salicylic Horse Cure."—F. ALFRED REICHARDT, New York, N. Y. Application filed October 21, 1875.

388.—Title: "Capitol, Richmond, Va."—M. J. ROSENDORF, Richmond, Va. Application filed September 6, 1875.

389.—Title: "Sawyer's Crystal Blue."—HENRY SAWYER, Chelsea, Mass. Application filed November 4, 1875.

390.—Title: "Sawyer's Crystal Blue."—HENRY SAWYER, Chelsea, Mass. Application filed November 4, 1875.

391.—Title: "The Sorrento Glue-Pot."—S. W. TILTON & Co., Boston, Mass. Application filed November 11, 1875.

392.—Title: "Upham's Malarial, or Fever and Ague Sachet."—SAMUEL C. UPHAM, Philadelphia, Pa. Application filed November 11, 1875.

393.—Title: "H. W. Wallace's National Approved Heave Remedy."—E. W. WALLACE, Saline, Mich. Application filed November 8, 1875.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by giving the number, name, and date of each patent.

The cheapness of the copies, (ten cents apiece when ordered in quantity or by the whole class,) and the comparatively small number of patents in each of the 176 classes, render an order by class by no means an onerous undertaking.

SUBJECT-MATTER INDEX OF JULY 1, 1871.

Aërated liquor apparatus	1	Leather	92
Air and gas engines	2	Locks and latches	93
Amalgamators, ore-mills	3	Locomotives	94

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

THE OFFICIAL GAZETTE.

The OFFICIAL GAZETTE of the United States Patent Office is published weekly by the Patent Office. It is printed by authority of an act of Congress, which provides for its gratuitous distribution to libraries at the rate of eight for each congressional district.

The GAZETTE contains the decisions of the Commissioner of Patents, and such decisions of the courts in patent causes as are believed to possess general interest to inventors and patentees.

The claims of all patents granted are printed in the GAZETTE, bearing the same date as the issue of the patent, accompanied by a brief synopsis of the invention and a portion of the drawing.

The illustrations are photographic reproductions on a reduced scale of the drawings accompanying the original application, and preserve their fidelity. The limited space permitted for each patent prevents, in many cases, an adequate representation, but the prominent feature of invention is usually shown. Disclaimers filed in the Office are nowhere else published.

Changes in the rules of practice of the Office are announced in the GAZETTE, which affords a much readier mode of communication with parties interested than to await a new edition of the Rules of Practice.

Finally, any matter believed to be of interest to inventors in their official intercourse with the Office, will receive in the GAZETTE the attention the subject warrants.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 13, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, (not the subject-matter classification elsewhere referred to,) governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture	2,500
FELTING and HATS; including caps, bonnets, flock, &c	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS	6,000
BRIDGES; including ferry-guards, girders and columns, piers	408
CARDING, CLOTH, CORDAGE, KNITTING, SILK, SPINNING, WEAVING	4,800
RAILWAYS	3,500
ELECTRICITY	888
TEXTILE	4,800
DRAFTING	162
DRIERS and KILNS	562
HOROLOGY	524
LAMPS, &c	2,505
MEASURING INSTRUMENTS	1,340
OPTICS	332
STOVES and FURNACES	5,214

INDEX OF INVENTIONS PATENTED NOV. 16, 1875.

Can, milk, J. H. Lester	45	170,084
Cane, W. R. Park	165	169 916
Car axle box, L. R. Faught	122	169,975
Car axle boxes, packing ring for, T. C. Hargrave	122	170 084
Car coupling, Carson and Whiting	122	169,891
Car coupling, O. F. Ford	122	169,981
Car coupling, G. E. Lacy	122	170 093
Car coupling, J. Singer, (reissue)	122	6,752
Car coupling, T. A. Watson	122	170,035
Car coupling and brake, F. M. Campbell	122	169,957
Cars, apparatus for transferrings goods to and from, W. H. Elliot	121	169 896
Carburetor, S. McKissock	27	170 097
Card for wrapping thread, H. Sutro, (reissue)	38	6 751
Carriage, child's, M. Medart	31	170 098
Carriage wheels, dust guard for, M. C. Nay	31	169,915
Chair, dentist's, J. B. Newbrough	46	170 012
Chair, folding, I. N. Dann	62	169,968
Chair for school houses, &c., P. Mihan	62	169 9 4
Chair seat, L. Atwood	62	169,944
Churn dasher, E. Steadman	45	170,126
Cigar machine, C. Talbotclarke	160	170,030
Clasp, Frost and Phelps	23	169,9 3
Clothes drier, W. Adams	91	169,930
Clothes pounder, E. Crowell	91	169,903
Cock, combined compression and swing, W. L. Brownell	167	169 952
Coffin handle, T. C. Richards	39	169,924
Coffin screw, F. W. Cabot	39	169 8 9
Cog wheel, G. E. Brooks	67	170 049
Confectionery, machine for casting, S. F. Whitman	155	169 935
Cooler, milk, C. A. Douglas, (reissue)	45	6 744
Copy holder, L. Conant	146	169,903
Cord binder, W. B. Snyder	17	170 123
Corn cutter, P. McL. McLeod	44	170,0 0
Coupling, G. W. Rowell	167	170,019
Cow tail holder, G. Stickney	144	170,127
Crank step, W. R. Phillips	79	170 013
Curtain fixture, W. H. Maine	62	170 006
Curtain roller, Fisher and Lichtenber	62	169,979
Curtain roller and bracket, O. Ellsworth	62	170,072
Dental engines, hand piece for, E. T. Starr	46	170,125
Dental engines, tool carrier for, T. Cogswell	46	170,057
Dental plugger, S. D. Strohm	46	170,129
Dental plugger, electro magnetic, W. G. A. Bonwill	46	170,045
Derricks, machine for operating, A. Jackson	79	169,996

	Class No.	No. of Patent.
Die stocks, threading, A. Saunders	14	170,119
Elevator, platform, G. C. Howard	79	170,087
Explosive compound, H. J. Detwiller	71	170,066
Fare box, recording and signal, E. H. Schnell	42	170,022
Fats, rendering animal, W. E. Andrew, (reissue)	26	6,737
Faucet, D. W. Goodell	167	169,988
Feed cooker, J. S. Brubaker	59	170,050
Feed cutter, B. A. Wilton	59	169,937
Feed regulator, Ford and Hicks	57	169,982
Fence, H. B. Claxton	52	170,055
Fence, iron, D. C. Guthridge	52	169,989
Fence, wire, T. S. Seabury	52	170,024
Fire arms, lock for, G. E. Williams	55	170,038
Fire extinguishing apparatus, J. H. Connelly	118	170,060
Floting iron, M. Newton	91	170,105
Foot rest, F. A. Farnham	62	169,897
Fork, horse hay, E. Raber	77	169 919
Fringe, J. Hirner	17	169 993
Fruit gatherer, L. Coe	63	170,056
Funnel, measuring, R. A. Landon	132	170 093
Furnace, ore roasting, W. McCall	99	170,095
Furnace, singeing, B. Rose	23	170 018
Gas apparatus, J. H. Eichholz	66	169,973
Gas retort lid, H. Collinson	66	169,960
Glass, elastic underlay for printing on, J. L. Wells	117	170,136
Globe for schools, geographical, N. N. Brown	146	169,950
Goods to and from cars, apparatus for transferring, W. H. Elliot	121	169,896
Harness, elastic back band for, J. W. Hollis	72	169,994
Harness rosette, S. S. Sargeant	72	170,021
Harvester, J. H. Whitney	74	170,140
Harvester, corn, Blood and Hager	75	169,946
Harvester rake, P. F. Hodges	74	170,086
Harvester rake, J. H. Whitney	74	169 936
Harvesters, grain wheel arm for, C. H. Salzman	74	169,924
Harvesters, rotating sliding rake for, Brown and Hoover	74	169,951
Heel burnishing machine, C. J. Addy	16	169 884
Hides, preparing and coloring, Merrill and Holtt	92	170,100
Hinge, L. H. Rogers	24	170,116
Horse collar, Van Wagenen and Goble	72	169 933
Horse hitching device, J. Schoonmaker	144	170 023
Horses, vehicle device for checking, J. Knight	31	170 091
Hose nozzle, C. S Westland	167	170 138
Indicator, navigator's bearing, J. D. Leach	50	170 001
Jewelry, braided, W. W. Alden	86	169 940
Kaleidoscope, J. F. Adams	157	169 882
Kitchen shelf, A. A. Carter	62	169,892
Knitting machine needle, C. J. Appleton	89	169,943
Lamp extinguisher, W. C. Cross	90	170,064
Lantern, L. Nutting	90	169,916
Lantern and dinner kettle, combined, W. W. Price	65	170,110
Latch, gate, J. Vetterlein	93	170,033
Lathe and belt saw, combined universal, H. A. Kimball	173	169 998
Lathing machine, C. B. Trimble	30	170,031
Letter box, D. J. Wilcoxson	146	170,141
Level, plumb, H. S. Tarr	157	169,947
Lock, till, G. H. Peacock	93	170,108
Locking device for desk drawers, J. H. Williams	93	170,145
Loom let off mechanism, J. H. Moore	95	170 011
Loom shuttle check and binder, S. T. Hurd	95	169 995
Loom stop motion fork, J. McCaffrey, Jr	95	170,007
Lumber drier, M. Harris	48	169,903
Malt kilns, stirring apparatus for, A. Von Schlemmer	19	170,134
Matches, &c., automaton box for, H. Roman	90	169,923
Matching machine for box stuff, G. T. Riddle	174	170,114
Meat cutter, G. L. and J. B. Chadborn	25	170,053
Milk against injury by transportation, preserving, J. H. Lester	45	170,003
Mill burr furrow gage, Wilhelm and Leyde	57	170,143
Millstone, G. T. Smith	57	170 120
Mill, rolling, J Jepson	125	169,907
Molding apparatus, P. W. Doherty	33	170,070
Motor, spring, Hallam and McKee, (reissue)	67	6,740
Music leaf turner, W. Miller	102	170,093
Nail plate feeder, M. Leach	103	170 002
Nail plate feeder, G. H. Ryan	103	170,118
Nails, screw attachment to picture, T. C. Richards	103	169,921
Navigator's bearing indicator, J. D. Leach	50	170,001
Nut lock, Keating and Bristor	14	169,908
Nut lock, C. B. Rager	14	170,015
Ointment J. B. and S. W. Brown	98	169 949
Organ, reed, G. Blatchford	106	169,945
Organ, reed, H. N. Goodman	106	170,078
Paint composition, C. C. Benis	107	169,827
Paper box, J. P. Buckingham	109	169,953
Paper box, D. L. Hawkins	109	169,992
Paper box machine, Heyl and Brehmer, (reissue)	109	6,745
Paper box machine, J. E. Williams	109	170,039
Paper boxes, manufacture of, J. E. Jeffrey	109	170,084
Paper fastener, metallic endless, J. W. McGill	146	170,009
Pencil sharpener and eraser, combined, J. S. Hale	146	170,083
Piano forte agraffe, E. Gabler	112	169,985
Piano forte pedal, W. F. Ulman	112	169,931
Piano forte stringing device, W. F. Ulman	112	169,932
Piano, upright, E. Gabler	112	169,984
Pipe coupling, J. A. Cole	167	170,058
Pitcher, self-closing, McGrew and Clark	88	170,096
Planters, check row attachment for corn, G. C. Flagg	133	169,980
Plate rack, W. R. P. Cross	88	169,962
Plow, double, S. D. Williams	43	170,146
Press, cotton, W. S. Frost	7	170,075
Press, power, A. H. Merriman	119	170,101
Printing on glass, elastic underlay for, J. L. Wells	117	170,136
Printing presses, sheet delivery mechanism for, C. B. Cottrell	117	170,061
Pump, W. S. Laney	118	169,999
Pump for driven wells, P. A. Spicer	118	170,124
Pump plunger, J. S. Engle	118	169,974
Pump, steam, McCormack and Kelly	118	170 008
Pumps, attaching handles to, O. E. Farber	118	169,900
Punch, registering ticket, A. D. Hoffman, (reissue)	42	6,746
Purifier, middlings, J. W. Metz	57	170,102
Railroad rails, rail for utilizing the fag ends of, H. Chisholm, (reissue)	125	6,738
Railroad signal, detonating, H. J. Detwiller	120	170,067
Rake, horse, J. Badger	77	170,044
Rake, horse, J. H. Thomas	77	170 130
Rake, horse hay, L. A. Taylor	77	169,928
Registering gate, J. T. Aldrick	42	169,941
Rivets, machine for making, B. C. Quinby	14	170,112
Sack holder, adjustable, H. W. Clark	57	169,959
Salt apparatus, S. Lewis	129	170,005
Sand and gravel drier, S. S. Daish	126	169 895
Sash fastener, E. K. Breckenridge	24	170,047
Sash holder, Torrey and Lyman	24	170,131
Saw filing machine, F. W. Latts	131	169,912
Saw, scroll, W. H. Briggs	131	170,048
Scaffold, adjustable, H. Hilliker	30	169,904
Scaffold, window, G. Roberts	30	170,115
Screw attachment to picture nails, T. C. Richards	103	169,921
Screw fastening, J. O. Anistrom	14	170,041
Separator, coal and ore, J. B. Wilford	3	170,142
Sewing machine, C. S. Cushman	134	169,965
Sewing machines, under braider for, V. Lapham	134	169,910
Sewing machine balance wheels, compensating journal for, D. Snitjer	134	170,122
Sheet metal traps and bends, machine for making, W. A. Butler	136	170,051
Shingle packer, R. B. Taylor, (reissue)	174	6,742
Shingle packers, clamp for, R. B. Taylor, (reissue)	174	6,741
Shirt, S. Gutmann	38	170,081
Shirt, S. Gutmann	38	170,082
Shirt, J. H. Myers, (reissue)	38	6,749
Shoe making, nail driving machine for, S. Harris	16	170,085
Shoe sole fastening, H. S. Cushman	16	169,894
Shoe tips, machine for making, J. A. Stockwell	16	170,128
Sieve, A. Root	170	170,117
Signaling instrument, electric, Edison and Batchelor	50	169,973
Skid, portable, G. E. Harrington	79	169,990
Slicer, apple, L. C. Richards	88	170,017
Soap, composition for, W. F. Darnoby	26	169 967
Spark conveyer, C. K. Cullers	94	169 964
Stench plate, J. L. and H. L. Turbox, (reissue)	54	6,753
Still, Deyman and Meichers	47	169,970
Stone, artificial, J. C. Tucker	133	170,139
Stump extractor, W. F. Kengle	79	169,909
Suspender, W. Stokes	38	170 027
Table, extension, A. D. and S. L. Jones	63	169 997
Table, ironing, A. H. Swain	91	169,926
Table, work, J. Cannon	62	169,938
Telegraph, pressure, alarm, and signal, C. E. Buell	50	169,954
Telescopes, eye piece for, J. W. Nystrom	157	169 917
Thill coupling, W. L. Rayment	31	170,113
Thread, card for wrapping, H. Sutro, (reissue)	38	6,751
Ticket case, Vine and Shuler	146	170,133
Time check, watchman's, L. Aldridge	36	169,942
Tombstones, floral ornament for, A. French	54	169 898
Trace coupling, H. G. Brown	31	169,888
Trap, animal, T. Belknap	143	169 886
Trap, moth, B. F. Daniel	9	169,966
Trellis, grape vine, T. S. Seabury	63	170,025
Truck, hand, N. Adams	31	169,883
Truss, F. G. Otto	156	170,106
Tuyeres, F. Boiender	12	169,947
Underwaist, Frost and Phelps	38	169,899
Valve and overflow, waste, J. Foley, (reissue)	167	6,739
Valve, combined steam and cut off, A. J. L. Loretz	152	169,911
Vault, burglar proof, C. O. Yale	128	169,938
Vegetable cutter, S. Hauck, Jr	59	169,991
Vehicle device for checking horses, J. Knight	31	170,091
Vehicle seat, J. Bond	31	169,948
Vermin, composition for the destruction of, J. G. Steele	35	169,925
Vessels, caulking, J. T. White	137	170,139
Wagon axle skein, Fetta and Tuttle	31	170,074
Wagon brake, H. Decker	31	169,969
Wagon brake, Gourley and Lovelace	31	170 080
Wagon, dumping, W. H. Cooksey	31	169 961
Wagon end gate, J. P. Outson	31	170 107
Wagon jack, J. C. Crawford	79	170 062
Wagon, side bar, J. F. Barnecott	31	169,885
Washing machine clamp, Camp and Osterbout	91	169,956
Watch case centers, die for making, J. Geldreich	36	170 076
Watch, stem winding, C. D. P. Gibson	36	169,987
Watchman's time check, L. Aldridge	36	169,942
Water raising apparatus, electrical, E. Ponvert, Jr	50	170,014
Water wheel, G. H. Darling	168	170,065
Water wheel, W. C. Groves	169	169,901
Weather strip, W. Sustins	30	170,029

	Class No.	No. of Patent.
Welt cutting and counter skiving machine, S. D. Tripp	16	169,930
Windmill, J. K. Babcock, (reissue)	118	6,743
Windmill, A. O. Campbell	118	169,890
Windmill, M. Carter	118	170 052
Windmill, M. Crossman	118	170,063
Window screen, H. B. Walbridge	30	170,034
Wire fabric, A. C. Garrett	170	169,986
Wrench, B. F. Joslya	100	170,089
Wringer, J. Smith	91	170,121

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED NOVEMBER 16, 1875,

	Patent No.
Adams, J. F., Kaleidoscope	169,882
Adams, N., Hand truck	169,883
Adams, W., Clothes drier	169,939
Addy, C. J., Heel burnishing machine	169,884
Ahlstrom, J O., Screw fastening	170,041
Alden, W. W., Braided jewelry	169 940
Aldrich, J. T., Registering gate	169,941
Aldridge, L., Watchman's time check	169 942
Allen Fire Department Supply Company, assignee	170,136
Andrew, W. E., Rendering animal fats, (reissue)	6,737
Andrews, J. T., 2d, assignee, (reissue)	6 753
Anthony, E. and H. T., & Co., assignees	170 042
Anthony, H. T., Photograph albums	170 042
Appleton, C. J., Knitting machine needle	169,943
Asby, W., assignee	170,107
Atwood, L., Chair seat	169,944
Babcock, J. K., Windmill, (reissue)	6,743
Babcock, W. H., Combined blotter and paper weight	170,043
Badger, J., Horse rake	170,044
Barnecott, J. F., Side bar wagon	169 885
Barnett, J., assignee	170,105
Batchelor and Edison	169 972
Belknap, T., Animal trap	169,886
Bemis, C. C., Paint composition	169,887
Bertner, R., assignee	169 924
Blatchford, G., Reed organ	169,945
Blood, E. J., and A. D. Hager, Corn harvester	169,946
Bolender, F. Tuyeres	169,947
Bond, J., Vehicle seat	169,948
Bonwill, W. G. A., Electro magnetic dental plugger	170 045
Bopp C., Box trimming machine	170 046
Bradford, H., assignee	170,142
Breckenridge E. K., Sash fastener	170,047
Brehmer and Heyl, (reissue)	6 745
Briggs, W. H., Scroll saw	170 048
Bristor and Keating	169,908
Brooks, C. E., Cog wheel	170 049
Brown, H. G., Trace coupling	169,888
Brown, J. B. and S. W., Ointment	169,949
Brown, N. N., Geographical globe for schools	169,950
Brown, R., and A. Hoover, Rotating sliding rake for harvesters	169,951
Brownell, W. L., Combined compression and swing cock	169,952
Brubaker, J. S., Feed cooker	170,050
Bruff, R. P., assignee	170,089
Bryant, W., A. C., F. C., and T. H., assignees	169,923
Buckingham, J. P., Paper box	169 953
Buell, C. E., Pressure, alarm and signal telegraph	169,954
Bush, E. C., assignee	169,994
Bushnell, H., Chain belt	169,955
Butler, W. A., Machine for making sheet metal traps and bends	170,051
Buxtorf, F., assignee	170,137
Cabot, F. W., Coffin screw	169 889
Camp, C. B., and C. Osterbout, Washing machine clamp	169,956
Campbell, A. O., Windmill	169,890
Campbell, C. C., assignee	169,994
Campbell, F. M., Car coupling and brake	169,957
Cannon, J., Work table	169,958
Carson, T. T., and P. F. Whiting, Car coupling	169,891
Carter, A. A., Kitchen shelf	169,892
Carter, M., Windmill	170 052
Chadborn, G. L. and J. B., Meat cutter	170,053
Chase, C. H., Bale band tightening device	170,054
Chisholm, H., Roll for utilizing the fag ends of railroad rails, (reissue)	6 738
Clark, H. W., Adjustable sack holder	169,959
Clark and McGrew	170,096
Clinton, M. B., assignee	169,981
Claxton, H. B., Fence	170,055
Coe, I., Fruit gatherer	170,056
Cogswell, T., Tool carrier for dental engines	170,057
Cole, J. A., Pipe coupling	170,058
Collender, H. W., Billiard table	170 059
Collinson, H., Lid for gas retorts	169,960
Conant, L., Copy holder	169,893
Connelly, J. H., Fire extinguishing apparatus	170 060
Cook, Kline, and Williams	170,144
Cooksey, W. H., Dumping wagon	169,961
Cottrell, C. B., Sheet delivery mechanism for printing presses	170,061
Crawford, J. C., Wagon jack	170,062
Cross, W. C., Lamp extinguisher	170,064
Cross, W. R. P., Plate rack	169,962
Crossman, M., assignee	170,124
Crossman, M., Windmill	170,063
Crowell, E., Clothes pounder	169 963
Cullers, C. K., Spark conveyer	169,964
Cushman, C. S., Sewing machine	169 965
Cushman, H. S., Shoe sole fastening	169,894
Daish, S. S., Sand and gravel drier	169 895
Daniel, B. F., Moth trap	169,966
Dann, I. N., Folding chair	169 968
Darling, G. H., Water wheel	170 065
Darnoby, W. F., Composition for soap	169,967
Decker, H., Wagon brake	169,969
Deckert, J. G., assignee	170,002
Detwiller, H. J., Explosive compound	170,066
Detwiller, H. J., Detonating railroad signal	170,067
Deymann, H., and E. Meichers, Still	169 970
Dick, R., Address-ing machine	170,068
Dick, R., Addressing machine	170,069
Doerr, G., assignee	170,076
Doherty, P. W., Molding apparatus	170 070
Dooter, H. A., assignee	170,066, 170,067
Douglas, C. A., Milk cooler, (reissue)	6,744
Eastburn, R. H., Broom	170 071
Eddy, W. H., Boot crimper	169,971
Edison, T. A., and C. Batchelor, Electric signaling instrument	169,972
Eichholz, J. H., Gas apparatus	169,973
Elliot, W. H., Apparatus for transferring goods to and from cars	169,896
Ellsworth, O., Curtain roller and bracket	170 072
Engle, J. S., Pump plunger	169,974
Ernst, J., Bottle	170,073
Farnham, F. A., Foot rest	169,897
Faught, L. R., Car axle box	169,975
Fetta, H. H., and S. D. Tuttle, Wagon axle skein	170,074
Fifield, J. B. M., Sofa bedstead	169 976
Firmenich, J., and F. P. Striker, Sectional boiler	169 977
Fischbeck, F., Sofa bedstead	169,978
Fisher, R. J., and J. Lichtenberger, Curtain roller	169,979
Flagg, G. C., Check row attachment for corn planters	169 980
Foley, J., Waste valve and overflow, (reissue)	6,739
Ford, F. M., and J. F. Hicks, Feed regulator	169 982
Ford, O. E., Car coupling	169 981
French, A., Floral ornament for tomb-tones	169,898
Frost, G., and G. H. Phelps, Underwaist	169 899
Frost, G., and G. H Phelps, Clasp	169,983
Frost W. L., Cotton press	170 075
Furber, O. E., Attaching handles to pumps	169,900

TITLES, DRAWINGS, AND CLAIMS

OF

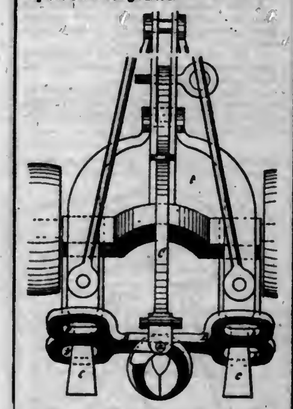
PATENTS GRANTED NOVEMBER 16, 1875.

169,893. KALEIDOSCOPES. John F. Adams, Irvington, N. Y. [Filed Sept. 27, 1875.]

Brief.—The two mirrors are hinged together at the required angle. Under them is placed a movable disk, containing the objects necessary to form the designs. The apparatus rests upon the top of the box when not in use.

1. The combination, with a pair of mirrors, of an open movable receptacle for the objects forming the design moving beneath the mirrors, substantially as shown and described.

2. The frames holding the mirrors, provided with leaves E, forming a hinge, substantially as shown and described.



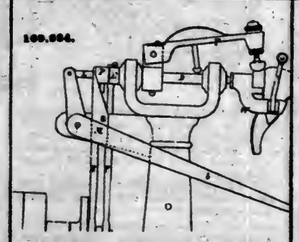
3. In combination with the frames, the supports H, the pin screwed to the box, over which one hinge of the frames rests, and the box D, substantially as shown and described.

4. In combination with the mirrors and disk the box D, constructed to support and receive the same, substantially as shown and described.

5. The frames raised above the disk, in combination with the hinges and the box, substantially as shown and described.

169,894. HAND-TRUCKS. Nathan Adams, Altoona, Pa. [Filed May 3, 1875.]

Brief.—The bar to be transported is caught by the grapples *g g*, and held until released by the bar O being raised.



1. The tongs B B, having loop-holes *b*, in combination with the truck, having rests *e e*, substantially as and for the purpose set forth.

2. The combination of the lever C, with the tongue D and tongs B B, for discharging the load, substantially as set forth.

169,895. HEEL-BURNISHING MACHINES. C. J. Addy, Boston, assignor to Tapley Heel-Burnishing-Machine Association, Lynn, Mass. [Filed Nov. 6, 1871.]

169,896.

1. A machine for burnishing the heels of boots and shoes, in which the boot support or jack and the burnisher are combined with mechanism for actuating the same, arranged and operating substantially in the manner herein shown and described, to impart to the two simultaneously-vibrating movements in a curved path, but in opposite directions, for the purposes set forth.

2. The combination, with the boot-jack and the burnishing-tool, of the spindles or shafts for supporting the same, and the mechanism, substantially as herein shown and described, for imparting to said shafts simultaneously vibratory or rocking movement in opposite directions for the purposes stated.

3. The combination of the boot-jack and burnisher with their supporting spindles or shafts when arranged the one within the other, so as to vibrate or rock upon the same axis, substantially as herein shown and set forth.

4. The combination of the boot support or jack, with a rocker-shaft which carries the same, and is capable of sliding longitudinally, substantially as shown and described, for the purpose of moving the jack toward or away from the burnishing-tool.

5. The combination, with the jack and the sliding rocker shaft or spindle which carries the same, of the means, substantially as herein shown and described, for producing the sliding movement of said spindle.

6. The jack herein described, consisting of the boot-supporting yoke, the boot-holding clamp, and the rest for the heel-tread, said parts being arranged to receive and support the boot, substantially in the manner herein shown and set forth.

7. In combination the jack herein explained, the burnishing-tool and its carrier, the arbor D and spindle L', the lever M or its equivalent, the arms P and E, pitmen F and E, crank arms G, and wheel I or its equivalent, the whole operating in manner and for purposes substantially as stated.

169,897. SIDE-BAR WAGONS. John F. Barnecott, Westchester, N. Y. [Filed June 26, 1875.]

The combination of a side bar, composed of the stiff middle portion *a* and spring ends *b b*, each lower spring leaf *b* having a hook *i* formed on its inner end, and a narrow neck, *c*, on its outer end, with the clips *f f*, staples *g g*, and transverse springs C D, all substantially as herein shown and described

169,898. ANIMAL-TRAPS. Thad. Belknap, Austinburg, Ohio. [Filed Feb. 11, 1875.]

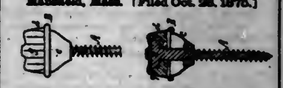
Brief.—Relates principally to the method of securing the pivot to the tilting platform, and adjusting its balance.

169,894.

1. The combination, with the platform D, of the pivoted cross-bar H, provided at its ends with recesses *e* and suitable packing, substantially as described, by which arrangement the platform may be withdrawn from said cross-bar or adjusted thereon, for the purpose set forth.

2. The combination of the platform D, pivoted cross-bar H, provided at its ends with recesses *e* and suitable packing, the step *b*, and spring-arm *a*, constructed to operate substantially as and for the purpose specified.

169,897. PAINT COMPOSITIONS. Charles C. Bemis, Brattleborough, Vt. [Filed Sept. 10, 1875.]



The composition as described, for mixture with an animal or vegetable oil, each composition consisting of lime, sulphur, muriate and carbonate of ammonia, sal-soda, bicarbonate of potash, borate of soda, and water, substantially as specified.

169,899. TRACE-COUPLINGS. H. G. Brown, Collinsville, Conn. [Filed June 28, 1875.]

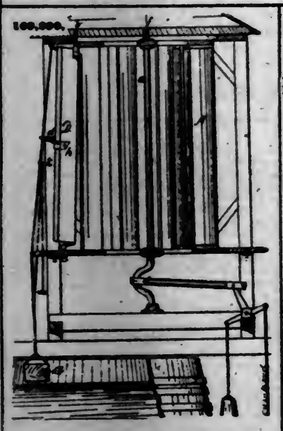
The hollow socket or stud D passing through the trace-leather, provided at its outer end with the curved catch-spring F and cover *d*, and at its inner end with a screw-plate, E, for securing it in its place and embracing the trace-leather between itself and the box containing the spring F, in combination with a spindle, C, having a groove, *c*, upon the end of a whiffletree, substantially as described.

169,899. COUPLING-SCREWS. F. W. Cabot, Mansfield, Mass. [Filed Oct. 26, 1875.]

1. The screw-shank A, as fastened to the base portions *c*, and extended up therefrom to and against the cap portion *d*, so as to constitute a support thereto.

2. The screw-shank A, secured in the base *c* of the head B, and extended in opposite directions therefrom, and provided with the tenon or head *e*, as described, in combination with the dome-cap *d*, provided with the corresponding mortise or recess *f*, and having the said head *e* arranged in said recess, as and for the purpose or purposes explained.

3. The dome-cap *d*, provided with the handle or device *g*, for aid in effecting rotation of the screw, as described.



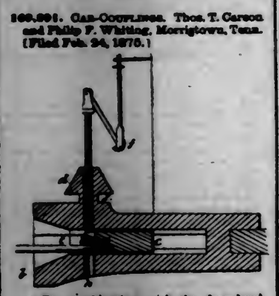
4. The dome-cap *d*, having the handle *g* and mortise or recess *f*, in combination with the base portion *c*, and with the screw-shank A, fastened to the said base portion *c*, and extended in opposite directions therefrom, and provided with the tenon or head *e*, arranged in said mortise or recess *f*, all being as set forth.

169,900. WINDMILLS. Albert O. Campbell, Oakland, Cal. [Filed July 21, 1875.]

Brief.—There are two platforms, between which the wheel and its shutters are placed. The shutters are arranged in a circle about the wheel, and open and close upon pivots, when open taking an inclined position out of a vertical line, therefore falling together and closing one upon the other. The shutters are held open by the weight of the float, which allows the wind to enter and act upon the buckets of the wheel, and they are so held until the level of the water in the tank reaches the float and lifts it, when, the weight being removed from the cord, the shutters fall together and close around the wheel.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

No. 169,890.



1. In a windmill, having its wind-wheel mounted on a vertical axis, the combination of a series of shutters arranged around said wind-wheel, and mounted in such a position as to close together by their own weight, and a float for opening the said shutters, substantially as described and shown.

2. In a windmill, having its wind-wheel mounted on a vertical axis, the combination of a series of shutters hung upon pivots *b c*, out of a vertical line, as described, and connected together by cords or wires *d* and the angle-irons A, and a float for simultaneously opening the said shutters by its weight, substantially as described and shown.

3. In a windmill, having its wind-wheel mounted on a vertical axis, the combination of a series of shutters, D, adapted to close together by their own weight, a float for opening the said shutters, and a stop for limiting their motion, substantially as described and shown.

No. 169,891. GAS-COUPLINGS. Thos. T. Carson and Philip F. Whiting, Morristown, Tenn. (Filed Feb. 24, 1875.)

1. The combination, with the draw-bead, having an extended opening or mouth, as shown, the movable block *c*, with its beveled face *r*, arms *f i*, and springs *t b*, all substantially as set forth.

2. The pin *e* and sector *f*, in combination with the turret *d* and groove *s*, whereby the pin is locked in position, substantially as herein described.

No. 169,892. KITCHEN-SHELVES. A. A. Carter, Philadelphia, Pa. (Filed Oct. 11, 1875.)

No. 169,892.

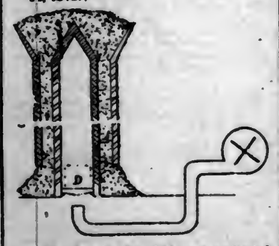
1. The shelves A and D, provided with hinges B B, and links E and F, and pins G and H, constructed as and for the purpose set forth.

2. The link E, with a beveled edge, combined with the shelves A and D, as and for the purpose set forth.

3. The reversible shelf D, provided with studs adapted to hold a grater, as set forth and described.

No. 169,893. COPY-HOLDERS. Luther Conant, Geneva, Ill. (Filed Mar. 29, 1875.)

Brief.—The slot in the card leaves a space to be written upon, and serves as a gage for lining truly. The card also shuts out from the pupil his former efforts, and presents the copy with equal clearness to all parts of the page.

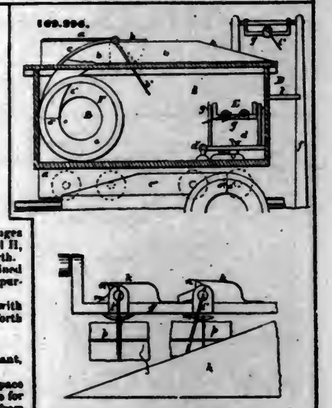


The combination, with the gage or copy-holder A, having the slot C, of the copies B B, as and for the purposes set forth.

No. 169,894. SHOE-SOLE FASTENINGS. Henry S. Cushman, Milford, Mass. (Filed Aug. 26, 1875.)

As an improved manufacture, the metallic tubular nail or sole fastening A, provided with the water proof core B arranged in it, all being substantially as represented and described.

No. 169,895. SAND AND GRAVEL DRIERS. Silas S. Daish, Washington, D. C. (Filed Oct. 14, 1875.)



1. The combination of the two perforated cylinders, the furnace, and the blower.

2. The combination, in a sand or gravel drier, of the furnace D and its combustion chamber, the inner perforated cylinder C, the outer perforated cylinder A, and the sand and gravel chamber between the two latter, substantially as and for the purpose set forth.

No. 169,896. APPARATUS FOR TRANSFERRING GOODS TO AND FROM CARS. W. H. Elliot, New York, N. Y. (Filed Oct. 21, 1875.)

Brief.—Inclined plane trips catch, and allows package to fall into trough leading to receptacle in car. A similar method of release transfers package from car to outside receptacle.

No. 169,896.

1. The receiver B, consisting of an entrance-passage, *b*, and a cylindrical chamber, F, substantially as and for the purpose specified.

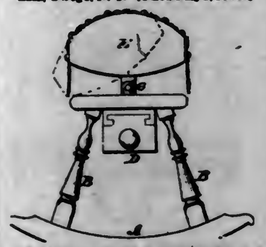
2. The package-deliverer, consisting of swinging frame *d*, cover *g*, and hooks *m*, whereby the packages are protected from wind and rain while they are held in proper position over the receiver, substantially as set forth.

3. In combination with levers *f* and hooks *m*, the inclined plane A, whereby the packages are gradually released from the suspending-hooks, substantially as specified.

4. The cover *g* and hooks *m*, in combination with the entrance-passage *b*, open at the top, whereby the packages are inclosed in the passage before they are released from the hooks, substantially as specified.

5. The guards *a*, in combination with the train-deliverer E, substantially as and for the purpose specified.

6. The parallel bar *n*, in combination with the upright posts *f*, the swinging frame *d*, and cover *g*, substantially as and for the purpose specified.



7. In a train-deliverer, E, the swinging frame *d*, latch *o*, and lever *o'*, substantially as and for the purpose set forth.

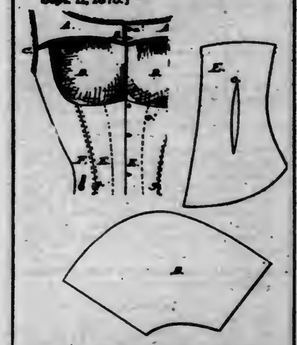
8. The entrance *b*, when left uncovered or open on the top, and provided with an open floor, substantially as and for the purpose set forth.

9. The valve *b'* and lever *b''*, in combination with entrance-passage *b*, substantially as and for the purpose set forth.

10. The bossing *o'*, in combination with the entrance-passage *b*, provided with a grating, *c*, substantially as and for the purpose set forth.

No. 169,897. FOOT-REST. Frederick A. Farnham, Owego, N. Y. (Filed July 1, 1875.)

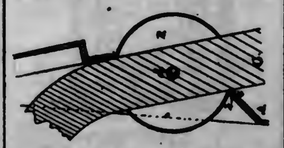
The foot-rest consisting of rocking frame A B C and hinged or pivoted cushion E *c*, the frame being provided with a slipper-drawer, D, sliding longitudinally in grooves therein, substantially as and for the purposes described.



No. 169,898. FLORAL ORNAMENTS FOR TOMBSTONES. Anna French, Bangor, Me. (Filed Nov. 2, 1874.)

No. 169,898.

In combination with a tombstone, fadeless wreaths or flowers made of glass beads or other material not naturally susceptible to injury from atmospheric influences, and arranged upon brass or copper wire, all as shown and set forth.

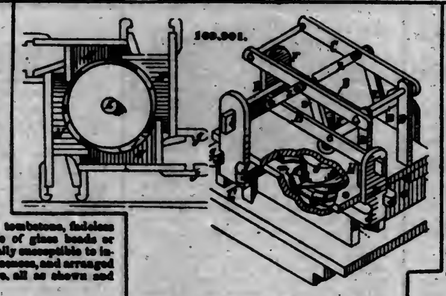


No. 169,899. UMBRA-GARMENTS. George Frost and Geo. H. Phelps, Boston, Mass. (Filed Sept. 11, 1875.)

In a combined under-waist and skirt-supporter, the combination of the yoke A, breast-form D, and the body or lower front parts B E and F F, the whole constructed and combined substantially as herein specified.

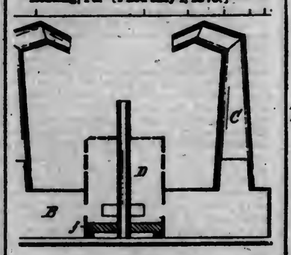
No. 169,900. ATTACHING HANDLES TO PUMPS. Oscar B. Parker, Saco, Me. (Filed Oct. 14, 1875.)

Brief.—The opening for the handle in the pump-barrel has a case or cover provided with a revolving drum. Through said drum passes the handle, as shown. The device permits of the easy operation of the pump, at the same time preventing the introduction of injurious substances.



The improved device as described, the same consisting of the hollow metallic case A, provided with an opening, *c*, and the movable drum B, the latter having a handle, C, extending diametrically through its periphery—such drum and handle being pivoted on the rod *d*, the whole being constructed, combined, and arranged in manner as stated, and for application to the body of a pump, as and for the purpose set forth.

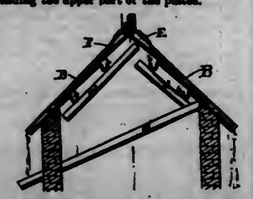
No. 169,901. WATER-WHEELS. W. C. Groves, Liberty, Wis. (Filed Sept. 15, 1875.)



Brief.—There are in this device four vertically-moving gates arranged to work in the ways. These gates are framed together, and are raised and lowered conjointly by the levers pivoted in the uprights, and connected to the frame-work by links.

No. 169,901.

The gates F, frame E, levers C, and links *s*, combined to operate substantially as set forth.



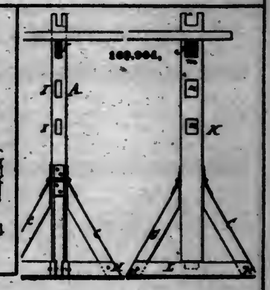
No. 169,902. WASH-BOILERS. C. W. Guenther, Reading, Pa. (Filed May 1, 1875.)

In a steam wash-boiler the base E *a*, provided with the fountain-tubes C C and the cylinder D, the top and sides of which are provided with the perforations *e*, in combination with the disk *f*, rigidly secured to the lower end of the fountain-tube *a*, substantially as and for the purposes set forth.

No. 169,903. LUMBER-DRIERS. Milo Harris, Jamestown, N. Y. (Filed Oct. 9, 1875.)

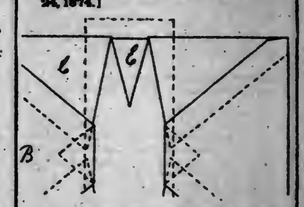
Brief.—The roof is cooled by water from the pipe sprayed upon the outside. The moisture condensed on its inner surface is caught in the gutters, which are made by bending the upper part of the plates.

1. The plates B, constructed with the gutter-edge *b*, and secured together as set forth to form a condensing roof or wall of a drying-kiln, with gutters to receive and carry away the water of condensation, as set forth.



2. The condensing-plates B, gutter *b*, and pipes P, all made, combined, and arranged in manner, and for the purpose set forth.

3. The roof-plates B, with guttered edges, combined with supporting-rafters E placed outside of said roof-support, the same as set forth.



No. 169,904. ADJUSTABLE SCAFFOLDS. Henry Hillmer, St. Louis, Mo., assignee of one-half his right to Wm. C. Warren. (Filed May 1, 1875.)

A scaffold constructed as shown and described, having stands A and K, with a series of rail-mortises, I, and slots P, hinged braces C, and foundations B and L, as set forth.

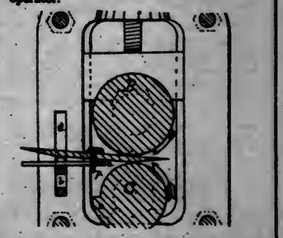
No. 169,904.

No. 169,905. BOOK-COVER PROTECTORS. Geo. W. Holden, Dayton, Ohio. (Filed Apr. 24, 1874.)

As a new article of manufacture, the book-cover protector, the side lap B of which embraces the top and bottom laps C, as and for the purpose specified.

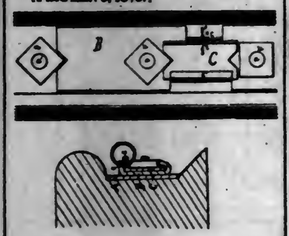
No. 169,906. PAINT-BRUSHES. George P. Hunt, Boston, Mass. (Filed Sept. 11, 1875.)

Brief.—A socketed holder formed to permit two independent brushes, with handles, to be inserted therein, and to permit the withdrawal of either or both at will.



1. The combination of handle B and stock A, provided with two or more tubular sockets, C, adapted each for the insertion of a removable smaller-handled paint-brush of ordinary or suitable construction, substantially as shown and described.

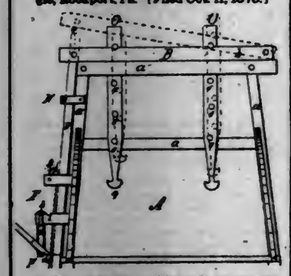
2. The handle B and stock A, provided with two or more tubular sockets, as described, in combination with paint-brushes fitting said tubular sockets, and removable therefrom at pleasure, as shown and set forth.



No. 169,907. ROLLING-MILLS. Joseph Jepson, Philadelphia, Pa. (Filed Oct. 20, 1875.)

Brief.—The pin is placed in the central aperture of the plate, which rests upon the screw-bolts, and is pushed between the rolls until the pin strikes the guide. Power applied to the lower roll forces the blank toward the operator.

The combination of a pair of rolls, one or both eccentric, with the adjustable guide or stop *o* and center pin or pins *p*, as shown and described, and for the above purpose.

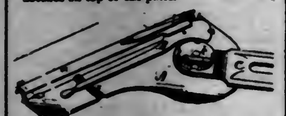


169,908. NUT-LOCKS. Thomas B. Keating and Thomas G. Brister, Mansfield, Ohio. [Filed Mar. 5, 1875.]

1. The locking-plate B, having the lip *c*, pocket *d'*, and notches *m*, in combination with the angle-plate C, substantially as shown and described.

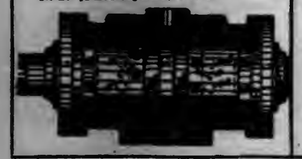
2. The combination of the locking-plate B, angle-plate C, and ring X, substantially as and for the uses and purposes set forth.

169,909. STUMP-EXTRACTORS. W. F. Keagle, Rockport, Pa. [Filed Oct. 11, 1875.]



1. The combination of lever B, one or more lifting-bars O O', frame A, beam D, having ratchet-plate F, and lever M, substantially as shown and described.

2. The combination of frame A, lever B, lifting-bars O O', beam D, having ratchet-plate F, pawl *g*, and lever M, substantially as described.



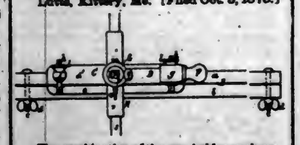
169,910. UMBER-BRAIDERS FOR SEWING-MACHINES. Valentine Lapham, Marion, Ohio. [Filed Mar. 17, 1875.]

Brief.—Improvement on Patent No. 160,039. The cloth passes over the plate on the bed, and the braid through a channel on the bottom of the plate. A spring bears on the top of the braid, and the width of the channel is regulated by a guide attached to one end of a pivoted lever, the other end of which fits into notches on top of the plate.

The combination, with the bed-plate A, provided with the race *a* and notches *x x*, of the pivoted lever B, provided with the braid-guide *c* and tongue *i*, as and for the purposes set forth.

169,911. COMBINED STEAM AND OUT-OUT VALVES. Arthur J. L. Lorain, Brooklyn, N. Y. [Filed Sept. 20, 1875.]

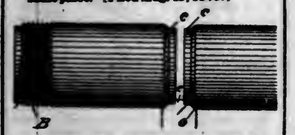
169,911.



1. The valve C, with grooves D^1 D^2 and connecting-holes C^1 C^2, arranged in the manner described, and having an oscillating or rotative and rectilineal movement, in combination with the valve-chest, provided with apertures N^1 N^2 connecting with jacket M, substantially as and for the purpose herein described.

2. The combination with a valve, C, provided with grooves D^1 D^2 and connecting-holes C^1 C^2, arranged as described, and having an oscillating or rotative and rectilineal movement, the valve-chest, provided with counter-bored ports O^1 O^2, for the purpose herein set forth.

3. The valve C, provided with springs S, arranged and secured as described, in combination with the heads E^1 E^2, provided with an interior projection, as described, and stem D, arranged as specified, for the purpose of cushioning the action of the valve C against the heads E^1 E^2, and also cushioning the action of the stem D against the valve C, each spring performing a double function, as herein, and for the purpose specified.

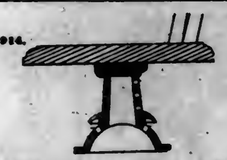


4. In combination with a valve, C, acting as main valve and auxiliary piston, and valve-stem D, arranged and constructed as specified, and acting as an auxiliary valve, when combined with ports and passages in the valve-chest and heads E^1 E^2, as specified, a spring, S, acting to start the main valve and auxiliary piston C, as specified, in addition to the functions of cushioning the action of the valve C against the heads E^1 E^2, and also cushioning the action of the stem D against the valve C, constructed and operating substantially as and for the purpose herein specified.

169,912. SAW-FILING MACHINES. F. W. Lotte, Kittery, Me. [Filed Oct. 5, 1875.]

The combination of the saw holder or clamp A, auxiliary clamp C, standard *g*, rotary arbor D, set-screw E, nut F, sleeve G, set-screw *e*, adjustable gage I, T-piece H, and the file-carrier K, all constructed, arranged, and applied substantially in manner and to operate as set forth.

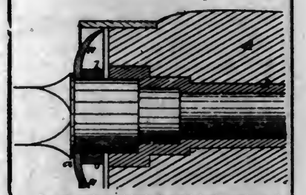
169,913. BOILER-TUBES. Saml. W. Martin, Springfield, Ohio, assignor to P. P. Mast, same place. [Filed Aug. 19, 1875.]



1. A tube for boilers and similar articles, having a right-hand screw-thread cut on one end, with a left-hand screw-thread on its opposite end, and a shoulder, *c*, formed on each end, as herein set forth.

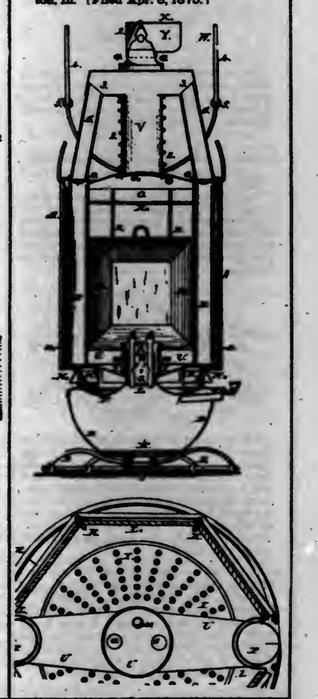
2. The tool B, provided with the cutting-off lip *c*, and the neck-forming lips *c* and *c*, substantially as and for the purpose set forth.

169,914. CHAIRS FOR SCHOOL-HOUSES, &c. Patit. Milton, Cambridgeport, Mass. [Filed Aug. 2, 1875.]



Brief.—The pedestal of the chair is formed with an air-chamber, and with a base of greater area than the air-port in the floor, over which it is to be placed. A number of ducts open laterally out of the chamber, so as to distribute the air equally around a person.

169,914.



A chair or stool provided with a hollow pedestal, having a series of orifices opening out of the same, substantially as and for the purpose set forth.

169,915. DUST-GUARDS FOR CARRIAGE-WHEELS. Moses C. Nay, East Boston, Mass. [Filed Apr. 23, 1875.]

In an axle and hub in which the axle and its journal are formed in one piece, the axle provided with a shoulder, *a*, in combination with a meniscus-shaped metallic guard, E, and a washer or ring, *b*, the said guard and washer being swaged on the axle, and the guard E extending and fitting in the chamber of the hub-head, in manner as shown and described.

169,916. LANTERNS. Burke Nutting, Wheaton, Ill. [Filed Apr. 8, 1875.]

1. The lantern-pedestal B, in sections, detachably joined together, in combination with the front, substantially as and for the objects described.

2. The detachable brace-chamber H, in combination with a lantern-front and protector-bottom, as described.

3. The automatic dampers H_1, in combination with the brace-chamber H, substantially as described.

4. The perforated concave bottom I, in combination with the perforated chamber H and a burner, substantially as described.

5. The swaged vertical stripe K, in combination with the beaded plate M and the guards K_1, hinged to the studs P, substantially as described and shown.

6. The curved stripe L, in combination with the guards K, and studs P, substantially as described.

7. The beaded plate M, attached to the stripe K and L, in combination with the pannel L_1, and bottom L, substantially as described.

8. The chambers U, in combination with the perforated concave bottom I and a burner, substantially as described.

9. The canopy O, in combination with the studs P and bottom L, substantially as described.

10. The canopy O, attached to the studs P, in combination with the detachable chamber V, blocked by and attached to the square tube 3, as and for the purposes described.

11. The chamber V, in combination with the canopy O and cowl W, substantially as described.

12. The chamber V, in combination with the canopy O and bracket Q.

13. The tube 3, bisecting and attached within the open-top chamber V, as and for the purposes described, in combination with the canopy O, substantially as described.

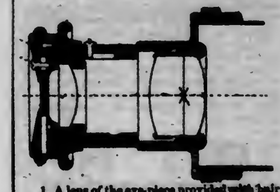
14. The chamber V, in combination with the bracket Q and cowl W, substantially as described.

15. The pin O_1, in combination with the chamber V and canopy O, for the purposes described.

16. The cowl W, constructed, poised, and combined with a lantern-top, substantially as and for the purposes described.

17. The square tube 3, bisecting and attached within the open-top chamber V, as and for the purposes described, in combination with the passages S, substantially as described.

18. The passages S, detachably combined with the square tube 3, bisecting and attached within the chamber V, and with the canopy O attached to the studs P, substantially as described.



19. A passage for cooling and conducting heated air from above the flame of a lantern or lamp down toward the flame, made of paper, for the purposes described.

20. The vertical spring 2, in combination with the chamber V and detachable handle 4, as and for the purpose described.

21. The vertical spring 3, detachable, in combination with the chamber V and handle 4, substantially as described and shown.

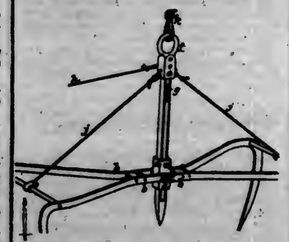
22. The handle 4, adjustable to conform to the contraction and expansion of the spring 2, in combination with the chamber V, substantially as described.

169,917. EYE-PIECES FOR TELESCOPES. J. W. Nystrom, Philadelphia, Pa. [Filed Oct. 19, 1875.]

1. A lens of the eye-piece provided with hair-lines, inclosed therein, substantially as set forth.

2. The eyeglass-cover D, pivoted at one end, and provided with a slot, in combination with a rotating piece having a pin, substantially as set forth.

169,918. GAMES. William B. Park, Philadelphia, Pa. [Filed Sept. 11, 1875.]



169,918.

The walking-stick A, having the recess *a*, the removable cap B, flag-staff *c*, and spring D, the several parts being combined and arranged substantially as shown and described.

169,919. HORSE HAY-FORKS. E. Baber, Canton, Ohio. [Filed May 18, 1875.]

Brief.—Hinged forks having slotted sliding spear passing through hollow head. When loaded the forks are retained in position by engagement of spring-latch at upper part of spear in opening in head, until disengaged by tripping cord.

In combination with the forks hinged to the head *a*, and the spear sliding through said head, the cords *f* and *h*, and the spring-latch *g*, and opening *i* in the head *a*, whereby the hay-fork may be readily loaded with hay, and as readily freed or discharged of it, substantially as described and represented.

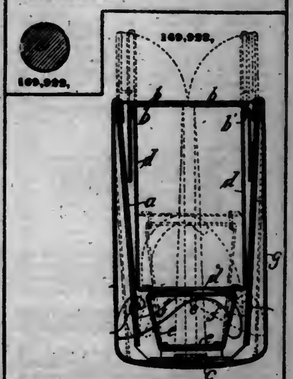
169,920. BALE-TIES. John P. Radley, Albany, N. Y. [Filed Oct. 14, 1875.]

The button F, constructed of malleable metal, with projecting lips *a a* and *c c*, separated by a double or duplex cheek or neck, *a a*, having projections *c c* between the recess of said duplex cheek or neck, in combination with the grasping-loop B, permanently secured to the said button, and the detachable loop D, capable of receiving the lip and *a* of said button at a point remote from the end of said detachable loop, substantially as described.

169,921. SCREW ATTACHMENTS FOR PICTURE-NAILS. Thomas C. Richards, West Winsted, Conn. [Filed Apr. 19, 1875.]

A male or female screw composed of a corrugated disk or plate of metal, having the screw-threads formed upon or in and intersecting its corrugations, substantially as and for the purposes herein described.

169,922. COFFIN-HANDLES. Thomas C. Richards, West Winsted, Conn. [Filed Apr. 26, 1875.]



Brief.—A piece of sheet metal is locked at its edges to form a tube, and is then slipped over a wooden core. It is afterward drawn out by machinery, so that it greatly compresses the wood. When sawed off into lengths, the ends of the wood are coated with some water-proof mixture, to prevent the wood from expanding and opening the tube.

1. A coffin-handle having its bar composed of a lock-seamed tube and a wooden core, upon which said tube is drawn in such a manner as to compress the wood, substantially as herein described.

2. The bar composed of a metal tube and wooden core, having the ends of the wood sealed and rendered impervious to moisture by means of a water-proof substance or composition, substantially as and for the purpose herein described.

169,922.

169,922.

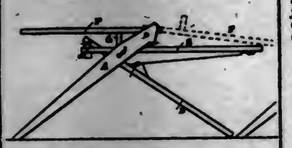
169,923. AUTOMATON-BOXES FOR MATCHES, &c. Henry Roman, Brompton, England, assignor to Wilbur Cooe Bryant, Arthur C. Bryant, Frederick C. Bryant, and Theo. H. Bryant. [Filed Oct. 22, 1875.]

1. The combination of the yielding inclosure or flaps *g*, moving tray *d*, and lid or lids *b*, substantially as described.

2. The combination of the framing or body, the levers fulcramed therein, the tray resting upon the long ends of the levers, the retracting spring connecting the tray and framing or body, and the hinged lid, these members being constructed and operating substantially as set forth, whereby the tray is moved and the lid opened by pressure upon the short arms of the levers, and the tray returned to its normal position and the lid closed when the pressure is stopped.

169,924. GRAIN-WHEEL ARMS FOR HARVESTERS. Christian H. Salzman, Quincy, Ill., assignor to himself, Andrew Wickey, and Reuben Bertner, same place. [Filed July 3, 1875.]

Brief.—Adjustment for the "grain-wheel" of a harvesting-machine.



1. The grain-wheel arm B, in combination with the detent H, ratchet F, and stop *d*, substantially as set forth.

2. The grain-wheel arm B, in combination with the pivoted segmental ratchet F and detent H, substantially as shown and described.

160,926. COMPOSITIONS FOR THE DESTRUCTION OF VERMIN. James G. Steele, San Francisco, Cal. [Filed Aug. 6, 1875.]

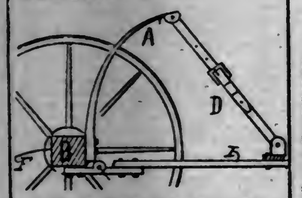
A composition of matter consisting of wheat, sulphate of strychnine, distilled water, acetic acid, corrosive sublimate, granulated sugar, and wheat-flour, all substantially as described, and for the purposes specified.

160,927. INCLINE-TABLES. Alva H. Swain, Winchester, Ind. [Filed May 6, 1875.]

The combination of the frame A and support D, as described, with the ironing-boards B and F, all hinged together and operated substantially as specified.

160,928. PLUMB-LEVELS. Henry S. Tarr, Philadelphia, Pa. [Filed Sept. 23, 1875.]

Brief.—The plumb-level is provided with two adjustable plates attached to the main top plate, for the purpose of indicating the accuracy, looking from above or below, of the reading of plumb-scale, and a brake to attach to the plumb-wheel during transportation.



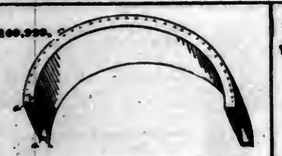
1. The combination, with plate P, of the adjustable plates L and K, for the purpose of facilitating the adjustment of the instrument, and reading its inclinations either from above or below, as described.

2. The combination, with the plumb-sight opening O, of the open adjustable plate E, as and for the purpose set forth.

3. The combination, with the stock A and wheel W, of the brake G H, constructed and operating in the manner and for the purpose stated.

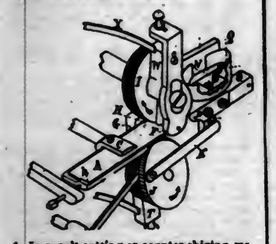
160,929. HORSE-HAY-RAKES. L. A. Taylor, Shanestchen, N. Y. [Filed July 2, 1875.]

Brief.—Means for adjusting height of teeth from the ground.



1. The combination of an axle, a spring-bar rigidly attached thereto, and means for connecting the free end of the spring-bar with any portion of the horse-rake pivotally attached to the axle, and being suitably situated as and for the purpose set forth.

2. The combination of an axle, a spring-bar rigidly attached thereto, and an adjustable means for connecting the free end of the spring-bar with any portion of the horse-rake pivotally attached to the axle, and being suitably situated as and for the purpose set forth.

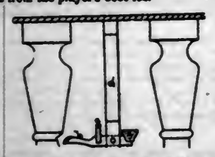


3. The combination of the axle B, carrying teeth F, spring-bar A, adjustable strap D, pivoted shafts I, and cross-bar C, as and for the purpose set forth.

160,930. BRACELETS. John N. Thomson, Providence, R. I. [Filed Mar. 3, 1875.]

The herein described method of uniting the separate parts of a bracelet or other article of jewelry by means of grooves a and turned edges b, substantially as and for the purpose specified.

160,931. WELT-CUTTING AND COUNTER-SKIVING MACHINES. Seth D. Tripp, Lynn, Mass. [Filed Apr. 27, 1875.]

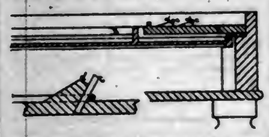


1. In a welt-cutting or counter-skiving machine, the combination of the knife A, pivot D, and adjustable legs F and G, all substantially as and for the purpose specified.

2. In a welt-cutting or counter-skiving machine, substantially such as described, the leg F, provided with the wheel Z, substantially as set forth.

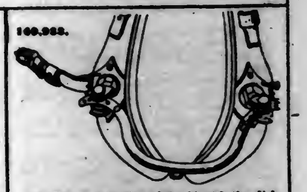
3. The combination of the hopper Q, toothed sliding bar M, pitman K, and wheel J, all substantially as and for the purpose stated.

160,932. PIANO-FORTE PEDALS. Wm. F. Ulman, Boston, Mass. [Filed Feb. 2, 1874.]



Brief.—The ordinary piano-pedal is provided with a spur on the upper face, to protect the lyre from the player's boot-toe.

The combination, with a centrally-pivoted pedal-foot, b, such as herein described, of a toe-guard, c, rising from the top of the foot a little forward of the pedal d, substantially as shown and described, and for the purpose herein specified.

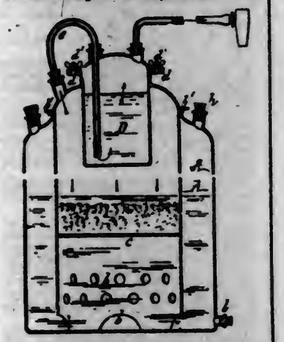


160,933. PIANO-FORTE-STRINGING DEVICES. Wm. F. Ulman, Boston, Mass. [Filed Feb. 2, 1874.]

Brief.—Each hitch-pin has an abutment to support it against the pull of the strings, preferably cast with the plate.

The brace *d*, in combination with the plate B and with the string-connecting pins *c*, for the purpose and in the manner described.

160,934. HORSE-COLLARS. Garrett Van Wagenen, Monroe, Wis., and M. D. Goble, Dubuque, Iowa. [Filed May 14, 1875.]

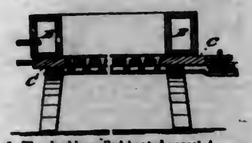


1. The combination of the U with the disk D and plate K, substantially as and for the purpose set forth.

2. The combination of the U, the disk B, the plate K, and the frames A A', with the curved bar O O', substantially as and for the purpose set forth.

160,935. APPARATUS FOR PRESERVING EGGS, &c. Louis Weismar, Buffalo, N. Y. [Filed Oct. 12, 1875.]

Brief.—The essential parts are substantially grouped in one case, composed of three apartments. When generation takes place faster than can be absorbed, the pressure of the gas driven the acid below the marble-dust, thus stopping the generation; but the pressure being removed, the acid returns. The vents in the outer casing are for escape of air.



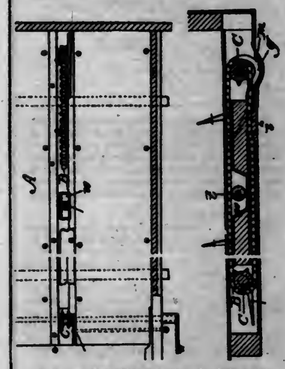
1. The combination, with the open outer acid-vessel A, of the inner removable generating-vessel B and washing-vessel D, connected with the latter, substantially as and for the purpose hereinbefore set forth.

2. The combination, with the open acid-vessel A, of the inner generating-vessel B, provided with perforations b and perforated discharge c, washing-vessel D, and connecting depending pipe e, substantially as and for the purpose hereinbefore set forth.

3. The combination, with the acid-vessel A, generating-vessel B, and washing-vessel D, of the air-admitting vent h and air-escape vent i, arranged in the acid vessel, substantially as and for the purpose hereinbefore set forth.

160,936. MACHINES FOR CASTING CONFECTIONERY. Stephen F. Whitman, Philadelphia, Pa. [Filed Oct. 12, 1875.]

Brief.—Attaching to a box formed with double walls, adapted to heating its contents, a bottom perforated so as to deliver a stream of material into each mold. Underneath each aperture is placed a sliding gate or gates, by which the several streams can be simultaneously cut off.



1. The double-walled heated vessel A, combined with the perforated bottom C, provided with a sliding gate or gates at the lower side, as and for the purposes set forth.

2. The double-walled vessel A, provided with detachable perforated bottoms having sliding gates on the lower side, as and for the purpose set forth.

3. The double-walled perforated bottom C, combined with the tank A and gates E, as and for the purpose set forth and shown.

160,938. HARVESTER-RAKES. J. H. Whitney, St. Louis, Mo., assignor to the firm-ner & Whitney Manufacturing Company, same place. [Filed June 7, 1875.]

1. In combination with the wheel C and the chain B, provided with the pivoted fingers, having their ends mounted in the grooves *g*, the shield *m*, arranged as shown, for the purpose of holding the chain against the wheel and insuring the proper motion of the fingers, as shown and described.

2. In combination with the chain, provided with the pivoted fingers engaging in the groove, as shown, the stationary cam or bolster *i* below the chain, as and for the purpose described.

3. In a grain-harvester, the combination of parallel conveyer belts or chains, driven from a common source, and arranged in such manner that the rear one of the series may be thrown out of action at will, while the others remain in action.

4. In combination with the chain *c*, the oil-cup *w*, and roller *t*.

160,939. BURGLAR-PROOF VAULTS. Chas. O. Yale, New York, N. Y. [Filed July 21, 1875.]

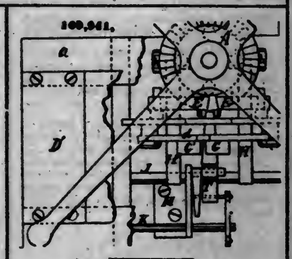
1. A burglar-proof vault having the walls, ceiling, and floor of railroad or T rails, interlocked with each other, as described, combined with a frame-work of angle-iron.

2. The combination, with such wall, ceiling, or floor of interlocked railroad or T rails, of inner bracing-strips, inserted between the rails.

3. In a combination of the T-rails and bracing-strips, the arrangement of such braces obliquely from rail to rail.

4. A wall for burglar-proof vaults, composed of interlocked railroad-rails, having the interstices between the rails filled with grouting, such as cement, sand, emery, &c., for the purposes specified.

5. In combination, the interlocked rails, the inside bracing-strips between them, and the angle-iron frame-work.



6. In a vault having walls composed wholly or in part of railway T-rails, the vestibule having the walls, ceiling or roof, and the floor, one or either, formed in one with the rails of the vault, substantially as described.

160,940. CLOTHES-DRIERS. Willis Adams, Neelyville, Ill. [Filed Oct. 6, 1875.]

1. The combination of two or more sets of pivoted arms, B, the connecting-bars C and D, the sliding band E, and the jointed wire G, with each other, and with the post A, substantially as herein shown and described.

2. The rectangular band H, having corner flanges or lug-stops, in combination with the standard A and pivoted legs I, as and for the purpose set forth.

160,941.

1. The combination, in a watchman's time-register, of a rotary drum impelled by a clock-movement or equivalent motor, a ribbon of paper or other suitable material traveling therewith, and a series of type-receiving channels, *b*, through which types may be projected against the periphery of the drum, to impress or mark the ribbon intermediate between the periphery of said drum and the inner ends of the type-receiving channels, as and for the purposes shown and set forth.

2. As a means of determining the proper positions of the printed characters upon the strip of paper, an independent scale, substantially as and for purposes stated.

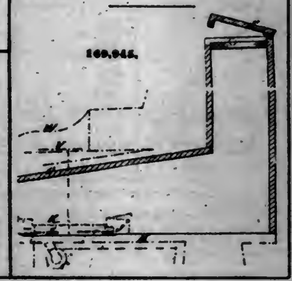
160,942. KNITTING-MACHINE NEEDLES. G. J. Appleton, Philadelphia, Pa. [Filed May 24, 1875.]

A knitting-machine spring-bearded needle, provided with a slide, having a hook located within the beard, and adapted to open it, substantially as described.

160,943. WATCHMEN'S TIME-CHECKS. Liberty Aldridge, Boston, assignor to himself and H. Baker Welch, Cambridge, Mass. [Filed Sept. 16, 1875.]

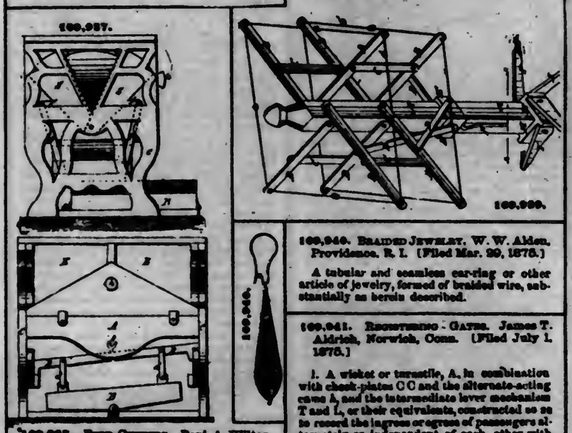
Brief.—A portable time-check, in which types propelled through a series of channels against a rotating drum mark upon the paper which surrounds the drum the character necessary, and a scale to determine the proper position of the impression of the type upon the paper.

1. The combination, in a watchman's time-register, of a rotary drum impelled by a clock-movement or equivalent motor, a ribbon of paper or other suitable material traveling therewith, and a series of type-receiving channels, *b*, through which types may be projected against the periphery of the drum, to impress or mark the ribbon intermediate between the periphery of said drum and the inner ends of the type-receiving channels, as and for the purposes shown and set forth.



2. As a means of determining the proper positions of the printed characters upon the strip of paper, an independent scale, substantially as and for purposes stated.

160,944. CHAIR-SEATS. Loring Atwood, Rutland, Vt., assignor of one-half his right to Henry A. Hale, Brooklyn, N. Y. [Filed Aug. 7, 1875.]



As a new article of manufacture, a chair-bottom composed of alternate strips of differently-colored wood, or different varieties of wood, united at their edges by dovetailed tongues and grooves, substantially as described.

160,945.

160,937. FEED-CUTTERS. Benj. A. Wilton, West New Brighton, N. Y. [Filed Mar. 13, 1875.]

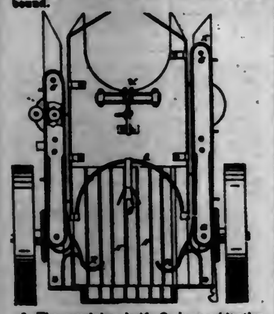
Brief.—The hay or other material is fed down inclines to shear-cutting knives situated at opposite ends of the trough, which cut alternately by means of links connecting with and operated by a double treadle.

160,946. BRAIDED JEWELRY. W. W. Alden, Providence, R. I. [Filed Mar. 20, 1875.]

A tubular and seamless earring or other article of jewelry, formed of braided wire, substantially as herein described.

160,947. REGISTERING-GATES. James T. Aldrich, Norwich, Conn. [Filed July 1, 1875.]

1. A wicket or turnstile, A, in combination with chest-plates C C and the alternate-acting cams *h*, and the intermediate lever mechanism T and *l*, or their equivalents, constructed so as to record the ingress or egress of passengers alternately or independent of each other with any suitable register.



2. In combination with the above, the treadle or treading-pieces D D' and lock or stop levers H H', and dogs or pawls E E', and inclines G G', or their equivalents, so constructed as to alternately lock the turnstile as a passenger passes through the entrance.

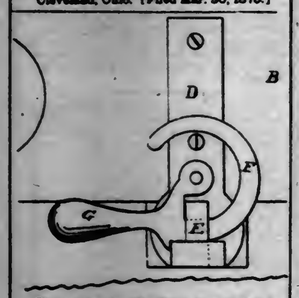
169,945. REED-ORGANS. Geo. Hatchford, Mitchell, C. Addn. [Filed Aug. 14, 1875.]

The resonant chamber having inclined and perforated top O, in combination with top-perforated vertical chamber having grated swell S, as and for the purpose specified.

169,946. CORN-HARVESTERS. Edwin J. Blood, Vernon, Wis., and Albt. D. Hager, Chicago, Ill. [Filed July 15, 1875.]

Brief.—When the corn is dropped the slats of the platform are returned to position by the springs. The fork and curved frame sustain the corn in standing position while being bound.

1. The revolving knife C, in combination with stationary knife D, sprocket-wheel V, and revolving chain F, substantially as set forth.
2. Fork S, with frame Q, and platform N, in combination, substantially as described.
3. Spring P, in combination with slats N, substantially as set forth.

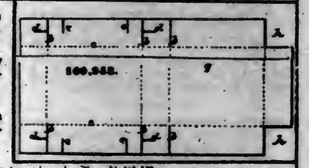


169,947. TUYERES. Frederick Bolender, Cincinnati, Ohio. [Filed Oct. 28, 1875.]

Brief.—The large slot between the bars is divided into small slots by the plate. The inclined plate deflects upward to the fire the currents of air thrown into the tuyere-box.

The bars C C and divisions a, forming slots b, and supported by legs B B, in combination with the deflecting-plate E, substantially as described.

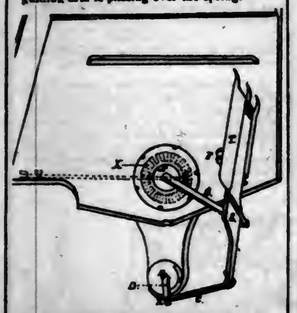
169,948. VEHICLE-SEATS. Jacob Bond, Cleveland, Ohio. [Filed Mar. 30, 1875.]



The combination, with the right-angled plate D secured to the seat, of the weighted boot F G and staple E, all substantially as and for the purpose set forth.

169,949. OINTMENTS. Jerome B. Brown and Sarah W. Brown, Willoughby, Ohio. [Filed Sept. 20, 1874.]

A compound of glycerine, arnica, woody nightshade, and nutmeg, in about the proportions and for the purpose specified.



169,950. GEOGRAPHICAL GLOBES FOR SCHOOLS. Newbern N. Browne, Woodstock, Ala. [Filed Oct. 17, 1874.]

1. In combination with an inflatable and collapsible geographical globe, the rigid poles B B, substantially as shown and described, for the purpose set forth.
2. The hole C, opening D, and stop-cock E, in combination with the rigid pole of a collapsible geographical globe, substantially as and for the purposes described.
3. In a geographical and inflatable globe, the collars F F and nuts G G, substantially as and for the purposes described.
4. In combination with the inflatable globe A, the tubular shaft or pole B, through which the globe may be inflated, substantially as described.

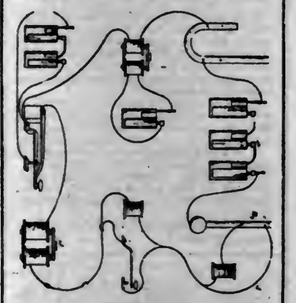
169,951. ROTATING SLIDING RAKES FOR HARVESTERS. Robt. Brown, Dayton, and Abel Hoover, Miamisburg, Ohio. [Filed Feb. 19, 1875.]

Brief.—The check-spring cam, which is simply a plate with a spring incline upon it, acts as a restraint upon the rake, causing it to swing around to the front when the radial guiding-arm is passing over the spring.

The rotating sliding rake consisting of a fixed part, E, and a movable part, F, in combination with the radial arm S, actuated by a bevel gear, X, the controlling radial arm D, connecting-arm C, and check-spring cam S, substantially as described.

169,952. COMBINED COMPRESSION AND SWING COCKS. W. L. Brownell, Brooklyn, N. Y. [Filed Oct. 29, 1875.]

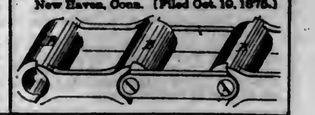
The combination of the compression-valve and the swinging faucet, substantially as herein shown and described.



169,953. PAPER BOXES. J. P. Buckingham, Chicopee, Mass. [Filed Sept. 1, 1875.]

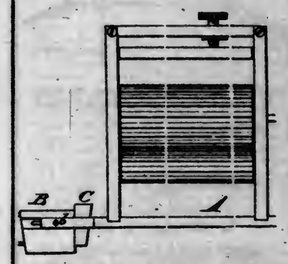
Brief.—The blank from which the boxes are formed are cut so that when bent into shape the corners will be of a double thickness, and will be locked together, so as to hold the sides in position.

A blank for folding boxes, having the slits *b* reaching to the line upon which the box is folded, the short slits *c* running parallel with the slits *b*, and slits *d* running at right angles to the slits *b* and *c*, whereby, when the box is bent into shape, the corners may be locked together, substantially as shown and described.



169,954. PRESSURE, ALARM, AND SIGNAL TELEGRAPHS. Chas. H. Buell, New Haven, Conn., assignor of one-half his right to G. C. Buell, West Springfield, Mass. [Filed Aug. 6, 1874.]

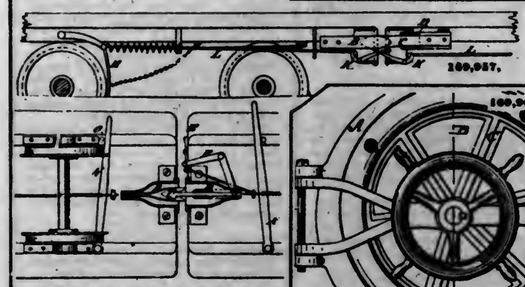
Brief.—The "water-barometer" is connected to the water in a dam or reservoir, so that the circuit is broken by a diminution of pressure in the reservoir, due to breakage of dam or any other cause. Includes in same circuit means for giving various alarms and signals.



1. The combination, with a confined body of water, of the mercurial electric-circuit controller, described herein as a water-barometer, an electric circuit, and a suitable alarm, substantially as set forth.
2. The combination, with a differential relay or magnet, of a constantly-closed electric circuit through one coil thereof, a normally-closed signaling electric circuit, including the other coil thereof, and means, included in the latter circuit, for signaling by varying the tension or electro-motive force of the current therein, substantially as set forth.
3. The combination, in one main and normally-closed electric circuit, of the water-barometer, thermostat, the differential magnet, and means for signaling, independently of the water barometer, by varying the tension of the closed circuit, substantially as described.
4. The combination, with one main and normally-closed electric circuit, of the water-barometer and the fusible-alloy joints, whereby the circuit may be completely broken open by a variation of the pressure of water, or a dangerous rise of temperature, substantially as set forth.

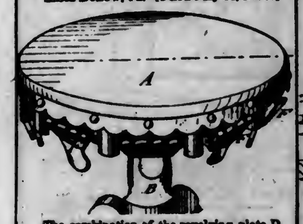
169,955. CHAIN-BELTS. Henry Bushnell, New Haven, Conn. [Filed Oct. 19, 1875.]

The herein-described chain, consisting of the principal links, composed of two sides connected by parallel tubular bars, and intermediate links, composed of two sides, each with a stud at each end, corresponding to and inserted and secured in the tubular bars, substantially as described, so as to make connections between the principal links, substantially as specified.



169,956. WASHING-MACHINE CLAMPS. C. B. Camp and Christian Osterhout, White Pigeon, Mich. [Filed Apr. 3, 1875.]

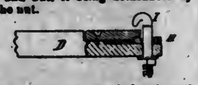
The sill-bar A, armed with spurs *a*, combined with the adjustable piece B, arranged at right angles with each other, pin *b*, and wedge C, set within a slot in the piece A, and bearing its plain edge against the end of the piece B, as and for the purpose set forth.



169,957. CAR COUPLINGS AND BRAKES. F. M. Campbell, Crow Wing, Minn. [Filed Sept. 11, 1875.]

Brief.—Brake actuated by spring is released when cars uncouple.

1. The combination of the double spring-coupler B, single dart-headed coupler C, and the slide D, substantially as specified.
2. The combination of the spring-brakes H, rod I, pivoted hook K, and a coupler, B or C, as shown and described.



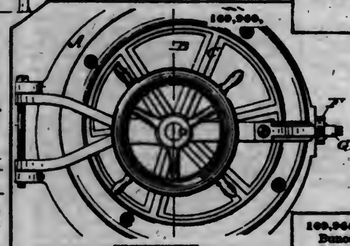
169,958. WORK-TABLES. John Cannon, Lime Hollow, Pa. [Filed July 31, 1875.]

The combination of the revolving plate D, having open pockets or receptacles F attached to its outer edge with the stand A B, as and for the purpose set forth.

169,959. ADJUSTABLE SACK-HOLDERS. H. W. Clark, Red Bluff, Cal. [Filed Oct. 2, 1875.]

Brief.—The semicircular spring, upon which the bag hangs, is held in the corresponding grooves of the plate and bolt by the action of a screw and nut, it being detachable by loosening the nut.

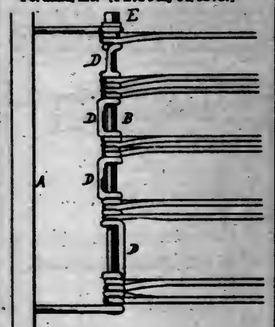
The plate H, made with the bolt-hole and the groove, and the bolt I made with the groove in the rear part of its head, and provided with a nut, in combination with the upper arm D of the sack-holder for securing the semicircular spring F that receives the edge of the sack to said arm detachably, substantially as herein shown and described.



169,960. LIDS FOR GAS-RETORTS. Henry Collinson, Boston, Mass. [Filed Oct. 13, 1875.]

Brief.—The end of the cotter-bar is provided with a spring, over which a latch pivoted to the mouth-piece or seat of the lid catches. A large skeleton eccentric is fitted into the lid, and bears upon it near its circumference. The sliding eccentric motion of the lid upon its seat, produced by turning the screw, is prolonged by the spring on the cotter-bar bearing on the latch first, and gradually yielding till the bar is pressed firm against the latch.

1. The combination, substantially as shown and described, of a seat or bearing, A, and a lid, B, having a spring-pressure against, and a sliding motion upon, the seat while being fastened in place.
2. The combination of the seat A, lid B, eccentric C, screw D, bar E, spring G, and hook F, substantially as shown.
3. In combination with the lid A, constructed and operating as described, the skeleton eccentric C, mounted on the screw or its equivalent, and bearing on the edge of the lid.



169,961. DUMPING-WAGONS. William H. Cooksey, Washington, D. C. [Filed May 12, 1875.]

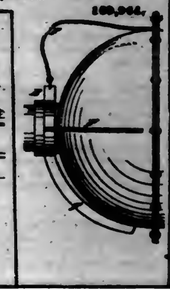
Brief.—The box, being raised up by means of the pivoted levers and supported on rollers, slides to the rear and dumps its contents.

1. The pivoted levers L L, provided with the rollers M M, in combination with chains K, rod I, and lever C, substantially as described.
2. The lever B, and curved arm F, in combination with standards H, moving in vertical guides, and having the end gate hinged thereto, substantially as described.
3. The lever A, in combination with the rod T, and hooks A', substantially as described.

169,962. PLATE-RACKS. Wm. R. P. Cross, Portland, Me. [Filed July 14, 1875.]

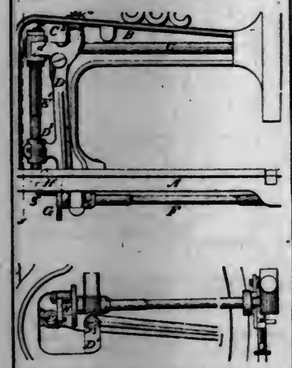
The combination of the bar A, upright rod B, plate-holders C, separating-pieces D, and nut E, all operating together as described.

169,963. CLOTHES-FOUNDERS. B. Crowell, Belfast, N. Y. [Filed Aug. 28, 1875.]



The piston E, made hollow, with an opening in its side and perforations in its lower head, and provided with a movable head, F, having a corresponding opening in its side, to adapt it to operate as an automatic soap-applier when the machine is in use, substantially as herein shown and described.

169,964. SPARK-CONVERTERS. C. K. Cullers, Dunnoston, Mo. [Filed Sept. 25, 1875.]

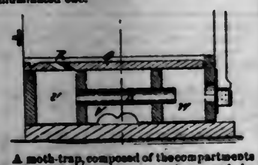


Brief.—The section is held in position by the collar and springs.

The combination of the collar E and springs F with pipe D, cap C, and hollow sphere A, substantially as specified.

169,966. SEWING-MACHINES. Cyrus E. Cushman, Philadelphia, Pa. (Filed June 26, 1875.)

Brief.—A vertical rock-shaft is journaled at the top in the needle-arm, and at the bottom in a projection of said arm extending below the bed-plate. This shaft is provided with an aperture for the passage of the driving-shaft, and with jaws, which embrace the tablet or strap of an eccentric mounted upon said driving-shaft. The sides of the strap or tablet are segments of a cylinder, to which the inner faces of the jaws are shaped. The eccentric rod secured to the tablet passes through a guide on the rock-shaft, by which its vibratory motion is controlled. The shuttle-carrier lever is secured to the rock-shaft. A crank-wheel and link connect the feed-shaft with the eccentric rod. The rotation of the driving shaft operates both the shuttle-carrier and feed device.

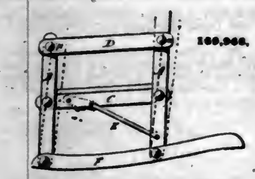


1. The combination of the operating eccentric, the cylindrically-sided strap, and the eccentric rod, with the vibrating rock-shaft, the jaws embracing the strap and the guide for the eccentric rod, substantially as set forth.

2. The combination of a feed-shaft and an eccentric rod, with a vibrating rock-shaft and an eccentric arranged upon the driving-shaft, substantially as and for the purpose set forth.

169,967. MOTH-TRAPS. Benj. F. Daniel, Quincy, Fla. (Filed July 3, 1875.)

Brief.—The trap is formed of two separate compartments, one dark the other illuminated. A tube connects them. The moths enter the dark one, and pass through the tube into the illuminated one.

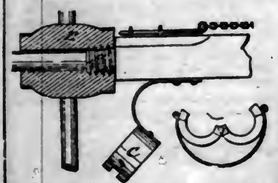


A moth-trap, composed of the compartments U, V, and W, and tube S, as shown and described.

169,967. COMPOSITIONS FOR SOAP. Wm. F. Darnaby, Nashville, Tenn., assignor to himself and E. B. Stahlman, same place. (Filed July 12, 1875.)

The compound of Kirk's double extract, Colgate's soda-soap, sal-soda, water-spirits of ammonia, ether, and oil of sassafras, substantially in the proportions and manner herein described.

169,968. FOLDING CHAIRS. Isaac N. Dana, New Haven, Conn., assignor to the New Haven Folding-Chair Company, same place. (Filed Aug. 9, 1875.)



169,968.

1. In a folding chair, the combination of the rear and front posts A B, parallel to each other, the seat-bar C and the arm-bar D above, and parallel to each other, both jointed to the front and rear posts, and with the brace E hinged to the rear post, and through the link c to the seat-bar, the combination and arrangement being substantially as described, whereby the joint between the said brace and link, when the chair is set up, will pass above the line of its two ends, substantially as set forth.

2. In a folding chair, the combination of the rear and front posts A B, parallel to each other, the seat-bar C, and the rocker F, both jointed to the front and rear posts, parallel to each other, and with the jointed brace E hinged to the rear post and the seat-bar, substantially as described, so that the joint in the said brace, when the chair is set up, will pass above the line of its two ends, substantially as set forth.

169,969. WAGON-BRAKES. Henry Decker, Orange, N. J. (Filed Oct. 23, 1875.)

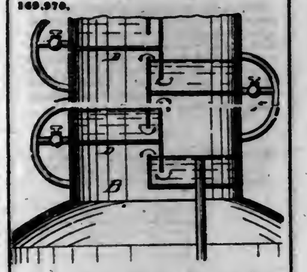
Brief.—As the collar is removed the hub screws up.

1. The combination, with the axle of a vehicle having a threaded section at the junction of the square part and journal end of the same with an interior-threaded wheel-hub for screwing up on the axle when allowed to pass on the threaded portion of the same, substantially in the manner and for the purpose set forth.

2. The combination of a vehicle-axle having a threaded portion of the journal end adjoining the square part of the axle, with a spring-collar secured around the same, and with the hub of the wheel, substantially as and for the purpose set forth.

3. The combination of the spring-collar encircling the threaded portion of the journal end of the axle with a locking device and releasing mechanism for detaching the collar, and producing brake-action of wheel by screwing up of wheel-hub, substantially as shown and described.

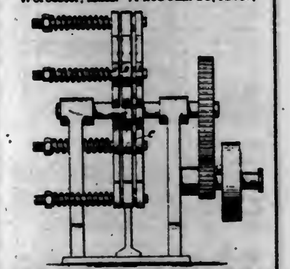
169,970. STILLS. Henry Deymann and Edward Melchers, Toledo, Ohio. (Filed Sept. 11, 1875.)



Brief.—The chambers of the refining-column are placed alternately on opposite sides thereof, and communicate with each other at the center of the column. The overflow and draw-off pipes of each chamber are on the outside of the column, the draw-off pipes being provided with stop-cocks.

1. The column of a refining-still constructed of two series of alternating and communicating chambers arranged on opposite sides thereof, substantially in the manner and for the purpose set forth.

2. The alternating chambers of the column, communicating by central spaces formed by alternating horizontal and vertical partition-plates, substantially as specified.

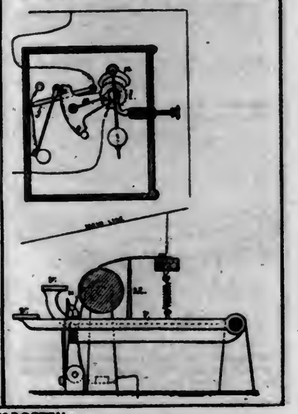


3. The alternating chambers of the column, having overflow and drain pipes arranged at the outside of the column, substantially as set forth.

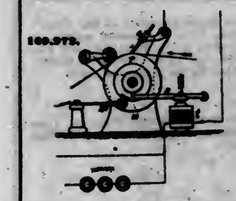
169,970.

169,970.

169,971. BOOT-CRIMPERS. Wm. H. Eddy, Worcester, Mass. (Filed Jan. 30, 1876.)



1. The combination, with the carrier or operating shaft D and annular jaws B B, of a former or formers, C, attached to the shaft and arranged to rotate between said jaws, and capable of independent lateral adjustment, substantially as and for the purpose set forth.



2. In a machine for crimping boots and shoes, the combination, with the jaws B, of a former, C, adjustably attached to a rotating shaft, working with a constant forward action, and a clamping device, I, operated against the edge of said former by the friction of the jaws against said clamp, substantially as and for the purpose set forth.

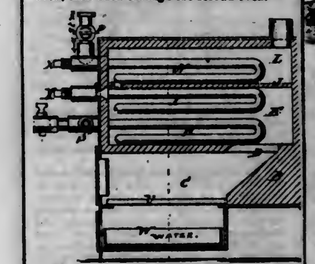
3. In a boot-crimping machine, annular or curved jaws B B, provided with crescent-shaped grooves b b, in combination with a former or brake, C, mounted upon and operated by a rotating shaft and a clamp or guard mechanism for holding and protecting the leather along the front edge of said former, substantially as herein set forth.

169,972. ELECTRO-SIGNALING INSTRUMENTS. Thos. A. Edison and C. Batchelor, Newark, N. J. (Filed Mar. 23, 1875.)

169,973.

169,973.

1. The combination, with the segmental circuit-closing weight, of the switch *f*, for the purposes set forth.

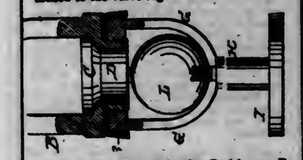


2. The combination, with the circuit-closing segmental weight, of the ratchet-wheel *i*, escapement *n*, pendulum *o*, and spring 16, for the purposes set forth.

3. The receiving-instrument, composed of a drum and stylus for chemical paper, and electro-magnet and armature-lever stop, and a circuit-closer insulated from the drum when the parts are at rest, for the purposes set forth.

4. The combination, with the circuit-closing cylinder *u* and keys *v*, of the springs *x*, held up by the studs 32, and the stop *w*, actuated by the frame *v'*, substantially as set forth.

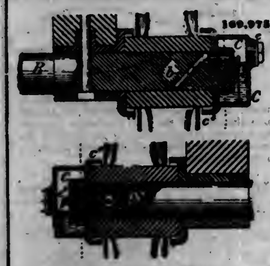
169,974. GAS APPARATUS. J. H. Hobbein, Brooklyn, N. Y., assignor to himself and H. A. Green, New York city. (Filed Sept. 25, 1875.)



Brief.—The retorts are connected together at their ends, which project outside of the walls of the furnace, and the ends are provided with screw-plugs, which may be removed for cleaning the retorts. A horizontal partition in the heating-chamber divides it into two ovens, and causes the products of combustion to pass forward through the first oven, then back through the second oven.

The combination of furnace C, having passage D, the oven E, having oil-retorts F G and steam-retorts H I, the partition J, having passage K, and the oven L, having oil-retorts M and steam-retorts N, all arranged substantially as and for the purpose specified.

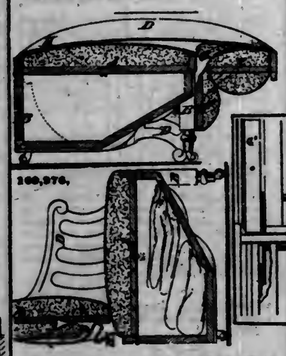
169,975. PUMP-PLUNGERS. Jacob S. Ragle, Palmyra, Pa. (Filed July 24, 1875.)



Brief.—A stem and guide foot or disk is attached to the valve-cage.

The combination of the ring C with arms B, stem A, and screw-collar D, the annular ring E with female screw-threads, arms G, stem H, and guide-foot I, the cup-shaped packing J, and ball-valve L, all substantially as set forth.

169,975. CAR-AXLE BOXES. L. B. Faught, Philadelphia, Pa. (Filed Aug. 27, 1875.)



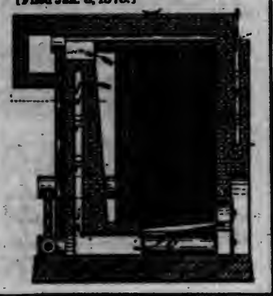
169,975.

169,975.

The combination of the oil-reservoir C in the cap C, the recess in the axle, the tube *c*', the wick, and wire *c*', substantially as herein-before described and set forth.

169,976. SOFA-BEDSTEADS. J. B. M. Fifield, Philadelphia, Pa. (Filed Aug. 10, 1874.)

169,976.



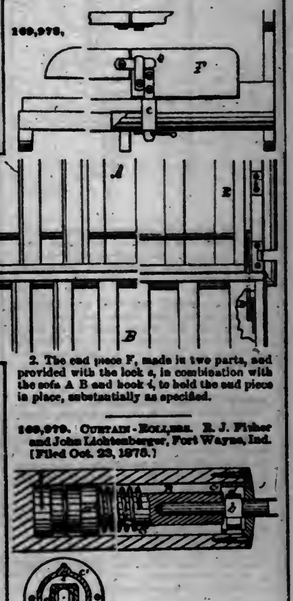
1. The swinging or movable back, composed of the fixed upper section E, upholstered on both sides, and the lower section F hinged to the same, in combination with the seat portion A and base B of a sofa-bedstead, substantially as herein described.

2. The combination of the pivoted ends D, with the seat A, the base B, and the back E F, made in two parts, substantially as herein shown and described.

3. The combination of a loosely-attached protecting-sheet H, with the seat and movable back of a sofa, as and for the purpose specified.

4. The pad or cushion G, combined with the back and seat of a sofa, substantially as described, to fill the cavity between the rear portion of the upper part of the back and the seat.

169,977. SECTIONAL BOILERS. Jos. Firmenich and Flavius P. Stiker, Buffalo, N. Y., assignors to Jos. Firmenich, Geo. Firmenich, and Frank Firmenich, same place. (Filed Jan. 8, 1876.)

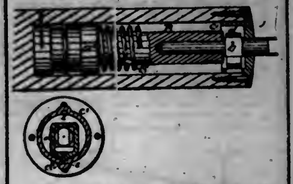


1. In a sectional steam-boiler, a series of steam and water drums, a corresponding series of mud-drums, and rows of upright tubes connecting them, in combination with grate or fuel surfaces, arranged between the tubes above the mud drums, substantially as specified.

2. In a sectional steam-boiler, such as herein-before described, where the mud-drums are below the fire-line, circulating-tubes connecting the steam and water drums with the mud-drums outside of the combustion-chamber, substantially as specified.

169,978. SOFA-BEDSTEADS. Fredk. Fleckbeck, Chicago, Ill. (Filed June 12, 1875.)

169,978.



169,978.

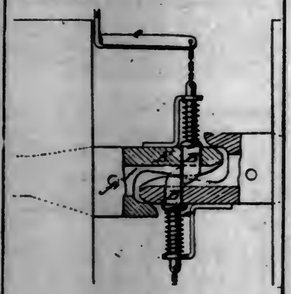
1. The frame of the main sofa A, having cross-bars E E', the end pieces G G', rod C, arms D, and shell B, in combination with the plate *a*, provided with pin *b*, substantially as and for the purpose herein set forth.

2. The end piece F, made in two parts, and provided with the lock *a*, in combination with the sofa A B and hook *d*, to hold the end piece in place, substantially as specified.

169,979. CURTAIN-ROLLERS. R. J. Fisher and John Lichtenberger, Fort Wayne, Ind. (Filed Oct. 23, 1875.)

The combination of the roller A, the spindle B, the spring S, the loose collar *d*, with its pawl, and the catch or catches *c*, when the spring, the loose collar and pawl upon the spindle, and the pawl-catch in the rotating roller are all inclosed within said roller, and are all constructed and arranged to operate substantially as described.

169,980. CHECK-ROW ATTACHMENTS FOR CORN-PLANTERS. Geo. C. Flagg, Columbus, Ill. (Filed July 17, 1875.)

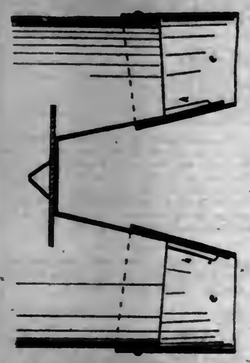


1. The L-shaped arms G, hinged to the ends of cross-bars F, fixed on the axle, and springs H, for holding the same extended horizontally from the wheels, as shown and described.

2. The combination of the parallel disks W W, and rod and lever for adjusting them on the axis, with the friction-wheel M, as shown and described, for the purposes specified.

3. The combination of the sleeve B, the disk I, the swiveled screw J, the gear-wheels K L, the two movable disks W, the screw-wheel N, and the sleeve O with the drive-wheel D, the axis B, and the markers F O H, substantially as herein shown and described.

169,921. CAR-COUPLINGS. Oscar H. Ford, Meridian, Miss., assignor to himself and Milner B. Clinton, Dallas, Tex. [Filed Aug. 26, 1875.]

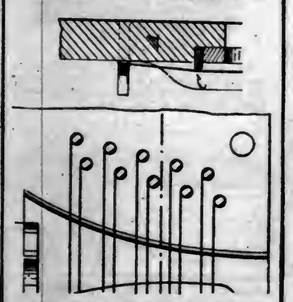


1. An automatic car-coupling composed of draw-heads with projecting side parts forming an L-shaped space, and provided with laterally sliding and interlocking spring-jaws, substantially in the manner and for the purpose set forth.

2. The L-shaped draw-head provided with a recess at the inner side of the forward-extending part, said recess being widest at the rear part, narrowest at the jaw part, and tapering at the front part for guiding and retaining the jaws, substantially as specified.

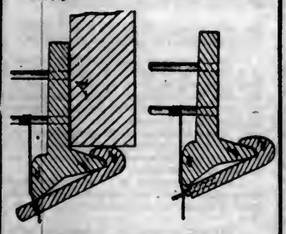
169,922. FEED-REGULATORS. Francis M. Ford and John F. Hicks, Bristol, Tenn. [Filed Sept. 7, 1875.]

Brief.—The lower sections of feed-regulator project outwardly, and are loosely bolted to the upper section, to render them adjustable to any-sized stone, and are held out against stone by springs between them.



The combination of the casings d, provided with downwardly-projecting flanges h, the lower sections e, loosely bolted to the upper sections, and springs n, which hold the lower sections of the tube against the stone, all relatively arranged as and for the purposes described.

169,923. CLAMPS. George Frost and Geo. H. Phelps, Boston, Mass. [Filed Nov. 1, 1875.]

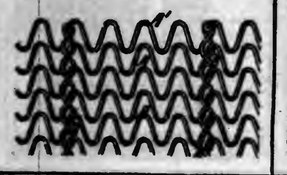


A clasp-hook constructed of one piece of metal, having the spring-hook at the bottom and the clasp at the top, the latter guarded by a spring-tongue, which is struck from the center of the sheet, substantially as herein shown and described.

169,924. UPRIGHT PIANOS. Ernst Gabler, New York, N. Y. [Filed Sept. 11, 1875.]

In upright pianos, the combination, with the wrest-plank and the string-plate, of an interposed isolating agraffe-bar, secured rigidly against the wrest-plank by the compound pressure of the strings on the plate, substantially in the manner and for the purpose specified.

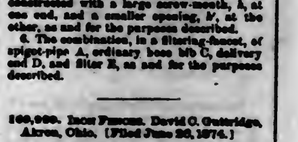
169,925. PIANO-FORTE ACTIONS. Ernst Gabler, New York, N. Y. [Filed Sept. 11, 1875.]



1. The combination of the string-plate, having raised bridge, front concavity, and bottom shoulder or rib, with an agraffe provided with a hook-shaped base part, and held in position by the pressure of the strings on the top part, substantially as specified.

2. The string-plate provided with concave front part, in combination with the agraffe, extending in front of the same, to form an isolating air-chamber, substantially as specified.

3. An agraffe provided with a hook-shaped base part, substantially as specified.



169,926. WIRE FABRICS. Alba C. Garrett, Boston, Mass. [Filed May 26, 1875.]

Brief.—The spiral warp-wires are at intervals confined in loops formed by two transverse-wires bent across each other, and having their ends secured to the selvage-wires of the warp.

A wire fabric consisting of the spirally-coiled warp-wires A, connected together by the bent wires B, interlaced with each other at intervals between said warp-wires, substantially as and for the purpose set forth.

169,927. STEM-WINDING WATCHES. Chas. D. P. Gibson, New York, N. Y. [Filed Mar. 3, 1875.]

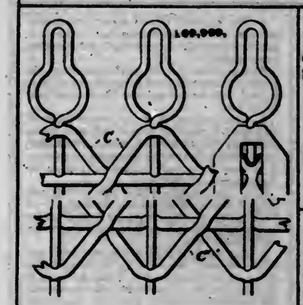
In combination with the swinging bridge B b, and with the wheel *D d d'*, the spring-click C, arranged to perform the double function of a hook-pawl for the ratchet A, and of a spring for the bridge B b and its connections, as herein specified.

169,928. FAUCETS. Dexter W. Goodell, Florence, Mass. [Filed Oct. 11, 1875.]

1. A filtering-faucet, wherein the delivery rod or mouth is turned to open the passage to the filter or ordinary delivery-nozzle, or forms the cock or valve to the device, as described.

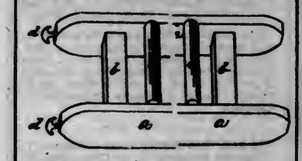
2. In a filtering-faucet, in combination with the downwardly-bent spigot A, the head B, constructed on one side with an ordinary hose-bib, and at the other with a filtering chamber or end, whereby, by turning the head around in one direction, filtered water may be obtained, or in the other direction the ordinary flow, as and for the purpose described.

3. The filtering-chamber E, constructed slim at both ends, with screw-head and removable screw-head *e'*, and provided in its interior with central filtering material F and wire-gauze screens G at each side of the filtering material, as and for the purposes described.



4. The combined filter and faucet constructed with two separate delivery-mouths, adapted to be used separately and independently of each other by operating or bringing the delivery head or end itself around in position to open the passage through the spigot and head, as and for the purposes described.

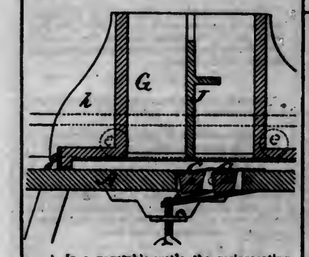
5. In combination with the ordinary hose-bib C and filtering-chamber E, the cylinder H, constructed with a large screw-mouth, A, at one end, and a smaller opening, *b'*, at the other, as and for the purposes described.



6. The combination, in a filtering-faucet, of spigot-pipe A, ordinary hose bib C, delivery end D, and filter E, as and for the purposes described.

169,929. IRON FENCES. David C. Cuteridge, Akron, Ohio. [Filed June 26, 1874.]

An iron fence, composed of vertical pickets A, top and bottom horizontal runners B B', and ornamental scrolls, looped, continuous top and bottom pairs of stringers C and C', all constructed, arranged, and combined substantially as and for the purposes described.



169,930. PORTABLE SKIDS. G. B. Harrington, Salem, Mass. [Filed Oct. 16, 1875.]

In combination with the frame a a, braces b b, and rollers c c, the T-shaped bolts d d, substantially as set forth and described.

169,931. VEGETABLE-CUTTERS. Samuel Hensk, Jr., Lebanon, Pa., assignor of one-half his right to A. B. Hensk, same place. [Filed Sept. 30, 1875.]

Brief.—The holder is divided by a movable partition, is guided by friction-rollers, impinges in its reciprocations against a rubber cushion at the end of the rails, and is provided with rubber scrapers to keep the working parts clean.

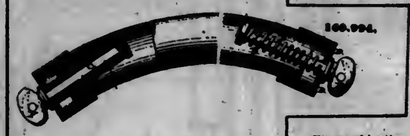
1. In a vegetable-cutter, the reciprocating holder G, divided by a movable partition, J, and guided by means of anti-friction rollers e, working in grooved ways B B, substantially as described.

2. The combination of a holder, G, and the elastic wipers *f f*, substantially as described.

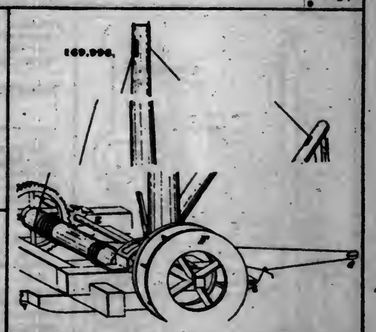
3. In combination with the holder G, the sides h, which extend beyond the holder, and impinge against a cushion, p, at each forward stroke, substantially as described.

4. In a vegetable-cutter, the combination of the two cutting-blades O O, adjustable simultaneously by a thumb-screw, D, substantially as specified.

169,932. PAPER BOXES. David L. Hawkins, Elizabeth, N. J. [Filed May 26, 1875.]



As a new article of manufacture, a pill-box having printed on the periphery of the cover, or on the periphery of the body of the box, twelve numbers, corresponding to twelve hours of a day, which numerals are arranged at regular intervals apart around the box, and a pointer to indicate the hour for taking a dose of medicine, substantially as described.

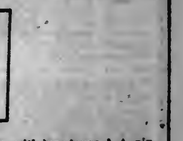


169,933. FENDERS. Jacob Hirner, Philadelphia, Pa., assignor of one-half his right to Clarence A. Hart, same place. [Filed Mar. 10, 1875.]

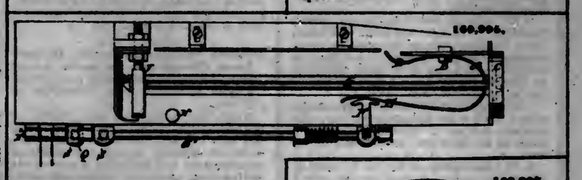
A fringe consisting of pendants formed wholly of thin sheets of pliable or plastic material, embossed in any ornamental design, substantially as set forth.

169,934. ELASTIC BACK-BANDS FOR HARNESS. John W. Hollis, Cincinnati, Ohio, assignor of two-thirds his right to American Warden, C. C. Campbell, and Edwin C. Bush, same place. [Filed Apr. 1, 1875.]

The combination, with the bent tube of the hook or eye rods and springs, substantially as described, and for the purpose set forth.



1. The sill A, with beveled or sloped ends, socket W, for pivot of the crane, the crane and windlass, both arranged on the same sill.



2. The water-wheel F, with friction-surface or widened rim for the brake, the rims extending farther from center of wheel than the paddles T, paddles of smaller shape on both sides, and thin at outer edge, as shown.

3. The brake with the arm M, having two right angles and two oblique faces, as herein shown.

169,937. EXTENSION-TABLES. A. D. Jones and S. L. Jones, Kirksville, Ky. [Filed Oct 8, 1875.]

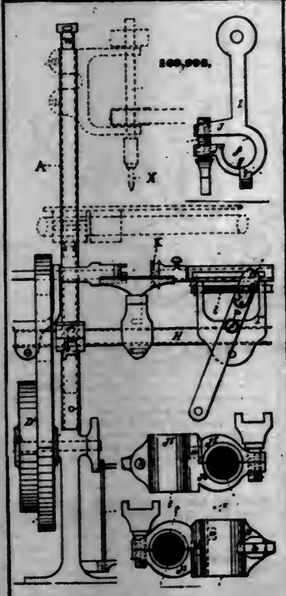
The combination, with lazy-tongs A A, pivoted to ends C C, of the centrally-placed clamp G and slotted bar F, as and for the purpose specified.

169,935. LOOM-SHUTTLE CHECKS AND BINDERS. Seth T. Hurd, Goshen, N. H., assignor to himself and Thomas Sanderson, Lawrence, Mass. [Filed July 24, 1875.]

1. The combination of the U shaped shuttle checking and binding spring A, formed in one piece, with the head-block C, its arm, and the binding-finger F, all arranged and operating substantially as and for the purpose set forth.

2. The combination of the slotted arms P Q and adjustable stud E with the binder-finger shaft G' and the dagger-shaft N', substantially as specified.

3. The combination of the picker-rod G, adjustable supports O J, head K, and nut H, all constructed and arranged as set forth.



4. The combination of the guard-stud H, adjustable side board M, U-shaped spring A, and head-block C, all arranged as and for the purposes set forth.

169,936. MACHINES FOR OPERATING DEMIJOHNS. Andrew Jackson, Mohawk Valley, Cal. [Filed May 22, 1875.]

Brief.—The nozzle end of the piston-shaft, through which motion is imparted to the windlass, turns upon its end a water-wheel attached, which is operated by a jet from a hydraulic washing-nozzle.

169,938. COMBINED UNIVERSAL LATHES AND BELT-SAWS. Hiram A. Kimball, Philadelphia, Pa. [Filed June 26, 1875.]

Brief.—The machine may be used for boring, turning, or sawing, by slightly changing the arrangement of the different parts.

1. For clamping together tubes or rods at right angles to each other, a double clamp, shown in Figs. 3 and 4, having parts J' and J'', with bearings f f at right angles to each other, the parts J'' having pins a, which fit corresponding holes in the part J', substantially as above set forth.

2. The combination of the tubular shear H, double clamp J J', and standard A, for the purpose set forth.

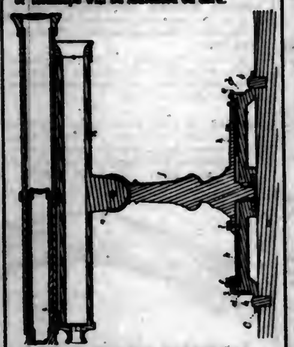
3. The standing head I, having two curved bearings, f f', at right angles to each other, and a clamping plate or cap with two corresponding bearings, whereby the head may be connected with a tube or rod either parallel or at right angles thereto, substantially as and for the purpose set forth.

4. The pumper-head F, having a single clamp, shown in Fig. 5, in which the cap J'' has a pin, r, at one end, and is confined by means of a screw at the other end, substantially as set forth.

5. The combination of the rod P, clamp Q, and double clamp J J' with the standard A and adjustable shelf O, for holding the latter in its adjusted position, as set forth.

169,999. PUMPS. Wm. S. Lossey, Lithopolis, Ohio. [Filed Sept. 7, 1875.]

Brief.—A double lifting-pump, re-enforced and supplied, in deep wells, by a force-pump applied as a lower point to their suction-tube.

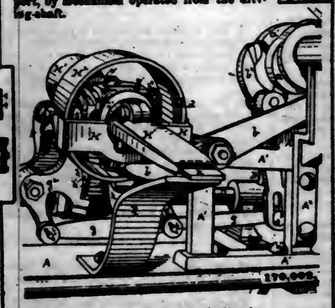


A combined force and lift pump, embodying in its construction a pair of cylinders, a a', formed in a single casting or framing, A, and provided with removable perforated seats d', valves d', and stationary plungers O O, and an external force-pump, L, having removable perforated seats d'', valves d'', piston l, and a re-ciprocating piston-rod, k, the plungers O O and piston l being operated by a revolving crank-axle, F, substantially as shown and described.

170,000. COMPOUNDS FOR LINING FOR MACHINE-BEARINGS. Lebbeus W. Lathrop and Theodore A. Weber, New York, N. Y. [Filed Nov. 2, 1876.]

As an improved article of manufacture, a lining for machinery bearings, consisting of a compound of animal glue and graphite, with or without a backing of cloth, leather, or other equivalent substance, substantially as specified.

170,001. MANUFACTURE BEARING-INDICATORS. Joseph D. Leach, Pinckneyville, Mo. [Filed May 17, 1876.]



Brief.—Indicator so placed that a line through the pins shall be parallel to central fore-and-aft line of vessel. The index-hand is attached to movable standard, so that the bearing of an object brought into field of view of telescope will be indicated on card.

In a bearing-indicator, the combination of bed d, lubber-mark c, locking-screw f, cam e e, rotating standard j, locking-screw l, pointer m, pivoted sighting-tube n, and cord k, substantially as described and shown.

170,002. NAIL-PLATE FEEDERS. Matthew Leach, Youngstown, assignor to himself and John Smith, same place, and John G. Decker, Coitsville, Ohio. [Filed Oct. 5, 1875.]

Brief.—The intermittent semi-rotation of the feeding-tube is effected by a band-connection with two arc-shaped oscillating levers, which are operated, through the medium of connecting-rod and levers, by a cam on the driving-shaft. A pair of automatically-working feed-rollers advance the plate through the same-piece while the tube is being drawn back and turned over, to clear the moving cutter, and vertically reliant to clear the guide-support, by mechanism operated from the driving-shaft.

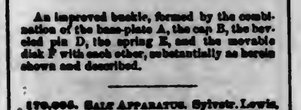
1. As a means of rotating the feeding box or tube, a pair of bent levers, g', and band h', in combination with a reciprocating rod, g, substantially as described.

2. The frame P, P', and H, carrying loosely pivoted therein the feeding box or tube, in combination with a rock-shaft, D, substantially as set forth.

3. The levers b' b', in combination with the wiper c', connecting-rod g, bent levers g', band h', and feeding box or tube H', substantially as set forth.

4. The combination of the pivoted frame H, ring or circle plate H', formed with cam-groove d, feeding box or tube H', yoke e, with stud e', pawl r, ratchet-wheel r', fixed-rollers r s, spring r, and bearing-pins r', substantially as and for the purposes set forth.

5. In combination with a pair of feed-rollers o o, arranged within the feeding tube or box, a yoke, e, and cam-groove d, and ratchet and pawl, arranged and operative substantially as set forth.

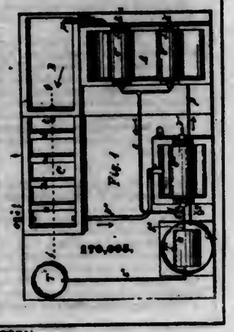


6. The frame P P', made in two parts and bolted together, whereby, by the interposition of a washer, the angle of feed may be varied at pleasure, the combination of these parts with the angularly-arranged feed-tube being substantially as described.

170,003. PRESERVING MILK AGAINST INJURY BY TRANSPORTATION. Jno. H. Lester, New York, N. Y. [Filed Oct. 26, 1875.]

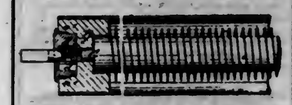
The process herein described for preserving milk against injury by transportation or otherwise, which consists in forcing milk into an air-tight vessel, thereby preventing, as nearly as possible, a body immovable within the receptacle containing the same, substantially as specified.

170,004. REVERSIBLE LOCK-BUCKLES. L. Lawine, Brooklyn, N. Y. [Filed Sept. 20, 1875.]



Brief.—A revolving disk carries a beveled pin. When the strap is drawn in the direction of the incline, it forces down a spring which holds the disk, and slips past the pin. When the strap is drawn against the straight side of the pin it is held securely. The disk is operated by a projecting lever to release the strap.

An improved buckle, formed by the combination of the base-plate A, the cap B, the beveled pin D, the spring E, and the movable disk F with each other, substantially as herein shown and described.



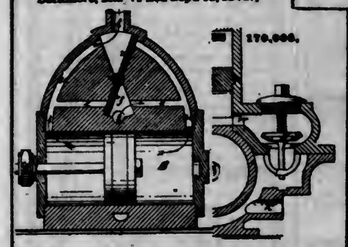
170,005. SALT APPARATUS. Sylvstr. Lewis, Rochester, N. Y. [Filed Mar. 17, 1876.]

1. The platform F upholding the vats A B C, vat B, provided with the induction-pipe c', vat C, having the partitions s and s' by which the chlorides are separated from the brine, pipes p'' and o for drawing off the purified brine, and pipe n for expelling the chloride of calcium, in combination with the cylinders c' c'', all arranged in the manner substantially as shown and set forth.

2. In combination, the vat T, provided with the cylinder c, by which exhaust steam is used for heating crude brine, vat T, by which the same further-exhaust steam is again used for heating water for the steam-boiler, and the cylinders c' and c'', arranged substantially as shown and described.

170,006. CURTAIN-FIXTURES. W. H. Maine, Abington, Mass. [Filed Oct. 16, 1875.]

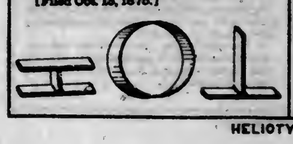
1. As an improvement in spring curtain-rollers, the improved spindle-locking device, consisting of a curtain-roller with fixed cam-sleeve at the end, in combination with a sliding pin seated in a perforation of the spindle within the sleeve, to arrest the spindle when the roller is detached from the supporting-bracket, substantially as specified.



2. The spindle of a spring curtain-roller, provided with a guide-hole for the sliding locking-pin at a point within the cam-sleeve of the roller, the pin-hole being in vertical position when the spindle is seated in the brackets, substantially as specified.

170,007. STOP-MOTION FORKS FOR LOOMS. John McGaffrey, Jr., Lawrence, Mass., assignor of one-third his right to S. M. Steadman, same place. [Filed Aug. 30, 1875.]

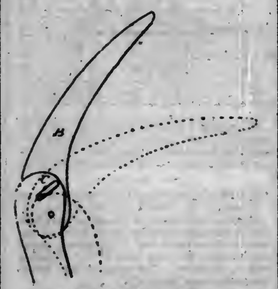
The combination of the continuous wire B B and the wire D, having their points of contact with the thimble bent or shaped to conform thereto, with the thimble or arbor-rest A, substantially as and for the purpose herein described and set forth.



170,008. STEAM-PUMPS. Jas. McCormick, Greenfield, Ohio, and Sylvester B. Kelly, Baltimore, Md. [Filed Sept. 18, 1876.]

1. The pendulum-valve I, constructed with one arm longer than the other, in combination with the inlet and outlet ports w t and passages s s, the whole arranged in connection with the pump-barrel B, substantially as and for the purpose set forth.

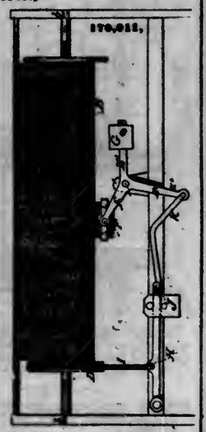
2. The check-valve E, arranged in relation with the inlet-port W, pendulum-valve I, and passages s s of the pump-barrel, substantially as and for the purpose set forth.



170,009. METALLIC ENDLESS PAPER-FASTENER. John W. McGill, Brooklyn, N. Y. [Filed Oct. 13, 1876.]

As an improved article of manufacture, an endless fastener or binder, constructed out of cylindrical metal or any other suitable material, bent and formed substantially as herein represented, the same to be applied for the purposes herein set forth and described.

170,010. CORN-CUTTERS. P. McI. McLeod, Sun Prairie, Wis. [Filed Aug. 7, 1875.]



Brief.—The blade is adjustable at different angles to the convex grooved handle, and held in position by a set-screw.

1. A corn-cutter handle having a convex grooved and pivoted adjustable sickle shaped blade, B, substantially as described.

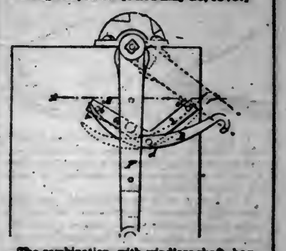
2. The combination of the convex grooved helve A, adjustable blade B, and thumb-screw C, substantially as described and set forth.

170,011. SLEY-OFF MECHANISMS FOR LOOMS. John H. Moore, Fisherville, N. H. [Filed Aug. 11, 1876.]

The combination, with the warp-beam B, of the grooved frictional band D, frictional cord I, lever H, sliding weight J, rod K, triple-armed lever E E' E'', rod F, and weight G, constructed and operating substantially in the manner described and specified.

170,012. DENTISTS' CHAIRS. John B. Newbrough, New York, N. Y., assignor to S. S. White, Philadelphia, Pa. [Filed Apr. 23, 1875.]

1. The combination of the rack, the chair-supporting frame projecting laterally therefrom, and the pinion mounted on the frame, and meshing with and binding in the rack, these members being constructed and operating substantially as set forth, whereby the weight of the frame automatically locks it at any height to which it may be adjusted.



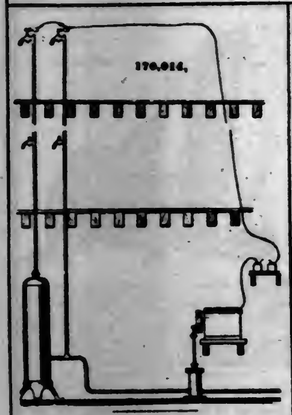
2. The combination of the rack; the supporting-frame projecting laterally therefrom, the adjustable horizontally-turning frame, mounted on the supporting-frame, and the chair pivoted to uprights on said turning-frame, these members being constructed and operating substantially as set forth.

3. The combination of the supporting-frame, the horizontally-turning frame, the chair pivoted near the line of its arms to uprights on said turning-frame, and the adjustable link connecting the chair-back with the turning-frame, these members being constructed and operating substantially as set forth.

4. The combination, in a dentist's chair, of the fixed bottom section of the back, the central guide thereon, the movable back section, its central bar sliding in the guide, and the set-screw for clamping the sliding bar and movable section at any desired elevation, these members being constructed and arranged for joint operation as set forth.

5. The combination, in a dentist's chair, substantially as hereinbefore set forth, of a head-rest mounted on a cross-bar, a loop-bracket, to which said cross-bar turns and moves endwise, which bracket also turns and moves endwise on its supporting-arm, and a set-screw, which clamps the loop-bracket and head-rest firmly upon the supporting-arm in any desired position.

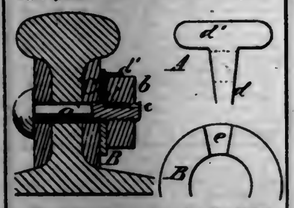
170,013. CRANE-STOPS. Wm. H. Phillips, Bridgeton, N. J. [Filed May 20, 1875.]



The combination, with windlass-shaft, having contiguous squared and cylindrical portions, of the crank F, slotted sliding-locking piece K, having sided a, and the pivoted bevel catch B, and fixed steps f f, all constructed and arranged as shown and described, to operate as specified.

170,014. ELECTRICAL WATER-RAISING APPARATUS. Elias Pouvert, Jr., New York, N. Y. [Filed Sept. 13, 1875.]

Brief.—Dispenses with the reservoir commonly in use when the head of water is insufficient, and puts the water-raising motor in motion by closing the electric circuit at the faucet where the water is needed.



In combination with an electric motor-pump and water-distributing pipes, the wire 3 from the battery, and the circuit-closing mechanism adjacent to the respective faucets, for the purposes and substantially as set forth.

170,014.

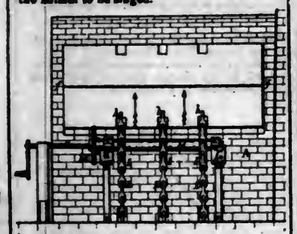
170,014. NUT-LOCKS. C. B. Bagar, North Manchester, Ind. [Filed Aug. 21, 1875.]

Brief.—The washer is slotted for the locking T-plate.

The T-shaped pawl A, having the tongue *d* and head *d'*, and the washer B, having the radial groove *c*, arranged between the nut *b* and fish-plate C, in combination with the bolt *a*, having the groove *e* and the nut *b*, all constructed as set forth.

170,015. BOOTS AND SHOES. Wm. B. Rice, Quincy, Mass. [Filed Sept. 27, 1875.]

1. A toe-tip or pugneron having an upper-edge finish, *b*, and thickened and formed in one and the same piece with a sole outside the apron of a boot or shoe, substantially as and for the purpose set forth.

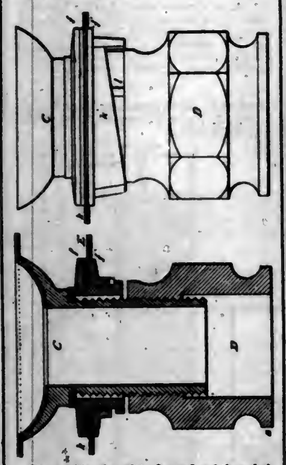


2. A boot or shoe so constructed that the upper-edge finish *b* of its toe-tip, struck up as described, shall form one and the same continuous or unbroken upper edge or surface, *c*, substantially as specified.

170,017. APPLE-SLICERS. I. C. Richards, Farmington, Me. [Filed Sept. 25, 1875.]

In an apple-slicer, the reciprocating slide C, having collar *g*, a guiding-spike, *g'*, and cover B, in combination with spaced concentric cutting-rings E E' E'' E''', substantially as specified.

170,018. SMELTING-FURNACES. Benj. Rose, Cleveland, Ohio. [Filed Aug. 30, 1875.]

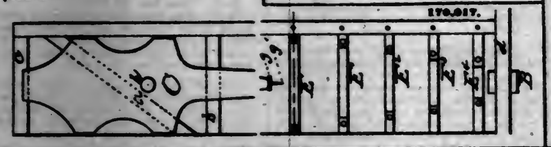


Brief.—An apparatus in which endless chains are carried over guide-wheels passing through the reverberatory chamber carrying the animal to be singed.

The wheels I I', guide-wheels K, chains L, reservoir J, and furnace B, constructed and arranged to operate substantially in the manner as described, and for the purpose set forth.

170,019. COUPLINGS. G. W. Rowell, Mount Upton, N. Y. [Filed July 24, 1875.]

Brief.—The device is designed for discharge-spouts for milk-pans, the latter being in connection with a water-vat. The tube is threaded and flanged, and has flanged nut engaging with it, as shown. The coupling-rings secure the posts to the water-vat.



The combination of the flanged and threaded tube C, the nut D, and the coupling-rings *k k'*, having the flanges *f f'*, he engagement-lugs *l*, and the cams *m*, substantially as specified.

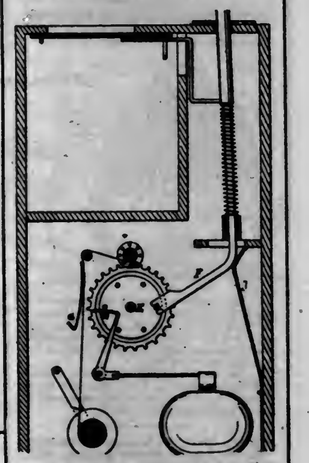
170,020. RAIL FOR LAND-SIDE PLANES. Joshua Sandage, Moline, Ill. [Filed Nov. 27, 1874.]

170,017.

170,020.

As a new article of manufacture, rolled bars for plow land-sides, of the form in cross-section shown and described—that is to say, bars plain or flat on one side, and having projecting from the other side two flanges or ribs, one at each edge, said flanges presenting sloping sides, both externally and internally, in relation to the flat surface, and terminating by their convergence in an edge—substantially as and for the purpose shown and specified.

170,021. HARNESS-ROSETTES. Saml. S. Sargeant, Newark, N. J. [Filed June 17, 1874.]



As a new article of manufacture, a harness-rosette composed of a sheet-metal top or front piece, A, ornamented by perforating or shaping a sheet-metal back piece, B, perforated to receive the attaching loop or shank, a filling-disk, C, and a loop or shank, D, inserted through the back plate, and bent over the inner surface thereof, the several parts being united by bending the edge of the top piece around the edge of the back piece, substantially as herein specified.

170,022. RECORDING AND SIGNAL FARE-BOXES. Edward H. Schnell, South Norwalk, Conn. [Filed Mar. 20, 1875.]

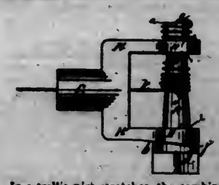
Brief.—A recording and signal device for fare-boxes. It is operated by a push pawl, which engages with pins on the face of a rotating disk, the said disk having teeth on the circumference, meshing into a pinion attached to a roll on which the paper is wound. By every downward movement of the push-pawl, the paper is moved a certain distance, and caused to be punctured by a pricker, which is thrown against the paper by the pins on the face of the disk, and at the same time an alarm is sounded by a gong, the tongue of which is attached to the pricker.

1. The puncturing device, formed on or connected with the arm of the signal-hammer, substantially as specified.

2. The combination, with bell-hammer and rotor, of the wheel B, push-pawl F, rest G, point H, and springs *f* K, all substantially as shown and described.

170,023. HORSE-HITCHING DEVICE. Johns Schoonmaker, New York, N. Y. [Filed Oct. 20, 1875.]

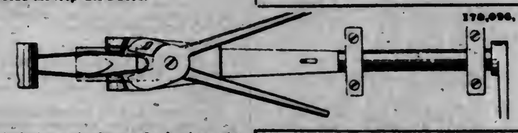
The combination of the devices B O D E and the hooks F, with the reins A of a harness, and with the shafts or body of a wagon, substantially as herein shown and described.



170,024. WIRE FENCES. Thos. S. Sanbury, St. James, N. Y. [Filed Sept. 21, 1875.]

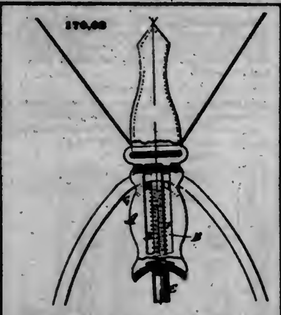
Brief.—Slotted blocks of wood are slipped upon the wire, and socketed into each other, thus admitting the employment of lighter and cheaper wire, and protecting it from rust.

The curves D, with stems *a*, sockets *f*, and longitudinal slot *g*, in combination with the wire C and posts A A, substantially as and for the purpose set forth.



170,025. GRAPE-VINE TRELLISES. Thomas S. Sanbury, St. James, N. Y. [Filed Apr. 28, 1875.]

In a trellis-wire stretcher, the combination, with a forked framing, E, constructed with arms E' E', having bearings *i i* and ratchets *j*, and supported by a hollow stand, G, of the windlass-shaft A, formed with ratchets *a*, square end *d*, and holes *e* and *f*, leading from the periphery of the windlass-shaft A to the extremity thereof, all constructed and operating substantially as and for the purpose described.



170,026. TOOLS FOR BENDING BALE-HOOPS. Benjamin R. Springsteen, Schodack Landing, N. Y. (Filed Sept. 20, 1875.)

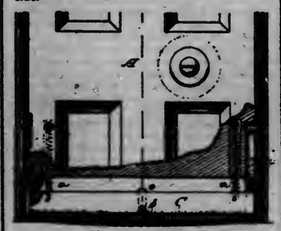
Brief.—A heat wire, with its open ends confined in a stationary vise, is laid over the forming-block of the tool, and its looped end pressed together in pinchers. The tool is then revolved by a crank, twisting together the free ends, whereupon the hinged plate, to which the pinchers are attached, is turned over to bend the loop into a hook.

A device or implement for bending wire into bale hooks, made of rotating stock, with a raised shaping-piece at one end, and a hinged base-plate with clamping-jaws pivoted to said base, for twisting and bending the wire into hooks of the required shape, substantially in the manner and for the purpose set forth.

170,027. SCARFBOARDS. William Stokes, New York, N. Y., assignor to himself and Henry Heath, Brooklyn, N. Y. [Filed July 3, 1875.]

1. The combination, with a door, A, having a groove in its lower end, of the wood-n strip C, rubber tube D, springs *a a*, and guide-pin *b*, working in the slots *a*, substantially as and for the purposes herein set forth.

2. The stub E and revolving wheel G, in combination with the weather-strip C D, substantially as and for the purposes herein set forth



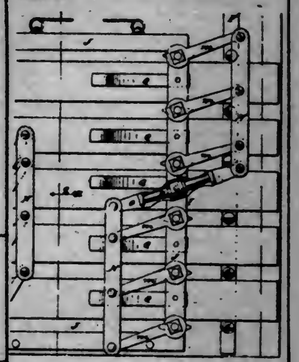
170,028. HEEL-TIPS. Frank L. Straw, Boston, and Benjamin F. Sparrow, Cambridge, Mass.; said Sparrow assignor to H. F. Sparrow, Boston, Mass. [Filed June 28, 1875.]

A heel or shoe tip constructed with penetrating fastening-points, substantially as herein described, as an article of manufacture.

170,029. WEATHER-STRIPS. Wm. Stettins, Waupaca, Wis. [Filed Oct. 22, 1875.]

Brief.—The weather-strip is held up from the threshold by springs when the door is open, and as the door is closed the strip is forced down by a stub attached to one side of the door-jamb, and a wheel or disk at the other side.

170,030.



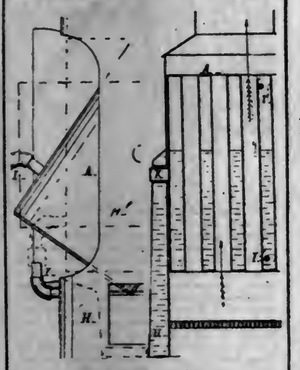
A device or implement for bending wire into bale hooks, made of rotating stock, with a raised shaping-piece at one end, and a hinged base-plate with clamping-jaws pivoted to said base, for twisting and bending the wire into hooks of the required shape, substantially in the manner and for the purpose set forth.

170,030. CIGAR-MACHINES. Charles Talbot-clarke, San Francisco, Cal., assignor of two-thirds his right to William W. Leigh and Amos S. Warner, same place. [Filed May 17, 1875.]

Brief.—The cigar is formed in a space surrounded by double series of rubber-covered rollers, one series journaled at each end, and the other at one end only, the other ends yielding to slight irregularities of substance on pressure, the two classes of rollers revolved at different rates of speed.

170,031. LATHING-MACHINES. Charles B. Trimble, New York, N. Y. [Filed June 13, 1874.]

Brief.—The laths are placed in a gage frame, thus spacing them properly. The machine is then placed upon them, the turn-buttons projecting between and below the laths. The handles which operate the buttons are then turned, forcing the laths up against the retaining springs, where they are securely held until nailed to the wall. The machine is then removed.



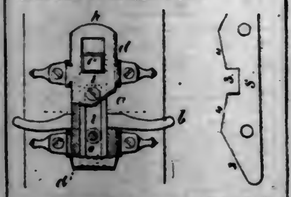
1. The combination, in a lath taking up and clamping apparatus, of the frame J, pivoted headed buttons K, arms m, connecting-bars N, central pivoted bars O, and handles P, the buttons and their connecting-arms being located in double sets at both sides of the end bars of the frame, as and for the purpose described.

2. In combination with the lath taking up and clamping apparatus herein described, the lath-retaining springs Q, arranged as shown, for the object stated.

3. The case A, having hinged bars F and pins G, for separating and arranging the lath in one or more tiers, substantially as shown and described.

170,032. REVERSIBLE STEAM-BOILERS. S. S. Vail, Keokuk, Iowa. [Filed May 1, 1875.]

Brief.—The boiler is suspended within an inclosed frame upon trunnions, by which the ends are reversed. The lower part of said frame forms a feed-water heater. The boiler and heater are connected by means of detachable pipes, which hold the boiler in position when in use.



1. The upright boiler with upright flues, hung on bearings to reverse ends, substantially as set forth.

2. The reversible boiler A, hung on trunnions K, and fixed firmly in position to its supporting-frame H' when in use, by detachable connections, substantially as set forth.

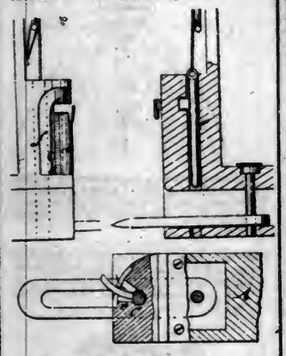
3. The combination of the reversible boiler A, hung on trunnions K in frame H', with feed-water heating-chamber B, and detachable pipes I I', substantially as set forth.

170,033. GATE-LATCHES. John Vetterlein, Plainfield, N. J. [Filed Oct. 22, 1875.]

Brief.—A vertically-moving latch and latch-block provided with handles, a slotted case that sustains each latch, a cap to exclude moisture, and rollers around the supporting-screws, upon which the latch moves, are combined. The end of the latch projects through the case, to enter a notch in the double-inclined catch on the opposite post.

1. The vertically-sliding slotted bar *a*, latch-block *c*, and handles *b*, in combination with the slotted latch-case *d*, cap-plate *h*, screws *l*, and rollers *e*, as and for the purposes set forth.

2. The catch-plate *s*, made with the descending inclines 4 4 between the notch 3 and the ascending inclines 2 2, for the purposes set forth.

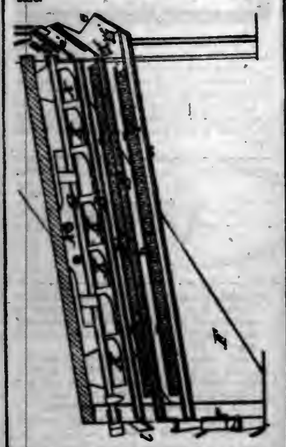


170,034. WINDOW-SCREENS. H. B. Walbridge, Brooklyn, N. Y. [Filed Oct. 29, 1875.]

The combination of the keepers F and the open ring springs E, with the rollers D and the gauze C, to adapt the screen to be applied to a window, substantially as herein shown and described.

170,035. CAR-COUPLINGS. T. A. Watson, Bentonville, Ark. [Filed Oct. 2, 1875.]

Brief.—The concussion of the cars causes the bent arm to turn and drop the pin.

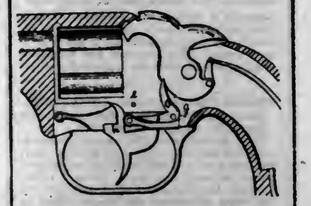


1. In automatic car-couplings, a draw-head having a front recessed and slotted top standard, in combination with a sliding coupling-pin having curved and spring-acted arm for retaining the pin in raised position and dropping it when released from the shoulder, substantially as specified.

2. The top part or guide-standard of the draw-head, being rounded off at one side for the projecting arm, and of square shape at the other side to come in contact with the arm of the coupling-pin and drop the same for coupling, substantially as specified.

170,036. APPARATUS FOR TREATING BLOOD, TANK-OFFAL, &c. Thomas Webber, Chicago, Ill. [Filed Sept. 18, 1875.]

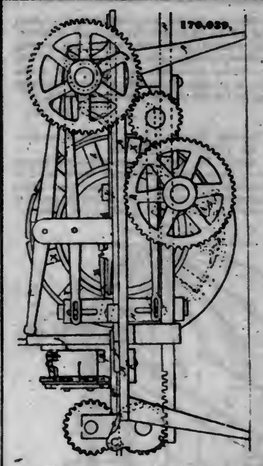
Brief.—The blood, having first been coagulated by steam heat in a tank, is placed on a heated plate, which is armed with spikes. A similar plate, similarly armed, engages with the first, and the blood is thus thoroughly dried and disintegrated. Upon the exit of the material from between these plates, it is carried by suitable elevators to a hopper, from which it passes between another pair of similar plates. It finally passes over a heated plate, upon which it is moved from side to side by a beam having a series of shovels on its under side.



170,037. BUCKLES. Paul Whitney, New York, assignor to Louis Sanders, Brooklyn, N. Y. [Filed Oct. 11, 1875.]

The combination, with the buckle-plate *c*, loop *b*, and pawl *a*, of the hinges *i* and bent arm *r*, the latter connected with the pawl, and having one end passed through a hole in the plate *c*, as and for the purposes set forth.

170,038. LOCKS FOR FIRE-ARMS. George B. Williams, San Francisco, Cal. [Filed Dec. 24, 1874.]



The combination of the trigger *s* and *g* with the pawl *a* and *f*, the spring *h*, and the stop-pin *c*, substantially as and for the uses and purposes hereinbefore described.

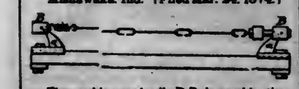
170,039. PAPER-BOX MACHINES. John B. Williams, New Haven, Conn., assignor to Hiram Stevens, same place. [Filed Apr. 7, 1875.]

Brief.—Paper from the web passes between the scoring, cutting, and feed rolls, under the paste-box, thence under the reciprocating knife, which severs the blank, when it is seized by the nippers, which draw it over the die. The wheel carrying the formers then rotates, forcing the sheet into the die, when the side and end folders advance and complete the box. The former-wheel then rotates one notch to bring another former into the die, while the end of the completed box is pressed by the segmental plate, and the pressure-fingers hold the sides until the paste is dry. At the proper time the box is delivered by the stripper-fingers.

170,039.

1. The combination, with the formers X X, of the presser-arms M', having the incline or cam M' formed thereon, constructed and operating substantially in the manner described and specified.

2. The combination, with a reciprocating paste-box, of the pasting-tubes *p p*, through which the gum or paste is ejected by a pumping or valve mechanism, operated by the descent of the box, constructed and operating substantially in the manner described and specified.



3. The reciprocating nippers E, in combination with the reciprocating paste-box and knife, constructed and operating substantially in the manner described and specified.

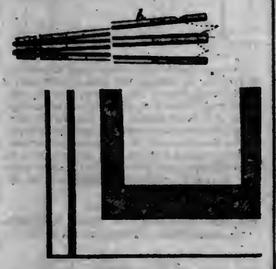
4. The combination, in a paper-box machine, of a series of formers, X, a die, H, through which these formers pass, a series of folders, and a system of devices for retaining the boxes in shape on the formers while drying, constructed and operating substantially in the manner described and specified.

5. The combination, in a paper-box machine, of a series of formers, X, a die, H, through which these formers pass, a series of folders, a system of devices for retaining the boxes in shape on the formers while the paste or gum is drying, and a device for stripping the boxes from the formers, constructed and operating substantially in the manner described and specified.

6. The combination of a pair of incising, scoring, and feeding rollers, a reciprocating knife and paste-box, a pair of nippers, a series of formers, a die through which these formers pass, a series of folders, a system of retaining devices, and a stripping device, constructed and operating substantially in the manner described and specified.

170,040. SPRING BED-BOTTOMS. A. Younge, Mishawaka, Ind. [Filed Mar. 24, 1874.]

The rocking rod rails B B, in combination with the hooks *c c*, arranged and operating in the manner described, and for the purpose specified.



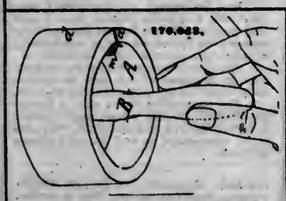
170,041. SCREW-FASTENINGS. Jesper O. Ahlstrom, Williamsburg, N. Y. [Filed Aug. 30, 1875.]

Brief.—Improvement on Patent No. 13,177, July 3, 1855. The expansible side pieces are operated upon at both ends at the same time.

The combination of the supplementary and free double wedge *g* follower *f f* with the double wedge *b*, the expansible side pieces *c c*, and the bolt B, substantially as specified.

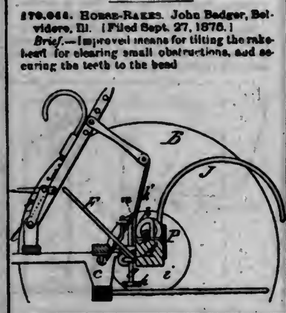
170,042. PHOTOGRAPH-ALBUMS. Henry T. Anthony, New York, N. Y., assignor to E. and H. T. Anthony & Co., same place. [Filed Aug. 20, 1875.]

The photograph-album sheets, united together by the sheet of cloth-lined paper, that is folded, and forms both the back hinge and the faces of the adjacent pasteboard bodies, as set forth.



170,043. COMBINED BLOTTERS AND PAPER-WEIGHTS. Wm. H. Babcock, Homer, N. Y. [Filed Sept. 20, 1875.]

Brief.—The blotting-paper is held upon the cylinder by a wedge-shaped key, which enters from the under side of a longitudinal slot formed in the cylinder. The handle is fitted loosely in and extends part way through the cylinder, thus permitting the latter to rotate upon the former, and also serve as a weight when not used for blotting purposes.



1. The key *m*, adapted to enter the slot *s* from the inside and hold by friction, as described, in combination with the cylinder A, the grooves *s s'*, and the blotting-paper *d*, as specified.

2. As a new article of manufacture, the paper-weight and blotter described, consisting of the cylinder A, carrying the attached blotting-paper *d*, and the loose shaft or handle B, projecting at one end only, as specified.

170,044.

170,045.

170,044. HORSE-RAKES. John Badger, Belvidere, Ill. [Filed Sept. 27, 1875.]

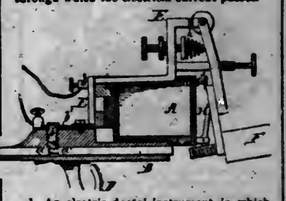
Brief.—Improved means for tilting the rake-head for clearing small obstructions, and securing the teeth to the head.

1. In a horse hay-rake mounted on two transporting-wheels, the thills C C, hinged to the top of the axle, in combination with a compound locking-lever for holding down or raising the lock-teeth at will, to be operated by a tripping-lever, F, for releasing this locking-lever when it is desired to discharge a gathered load, substantially as described.

2. In combination with an axle carrying rake-teeth, and having the draft-thills hinged to its upper side, the lever P, connecting-rods *f f*, levers carrying friction-rollers *h h*, and the plates *i i* on transporting-wheels B B, substantially as described.

3. In combination with the locking-lever *j*, formed with a longitudinal slot where the same is attached to the standard *l*, the double lever T and *i*, to produce a slight lengthening or shortening of said rod *j*, and thus slightly raise or lower the rake-teeth J without throwing the locking-lever out of lock.

4. The spring *m* on the thill-frame, in combination with the arm *h'*, axle, and locking-lever, substantially as described.



5. The hand-lever P, pivoted to a hinged-piece, *c*, for allowing a forward, backward, and lateral vibration thereof, in combination with the oscillating rake-head A, having thills C pivoted to it, as described.

6. The guard-plate P, rigidly secured to the under face of the rake-head, in combination with the curved teeth J, provided with coils *p* immediately over the guard-plate, substantially as described, and for the purpose set forth.

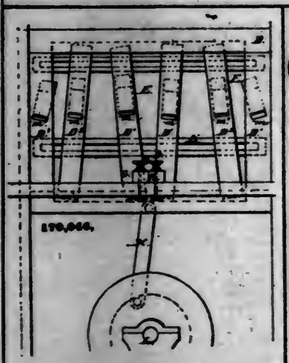
7. In combination with the spring-coils *p* and hooks *p'* on teeth J, the plates *s'*, slotted and lipped as described, and the removable key-rod N, for holding the teeth in their places, substantially as described.

170,045. ELECTRO-MAGNETIC DENTAL PLUGGERS. Wm. G. A. Bonwill, Philadelphia, Pa. [Filed July 21, 1873.]

Brief.—Frame provided with handle or guard to assist in holding. Pin that holds plugging-tool in instrument attached to an adjustable plate to compensate for wear. The circuit-breaking lever, which is struck by the mallet at every blow, has an adjusting-spring, through which the electrical current passes.

1. An electric dental instrument, in which the insulated coils A A' are arranged close together, with the tool B between and at one side, and the guard D upon the same side, and extending beyond the tool, all as and for the purpose set forth.

2. The combination, with the instrument, of a guard or handle, D, by which the said instrument may be held in a proper position for operation in either the right or left hand, substantially as herein described.



3. The combination of the socket, open at both ends, the tool B fitting the socket, and having shoulders *a a'*, and a spring-retaining pin beveled at one edge, as and for the purposes set forth.

4. The retaining-pin *b*, secured to and rendered adjustable upon the frame, with a plate, *b'*, from and toward the mallet F, substantially as and for the purpose specified.

5. The combination, with the said lever H, of a spring, *s*, the power of which can be increased or diminished as required, and through which the current is caused to pass, as specified.

170,046. BOX-TRIMMING MACHINES. Christ Bopp, Green Point, Brooklyn, N. Y., assignor to himself and Jos. H. Swift, same place. [Filed Oct. 27, 1875.]

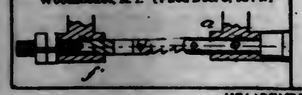
Brief.—The overhanging ends of boards used in the construction of boxes can be rapidly trimmed off by means of a series of laterally-adjustable planing-cutters, mounted in a vertically-reciprocating frame, and set in oblique positions to the line of their motion, in connection with suitable feeding and operating mechanism.

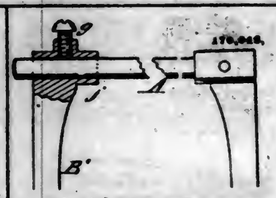
1. The slotted bars E and the adjusting-screws d^3 d^3, in combination with the nosh D and adjustable pieces D^1 D^1, as and for the purpose specified.

2. The adjustable pieces D^1 D^1, in inclined positions in the nosh D, with irons m^1 m^1 at right angles in said pieces, as and for the purpose specified.

170,047. FASTENERS FOR THE MEETING-RAILS OF SASHES. Elias K. Brockenridge, West Meriden, Conn. [Filed Oct. 21, 1875.]

Brief.—A beveled-edge locking-bolt placed within, and combined with, the swinging arm, in such manner as to automatically engage with the vertical bar of a suitable striking-plate, together with certain locking-recesses of the base-plate and a peculiar arrangement of the spring to give the bolts longitudinal movement.





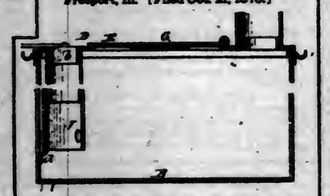
1. In combination with the sweep C *a*, pivoted upon the base-plate A, and engaging with the bar *f* of the striking-plate F, the locking-bolt D d^2, working longitudinally within said sweep, and engaging automatically with said bar *f*, in the manner and for the purpose substantially as specified.

2. In combination with the sweep C *a*, pivoted upon the base-plate A and engaging with the bar *f* of the striking-plate F, the locking-bolt D d^2, working longitudinally within said sweep, engaging with said bar *f*, and provided with a stud, d^{2a}, which engages with the recesses a' and a'' of said base-plate, substantially as and for the purpose shown.

3. In combination with the central portion *d* of the bolt D, and with the stud E, the spring E, encircling said stud, having its ends contained within the transverse notches *s s* of said part *d*, and operating to move said bolt longitudinally, substantially as and for the purpose set forth.

170,048. SCROLL-SAWS. Wm. H. Briggs, Woonsocket, R. I. [Filed Dec. 6, 1874.]

170,046.

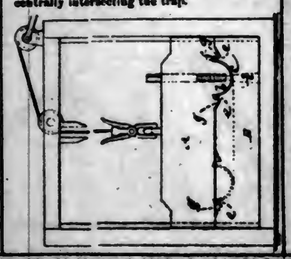


The saw-frame herein described, consisting of the arm B, having the arm A and tube *a* for the reception of the stem *b*, arm B^1, provided with tubes f f^1, stem b^1, and adjusting-screw *g*, in combination with the saw D, having a perforation at one end, and an oblique slot at the other end for the reception of pins, whereby the saw-frame may be adjusted to saws of different lengths, and at the same time may be readily removed, substantially as described.

170,049. COG-WHEELS. Chas. B. Brooks, Marshall, Mich. [Filed Oct. 12, 1875.]

The covering of solo-leather A, or other suitable material for the cogs of gear-wheels, as herein described, and for the purpose set forth.

170,050. FEED-COOKERS. J. S. Brubaker, Freeport, Ill. [Filed Oct. 21, 1875.]

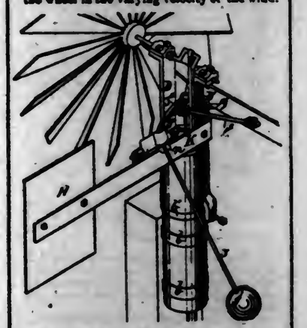


1. In a feed-cooker, the draft-tube I, provided with a cast-iron bottom piece, J, and held removed from the body of the cooker by means of the collar *b* and hook *d*, substantially as and for the purposes herein set forth.

2. The hooked legs or projections A, extending from the sides of the body A, substantially as and for the purposes herein set forth.

3. The combination of the cone A B, having draft-tube I, with bottom piece J, collar *b*, hook *d*, top D, and hinged lid E, with mica G, all substantially as and for the purposes set forth.

170,051. MACHINES FOR MAKING SHEET-METAL TRAPS OR BENDS. Wm. A. Butler, New York, N. Y. [Filed July 24, 1875.]



Brief.—For making a trap in two similar portions, with seam extending directly along the trap, and from front to back, in a plane centrally intersecting the trap.

The female die B, having ledges *c* along either edge of its forming chamber or cavity, in combination with the male die A, having cutters *g* correspondingly arranged on its face in relation with the former thereon, for operation in relation with each other, substantially as and for the purposes herein set forth.

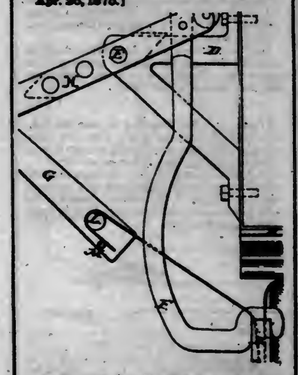
170,052. WINDMILLS. M. Carter, Princeton, Ill. [Filed May 11, 1875.]

Brief.—The vane and the wheel are hinged or pivoted relatively to each other, so as to approach and recede to or from each other automatically, and for regulating the speed of the wheel in the varying velocity of the wind.

In combination with the side vane H, located at a point between the vertical axis of the wind-wheel and the tail-vane, the levers J J^1, link *i*, rod K, and stops $n n'$, for regulating the position of the vane G, substantially as set forth.

170,053. MEAT-CUTTERS. George L. Chadborn and John B. Chadborn, Newburg, N. Y. [Filed Sept. 9, 1875.]

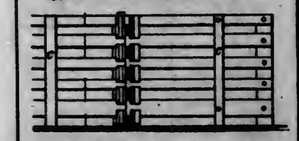
Brief.—The revolving cutter is adjusted at the end of the trough by set-screws at each side. A false bottom with claws is automatically moved as a feeder by means of a screw and traveler in line beneath—said screw rotated by a tappet on the periphery of a balance-wheel, which carries the cutters, and held to duty by a spring-cushion at its opposite end.



1. In combination with the pivotal bearing-pin C, made longitudinally adjustable within the leg B^1, and with the washer F, surrounding said pin between its shoulder *e* and said leg, the nut e', arranged to draw said bearing-pin inward, and the set-screws G and G_1, arranged to press said washer and pin outward, substantially as and for the purpose shown.

2. The false or movable bottom H, fitted loosely to, and moved longitudinally within, the box A, and provided at its end with the spurs h and h_1, substantially as and for the purpose set forth.

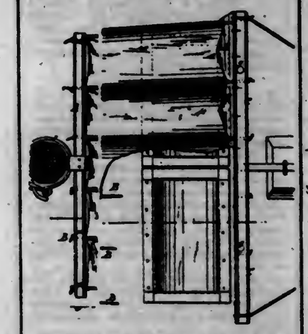
3. In combination with the false or movable bottom H, provided with the downward-extending arm h', the screw I, journaled beneath the box A, and provided with the star-wheel K, and the leg D^1, attached to the balance-wheel, and engaging with said star-wheel, substantially as and for the purpose shown and described.



4. In combination with the screw I and its bearing *i*, the spring i', placed within the latter, and bearing against the end of said screw, substantially as and for the purpose specified.

170,054. BALE-BAND-TIGHTENING DEVICE. Chas. H. Chase, New Orleans, La. [Filed Apr. 26, 1875.]

The lever H, bars F and G, in combination with the brackets D and rod E, the whole being constructed and arranged substantially as described, and for the purposes specified.

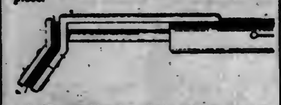


170,055. FENCES. Henry B. Claxton, Ripley, Ohio. [Filed Sept. 20, 1875.]

The combination, in a worm-fence, of the long and short panels, having the ends of their planks notched, as described, to interlock with each other, and braced and supported by the vertical slats C C, which extend to the ground, substantially as and for the purpose set forth.

170,056. FRUIT-GATHERERS. Ira Coe, Quincy, Ill. [Filed May 24, 1875.]

Brief.—The fruit-catcher may be rotated around the tree and fixed at any point.

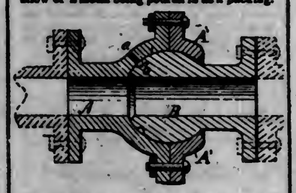


1. In a fruit-gatherer, the combination of the bars A C, of unequal lengths, cords B, and canvas D, arranged over said cords in folds or depressions, increasing in depth toward the discharge-ends, substantially as and for the purpose described.

2. A fruit-gatherer composed of the bars A C, cords B, and canvas D, in combination with the strap *f*, whereby said gatherer is attached to a tree and adapted to be moved into different positions around said tree, substantially as shown and described.

170,057. TOOL-CARRIERS FOR DENTAL RECEIVERS. Thomas Cogswell, Boston, Mass., assignor to Saml. S. White, Philadelphia, Pa. [Filed Nov. 5, 1875.]

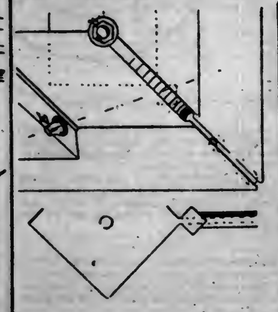
Brief.—A tubular support carries a driving-spindle, and has a carrier rigidly united to the hand-piece. Gearing is mounted at such an angle to the shaft as that the tool shall rotate at an angle both to the carrier and the hand-piece.



1. The combination of the tubular support or attachment of the hand-piece, the driving-spindle receiving therein, the carrier, rigidly united to the hand-piece attachment and projecting laterally therefrom, the gearing, mounted in the carrier, and the tool-holder, likewise mounted thereon, both at an angle thereto and to the hand-piece attachment, these members being constructed and operating in combination, substantially as set forth.

2. The sectional tool-carrier and gearing-frame, consisting of the combination of the angular arm and the plate detachably secured thereto, substantially as set forth, whereby the gearing is protected and removably secured in position.

170,058. PIPE-COUPLINGS. John A. Cole, Chicago, Ill. [Filed Sept. 22, 1875.]



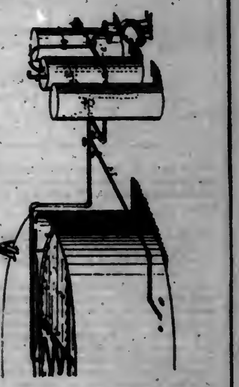
Brief.—The socket-head has a circumferential groove. The vent in the outer case is to allow of a metal being poured in as a packing.

The combination of ball B, having groove *b* with socket A A', constructed as described, and provided with aperture *a*, substantially as and for the purpose described.

170,059. BILLIARD-TABLES. Hugo W. Collander, New York, N. Y. [Filed Sept. 20, 1875.]

Brief.—Metal corner-pieces are used to hold the side and end pieces of the frame and rails securely in place.

---

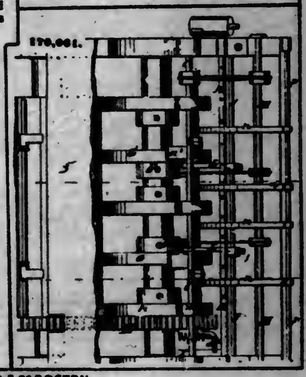


1. In combination with a side and end broad-rail, or with two sides of a wooden-frame table, an intermediate or interposed device or piece adapted to hold the ends of such broad-rails or table-sides in place laterally, substantially as described.

2. In combination with a wooden-frame table, a stand or plate suitably made to give a bearing to and afford means of securement to it of the leg, when such stand or leg-holding device is cast with or rigidly united to the plate or casting, which is interposed and held fast between the sides of the table, as set forth.

3. A corner-plate or intermediate casting, formed or provided with a brad or rib adapted to cover the joint between the wooden broad-rails at the outer corner of their junction, substantially as and for the purposes set forth.

170,060. FIRE-EXTINGUISHING APPARATUS. Jos. H. Connelly, New Brighton, assignor to James L. Hastings and W. H. Hastings, Pittsburg, Pa. [Filed Sept. 4, 1875.]



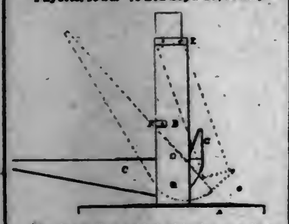
Brief.—A device for introducing a stratum of gas directly onto the surface of the oil, whereby combustion is stopped. The apparatus permits of water and gas commingled being used, or the gas may be used with air or other gas, steam, or vapor under pressure. The jets are kept at the level of the oil by weights and floats.

1. In combination with a tank for containing oil or other hydrocarbon, a series of jet openings or perforations, automatically adjustable to the varying level of the oil, and having a jointed pipe for furnishing a supply of fluid without regard to the adjustment of the jets or perforations, substantially as set forth.

2. The gas and gas-and-water receivers D D^1 D^2, alternately arranged, in combination with a common supply and a common discharge, substantially as and for the uses set forth.

170,061.

170,061. SHEET-DELIVERY MECHANISM FOR PRINTING-PRESSES. C. B. Cottrell, Westerly, R. I. [Filed Sept. 24, 1875.]

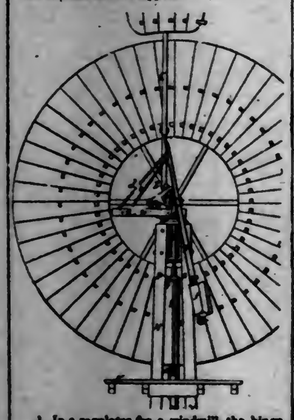


1. A series of griper wheels or disks, G, or their equivalents, adapted to operate substantially in the manner and for the purposes described.

2. The combination, with wheels or disks G, provided with gripers, of delivery-tapes mounted independently of said disks, substantially as and for the purposes described.

3. In combination with a wheel or disk, provided with a griper-finger, substantially as described, a griper-bar, and an intermediate device for operating said griper-finger, substantially as set forth.

4. The combination, with the delivery mechanism of a printing-press, of an air-pump, or its equivalent, for the production of air-jets or currents, substantially as described, to float or balloon away the printed sheets, as set forth.



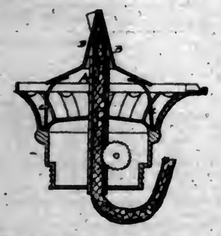
170,062. WAGON-JACKS. J. C. Crawford, Fayette, Iowa. [Filed Sept. 20, 1875.]

The lever C, provided with the seat G, in combination with the two-part frame B B, provided with the stop F and band E, as set forth.

170,063. WINDMILLS. Montgomery Cromman, Marshall, Mich., assignor of one-half his right to Pratt A. Spicer, same place. [Filed Aug. 2, 1875.]

Brief.—This windmill has a regulating-vane with wings set at an angle. The staff of the vane is attached to the bearing of the main shaft by a hinge arranged to revolve the staff and its vane. Below the yoke is a cross-bar and a short arm, having an eye in its lower end for attaching the rope. The upper and lower portions of the pitman-rod are connected together by means of a swivel-joint. When the staff and vane are brought to a horizontal position, the wheel is held firmly with its edge to the wind and is stopped.

1. In a regulator for a windmill, the hinge consisting of the parts *i*, *i*, *p*, and R, when arranged and combined with the regulator and with the windmill, substantially as and for the purpose as shown and specified.

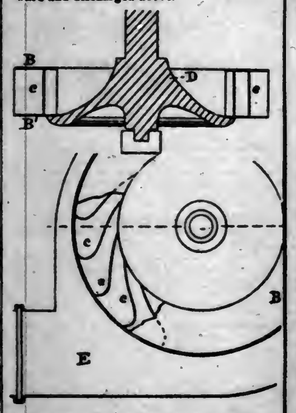


2. In a windmill, the bar *l t*, in combination with the yoke or clutch 7 of the swivel P and with the timbers H of the tower, when arranged and operated substantially as and for the purpose shown and described.

3. In a windmill, the socket J M 17, in combination with the timbers H of the tower and the pivot *g*, when constructed and arranged substantially as and for the purpose shown and specified.

4. In a windmill, the swivel-joint *k*, having a second bearing, *x'*, in combination with the two parts of the pitman-rod, when constructed and arranged substantially as and for the purpose shown and specified.

170,064. LAMP-EXTINGUISHERS. William C. Crow, Boston, Mass. [Filed Mar. 16, 1875.]



Brief.—The springs press the plates in contact when the wick is lowered.

The plates B B, arranged to have openings between their bases and the wick-tube, in combination with the springs *c c* and wick-tube A, substantially as described.

170,065. WATER-WHEELS. C. H. Darling, Crary's Mills, N. Y. [Filed Oct. 16, 1875.]

Brief.—The lower side of this wheel is closed and the upper side open, and provided with a conical formation about the center of the wheel, rising gradually from the floor of the buckets at their inner extremities, so that the water passing in the wheel is conducted upward and discharged above.

1. The turbine water-wheel, constructed with the central conical formation D, the open top and closed bottom, substantially as shown, for the purpose specified.

2. The combination of the chute E, and wheel provided with the interior conical formation D, buckets *a*, plates B and B', the open top and closed bottom, as and for the purposes described.

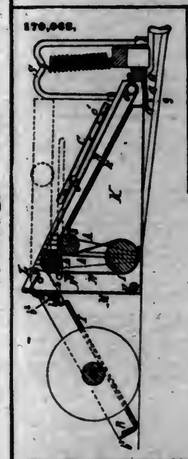
170,066. EXPLOSIVE COMPOUNDS. Henry J. Detwiller, Bethlehem, assignor to H. A. Doster and C. W. Roepper, same place, and Wm. J. Taylor, Chester, Pa. [Filed Aug. 26, 1875.]

The detonating compound consisting of ground bark or sawdust, chlorate of potassa, and amorphous phosphorus, substantially in the proportions herein set forth.

170,067. DETONATING RAILWAY-SIGNALS. Henry J. Detwiller, Bethlehem, assignor to H. A. Doster and C. W. Roepper, same place, and Wm. J. Taylor, Chester, Pa. [Filed Aug. 26, 1875.]

Brief.—A film of tin or lead foil and paper is placed between the bottom plate and the detonating composition, so as to completely seal the contents of the cavity.

1. In a detonating-signal or torpedo the combination, with the cavity *d* for the detonating compound, of a sealing-bottom film, *f*, therefor, substantially as herein set forth.



2. The combination, with the base and cap plates *a b* of a railroad-torpedo, of a lining or sealing partition, *f*, interposed between them, and protected in the manner and for the purpose herein set forth.

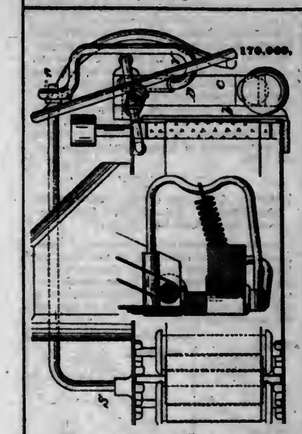
170,067.

170,068.

170,068. ADDRESSING-MACHINES. Robert Dick, Buffalo, N. Y. [Filed July 1, 1875.]

Brief.—The address-slip is wound on a reel at the back of the machine, and passes over a paste-belt to the knife, which is automatic in its operation. The lower knife is clamped to the frame by a spring.

1. The combination, with the shell M, endless belt N, and rollers 1, 2, and 3, of the guide-bearings A A, constructed and arranged substantially as and for the purpose hereinbefore set forth.



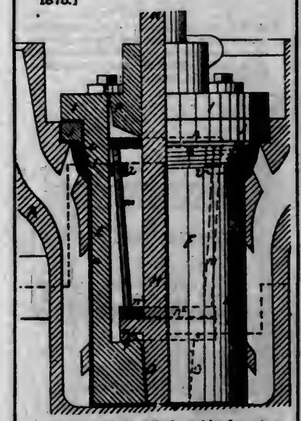
2. The combination, with the shell M, of the reel-frame B, hinged thereto, and provided with stop *b* and catch *b'*, substantially as and for the purpose hereinbefore set forth.

3. The combination, with the shell M, provided with shoulder or strip *g*, and the stationary blade Q, of the plate G, secured to the latter, and provided with flanges G'' G'', substantially as and for the purpose hereinbefore set forth.

4. The combination, with the shell M, supporting-arm(et D, and endless belt N, of the paste-fountain K, provided with inclined plate *i*, constructed and arranged as hereinbefore set forth.

5. The combination, with the shell M, provided with catch *c'*, of the hinged handle C, provided with locking-stop *c''*, substantially as and for the purpose hereinbefore set forth.

170,069. ADDRESSING-MACHINES. Robert Dick, Buffalo, N. Y. [Filed Oct. 15, 1875.]



170,070.

1. The combination of a spring-clamp, *d d*, cutter-stamp D, plate of metal *c c*, and strip of metal *a a* with the shell or frame of a mailing-machine, substantially as and for the purposes set forth.

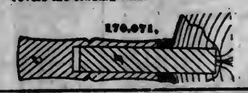
2. The combination, with the shell B, movable blade D, and lever V, of the combined motor-arm and the spring S U, substantially as and for the purposes herein set forth.

170,070. MOLDING APPARATUS. Patrick W. Doherty, Boston, Mass. [Filed May 7, 1875.]

1. The herein-described combined construction of a hollow sectional core, and of an inside pin, for an interlock between the pins and the inside of core-sections, and for a head or end to the core, which practically, and without additional fastening or other device, is solid and rigid, and is without seam or joint, all as and for the purposes specified.

2. A hollow sectional core, constructed with sections of a wedge shape from end to end, and from outside to inside, all substantially as described, for the purpose specified.

3. The combination of a hollow sectional core and an inside pin, constructed and adapted to form a solid head to the core, in combination with a matrix to secure, with the core, the molding of a head or end to the cylindrical part or body molded in the matrix, all substantially as described.



4. A matrix, constructed to cast a ring, and for the ring to close the molding-space between the core and matrix, in combination with core-sections constructed to fit within, and to rest on, said ring, substantially as described, and for the purposes specified.

5. The combination, with a sectional core, of an inside pin, connected by mechanism with more or less of the core-sections for setting them out and in, and adapted to be turned without effect on the said connecting mechanism, substantially as and for the purpose specified.

6. The connection of sections of a hollow sectional core with an inside pin, by means of rods *n* and lugs *l*, substantially as described, and for the purpose and operation on the core-sections specified.

170,071. BROOMS. Robert H. Eastburn, Philadelphia, Pa. [Filed Oct. 7, 1875.]

Brief.—The hollow handle has projecting into it the binding-stick, and between the handle and broom-head is an independent ferrule, that is held in place by the handle, and covers the binding-wire.

170,071.

In a whisk, duster, or broom, the combination of a recessed handle, a binding-stick fitting into said recessed handle, and a separate ferrule between the handle and the body of the whisk, duster, or broom, substantially as described.

170,072. CURTAIN ROLLERS AND BRACKETS. Oliver Ellsworth, Newton, Mass. [Filed May 11, 1875.]

1. The foot H, with the grooves *h* and *h'*, and the spring-bracket with ribs and guides *c'*, all constructed substantially as and for the purpose described.

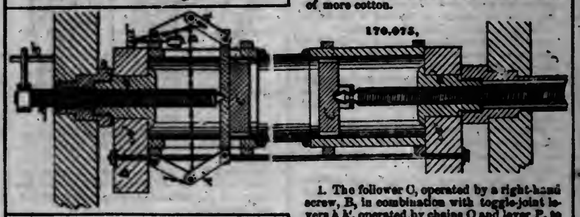
2. The counterbalanced dog F suspended to the spindle of a main gear-wheel, in combination with the pinion-wheel E.

170,073. BOTTLES. Joseph Ernst, Central City, Colo., assignor of one-half his right to Jos. Kempf, same place. [Filed Sept. 14, 1875.]

Brief.—A bottle made with compartments is provided with a revolving screw-cap, so that the tube in said cap may be placed over either of the compartments.

The combination of a bottle or other vessel having two or more compartments formed by vertical walls or divisions B C with a screw-cap having a rotating top piece, F, and tube H, that may be adjusted over either compartment, substantially for the purpose and in the manner hereinbefore described.

170,074. WAGON-AXLE SKEINS. Henry H. Fette, Richmond, Ind., and S. D. Tuttle, Eaton, Ohio. [Filed Mar. 31, 1875.]

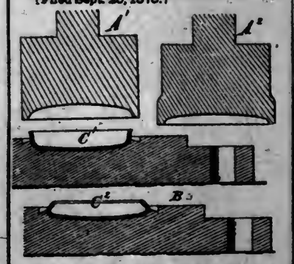


Brief.—A prismatic washer fitting on the end of the skein, and secured by a spring-bow.

The combination of the axle-skein A, provided with head A' *a' a'*, recessed washer B *a*, and spring-bow F, substantially as and for the purpose set forth.

170,075. COTTON-PRESSES. Willis L. Frost, Sherman, Tex. [Filed Apr. 19, 1875.]

Brief.—Press of cylindrical form, revolving on an upper and lower screw, causing the followers to approach or recede. Toggle-joints and chains over the upper follower retain the compression, while permitting the introduction of more cotton.



170,075.

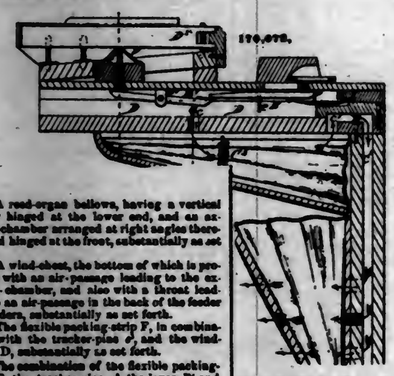
1. The follower C, operated by a right-hand screw, B, in combination with toggle-joint levers *h h'*, operated by chains O and lever P, to cause the follower C to follow the bale as the follower C' recedes, for the purpose of preventing the bale from becoming impacked, substantially as described.

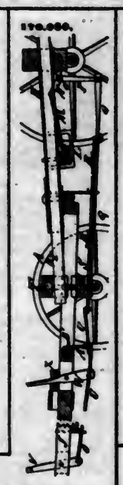
2. In combination with the follower C and toggle-levers *h* and *h'*, the weighted chain S, attached to the lever *h*, and passing over pulley T, for the purpose of elevating the follower C, substantially as described.

170,076. DIES FOR MAKING WATCH-CASE CENTERS. Joseph Goldreich, Cincinnati, Ohio, assignor to Geo. Doerr, same place. [Filed Sept. 25, 1875.]

The combination of the series of dies A B, A^1 B^1, and A^2 B^2, for forming the watch-case center, by successive compressions, from a flat plate, substantially as set forth.

170,077. SPRING BED-BOTTOMS. William Goforth, Windsor, Mo. [Filed Sept. 11, 1875.]





1. The spring bed-bars C C, hung in stirrups F F, in combination with the auxiliary spring-bars B D', cross-pieces G G, and slats E E, constructed and arranged as and for the purpose set forth.

2. The cross-piece G, hinged and bolted to the bar D', substantially as and for the purpose set forth.

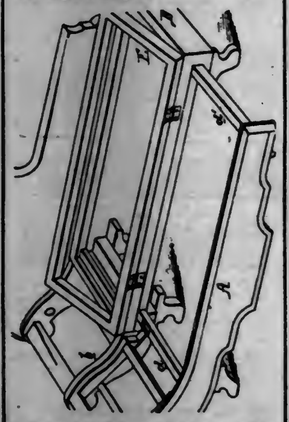
170,078. REED-ORGANS. H. N. Goodman, Syracuse, N. Y. [Filed Sept. 6, 1875.]

Brief.—To adapt the reed-organ to a case resembling an upright piano-case.

1. A reed-organ bellows, having a vertical feeder hinged at the lower end, and an exhaust-chamber arranged at right angles thereto, and hinged at the front, substantially as set forth.

2. A wind-chest, the bottom of which is provided with an air-passage leading to the exhaust-chamber, and also with a throat leading to an air-passage in the back of the feeder or feeders, substantially as set forth.

3. The flexible packing-strip F, in combination with the tracker-pins *c'*, and the wind-chest D, substantially as set forth.



4. The combination of the flexible packing-strip E, the tracker-pins *c'*, the lever E' and fulcrum-valves E, with the wind-chest D, substantially as set forth.

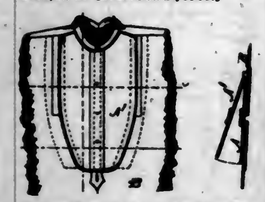
5. The herein-described organ-case, provided with an opening below the key-board to receive the exhaust-chamber of the bellows, substantially as set forth.

6. The herein-described organ-case, consisting of the narrow upright part, and the projecting key-board, having the opening below the same, in combination with the bellows made in two parts, arranged at right angles to each other, the vertical portion being arranged within the case, and the horizontal portion projecting beneath the key-board, substantially as set forth.

170,079. BOW-BEDSTEADS. John E. Gould, Jr., Philadelphia, Pa., assignor to John H. Gould, same place. [Filed Aug. 18, 1875.]

Brief.—The supplementary frame slides out from the main frame, and has a folding head-rest hinged to the side-bar.

The combination in a sofa-bedstead, of the frame D, its arm *b*, and supplementary hinged frame E, with the front A, having a hinged head-frame, F, and bars *d d'* adapted to ways in the frame, all as set forth.

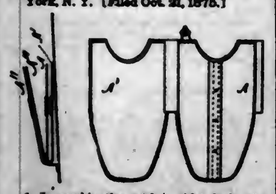


170,080. WAGON-BRAKES. Thos. H. Gourley and Wm. R. Lovelace, Talbott, Tenn. [Filed Nov. 20, 1874.]

Brief.—Operated either by pulling on end of pivoted lever or by draft of horses on whiffletrees.

170,080.

The combination of the link A' and pin or hook N with the tongue J, the lever V, the tongue-rod U, the pivoted hammer-bolt W, the slot or link S, the extension-rod R Q, the armed roller P O N, the connecting-rods M, and the brake-bar K, substantially as herein shown and described.



170,081. SHIRTS. Simeon Gutmann, New York, N. Y. [Filed Oct. 21, 1875.]

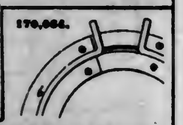
1. The bosoms A and A', formed and constructed as described and shown, in combination with the shirt-body B, provided with a neck-band, and attached to the said shirt-body at each side, as set forth.

2. The bosoms A and A', formed and constructed as described and shown, in combination with the shirt-body B, provided with a neck-band, and attached to the said shirt-body at each side of the same on the upper part only, and left free and unattached at the bottom, as specified and set forth.

170,082. SHIRTS. Simeon Gutmann, New York, N. Y. [Filed Oct. 21, 1875.]

1. In combination with a shirt-body, the bosom A', formed and constructed as described, and the bosom A, secured to each other on the upper part of the side, and on one side only, the bosom A'' being attached to the outer edge of the bosom A, with its face inward in reverse, so as to fold outward and appear face in front or inward, and be secured by the bosom A, in the manner specified and set forth.

2. In combination with a shirt-body, the bosoms A, A'', A', and A''', the two former attached directly to the shirt-body, on the upper part of one side only, the latter being attached to said bosoms in the same way, and having their outer edges left free and unattached, as shown and described, and all arranged in relation to each other, so that either bosom may be made to appear in front by the operation of folding and unfolding, as set forth.

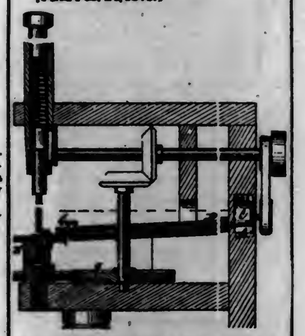


170,083. COMBINED PENCIL-SHARPENERS AND ERASERS. John S. Hall, San Francisco, Cal. [Filed Mar. 17, 1875.]

As a new article of manufacture, a slate-pencil sharpener, consisting of the block A, having the beveled corners c, chamber a, a V-groove, *b*, in its upper face, the cutters D, provided with the angular V-shaped edges *e e*, and cloth eraser *s*, substantially as and for the purpose set forth.

170,083.

170,084.



170,084. PACKING-RINGS FOR CAR-AXLE BOXES. Thos. C. Hargrave, Boston, Mass. [Filed Oct. 26, 1875.]

Brief.—Springs secured from injury by the weather or other cause; open ring retaining shape of axle, however worn.

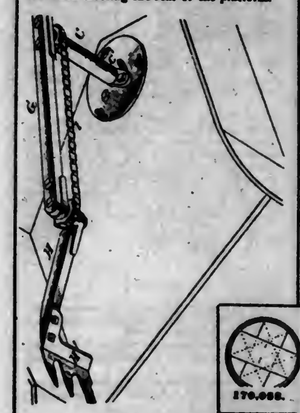
The elastic open packing-ring A, constructed, as described, of two or more pieces of leather, and provided with the metal spring *b*, secured between the thicknesses, substantially as and for the purpose set forth.

170,085. NAIL-DRIVING MACHINES FOR SHOE-MAKING. Samuel Harris, Boston, Mass., assignor to himself, Samuel Shephard, and E. P. Harrington, same place. [Filed Feb. 24, 1875.]

1. A rotary die slotted from its exterior to its center, to form a feeder for conveying the nail to the center of the die, down or in which the nail is deposited for subsequent operation on it by the driver, essentially as specified.

2. The combination of the guide M with the slotted portion or feeder *n* of the rotating die H, substantially as described.

3. The combination, in a machine for presenting or feeding and driving different-sized nails, of a combined rotary die and slotted feeder with one or more pairs of chutes, for conveying the nails to the die, essentially as specified.



4. The combination, with duplicate chutes D D, of a cut-off, G, adapted to stop the delivery from either or both of the chutes, substantially as specified.

5. A nail-feeding chute, composed of two lower and a single upper rigid and independently-vibrating wires, rods, or bars, substantially as herein described.

6. The combination of one or more hoppers, A, rotary pickers-up C, bridges *b b*, and chutes D D, substantially as herein described.

170,086. HARVESTER-RAKES. P. F. Hodges, Massillon, assignor of one-half his right to Hoover & Co., Miamisburg, Ohio. [Filed May 17, 1875.]

Brief.—The rake has a rotary motion upon its own axis, in addition to that imparted to it by the main arm, and passes under the latter when crossing the rear of the platform.

1. In combination with the oscillating pipe C, the cam-wheel F, bell-crank lever D, and link E, for communicating an irregular oscillation, substantially in the manner and for the purpose set forth.

2. In combination with the oscillating pipe C, the arm G, continuously revolving on its own axis, the sprocket-wheels O B', chain I, and rake H, having also an independent rotation, substantially as set forth.

3. The adjustable slotted plate B and sleeve B', in combination with the oscillating pipe C and the continuously-rotating shaft G', for communicating a constant rotary movement to the rake-arm, and an irregular independent movement to the rake, substantially as set forth.

170,087. PLATFORM-ELEVATORS. George C. Howard, Philadelphia, Pa. [Filed Sept. 20, 1875.]

Brief.—Platform suspended by four ropes, two of which pass directly around overhead drums, which receive also the others, that first pass over pulleys—the winding on the drums regulated by screw-threads thereon, the pulleys following the necessary lateral action by revolving along screw-threaded spindles. The drum-shaft is rotated by a hand-rope and wheel, actuating wheels and pinions by fast or slow motion.

1. In combination with the platform of a hoisting-machine, two sustaining ropes attached to opposite sides thereof, and connected to a take-up drum or drums, and two guide-pulleys, located between the platform and the drum, and mounted upon right and left hand screws, substantially as shown and described.

2. In combination with a sustaining-rope of a hoisting machine, and a take-up drum therefor, a guide-pulley mounted on a screw in such manner as to have a lateral movement for the purpose of laying the rope properly upon the drum.

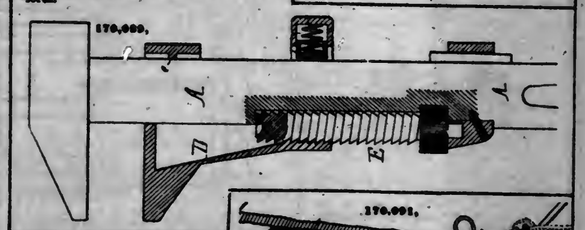
3. The combination of the platform B and its sustaining-ropes C C', with the right and left hand grooved drums I I, and the guiding-pulleys F mounted on right and left hand screws, substantially as shown.

4. In combination with the drum shaft E, provided with the wheel G, the shaft I, provided with the pinion H and wheel K, and the driving-shaft M, provided with the double sliding pinion N O, as and for the purpose described.

5. The combination of the brake-lever V, having the stud *s* and the spring *f*, arranged as shown.

6. In combination with the toothed guides A, the platform B, and the ropes C C, the catches Y, rock-shafts Z, provided with arms *g*, connecting bar *h*, and spring *m*, as shown.

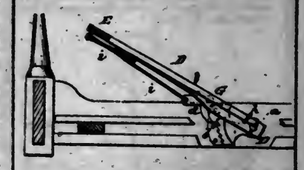
170,088.



170,088. MANUFACTURE OF PAPER BOXES. John B. Jeffrey, Brooklyn, N. Y. [Filed Mar. 26, 1875.]

The manner described of forming the sides and ends of paper boxes, by cutting the edges of the blanks, reducing the paper to a soft pulpy condition, and then rolling or pressing it into a uniform mass, substantially as specified.

170,089. WRENCHES. Benjamin F. Jocelyn, Worcester, Mass., assignor to R. P. Bruff, New York, N. Y. [Filed Sept. 19, 1874.]



The combination of the stem A, its screw E, tilting jaw D, bearing at *c* against the stem, and a spring secured to the jaw, bearing against the stem, and tending to maintain the jaw in contact with the screw, all as set forth.

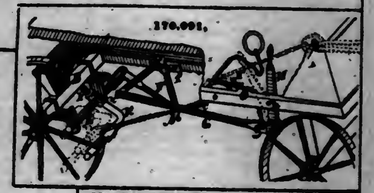
170,089.

170,090. INVALID-BEDSTEADS. W. J. Kent, Springfield, Mo. [Filed Apr. 16, 1875.]

Brief.—The spring side bars of the incline are pivoted on the notched segmental plates, and the incline is adjusted by means of the pawl and operating-cord. The slats of the incline are connected at their lower ends by a cord, which is left slack between them, in order to let the slats of the incline fall between the slats of the bed-bottom.

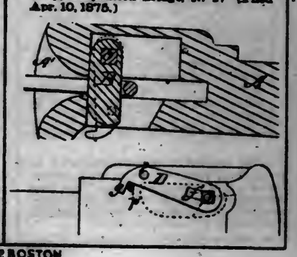
1. The combination of the broad head piece E, spring side bars D D, and slats G G, united at their lower ends by a cord, A, substantially as and for the purposes herein set forth.

2. The pieces C, provided with the pivots *a*, and notched segments *b*, in combination with the incline D E G, pawls *d*, and cord *f*, substantially as and for the purposes herein set forth.



170,091. VEHICLE DEVICES FOR CHECKING HORSES. Jas. Knight, Philadelphia, Pa., assignor of one-half his right to G. Miller, same place. [Filed Oct. 1, 1875.]

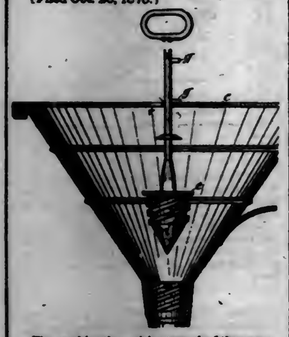
1. In combination with the jointed arm K, the sliding shaft E, double crank-arm F, arm G, and pivoted lever H, substantially as shown and described.



2. In combination with the jointed arm K, attached to the sliding shaft E, the strap or flexible connection M, substantially as shown and described.

3. In combination with the arm K and pivoted lever H, the strap or connection O, for automatically throwing back said lever and withdrawing said arm, as shown and set forth.

170,091.



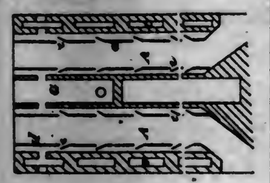
170,092. CAR-COUPLINGS. George Edgar Lacy, Suspension Bridge, N. Y. [Filed Apr. 10, 1875.]

1. In a car-coupling, the endwise-movable and vertically-vibrating lever D, in combination with the bolt C and coupling-arm B, substantially as specified.

2. The lever D, having hook *g* and slot *f*, in combination with a rest or pin, *p*, and a vertically vibrating and gravitating coupling-arm, B, substantially as specified.

170,092. MEASURING-FUNNELS. Reuben A. Lenden, Geddes, assignor of one-half his right to Richard A. Davis, Syracuse, N. Y. [Filed Oct. 26, 1875.]

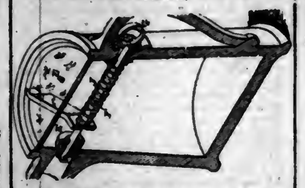
The combination, with a tunnel, of the screw-threads *a* in the outlet, screw-plug *b*, having the point or guide *i* and collar *c*, the rod *r*, provided with one or more combined gages and supports, *g*, and the detachable cross-bar *e*, provided with aperture *o*, having lateral slot *v*, all constructed to operate substantially as described and shown, for the purpose specified.



170,093. MILK-CANS. John H. Lester, New York, N. Y. [Filed Oct. 26, 1875.]

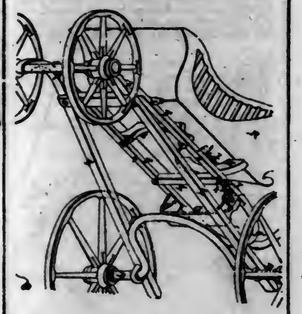
The combination of the can A, lid B, provided with the gasket, ball I, screw K, and faucets C and H, forming a vessel for the transportation of milk under pressure, substantially as described.

170,094. ORE-ROASTING FURNACES. Wm. McCall, San Francisco, Cal. [Filed July 12, 1875.]



Brief.—Five is built in a central chamber, on two opposite sides of which are the ore-chambers. Flues from the central chamber extend around the ore-chambers, so that the latter are heated on all four sides.

1. The series of narrow ore-chambers A A, in combination with the central heating-chamber B, and the surrounding flues C returning upon themselves in the walls of the furnace, as shown, so as to surround the ore-chambers, substantially as herein described.

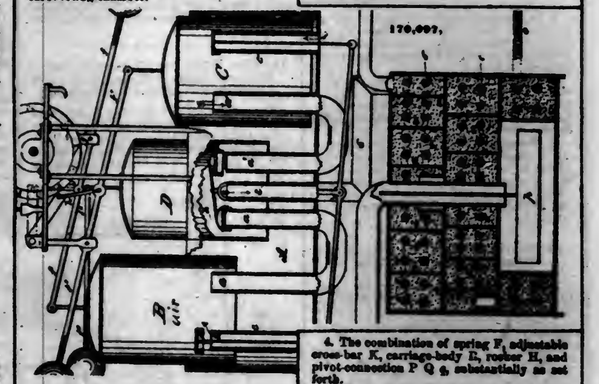


2. In combination with the narrow chambers A, central heating-chambers B, and surrounding flues C, the vertical frame passages *d d*, with their inclined shutter-like openings *e e*, and the collecting-chamber G, substantially as and for the purpose herein described.

170,095. SELF-CLOSING PITCHERS. Wm. H. McGrew and Charles A. Clark, St. Louis, Mo. [Filed Oct. 6, 1875.]

The combination, in the pitcher, of the close top D, tubular spout C, and spring-valve C E F J, substantially as set forth.

170,096. CHILDREN'S CARRIAGES. Martin Medart, Belleville, Ill. [Filed Oct. 4, 1875.]



1. The combination, with the reaches E E, of the U-shaped spring F, seat G, and strap *f'*, substantially as set forth.

2. The combination of reaches E E, bowed axle D, and spring F, substantially as set forth.

3. The combination of wagon-body B, spring F, and adjustable cross-bar K, substantially as set forth.

170,097. CARBURETERS. Saml. McKissock, Allegheny, Pa. [Filed July 10, 1875.]

Brief.—Alternately-reciprocating cylinders, having air-tight tops and working in water-seals, and having induction and eduction pipes provided with valves, force air into a central reservoir, from which it passes to the carbureter. Coils of wire form the air-passages through the fibrous absorbent packing in the carbureting-chamber.

1. In combination with the carbureting-chamber G, having the spiral partitions *a* and intermediate corresponding channels, the wires *c c*, arranged at intervals apart, running parallel with said partitions, wrapped in suitable packing, and forming continuous spiral air-passages through the said channels, substantially as specified.

2. In a carbureter, the porous air-pipes formed by the spirally-coiled wires *c*, externally packed, and having open channels through the center of the coils, with lateral access to the packing, substantially as described.

3. In combination with the chambers B C D, the pipes *a a'* and *c c'*, with their respective valves *b b'* and *d d'*, connected and operating alternately, as shown and described.

4. In combination with the chambers B C D and their operating-levers *f f'*, respectively, the adjusting counter-balances W W' W'', as and for the purposes set forth.

5. The alternately-acting pumping-chambers B C, in combination with the intermediate-acting said pressure chamber D, pipes *a a'*, connecting said chambers, valves *b b'*, carbureting-chamber G, and pipe *e*, substantially as described and shown.

6. The combination, with the alternately-acting pumping-chambers B C, weighted levers *f f'*, and ratchet-wheel E, having double row of alternating teeth, of the dogs *i i'* and links *h h'*, substantially as described, and for the purpose set forth.

4. The combination of spring F, adjustable cross-bar K, carriage-body B, rocker H, and pivot-connection P Q *q*, substantially as set forth.

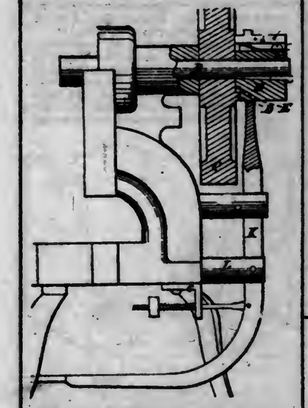
5. The combination of spring F, body B, and adjustable clamping-bars K and S, substantially as set forth.

6. The spring-link connection P L M, between the rocker H and bar K, substantially as set forth.

170,098. BOILER-COVERINGS. I. L. Merrill, San Francisco, Cal. [Filed Sept. 9, 1875.]

1. The improvement in covering boilers and and steam-pipes, the same consisting in first applying a fire-proof coating composed of the materials above mentioned; secondly, applying a second coating which is a non-conductor of heat; and, third, surrounding the whole with a material composed of the ingredients mentioned, viz., stanite, charcoal, magnesia, bittern-water, plaster-of-paris, and clay in the proportions named, which will form a hard impervious shell or casing, substantially as and for the purpose described.

2. The improvement in covering boilers and steam-pipes to prevent radiation of heat, the same consisting in surrounding the boiler covering or felt with a coating of materials consisting of stanite, charcoal, magnesia, bittern-water, plaster-of-paris, and clay in the proportions named, which will form an artificial stone or hard shell, substantially as and for the purpose described.

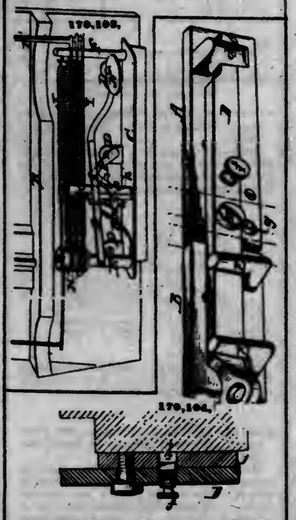


3. Stanite, charcoal, magnesia, bittern-water, plaster-of-paris, and clay, as ingredients for boiler and steam-pipe coverings.

170,100. PROCESSES OF PREPARING AND COLORING HIDES. Hollis W. Merrill and James W. Holtt, Lynn, Mass., assignors to National Boot and Shoe Tip Company. [Filed Aug. 6, 1875.]

The process herein described of preparing and coloring raw hides, consisting in soaking the unhaired and unfleshed hides in the log-wood-liquor, and then in a dyeing-liquor composed of log-wood-liquor, nut-galls, blue vitriol, vinegar, and an iron-salt, or their equivalents, substantially as described.

170,101. POWER-PRESSES. A. H. Merriman, West Meriden, Conn. [Filed Oct. 22, 1875.]

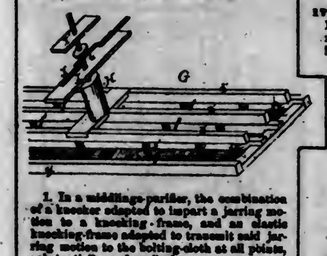


Brief.—The hub, that upon the arbor, has pivoted in a recess in one side a latch, that is normally held projecting out of the groove by a spring, and in this position extends across the path of a stub on the fly-wheel; but the latch may be depressed, when necessary, by moving the concave shoe on the end of lever in line with the stub of the latch, in which case the latch will no longer intercept the stub of the wheel.

The combination and arrangement, in a power-press, of the clutch-collar E, latch H, spring J upon the shaft B, dog D, one or more, in the hub of wheel C, guide P, and lever K, substantially as and for the purpose set forth.

170,102. MUSIC-LEAF TURNERS. William Miller, Boston, assignor to himself and H. M. Wiswall, Watertown, Mass. [Filed Sept. 4, 1875.]

In a music-leaf turner, the combination of the standards E F, guide G, slotted plate or guide M, supporting shelf or bracket C, which is adapted to be attached to a music-rack or other support, as shown, the knife H, arms I, springs J, lever L, having pawl P, toothed detent K, and spring R, all arranged and operating substantially as and for the purpose specified.

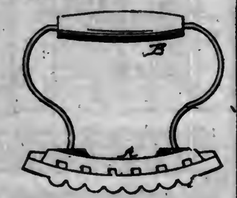


170,103. SHUTTER-BOLTS. John Mitchell, Philadelphia, Pa. [Filed Oct. 2, 1875.]

Brief.—A spring-catch, by which the main pivoted bar is held when swung in vertical position.

1. The plate A, having the hooked projection *d*, and carrying a pivoted bar, D, provided at its outer end with an eye, *b*, in combination with the plate B and its two hooked projections, B B, all substantially as set forth.

2. The bar D and its spring-bolt *f*, in combination with the plate A and its openings *g* and *h*, as and for the purpose specified.



170,104. FLOATING-BROOM. Mary Newton, Eau Claire, Wis., assignor of one-half her right to James Burnett, Oronoco, Minn. [Filed Sept. 11, 1875.]

1. In a middlings-purifier, the combination of a knocker adapted to impart a jarring motion to a knocking-frame, and an elastic knocking-frame adapted to transmit said jarring motion to the bolting-cloth at all points, substantially as described.

2. The knocking-frame G, having the springs *j* and *f*, substantially as and for the purposes set forth.

3. The combination of the knocker H, the shaft J, and the knocking-frame G, substantially as and for the purposes set forth.

A fluting-iron consisting of the corrugated plate A, with beveled ends, and the handle B, in combination with the auxiliary corrugated plate C, provided on its upper surface with a dovetail groove, substantially as and for the purposes set forth.

170,106. TRUSSES. F. G. Otto, Jersey City, N. J., assignor to F. G. Otto & Sons, New York, N. Y. [Filed Oct. 22, 1875.]

Brief.—A bar is attached to the pad, and there is hinged to this bar a plate, upon which a second plate is adjusted by a pivot, circular slot, and set-screw.

The combination of the pad A, the plate C, having the curved slot *g*, the set-screw A, hinged plates or bars B C, and spring E, arranged and operating as herein shown and described.

170,107. END-GATES FOR WAGONS. Jacob P. Outson, Racine, Wis., assignor of one-half his right to Wm. Axby, same place. [Filed Aug. 30, 1875.]

Brief.—Wedge-shaped flange engages with the clasp or hook on wagon-box.

The device for fastening end-gates for wagons herein described, consisting of the lever *a*, disk A, having wedge-shaped flange *d*, and pivoted eccentrically at *c*, in combination with the hooks or catches *e f*, arranged and operating substantially as and for the purpose herein shown and specified.

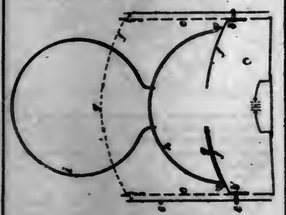
170,108. COMBINATION TILL-LOCKS. Geo. H. Peacock, Webster, assignor to George Plumb and Susan A. Newman, Fairport, N. Y. [Filed May 24, 1875.]

Brief.—A pivoted lever, having a thumb-knob projecting through an opening in the case, serves to retract a vertically-sliding spring-bolt carrier when the finger-bars are properly adjusted. A hinged guard-plate is arranged at the bottom of the case, so as to cover the finger-bars when it is closed. This guard-plate is provided with a projection, that prevents the withdrawal of the bolt-carrier, except when the said plate is closed.

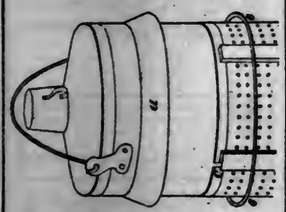
1. The combination of the bolt-carrier C, thumb-plate Q, cross-plate S, and finger-bars B B B B B and B' B' B' B' B', as herein described.

2. The guard-plate X, in combination with the bolt-carrier D, as herein described.

170,109. BUCKLES. Stephen Porter, Boston, Mass. [Filed May 7, 1875.]



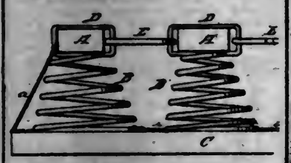
Brief.—A strap is adapted to be used as a shoe-fastener instead of a lace, by means of a buckle at one end and hooks at the other. The strap may be used and a lace dispensed with, and vice versa, or the strap may be removed from one shoe and used on another.



In combination with the buckle A, constructed as described, and the strap B, the hooks b b, for attaching the buckle to the shoe, substantially as described.

170,110. COMBINED LANTERNS AND DINNER-KETTLES. Warren Workman Price, Pottscodiac, Canada. [Filed Mar. 18, 1875.]

Brief.—The vertical slots in which the studs move are provided with notches for the same; the tubes inclosing slots and studs are embraced by hoops, and the cover is provided with folding handles and trencher.

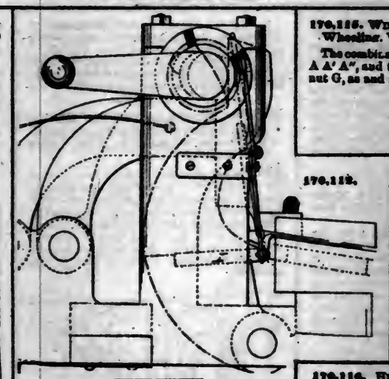


1. The flange c and studs b b, in combination with the tubes d d, provided with notched vertical slots e e, as hereinbefore specified.

2. The combination of the hoops e e with the tubes d' d' and slotted tubes d d, substantially as described.

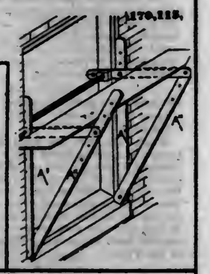
3. The regulating-cover f, provided with studs b' b', handles h and i, and trencher g, as hereinbefore set forth.

170,111. BED-BOTTOMS. Chas. W. Purcell and Samuel Purcell, Landy's Lane, Pa. [Filed Aug. 11, 1875.]



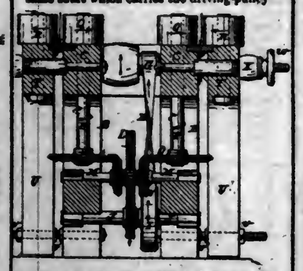
1. The spiral springs B, having the loops D formed on the top, and forming a part thereof, in combination with the slats A and links E, said links M connecting the loops D, and rigidly preventing lateral displacement, as and for the purpose set forth.

2. The springs B, having loops D, slats A, links E, and the cord a, connecting the frame C and end loops D, in combination with the staples b, all constructed and arranged as and for the purpose set forth.



170,112. MACHINES FOR MAKING RIVETS. Byron C. Quisby, Plymouth, Mass. [Filed July 1, 1875.]

In combination with the cutters, heading-tool, gage, punch, and spring-lever of a nail-cutting machine, constructed and operating substantially as described, the griping and swaging dies I J, each of breadth equal to the length of the blank covered by the cutters, minus that portion required to be upset to form the head, and each provided with a semi-cylindrical groove in its edge extending over its entire breadth, in virtue of which the dies, in compressing the blank, shall swage the same to a cylindrical form, as set forth.



170,113. WINDOW-SCAFFOLDS. C. Roberts, Wheeling, W. Va. [Filed July 2, 1875.]

The combination of the two A-shaped frames A A' A'', and the expansion screw-bar D, and nut G, as and for the purpose described.

170,114. MATCHING-MACHINES FOR BOX-STUFF. George T. Biddle, St. Louis, Mo. [Filed Apr. 6, 1875.]

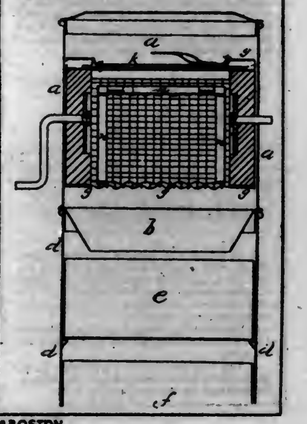
Brief.—The table is inclined to insure the constant contact of the lower edge of the stuff with it, as the stuff is fed in a horizontal direction. The outer feed-rolls are mounted in laterally-adjustable side frames, the upper parts of which are forced inward by springs, regulated by temper-nuts, on bolts passing through the main and side frames. The distance between the feed-rolls is regulated by screws passing through the side frames, and bearing against the upper part of the main frames. The cutter-heads are mounted on the same shaft which carries the driving-pulley

1. The combination, with the rolls Q and R, main frame A B C, and side frame T U, of the set-nuts v v', temper-nuts and springs w X, and distance-screws Y, all substantially as set forth.

2. The combination of cutter-heads D D', rolls Q and R, springs X, temper-nuts w, set-nuts v v', and frames T U, all substantially as set forth.

3. The combination of the cutter-heads D or D', vertical feed-rolls Q and R, and inclined bed or table C, substantially as and for the purpose set forth.

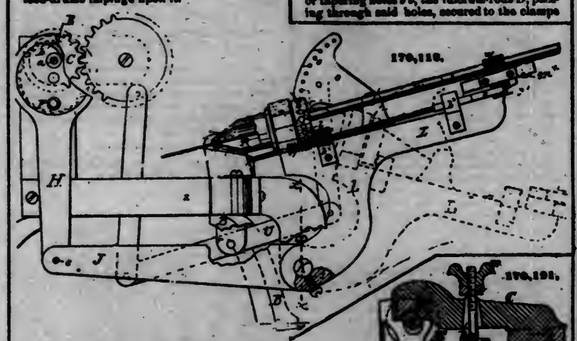
170,115. HINGE. Lewis H. Rogers, South Avon, N. Y. [Filed Oct. 12, 1875.]



Brief.—A solid flanged knuckle carries two conical pintles, which permit the hinge to be reversed. The flanges are notched to allow them to pass a projection on the other leaf of the hinge, which projection locks the parts together, except when in one position. The socket is shaped to correspond with the conical pintle.

The reversible or right-and-left hinge A A', cast with solid knuckles B B', and constructed with the socket a, conical pintle-points c c, notched flanges d d, and lip g, all combined and arranged to operate as and for the purpose specified.

170,116. SEWER. Augustine Root, Taunton, Mass. [Filed Apr. 15, 1875.]

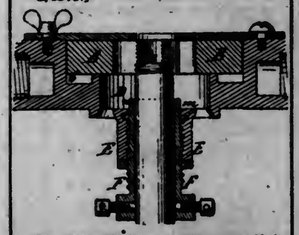


Brief.—A large rectangular sleve is operated by a divided axle and crank, so as to contain a smaller sleve with different-sized meshes.

The sifting device above described, consisting of the box a a', box d, receiver g h, receiver n n', flanges b, and drawers e f, constructed, combined, and arranged substantially as herein described.

170,118. NAIL-PLATE FEEDERS. George H. Ryan, Somerset, Mass., assignor to himself and J. M. Leonard, same place. [Filed June 26, 1875.]

Brief.—The eccentric rocks the shaft through the medium of rod and lever, and the arm which carries the nose-piece is connected to the rock-shaft by a set-screw. The nipper-rod is fed forward by two corrugated drums, one being in advance of the other, to keep the plate close up to a gage on the head side of the cutter, and is assisted in this by a conical roll under the nipper-rod. The nipper-rod is covered with rubber at the point where the feed-drums impinge upon it.



1. The combination of the eccentric E, strap and rod G H, lever J, rock-shaft K, set-screw f, and arm L, substantially as and for the purpose set forth.

2. The combination of the nipper-rod and its elastic covering with the feed-drums w and x, substantially as and for the purpose set forth.

3. The combination of the nipper-rod and the feed-drums w and x, the feed-drum w being larger and set in advance of the feed-drum x, as and for the purpose set forth.

4. The combination of the nipper-rod, the feed-drums w and x, and the conical roller w', as and for the purpose set forth.

170,119. TENSIONING DIE-STOCKS. Andrew Saunders, Yonkers, N. Y., assignor to D. Saunders' Sons, same place. [Filed Sept. 2, 1875.]

The plain cylindric extension m, provided upon the tubular feed-screw F, in combination with the cylindric bearing g, provided at the inner end of the socket E, carrying the said feed-screw, the whole arranged in relation with the essential working parts of the threading die-stock, substantially as and for the purpose set forth.

170,120. MILLSTONES. George T. Smith, St. Louis, Mo. [Filed Sept. 1, 1875.]

Brief.—The sharp edges of the cells of the stone, left by the usual methods of dressing, are ground off, while the stone is newly dressed and "in face."

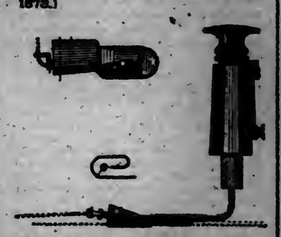
A millstone, having its grinding-surface reduced to a plane, and the edges of the cells dulled, substantially as set forth.

170,121. WRINGERS. John Smith, Conshohocken, Pa. [Filed Oct. 20, 1875.]

1. In combination with the levers C C', containing the rollers E E', and having beveled or tapering holes b b, the fulcrum-rods D, passing through said holes, secured to the clamps

A, and provided with adjusting-screws d, substantially as shown and described.

2. As an improvement in clothes-wringers, the combination, with the roller-shafts e e and recessed levers or bearings C C', of the rawhide linings F F, substantially as described.

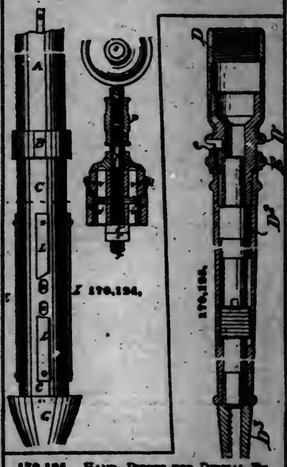


3. In combination with the rollers E E', the levers C C', fulcrumed on rods D, said levers having tapering openings for the passage of said rods, and being provided with shoulders e e', fitting in corresponding cavities, so as to permit said levers to rock and the rollers to yield independently, as shown and described.

170,122. COMPENSATION-JOURNALS FOR SEWING-MACHINE BALANCE-WHEELS. D. Snider, Quincy, Ill. [Filed June 3, 1875.]

In a compensating journal bearing for the balance-wheel of a sewing-machine, the conical bearing at the outer end of the stud, expansible by means of a tapered axial screw, and the conical sleeve combined with the conical bearings in the ends of the axis of the hub of the balance-wheel, substantially as described.

170,123. COIL-SPRINGS. Wm. S. Snyder, Bridgeport, Conn., assignor to himself and W. H. Perry, same place. [Filed Nov. 12, 1873.]



The combination of the threshold scroll-shaped folder, the cord-guide carried by the central fold thereof, the arm carrying the eye through which the cord enters at right angles to the guide, and the grooved stitching-plate, these members being constructed and operating substantially as set forth.

170,124. PUMPS FOR DRIVEN WELLS. Pratt A. Spicer, Marshall, Mich., assignor of one-half his right to Montgomery Ormsbee, same place. [Filed Aug. 16, 1875.]

Brief.—Over each of the rows of holes is laid a strip of sheet metal, close to the surface of the tube, so as to leave a very narrow passage, and thus act as a strainer. The stem of the valve is united to the pump-rod by a screw-coupling, which serves the double purpose of uniting the plunger or valve with the rod, and of forming a stop for the valve.

1. The combination, with the casing C, having vertical rows of holes s, of the metallic strips L, laid close to the casing over the holes therein, and leaving a narrow passage on both sides of each strip for the passage of the water to the holes, substantially as herein shown and described.

2. The combination of the valve d of a pump-plunger with the adjustable screw-coupling F, to form an adjustable stop for the valve, substantially as shown and described.

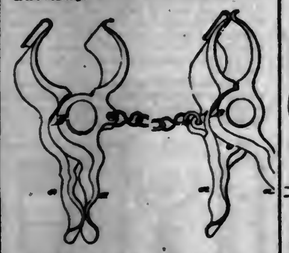
170,125. HAND-PIECES FOR DENTAL ENGINES. Eli T. Starr, Philadelphia, Pa., assignor to Samuel S. White, same place. [Filed Nov. 5, 1875.]

Brief.—A nose-piece of hardened steel is added to the dental hand-piece, which is itself made of soft metal. A peculiarly-arranged sliding key and collar prevent accidental separation of the two parts of the hand-piece.

1. The hand-piece, constructed as herein before set forth, with a detachable nose or bearing of hardened steel and a softer metal body, for the purpose set forth.

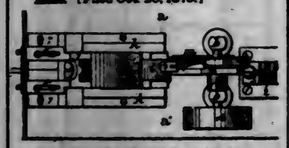
2. The combination of the fixed section D of the hand-piece, the section D' revolving therein, the casing screwed on the section D', and the screw-collar, and its locking-catch, whose members being constructed and operating in combination as set forth, whereby the hand-piece can be turned without disconnecting its contents.

170,196. CHUCK-DASHER. R. Steadman, Covington, Ga. [Filed Oct. 6, 1875.]



Brief.—The dasher-head is of the class formed of a disk with inclined funnel-shaped perforations, having both upward and downward, and is caused to rotate upon the staff by the reaction of the cream against the sides of the perforations. The cream in the perforations is also compressed and the friction among the particles increased.

A churn-dasher rotatively mounted on its handle and provided with funnel-shaped apertures, substantially as described, whereby, in its passage through the cream, the dasher is rotated and the latter compressed, as set forth.



170,197. COW-TAIL HOLDERS. G. Stickney, Philadelphia, Pa. [Filed Apr. 23, 1875.]

Brief.—The jaws of the clamps are extended beak, so as to form handles to open the clamps more readily.

The improved shackles for cows' tails, consisting of the pinchers and connecting-chain, said pinchers having their jaws extended to form handles *c c*, for the purpose of more readily opening said jaws, substantially as described.

170,198. MACHINES FOR MAKING SHOE-TIPS. John A. Stockwell, Lynn, assignor to the Stockwell Shoe-Tip Company, Boston, Mass. [Filed Oct. 20, 1875.]

1. The combination of the mold 4, having a beveled edge, in combination with a clamping-former, *j*, and a smoothing-down former, *i*, the two formers being made to operate substantially as shown and described.

2. The smoothing-former *i*, having projections *m* on its under side for pressing the material toward the center, substantially as specified.

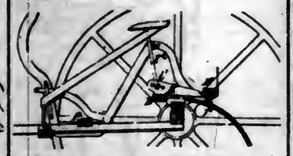
3. A mold, 4, having its front edge beveled away, substantially as described.

4. The combination of the connecting-rod *b*, cam *g*, projection *l*, with a slide, *l*, and spring *3*, substantially as set forth.

5. The combination of the jointed connecting-rod *a*, cam *f*, and the rods *p r*, substantially as specified.

170,199. DENTAL PLUGGERS. Samuel D. Strohm, Philadelphia, Pa., assignor of one-half his right to William H. Wright, same place. [Filed Oct. 2, 1875.]

Brief.—Two spindles are arranged in the case of a dental hand-piece, at right angles to each other, the one carrying a dental tool, and the other arranged for attachment to an ordinary straight plugging-instrument. Motion is communicated from one to the other of the spindles by the intervention of a pivoted lever, with its two faces at right angles to each other.



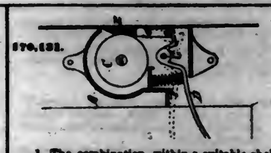
1. The within-described attachment for dental plugging-instruments, consisting of a casing having two spindles at right angles, or thereabout, to each other, one of said spindles carrying the plugging-tool, and the other being arranged for attachment to the operating-spindle of an ordinary straight plugging-instrument, substantially as set forth.

2. The combination of the casing A A', spindle B, lever E, and spindle D, having a dauge, *f*, with the coiled spring *e* and screw-plug *h*, adapted to the end of the arm A' of the casing, as set forth.

170,200. HORSE-RAKES. John H. Thomas, Springfield, Ohio. [Filed June 11, 1874.]

Brief.—The weight of the driver exerts a constant lifting action on the teeth, which are held in working position through the medium of a foot-lever counteracting each lifting action.

1. In a wire tooth-rake, in which the teeth are held down against the resistance of the work by pressure on a foot-lever, in combination with the rake-head and foot-lever made to sustain the strain on the teeth without the intervention of a locking device, a driver's seat resting on the rake-head, so as to exert a constant lifting-action on the teeth when not sustained by the foot-lever, substantially as set forth.



2. The combination, in a wire-toothed rake, in which the rake-head is hinged to a fixed axle, and the driver's seat rests on the rake-head, so as to exert a constant lifting-action on the rake-teeth, of the foot-lever sustaining the weight of the driver and the resistance of the teeth without the intervention of a locking device, and the hand-lever for operating the rake-head and teeth, substantially as set forth.

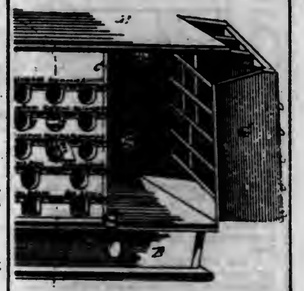
3. The combination of the axle, overhanging rake-head, and driver's seat, which rests and bears constantly with a tendency to lift the teeth on the rake-head nearly in a line with the pivot of the hinge when the teeth are down, and with an increasing pressure as the teeth are raised, substantially as set forth.

4. In combination with a rake-head hinged to a fixed axle, a driver's seat adjustably attached to the rake-head, and constantly exerting a force to lift the teeth to an extent determined by the adjustment of the parts, substantially as set forth.

170,201. SASH-HOLDERS. Hiram Torrey, Philadelphia, Pa., and Darius Lyman, Washington, D. C. [Filed Oct. 20, 1875.]

Brief.—An elastic roll, pivoted in a suitable case, has interposed between it and the jamb or window-frame a movable and adjustable rubber wedge, which is carried in a pivoted bar, the whole operated from the outside by the projecting handle of a spring-lever.

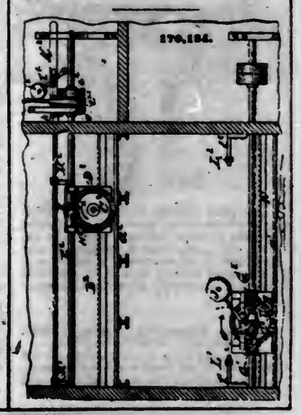
1. The combination, within a suitable shell or case, A, of a pivoted elastic roll, C, and movable or adjustable rubber wedge, E, for working in contact with, and between, the jamb or window-frame and roll, substantially as set forth.



2. The pivoted lever D, the spring F, the pivoted bar *c*, and elastic wedge E, in combination with a rubber or other elastic roll, C, as shown and described, to operate as specified

---

170,202. ARTIFICIAL STONE. J. C. Tucker, New York, N. Y. [Filed June 11, 1875.]

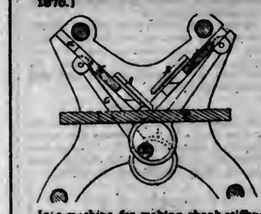


An artificial stone produced by combining clay with asphaltum or other bituminous material while in a heated state, and with an animal, vegetable, or mineral fibrous material, in sheet or block, with or without pressure, substantially as set forth.

170,203. TICKET-CASES. David T. Vine and Theo. J. Schuler, Fort Wayne, Ind. [Filed Oct. 4, 1875.]

1. The hinged cases G G, divided into smaller chambers or compartments, and provided with the apertures *b* and slits *i*, as and for the purpose herein set forth.

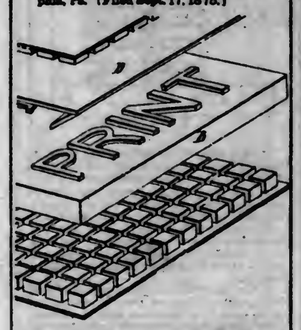
2. The combination of the base A, frame C D E, hinged cases G G, divided into smaller compartments, and provided with apertures *b* and slits *i*, the spring-catch *a*, and weights H, substantially as and for the purposes herein set forth.



170,204. STIRRING APPARATUS FOR MALT-KILNS. August Von Schlemmer, Hochheim-on-the-Main, Germany. [Filed Sept. 16, 1875.]

Brief.—The revolving stirrers or brushes are composed of split quills. The stirrer-shaft is at right angles with the driving-shaft, and connected with it by means of the bevel-wheels and clutch, the large bevel-wheel being on the end of the stirrer-shaft. The motion of the latter is automatically reversed when the pivoted weighted levers come against the arms or stops.

1. The combination, with the stirrer-shaft G and its gear-wheel D', of the bevel-wheels G' G², the double-coniby clutch G³, the driving-shaft E, the pivoted weighted lever I, and the arms L' L², arranged and operating as herein shown and described.



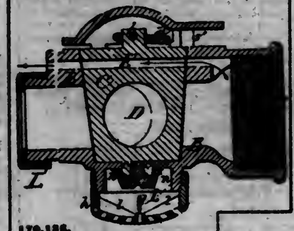
2. The stirrers, composed of split quills *q*, as herein described, for the purpose specified.

170,205. MACHINES FOR CUTTING SHANK-STIFFENERS FOR BOOTS AND SHOES. J. M. Watson, Sharon, Mass. [Filed Oct. 20, 1875.]

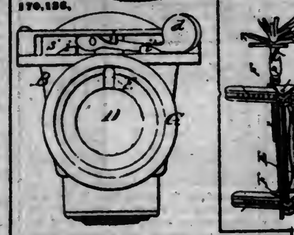
In a machine for making shank-stiffeners, the combination of the bed E, the knives A B, and means for operating said knives, substantially as set forth, whereby said knives are alternately reciprocated, each across the pathway of the other, so that the material, after being cut by them, is beveled at opposite edges, as and for the purpose described.

170,206. ELASTIC UNDERLAYS FOR PRINTING ON GLASS. Joseph L. Wells, Philadelphia, Pa. [Filed Sept. 17, 1875.]

1. The combination, with a flat printing-block, B, of a series of elastic pads, *c*, arranged a short distance apart from each other and interposed between the flat bed of a printing-press and the said printing-block, as and for the purposes specified.



2. The combination of a series of elastic pads, *c*, with a flat printing-block, B, and with the platen of a printing-press, between which and the said block the pads are interposed, as set forth.

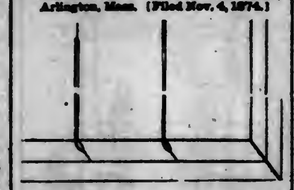


170,207. ANTI-INCRUSTATION COMPOUNDS. Emanuel Wilm. Rade, Switzerland, assignor to Frederick Baxter, Brooklyn, N. Y. [Filed Jan. 8, 1874.]

The composition herein described, consisting of nine-tenths caustic-soda lye and one-tenth solution of catechu.

170,208. HOSE-NOZZLES. C. S. Westland, Providence, R. I., assignor of one-half his right to the Allen Fire Department Supply Company, same place. [Filed Oct. 26, 1875.]

Brief.—Above the plug-valve is a pentagon-cap. By turning the wrench or handle, as described, the valve is made to register with the large or small discharge-orifice, as desired. The lugs shown are to serve as stops or guides for the handle.

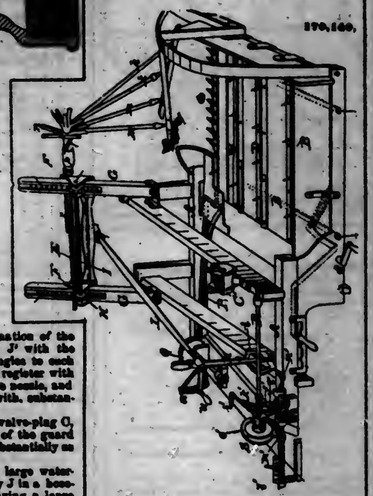


1. In a hose-nozzle, the combination of the large and small water-ways J J' with the plug-valve C, having at right angles to each other orifices D E, adapted to register with large and small ways J J' in the nozzle, and corresponding diameters therewith, substantially as specified.

2. The combination, with the valve-plug C, having hinged operating-arm *d*, of the guard cap or plate F, having slot *s'*, substantially as specified.

3. The combination, with the large water-way J' and the small water-way J in a hose-nozzle, and the valve-plug C, having a large orifice, D, and a small orifice, E, corresponding therewith, of the hinged operating-handle *d* and angular spaced stops *f f' f²* in the slot *s* of a guard.

4. The combination, with the hinged handle *d* on a valve plug, C, of the guard cap or plate F, for protecting the said handle from casual injury, substantially as specified.



170,209. CALKING VESSELS. J. T. White, Arlington, Mass. [Filed Nov. 4, 1874.]

The combination of the grooved edges and the fibrous packing, when the sides of the groove are cut so as to form an acute angle, or nearly so, with the surfaces of the board or plank, and to meet when the planks are in place, all when constructed and arranged substantially as described.

170,210. HARVESTERS. John H. Whitney, St. Louis, Mo., assignor to the Gunner & Whitney Manufacturing Company, same place. [Filed June 7, 1875.]

Brief.—The finger-bar and cutters are made adjustable forward and backward upon the platform and main frame.

1. The movable shoe *s*, mounted on the front edge of the platform, and provided with the finger-bar, as shown.

2. In combination with the adjustable cutting mechanism, the rods or bars *b* and the obliquely-slotted sliding bar *a*.

3. In combination with the cutter-bar or knife, movable forward and backward, as described, the pitman P, provided with an elongated wrist or journal, *b'*, substantially as shown.

4. In combination with the cutter-bar or knife, movable forward and backward, as described, the pitman, provided with the long wrist *b'*, and guided at its lower end in bearings on the frame, as shown.

5. In combination with the movable shoe or its equivalent, carrying the cutting devices, the rake-chain or conveyor, mounted therein so as to move forward and with the cutter, for the purpose described.

6. The combination of the two pivoted rear standards G, provided with the racks *f*, the sliding shoes F, mounted on the standards, and the pinions H, mounted in the shoes, and connected by the shaft I, as shown, whereby the rear shaft is maintained in a horizontal position, and adjusted at both ends at once.

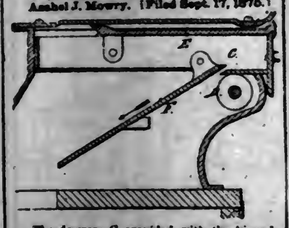
7. In combination with the shaft H, provided with the fixed head *l* and its rigid arms *k*, and the rotary head *n*, provided with the arms *m*, the blades or beaters, having their ends attached to said arms, as shown.

8. In combination with the shaft H, the rotating spirally-grooved head *n* and the sliding sleeve *p*, provided with a pin entering the groove, and held from turning on the shaft by a spline or its equivalent.

9. In combination with the sliding sleeve *p*, arranged as and for the purpose described, the bar *r*, crank *s*, and rock-shaft I, provided with handle *u*.

10. In combination with the sliding shoe F, provided with the pinion H, the pivoted latch K, arranged to engage with the pinion, as shown.

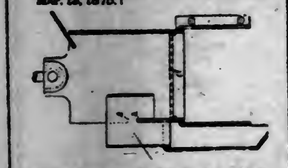
11. The device for controlling the operation of the binder-shaft, consisting of the loose pulley S, provided with the oblique rib *o'*, the clutch T, provided with the arm or lip *o*, the dog *f'*, provided with the inclined end, shoulder *g'*, and arm *f*, the sliding rack-bar *w'*, provided with the incline *v'*, the dog *r'*, the spring *p'*, for moving the rack-bar backward, and the adjustable stop for limiting the backward movement of the rack, substantially as shown.



12. A binder-operating mechanism, consisting essentially of a shaft, E, provided with a clutch, T, a loose driving-pulley, S, provided with a spiral rib, *o'*, and a sliding rack-bar, *w'*, operated by the rib *o'*, and arranged to throw the clutch in gear at regular intervals, substantially as shown and described.

13. In combination with the sliding rack-bar e', arranged and operating as described, an adjustable stop for limiting its backward movement, substantially as shown and described.

14. In combination with the rack-bar w', arranged and operating as described, the sliding and rotating rod f', provided with the handle w' and the plate w', for locking the same in place.



15. The tension device consisting of the cup or case O', provided with the vertical slits through its bottom, the horizontal slit s' and roller r' at its front, and the flanged roll in its interior, as shown and described.

170,141. LETTER-BOXES. David J. Wilcoxson, Milan, Ohio, assignor to himself and Ambel J. Mowry. [Filed Sept. 17, 1875.]

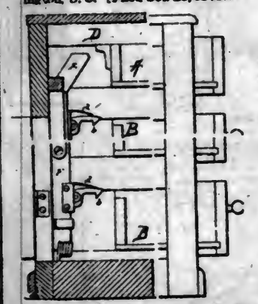
The drawers C, provided with the hinged cover E and hinged bottom F, in combination with the friction-roller D, all operating substantially in the manner and for the purposes set forth.

170,142. COAL AND ORE SEPARATORS. John B. Wilford, Philadelphia, Pa., assignor to Hezekiah Bradford, same place. [Filed Mar. 13, 1875.]

The reciprocating jig-box having delivery-edges 2 and 3 at different heights, and alternating along the side or sides of the jig-box, in combination with a hood contiguous to each of the lower delivery-edges 3, substantially as and for the purposes set forth.

170,143. MILL-BURR FURROW-GAGES. E. Williams and S. F. Leyda, Minerva, Ohio; said Leyda assignor of one-half his right to J. F. Leyda. [Filed Sept. 21, 1875.]

The device for gaging the furrows in burr-stones herein described, consisting of the level A, sliding plate B and F, oscillating plate C, having the jaws D D and graduated segment E pivoted thereto, staff H, and set-screws g f h, all combined and arranged substantially as and for the purpose herein before set forth.



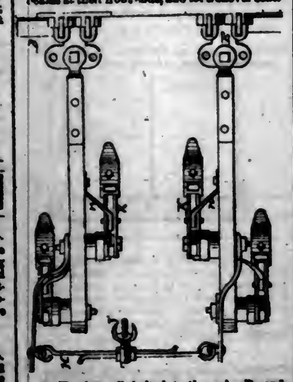
170,144. FASTENINGS FOR BUTTONS, &c. Frank B. Williams, Henry B. Cook, and John A. Kline, New York, N. Y. [Filed Nov. 6, 1875.]

1. In a button, the combination of the plate B, with post D, slotted as described, the pushers a a, with hooks a' a', and the spring A, all substantially as and for the purposes herein set forth.

2. In a button, the plate B, constructed substantially as described, with the lugs d' d', the post C, and the shank-post D, and adapted to receive the spring and pushers after the said plate is secured to the button, for the purposes herein set forth.

170,145. LOCKING DEVICES FOR DESKS. James H. Williams, Washington, D. C. [Filed Oct. 26, 1875.]

1. The lock-bar F, having arm E, which is thrown forward by a spring, combined with the spring-catches acting at the tops of the drawers, all constructed and operating as described.



2. In a desk or other case, the combination of the lock-bar F, the spring-catches b, and the strike-plates on the tops of the backs of the drawers, all constructed and operating as and for the purpose described.

3. In a desk or other case, the spring-catch i, in combination with the bar k, balance-lever l, bar k, and lock-bar F, constructed and operating as described.

4. The combination of the slotted and hinged lock-bar F, provided with the spring-catches to hold the drawers, the foot-spring g, the rods h and k, and the lever l, all constructed and operating as and for the purpose set forth.

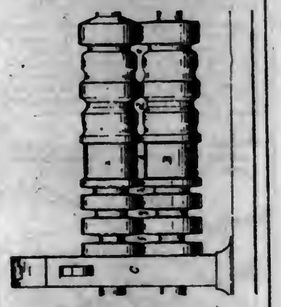
170,146. DOUBLE PLOWS. S. D. Williamson, Milford, Ind. [Filed Sept. 18, 1875.]

Brief.—Devices for connecting the plow-beams at their front ends, and for a shovel-seat.

1. The bars C, bolted to the axles B, and secured to the frame-pieces A by means of the flanged plate D, and the looped bolts a, all constructed and arranged substantially as and for the purpose set forth.

2. The shoe L provided with side flanges and stops at the top, against which the plow-share rests, in combination with the metallic U-shaped bar K, and connecting-bolt, whereby the shoe carrying the plow can be adjusted up and down on the standard, as set forth.

REISSUES.



6,737. PROCESSES OF RENDERING ANIMAL FATS. William B. Andrew, New York, N. Y. Patent No. 163,000, dated Aug. 11, 1874. [Filed Nov. 8, 1875.]

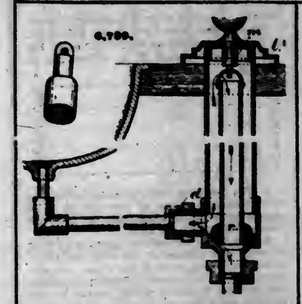
1. The process, herein described, for rendering fats, consisting in the application of dry heat or dry hot air to liquefy, and pressure to separate, the oily portion from the membrane, and removing the liquid portions from contact with the membranous portions as fast as separated.

2. The substantially-described process of separating the claine and stearine from the membrane of animal fat, consisting in subjecting the fat to pressure when raised to a sufficient temperature by dry heat to effect the separation, and conveying the oily product away from the heat to a cooler place, as soon as expressed, as and for the purposes specified.

3. In extracting claine from animal fat for food or culinary purposes, the process of separating the claine and stearine from the membrane, by taking the fat while it retains its animal heat, and subjecting it to heat and pressure, as specified.

6,738. ROLLS FOR UTILIZING THE FAG-ENDS OF RAILROAD-RAILS. Henry Chisholm, Cleveland, Ohio. Patent No. 124,116, dated Feb. 27, 1872; reissue No. 6,464, dated June 15, 1876. [Filed Oct. 19, 1876.]

1. The rolls A and B, provided with the series of grooves, constructed substantially as described, to gradually alter the sectional form of a railroad-rail, or fag end, &c., without crimping or lapping its external surface, substantially as and for the purpose described.

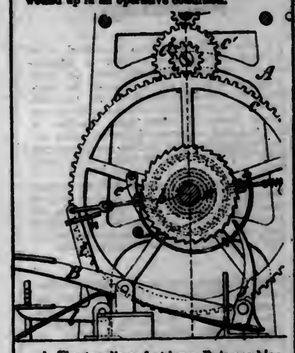


2. The rolls A B, having a series of irregular-shaped and graduated grooves of the form or construction shown at a c d, operating conjointly as and for the purpose substantially as described.

3. The manufacture of bars or rods of steel homogeneous in texture, from old rails, butts, or fag-ends by a process or method substantially such as that herein before described—that is to say, rerolling said old rails, butts, or fag-ends, by means of rollers having grooves so constructed that the body of the rail, butt, or fag end shall, by this operation upon it, be gradually contracted transversely and increasingly extended longitudinally without violent rupture and without pilaction of the surface.

6,739. WASTE-VALVES AND OVERFLOWS. James Foley, Brooklyn, N. Y., assignor of one-half interest to George C. Gunning. Patent No. 158,280, dated July 31, 1874. [Filed Oct. 1, 1875.]

Brief.—The stand-pipe has within it the overflow-pipe and valve, as shown. When the handle of the removable cap is raised and partially turned the valve is held suspended, and for this purpose the rod below the handle is made oval continually, with a circular neck at a proper place to allow of turning.

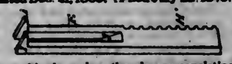


6,739.

The stand-pipe f of the bath or basin overflow passing through the slab or table b, and receiving at its upper end the removable cap i, in combination with the overflow-pipe o, valve r, and means for suspending the valve and overflow-pipe from the cap, substantially as set forth.

6,740. SPRING-MOTORS. Albert C. Hallam and James W. McKee, Brooklyn, N. Y., assignors, by mesne assignments, to Geo. W. Masson, Lewiston, Me. Patent No. 99,669, dated Feb. 8, 1870. [Filed Nov. 5, 1875.]

Brief.—With the ratchet-wheel are combined a treadle and spring-pawl, in such a manner that the pressure of the foot upon the treadle will turn the shaft, whereby the spring is kept wound up in an operative condition.

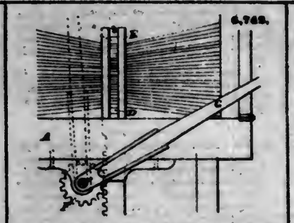


1. The treadle or foot-lever B, in combination with the winding-gear of a spring-power, substantially as and for the purpose described.

2. The lever I and spring k, in combination with the friction-strap j, drum i, and spring-power, substantially as set forth.

3. The pawl f, provided with the stop A, in combination with the spring g, substantially as herein specified.

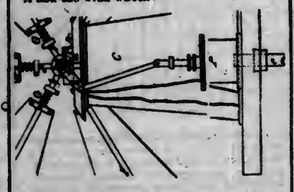
6,741. CLAMPS FOR SHINGLE-PACKERS. B. B. Taylor, Oconto, Wis. Patent No. 98,123, dated Dec. 21, 1869. [Filed July 22, 1875.]



In a shingle-packer, the clamps consisting of the shanks H', prongs E, and dogs or lugs I I, arranged to be operated as and for the purpose set forth.

6,742. SHINGLE-PACKERS. B. B. Taylor, Oconto, Wis. Patent No. 98,123, dated Dec. 21, 1869. [Filed July 22, 1875.]

Brief.—Benches of shingles can be clamped for binding with metal straps by means of a packing-bed, provided with a stationary end guide, and a hinged end guide, and a forked clamp, operated by a lever and pinion, the teeth of which engage with teeth upon the lower edge of the clamp.

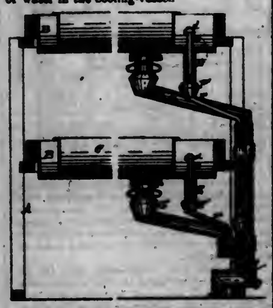


6,743.

The stationary guide B, hinged guide C, bed or table A, clamps E, in combination with lever G, pinions F, and shaft H, as set forth.

6,744. WINDMILLS. Jabez K. Babcock, Phelps, N. Y., assignor to the Hartford Pump Company. Patent No. 30,036, dated Sept. 18, 1860; extended seven years. [Filed Oct. 20, 1875.]

Brief.—Combining with a wind-wheel a receiver, which is a rotary tower made hollow and air-tight. Into this receiver the air is compressed by a suitable air-pump connected with the wind-wheel. The central axis is made hollow for the purpose of drawing off the air which has been compressed within it. The pump is attached to the tower, and turns with it and the wind-wheel.

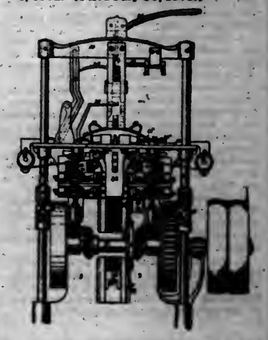


1. The combination of the wind-wheel A, the air-pump P, and the reservoir for compressed air C, substantially as described.

2. The hollow rotary tower C, with its tubular axle c, in combination with the wind-wheel A, substantially as herein described.

6,745. MILK-COOLERS. Charles A. Douglas, Franklin, N. Y. Patent No. 122,512, dated Feb. 20, 1872. [Filed Oct. 1, 1875.]

Brief.—A tube for drawing off water extends from the bottom of the water-vessel, and a smaller tube for drawing off milk extends into it from the bottom of the milk-vessel, and another tube is secured between them, which acts as a stop to the water tube, and which connects with a conduit-tube. An overflow tube is made adjustable to regulate the height of water in the cooling-vessel.



1. The vessels B and C, placed one within the other, with a space between for water, tubes a, c, and c, and the conduct G, combined to operate substantially in the manner set forth.

2. The water-vessel B, milk-vessel C, with space between for running water, governor D, tube E, and conduct F, combined to operate substantially in the manner set forth.

3. A series of water-vessels, B, placed one above the other, each with a milk-vessel, C, supported within, with a water-circulating space between their walls, governors D D, conducts F F, terminating with a common conduct, F', and conducts G G, terminating in a common conduct, G', all combined to operate as set forth.

6,746. PAPER-BOX MACHINES. Henry R. Heyl and August Brehmer, Philadelphia, Pa., assignors to the Novelty Paper-Box Company. Patent No. 122,078, dated Oct. 3, 1872. [Filed July 30, 1875.]

1. The blank-holder 5 6 and graduated counterbalance device 9 9 10 11 12, combined and arranged, substantially as herein described, to elevate the blanks, as required, with a force varied proportionally to the height of the pile of blanks.

2. The detent 13 14, and automatic device for temporarily releasing the same, substantially as set forth.

3. The feeder 21, constructed with one or more cavities in its face, connected with a pipe for exhausting the air, in combination with the valve or valves operated by the descent and ascent of the feeder by mechanism, substantially as herein described.

4. The annular punch or bending-fork 72, constructed with a cutting-face, and with internal longitudinal grooves 73, so as to sever a staple-blank, bend it around a suitable mandrel, and hold and guide it for driving, as hereinbefore explained.

5. The reciprocating punch or bending-fork 72, operating to sever the wire to bend it over a suitable mandrel or former, and to carry the staple forward into position to be driven, substantially as described.

6. The reciprocating punch or bending-fork having a longitudinal central opening, through which a hammer or driving-rod may operate, substantially as described.

7. The punch or bending-fork 72 and mandrel 71, operating in combination, substantially as set forth, to form the staples.

8. The wire-clinchers, sliding in a plane parallel with the material through which the staple is driven, so as to clinch the staple ends flat down on such material, as explained, without subsequent hammering.

9. The combination of a hammer or driving-rod, to force a staple through the material, and bending mechanism, operating, substantially as described, to turn the points of the staple flat against the material while the hammer rests on the head thereof.

6,748. REGISTERING TICKET-PUNCHES. A. D. Hoffman, Chicago, Ill., assignor, by mesne assignments, to the Railway-Register-Manufacturing Company, Buffalo, N. Y. Patent No. 100,096, dated Feb. 22, 1870; reissue No. 4,946, dated Jan. 31, 1871. [Filed Nov. 10, 1875.]

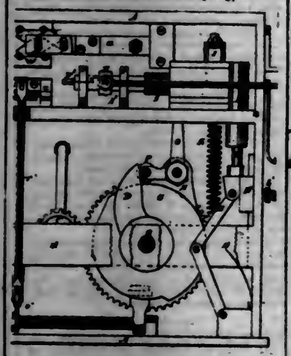
1. The combination, with a ticket-punch, of a bell, connected with the moving parts of the punch, so as to be rung each time the latter is operated, substantially as and for the purpose hereinbefore set forth.

2. The arrangement, in a ticket-punch, of the jaw A, bell F, bell-hammer e, bell-crank f, push-rod H, and jaw B, so as to operate as herein before shown and described.

3. The combination, in a ticket-punch, of the box E, for the cuttings, with a registering device, which shall indicate the number of times the jaws are actuated, substantially as herein before set forth.

4. The combination, in a ticket-punch, of a bell, a registering device, and a box to receive the cuttings, arranged so as to operate as herein before set forth.

5. The combination and arrangement, with the handles A B of a ticket-punch, of the spring-pawl J, ratchet-wheel M, and a registering device, as hereinbefore set forth.



6. The combination, with a registering mechanism and an actuating-lever, of an intermediate spring or motor, placed under tension by the movement of the actuating-lever, imparted by the hand of the operator in one direction, and acting to motion the registering mechanism upon the return movement of the lever in the other direction, substantially as set forth.

7. The combination, in fare or ticket registering machines, of an actuating-spring with a pulling pawl or hook which actuates the registering mechanism, substantially as described.

8. The combination, in fare or ticket registering machines, of a pawl with a spring, which, on its reaction or recoil, actuates the registering mechanism, substantially as and for the purpose hereinbefore set forth.

6,747. MACHINES FOR HEADING BOLTS. T. Hall and M. Thomas, Chicago, Ill. Patent No. 112,949, dated Feb. 28, 1871. [Filed Oct. 3, 1871.]

Brief.—Of the portable gaging die, the lower section W¹ is hinged, and is turned outward to discharge the bolt by means of a cam on shaft B, a rock-shaft, and a rod, T. The bender P is connected to a piston, S, that penetrates a water-chamber, while another piston, O, enters the same chamber from below, and is actuated by a cam, D, through the medium of toggles E. A valve at the top of the chamber is opened automatically, to discharge the water from the chamber into a reservoir after each stroke of the bender, and the latter is retracted by a bow-spring, H².

1. The combination, in a bolt-heading machine, of the hydraulic-press I, safety-valve J, the heading-tool F², and the bolt-heading dies W W², as combined and arranged as to be actuated as one machine, substantially as specified and shown.

2. The combination of the cams D, Q, and D² with the heading-tool and the dies, in the manner and by the means substantially as described.

3. The hinged die-block W², pitman F², lever O², and rock-shaft B², or their equivalents, arranged so as to tilt the die, substantially as specified.

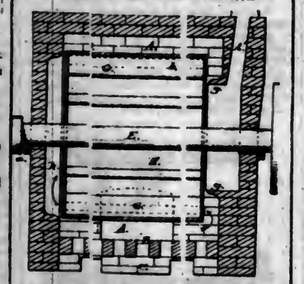
4. The combination of the spring H², crossbead G², bracket C, pitmen 1 2, the collar-arms X, and bender F², when arranged substantially in the manner and for the purpose specified.

5. The combination of the die-holders W W¹, levers V V', pitman T², lever O², and rock-shaft B², all constructed and arranged as described.

6,748. ANTI-FRICTION COMPOUNDS FOR BEARINGS. L. W. Lathrop and Theodore A. Weber, New York, N. Y., assignors, by mesne assignments, to the Lathrop Anti-Frictionate Company. Patent No. 165,340, dated July 6, 1875. [Filed Oct. 16, 1875.]

1. An anti-friction bearing for machinery formed of graphite whose particles have been united by cohesion and solidified by pressure, as set forth.

2. The process of forming solid anti-friction bearings by welding together the particles of graphite with melted sugar and subjecting the resultant to pressure, as described.



6,749. SHIRTS. James H. Myers, Montreal, Canada, assignor to Oliver H. Keep, New York city. Patent No. 123,721, dated Feb. 13, 1872. [Filed Sept. 14, 1875.]

As a new article of manufacture, a partial shirt, composed of a whole front part, B, a bosom, and a collar-band, the two latter complete in themselves, and fitted at the neck, the several parts being constructed and combined for use, substantially as and for the purpose specified.

6,750. ROTARY STEAM-BOILERS. Charles W. Pierce, New York, N. Y. Patent No. 166,807, dated Aug. 17, 1875. [Filed Oct. 9, 1875.]

Brief.—Water is supplied to all portions of the inner shell of the boiler by means of bucket arranged to encompass the fire-tubes.

1. Two sets of tubes or flues passing through the heads of the boiler and concentric with each other, in combination with the annular flange f and chamber h, whereby the products of combustion are caused to pass through the outer series and return through the inner series, as specified.

2. Buckets h, in combination with the inner surface of the boiler-shell to supply water to the flues G and shell D during that part of the revolution performed above the water-line.

3. The annular flange f and chamber h, in combination with the tubes G and H, substantially as and for the purpose set forth.

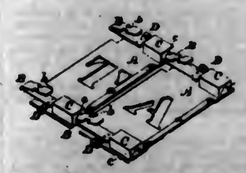
4. The combination of the shell D, buckets h, flues G and H, chamber h, flange f, and chimney A', constructed and operating substantially as and for the purpose specified.

6,751. CARDS FOR WRAPPING THREAD. Hugo Sutro, New York, N. Y. Patent No. 120,672, dated Aug. 20, 1872; reissue No. 5,726, dated Jan. 6, 1874. [Filed Aug. 11, 1875.]

1. The device for holding thread consisting of card-board notched at the ends, so as to separate said threads into two or more sections or skeins, as set forth.

2. The device for holding thread consisting of card-board notched at the ends, and perforated lengthwise, so as to be formed into sections, to allow of convenient separation of the sections and skeins of thread, as and for the purpose set forth.

3. The improved method described of putting up thread or any narrow fabric in skeins on card-board notched at the ends, by winding the fabric continuously from one notched section of the card-board to another, as and for the purpose set forth.



6,752. CAR-COUPLINGS. Jacob Singer, Harrisburg, Pa., assignor of one-half interest to Robert L. Muench, same place. Patent No. 161,734, dated June 9, 1874. [Filed Nov. 6, 1875.]

1. The combination, in a draw-head, of an inclined bearing, and a block or follower adapted thereto, and constructed and operating to fall by its gravity beneath the coupling-pin, bear upon the link, and maintain the same in a horizontal position after the pin drops, resist the thrust upon the link in coupling, and to rise on its bearing under excessive pressure upon the link, and permit the latter to pass beneath, all substantially as set forth.

2. A draw-head provided with an inclined bearing, and with a block or follower adapted thereto, whereby the block bears against and resists the thrust upon the link in coupling, but yields to excessive pressure, allowing the link to pass further inward, as described.

6,753. STENCIL-PLATES. Jerome L. Tarbox and H. L. Tarbox, New York, assignors, by mesne assignments, to J. T. Andrews, 2d, Penn Yan, N. Y. Patent No. 87,727, dated Mar. 9, 1869. [Filed Oct. 21, 1875.]

1. Stencil-letters constructed and adapted to be connected or disconnected at their edges, so as to form a continuous stencil-plate, substantially as and for the purpose specified.

2. Stencil-plates constructed and adapted to be connected at their edges, substantially as and for the purpose shown.

3. Stencil plates or letters, as above described and claimed, capable of being combined, and having their contiguous edges constructed so as to overlap, substantially as and for the purpose set forth.

4. In combination with the letter-plates A and A, the spring-catches B b and the housings C c, substantially as and for the purpose shown and described.

5. In combination with the plates A and A, the loops D and D, covered apex and extending outward from their edges, substantially as and for the purpose specified.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 21. TUESDAY, NOVEMBER 23, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time.

R. H. DUELL, *Commissioner.*

COMMISSIONER'S DECISIONS.

PARIS *vs.* BUSSEY.—*Interlocutory appeal; interference.*

[*Appeal from the Examiner of Interferences in the matter of the interference of Paris* vs. *Bussey* for "IMPROVEMENT IN COOKING-STOVES."—*Decided November* 27, 1875.]

It having been previously judicially determined that an interference cannot be legally declared between an application for reissue and a subsequent patent, (*Mayall ex parte*, Sup. Ct. D. C.:) *Held*, that the same rule applies to an application for the reissue of a prior patent and an application for the reissue of a subsequent patent.

The nature of the case is not affected by the attitude of the subsequent parties, whether simply as patentees or as applicants for reissue.

Case of *Merrill* and *Carleton* Sup. Ct. D. C. commented on.

SPEAR, *Acting Commissioner:*

This appeal is taken from a decision of the Examiner of Interferences overruling a motion made on the part of Bussey to dissolve the interference, on the ground that Bussey, being an applicant for reissue of the prior patent, is entitled to an adjudication of his claims without any interference with any party subsequent in the Office. In *Becker* vs. *Throop*, (8 OFFICIAL GAZETTE, p. 1,) the Commissioner, following the decree of the Supreme Court of the District of Columbia, in the *ex parte* case of *Mayall*, decided that an interference between an application for reissue and a subsequent patent was not properly declared and should be dissolved, and directed thereafter no such interference should be declared.

The only difference that I can discover between the case of *Becker* vs. *Throop* and that now under consideration is that the subsequent patentee in this case is also an applicant for reissue.

In the case of *Mayall* vs. *Murphy* and *Schenck*, the latter parties were patentees only. I find by the record in this case that the late Commissioner had allowed this interference to go on, regarding the difference which I have mentioned as sufficient to relieve the case from the rule which appears to have governed the court in the Mayall case referred to above. I am unable, however, to find any such distinction.

The present case appears to me to be precisely the same as that which was before the court, so far as affects the question of interference It is difficult to conceive of any reason which could exist for dissolving the interference in the case of *Mayall* vs. *Murphy* and *Schenck*, unless it were founded upon the rights of the prior patentee, which rights could not be affected by any attitude which the subsequent party could assume before the Office. If the reissue were simply for the purpose of correcting the original deed and Mayall was entitled to an adjudication upon his claims, subject only to the same conditions and proceedings as, he would have been subjected to had he made the same claims at the time of filing the original application, it is difficult to see how it would make any difference whether Murphy and Schenck appeared in the Office asking an interference simply as patentees, or whether they were applicants for reissue of their subsequent patent. No written decision was promulgated by the court in the case referred to, and only their decree was sent to the Office; but I see no consistent or logical rule which can be deduced from that decree, and which will not include at the same time the case which was before the court and that which is now under consideration.

But I need not depend wholly upon that decree. This question had been before the Supreme Court of the District of Columbia prior to the case above referred to, having been brought by Merrill & Carleton, who were applicants for the reissue of a patent, and whose application for reissue had been put in interference with a subsequent original application for patent. The court, after very full consideration of the case, reversed the decision of the Commissioner of Patents, declared the interference illegal, and ordered that the reissue be granted.

In the decision rendered in that case (on file with the papers in this Office) Judge Fisher says:

But if the Commissioner shall find that the original patent is invalid or inoperative by reason of a defective specification, or by reason of the patentee having claimed in his specification as his own invention more than he had a right to claim as new, and that the error was the offspring of accident, mistake, or inadvertence, and not fraudulent, he has nothing further to do, except to issue the new patent, unless it be to exercise his power of *revision and restriction*—that is to say, *examine the specification as corrected by the applicant*—and upon such revision so to *restrict* that amended specification, if necessary, as to have it cover the same invention which was described or shown in the original description, drawings, and model, and cover nothing more. Having made this revision and restriction, if the applicant for reissue shall accept the restriction, it only remains for the Commissioner to reissue the patent with the specifications so corrected, revised, and restricted. He has no right to review and revise prior decisions of the Office made upon the original application, but only to restrict the specification proposed for reissue, so as to limit it to the original invention.

It would seem from these provisions of the acts of Congress that the duty of the Commissioner of Patents is a plain and simple one. Although the section last alluded to contemplates and provides for a *revision and restriction* of the claim of the person offering the surrender, and asking for a reissue, the same as in case of original applications. Yet it does not mean to place applications for reissued letters patent in all other respects upon the same footing as applications for original patents. It places them upon the same footing only in regard to a *revision and restriction* of the amended specification, so that whenever a party being dissatisfied with his original patent shall make an offer of surrender and ask for a reissue it becomes the duty of the Commissioner simply to examine his amended specifications to determine whether an honest mistake has been made in the issuing of the original patent as contemplated by the law of Congress, and if he finds that the application for reissue is for the same invention or device, and that the mistake made in the original patent was honestly made, it is his duty, having examined the amended specification, to determine whether they are correctly and rightly made out, so as to cover the original invention and no more, as shown by the original description, drawings, and model. If he finds that they cover too much or too little it is his duty to inform the applicant of that fact, and to point out in what particulars the specification should be amended or restricted.

This being done, if the applicant should amend his specifications accordingly, there is no discretion left with the Commissioner in regard to granting the reissued letters patent.

This covers the whole ground beyond all question, and it remains for the Commissioner only to follow the plain decision of the court. The interference in this case should not have been declared, and is accordingly dissolved.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

DAVID BANKS *et al.* vs. JOHN R. McDIVETT *et al.*

[*In equity.—Before* SHIPMAN, *J.—Decided October* 29, 1875.]

MOTION FOR PROVISIONAL INJUNCTION.

The rights and duties of compilers of books which are not original in their character, but are compilations of facts from common and universal sources of information, of which books, directories, maps, guide-books, road-books, statistical tables, &c., are the most familiar examples, are well settled.

No compiler of such a book has a monopoly of the subject of which the book treats. Any other person is permitted to enter that department and make a similar book; but the subsequent investigator must do so for himself from the original sources, which are open to all. He cannot use the labors of a previous compiler, "*animo furandi*," and save his own time by copying the results of the previous compiler's study.

[*E. Ellery Anderson*, for complainants.
Reed and *Drake*, for defendants.]

SHIPMAN, *J.*:

The plaintiffs are the proprietors of a book which was published in 1871, entitled "Rules of Practice of the Supreme Court of the State of New York," &c., and are also proprietors of a book which was published in the year 1874, entitled "General Rules of Practice of the Courts of Record of the State of New York." All the requirements of the Statute of the United States in regard to copyright have been complied with by the plaintiffs in respect to each of these books. The book which was published in 1871 contains the rules of practice which were adopted in general session of the justices and judges of the State of New York on December 20 and 21, 1870, with notes appended to each rule. The notes briefly state the substance of the decisions which had been made by the courts of New York in reference to the rules to which the notes are, respectively, appended, give the number and page of the volume in which the decision is to be found, and in like manner refer to the volume and page of the statutes which relate to the rule.

A convention of justices and judges is required to be held biennially to revise, alter, abolish, and make rules, which shall be binding upon courts of record in the State. The book which was published in 1874 contains the rules of practice which were adopted in the convention of the justices and judges on November 24, 1874, and which took effect on February 1, 1875, and also contains notes and references upon the plan of the book of 1871, but upon a much larger scale, the book of 1871 having seventy pages, while the book of 1874 is of one hundred and twenty pages. The plaintiffs published a similar volume in 1858.

In the year 1875 the defendants published a book entitled "New Rules of the Courts, General and Special, 1875," &c. This volume contains the rules which had been adopted by the judges on November 24, 1874, with notes appended to each rule, which notes refer only to the volume and page of the various statutes and reports of decisions which relate to the rule.

The book also has an index of the general rules, and contains the special rules of the Supreme and other courts of the State.

The plaintiffs brought, in February, 1875, a bill in equity, alleging that the introduction, the notes, and the index of the defendants' book were copied from the plaintiffs' book of 1874, in violation of the rights secured to them by the acts of the United States respecting copyright, and praying for an injunction, and also filed a motion for a provisional injunction. This motion has been heard, and is the only part of the case which is now to be decided. The plaintiffs do not claim that they have acquired any title to the rules, which are admitted to be common property, neither do they assert that there is anything novel in the plan, or system, or arrangement of their compilation, or of their index. The notes are mainly a digest of the decisions of the courts of New York, and of the statutes of the State. The volume which contains the decisions and the statutes are sources of information which are common and open to all, and to which each compiler can resort. But the plaintiffs complain that the defendants have not availed themselves of the original sources of information, but have resorted to the labor saving expedient of copying the citations which the research of the plaintiffs had discovered, and that such a use of the labors of an author or compiler is an unauthorized violation of the rights which are secured by the acts of Congress.

The rights and duties of compilers of books which are not original in their character, but are compilations of facts from common and universal sources of information, of which books, directories, maps, guide-books, road-books, statistical tables and objects are the most familiar examples, are well settled. No compiler of such a book has a monopoly of the subject of which the book treats. Any other person is permitted to enter that department of literature and make a similar book.

But the subsequent investigator must investigate for himself from the original sources, which are open to all. He cannot use the labors of a previous compiler *animo furandi*, and save his own time by copying the results of the previous compiler's study, although the same results would have been obtained by independent labor. The compiler of a digest, a road-book, a directory, or a map can search and survey for himself in the fields which all laborers are permitted to occupy, but cannot adopt as his own the products of another's toil. "He may work in the same original materials, but he cannot exclusively use those already collected and embodied by the skill and industry and expenditures of another." (2 Story's Eq. Jur., sec. 940.) The rights of compilers of this class of works have been recently carefully considered by Sir W. Page Wood, vice chancellor, in the cases of *Jarrold* vs. *Houlston*, (3 Key and J., 708;) *Kelly* vs. *Morris*, (1 Law Rep. Eq. Cases, 697;) and *Scott* vs. *Stanford*, (3 Law Rep. Eq. Cases, 718;) and the rule, which I have stated, has been reaffirmed. In the case of *Kelly* vs. *Morris* the learned Vice Chancellor says:

> In the case of a dictionary, map, guide-book, or directory, where there are certain common objects of information, which must, if described correctly, be described in the same way, a subsequent compiler is bound to set about doing for himself that which the first compiler has done.

The rule is recognized or stated in *Hogg* vs. *Kirby*, (8 Ves. Jr., 215;) *Matthewson* vs. *Stortsdale*, (12 Ves. Jr., 270;) *Longman* vs. *Winchester*, (16 Ves. Jr., 269;) *Wilkens* vs. *Aikin*, (17 Ves Jr., 422;) *Lewis* vs. *Fullarton*, (2 Beav., 6;) *Holten* vs. *Arthur*, (1 H. and *M.*, 603;) *Gray* vs. *Russell*, (Story's R., 11;) *Folson* vs. *Marsh*, (2 Story's R., 100;) *Emerson* vs. *Davies*, (3 Story's R., 768, and Curtis on Copyright, 174–177.) I do not understand that the rule prohibits an examination of previous works by the compiler before he has finished his own book, or the mere obtaining of ideas from such previous works; but it does prohibit a use of any part of the previous book, *animo furandi*, "with an intention to take for the purpose of saving himself labor." (*Jarrold* vs. *Houlston*, 3 Key and J., 708.) A careful inspection of the plaintiffs' books of 1858, 1871, and 1874, and of the defendants' book, and of Lansing's Code and Rules, published by the plaintiffs, to which my attention has been directed by defendants' counsel, has led me to the conviction that the general course which was adopted by the compiler of the defendants' book was to copy the citations in the plaintiffs' book of 1874, and, if necessary, to supplement them with other citations in the book of 1871, and with references which his own research had discovered; but his chief original source of information was the plaintiffs' book of 1874. The conclusion that he copied these citations in the first instance from the plaintiffs' compilation is derived from the fact that in a large majority of the notes the citations are not only the same which are given in the plaintiffs' book of 1874, but are placed in precisely the same order in which they were arranged by the plaintiffs. This peculiarity is manifest throughout the defendants' book. It is noticeable in the notes which are appended to nearly all of the ninety-seven rules, other than those which follow rules 20, 22, 33, 35, 37, 43, 45, 47, 51, 53, 56, 58, 61, 63, 66, 68, 69, 71, 72, 77, 78, 82, 85, 86, 87, 88, 92, 93, 94, 96, and 97. Thus the citations under Rule 7 are Rule 7 of 1871 amended, 2 How., 154; 1 Code R., 119; 3 How., 276; 1 Code R., 42; 5 Paige, 83; 4 Paige, 140. The citations under Rule 8 are 1858 amended; Rule 8 of 1871, amended; Code Sects., 193 to 197; 4 Bosw., 632; 1 Wenv., 35; 2 East., 181; 111 Blk., 76; note at 7 Abb., 73; 15 John., 535; 20 John., 129; 1 Chilt., 713; 2 W. Blk., 799; 2 Strange, 889. These citations are the same as those which are contained in the plaintiffs' book, and are placed in the same order in each compilations. There are in the defendants' book, under the eighteenth rule, sixty-two citations of decisions, all but one of which are the same, and are in the same order as those which are contained in the plaintiffs' book of 1874. It is impossible to suppose that the defendants could, by accident, have placed these references in the exact order in which they are found in the plaintiffs' book. The inference is irresistible that the plaintiffs' book was first resorted to for the purpose of saving the time and labor which must otherwise have been spent in an original examination of the reports.

I presume that the defendants' compiler subsequently examined the reports in order to verify the accuracy of the citations, and to correct the errors which he may have found, and that he did correct errors, and it is apparent that in many instances he added citations which his own investigations discovered; but it is manifest that he was to a large extent, in the first instance, a copyist of the labor of the plaintiffs. He states, indeed, in his affidavit, that his notes and references were principally taken from the plaintiffs' books of 1858 and of 1871, and from Lansing's Code and Rules, published by the plaintiffs in 1872; but that he did not draw materially from the plaintiffs' book of 1874.

The defendants' index of ten pages is almost a reprint of the plaintiffs' index, except that the former refers to the rule instead of the page.

This fact is not denied in the affidavit of the defendants' compiler, and an examination shows that his index was almost exclusively made with the scissors, and not with the pen.

These sentences of the plaintiffs' introduction are also substantially found in the corresponding portions of the defendants' book; but I do not deem this resemblance to be important.

It follows that the principle of law which I have stated has been violated, and that the plaintiffs are entitled to relief, unless they are debarred from any remedy by some other principle, which may be invoked by the defendants. They insist in this part of the case that the provisions of the copyright act, which are now contained in sec. 4,962 of the Revised Statute of 1875, have not been regarded by the plaintiffs. This section provides that no person shall maintain an action for the infringement of his copyright, unless he shall give notice thereof by inserting in the several copies of every edition published on the title-page, or the page immediately following, if it be a book, * * * * the following words: "Entered according to act of Congress, in the year ——, by A. B., in the office of the librarian of Congress, at Washington." The preface page of the book of 1874 contained the entry "Entered, &c., in the year 1874," but did not also contain the announcement that a previous edition had been entered in the year 1871, and it is contended that inasmuch as the book called "Rules of 1874" is another edition of the "Rules of 1871," the non-entry in the book of 1874 of the fact that the book of 1871 was entered, has destroyed the right to any action for an in-

fringement. It is not necessary to consider the consequence of a non-compliance with this section in each edition of a book, for I am of the opinion that a publication of the Rules of 1874, with appropriate notes, is not a subsequent edition of the Rules of 1871. The statute of New York provides that a convention of justices and chief judges shall be held at the capitol, in the city of Albany, on the first Wednesday of August, 1870, and every two years thereafter, and such convention shall revise, alter, abolish, and make rules, which shall be binding upon all courts of records, so far as they may be applicable to the practice thereof." The rules of 1874 were adopted in pursuance of this statute on November 24, 1874, and were ordered to commence and take effect on February 1, 1875, and were a new and revised set of rules; new rules had been added and old rules had been amended.

They were virtually new rules of the courts, which were to take effect on an appointed day, and the publication of the plaintiffs was in no proper sense a new edition of the rules of 1871. An edition is defined to be "a republication, sometimes with revision and correction; any publication of a book before published." (Webster's Dict.) The book entitled "The Rules of 1874" was not a republication or a publication of "The Rules of 1871."

It is also suggested that the plaintiffs are not entitled to protection, because they are also infringers of previous publications of like character. I have not been referred to any book which they have infringed, except the Rules of Practice published by W. C. Little & Co., in 1858, and from my examination of this book I cannot perceive that the plaintiffs have made any unjustifiable use of it.

Where an infringement is palpable, and a provisional injunction will not be attended with serious injury, it is not ordinarily refused as to so much of the work as is a plain infringement of the prior publications.

Let a provisional injunction issue restraining the defendants from the sale of any volumes or books which contain the notes which are appended to the "New or Revised Rules of 1875," other than the notes to Rules 20, 22, 33, 35, 37, 43, 45, 47, 51, 53, 56, 58, 61, 63, 66, 68, 69, 71, 72, 77, 78, 82, 85, 86, 87, 88, 92, 93, 94, 96, and 97, and which contain the index now printed in said book.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date November 23, 1875.]

8,799.—Watch-Keys.—HORACE W. BULLOCK, Springfield, Mass., assignor to himself and ORVIN W. BULLOCK, same place. Application filed November 6, 1875. Term of patent 7 years.

8,800.—Bezes.—JOSEPH H. ENGLAND, Baltimore, Md. Application filed October 13, 1875. Term of patent 7 years.

8,801.—Lawn-Settees.—JOSEPH W. FISKE, New York, N. Y. Application filed July 19, 1875. Term of patent 7 years.

8,802.—Show-Case.—WILLIAM H. GROVE, Philadelphia, Pa. Application filed November 12, 1875. Term of patent 14 years.

8,803.—Hat and Bonnet Holders for Trunks.—JOSEPH HALL, Newark, N. J., assignor of one-half his right to JOSEPH M. L. GARDNER, same place. Application filed November 10, 1875. Term of patent 3½ years.

8,804.—Inkstands.—HOMER LEE, New York, N. Y. Application filed October 19, 1875. Term of patent 7 years.

8,805 to 8,807, inclusive.—Floor Oil-Cloths.—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J. Application filed November 10, 1875. Term of patent 3½ years.

8,808.—Paper-Weights.—CHARLES ROWLAND, New York, N. Y. Application filed August 26, 1875. Term of patent 3½ years.

8,809.—Coffin-Hinges.—JOSEPH W. VAUGHN, Peabody, Mass., assignor of one-half his right to ALBERT H. WHIDDEN, same place. Application filed November 1, 1875. Term of patent 14 years.

8,810.—Overshoes.—GEORGE WATKINSON, New Haven, Conn., assignor to L. CANDEE & Co., same place. Application filed November 2, 1875. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date November 23, 1875.]

3,148.—Cured Meats.—CHARLES BALTZ, Chicago, Ill. Application filed October 12, 1875.
"STAR OF THE WEST."

3,149.—Wines.—JOHN BARNETT & SON, London, England, and Reims, France. Application filed October 22, 1875.
"a bull's head."

3,150.—Medicine.—ELIZEBETH E. CHAMBERLAIN, Portland, Me. Application filed October 25, 1875.
"words and letters 'C. O. Chamberlain's 'Greenwood' Asthma Cure.'"

3,151.—Mixed Paints.—FRANK P. CALLAGHAN, Chicago, Ill. Application filed October 4, 1875.
"four kegs, barrels, or casks, the tub or vat placed on the platform, as above described, together with the bucket and measure, and the words 'Mixed Paints,' 'Pure Raw Linseed Oil,' 'Warranted Genuine Pure Boiled Oil,' 'Pure White Lead,' 'French V. M. Zinc.'"

3,152.—Axle-Grease.—SAMUEL CUPPLES & Co., St. Louis, Mo.—Case B. Application filed September 16, 1875.
"'Diamond Axle-Grease,' used in connection with the figure of a star."

3,153.—Medicine.—PERRY DAVIS & SON, Providence, R. I. (Re-registration.) Application filed July 25, 1871.
"Pain-Killer."

3,154.—Lubricating-Oils.—WILLIAM DOWNIE, Boston, Mass. Application filed October 22, 1875.
"words and letters 'HYPER SPERM OIL.'"

3,155.—Cigars.—FARRINGTON & SCHMAHL, Chicago, Ill.—Case A. Application filed July 22, 1875.
"word 'Yo-Semite,' and the manner in which it is lithographed and connected with the cut of the cigars."

3,156.—Cigars.—FARRINGTON & SCHMAHL, Chicago, Ill. Case B. Application filed July 22, 1875.
"words 'THE CORNER CIGARS.'"

3,157.—Cigars.—FREEDMAN, HESSLEIN & Co., Detroit, Mich.—Case A. Application filed August 24, 1875.
"words 'THE CHAMPION,' and two steamers."

3,158.—Cigars.—FREEDMAN, HESSLEIN & Co., Detroit, Mich.—Case B. Application filed August 24, 1875.
"representation of a bell, with the words 'Liberty Bell Cigar.'"

3,159.—Oils and Pastes.—J. GLOVER & Co., New York, N. Y. Application filed November 6, 1875.
"words 'PALMA CHRISTI.'"

3,160.—Flour.—HALLIDAY BROS., Cairo, Ill. Application filed November 8, 1875.
"word 'CLEOPATRA.'"

3,161.—Flour.—HALLIDAY BROS., Cairo, Ill. Application filed November 8, 1875.
"words 'BON-TON.'"

3,162.—Flour.—HALLIDAY BROS., Cairo, Ill. Application filed November 8, 1875.
"word 'SYLPH.'"

3,163.—Boots.—S. R. HEYWOOD & Co., Worcester, Mass. Application filed September 22, 1875.
"a circular figure inclosing a heart-shaped figure."

3,164.—Bitters.—ARNOLD KOCH, Pittsburg, Pa. Application filed October 29, 1875.
'words 'Swiss Stomach Bitters.'"

3,165.—Cigars.—LEWIS BROTHERS, San Francisco, Cal. Application filed September 13, 1875.
"a lithographed printed portrait (surrounded by a wreath of laurel) of W. C. Ralston, with the words, below the portrait, 'W. C. Ralston.'"

3,166.—Flannels and Cottonades.—PORTER & DICKEY, New York, N. Y. Application filed July 10, 1875.
"words 'Gold Miners.'"

3,167.—Pencils and Rubber Erasers.—GUSTAV SCHWANHÄUSSER, Nuremberg, Germany. Application filed September 25, 1875.
"figure or representation of a 'Floating Swan.'"

3,168.—Mechanical Lead-Pencils and Rubber Erasers.—GUSTAV SCHWANHÄUSSER, Nuremberg, Germany. Application filed September 25, 1875.
"device or representation of a 'key.'"

3,169.—Combs, Druggists' Articles, and other Goods Made of Hard Rubber.—THE INDIA-RUBBER COMB COMPANY, New York and College Point, N. Y. Application filed September 28, 1875.
"letters and words 'I. R. Comb Co.'"

3,170.—India-Rubber Combs.—THE INDIA-RUBBER COMB COMPANY, New York, N. Y. Application filed October 26, 1875.
"words 'CENTENNIAL COMB.'"

3,171.—Bathing-Suits.—A. J. TRIPLER, New York, N. Y. Application filed July 9, 1875.
"words 'Tripler's Bathing-Suit,' and the monogram composed of the letters 'T. B. S.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date November 23, 1875.]

394.—Title: **"That Liniment, Good for Man or Beast."** GARDEN & MINOR, Belmont, Wis. Application filed October 20, 1875.

395.—Title: **"Gruman's Genuine English Mustard."** J. B. GRUMAN & Co., Westwood, N. J. Application filed November 15, 1875.

396.—Title: **"Erasine, for Erasing Ink from Paper, and Removing Stains from Cotton, &c."**—ALBERT T. KNOWLSON, Titusville, Pa. Application filed Nov. 15, 1875.

397.—Title: **"Lautenbach's Cod-Liver Oil with Churchill's Hypophosphites and Phosphate of Lime."**—ROBERT LAUTENBACH, Baltimore, Md. Application filed November 5, 1875.

398.—Title: **"Singer & Wheeler, Brilliant White Oil."** SINGER & WHEELER, Peoria, Ill. Application filed November 13, 1875.

INDEX OF INVENTIONS PATENTED NOV. 23, 1875.

	Class No.	No. of Patent.
Alarm, door, Spoor and Searle	24	170,408
Alarm, electrical low water and high pressure, T. Hass	148	170,261
Amalgamator, Bancroft and Walker	3	170,329
Ashes, implement for sifting coal, J. Waldron	154	170,317
Auger handle, J. Swan	29	170,413
Bagasse, condensing saturator for, A. W. J. Mason	135	170,180
Bale band stretcher, J. Z. Stocker	7	170,411
Barrel, Flye and Watson	40	170,162
Bed stone, oscillating, E. Armitage	57	170,325
Bedstead, sofa, W. R. Hamilton	62	170,258
Bedstead, sofa, J. Schoen	62	170,403
Bee hive, O. Colvin	9	170,237
Billet loop, K. W. Holmes	23	170,264
Billiard table, A. Hand	143	170,169
Binder, temporary, C. D. Lindsey	15	170,282
Binder, temporary, H. B. Stephenson	15	170,202
Boiler, steam, R. Dempster	148	170,348
Boilers, injector for steam, W. Randall	148	170,299
Boilers, superheater for steam, T. Vernon	148	170,316
Bolts, rivets, &c., machine for making, J. R. Blakeslee	14	170,151
Boot and shoe, T. R. Evans	16	170,359
Boot and shoe tip, Merrill and Holtt, (reissue)	16	6,762
Boot and shoe, wooden soled, M. J. S. Falcon	16	170,161
Boots and shoes, burnisher and seat wheel for, A. C. and T. T. Esworthy	16	170,358
Box lid fastening, J. L. Stevens	93	170,410
Brush handles, machine for forming, W. Wendell	175	170,320
Buffer stem, P. W. Pratt	62	170,190
Building block, B. A. Berryman	20	170,331
Burner, gas, A. M. Silber	64	170,407
Butcher's saw, W. Millspaugh	25	170,181
Butter package, A. J. Dibble	45	170,242
Cable and conductor, electric, G. W. F. Hoogeveen	50	170,266
Camera obscura, T. A. Kellett	157	170,271
Car axle box, L. Brauer	122	170,338
Car brake, P. Klunsinger	122	170,379
Car brake shoe, H. Steus	122	170,409
Car coupling, Brinkerhoff, Bennett, and Selder	122	170,226
Car coupling, A. Brown	122	170,227
Car coupling, D. Harper	122	170,259
Car heater, safety, C. A. West	154	170,321
Car lifter, railroad, J. D. Imboden	122	170,374
Car platform, E. Tilp	122	170,415
Car seats, look for, E. S. Seofield	93	170,193
Car starter, A. Dahler	122	170,347
Car starter, G. S. Knapp	122	170,175
Cars, combined wind wheel and fan for railroad, A. W. Woodward	166	170,215
Cars, ventilating, E. E. Hargreaves	121	170,364
Carboy, A. H. Fatzinger	68	170,246
Carbureter, automatic feed and absorption, J. Austin, (reissue)	27	6,754
Card, playing, R. R Landis	143	170,381
Carpet rag looper, W. H. H. Wyckoff	95	170,323
Carriage curtain, H. C. Moody	31	170,291
Carriage top, shifting, Gillespie and True	31	170,361
Caster, furniture, L. F. Cerf	24	170,156
Chair, reclining rocking, J. R. Newman	62	170,293
Chairs, bellows attachment for rocking, E. E. Sells	62	170,308
Chandelier, F. S. Shirley	64	170,194
Cheese preserver, J. Q. Black	45	170,222
Cheese preserver, J. Q. Black	45	170,223
Chisel, submarine rock, A. J. Whitney	153	170,425
Chronometer, solar, M. Wheeler	36	170,423
Cigar mold, J. Charter, (reissue)	160	6,758
Clamp for stamp stems, tappet, N. J. Colman	3	170,236
Clock, geographical, S. J. Wallace	36	170,212
Clothes clamps, machine for slotting and drilling, M. Pratt	173	170,394
Clothes drier, F. M. Clark	91	170,235
Clothes drier, G. W. Green	91	170,253
Coffee huller, D. Lombard	57	170,383
Composition for infusion and beverage, W. A. Martin	98	170,286
Cooker, steam, G. H. Scribner	154	170,404
Cooking apparatus, H. M. Smith	154	170,199
Corn marker, J. McGregor	133	170,287
Corpses, head rest for, C. D. Blachford	39	170,224
Cow milker, W. H. Pearson	45	170,187
Cracker machine, C. S. Fowler	6	170,250
Cradle, W. V. and N. W. Van Dervort	62	170,418
Crane, R. B. Robison	79	170,301
Crosshead, J. W. Hill	87	170,370
Cultivator, Price and Hunt	43	170,395
Cutd cutter, A. and E. H. Sedgwick	45	170,405
Curry comb, C. E. L. Holmes	144	170,265
Curtain fixture, E. B. Lake	62	170,277
Curtain fixture, G. W. Peirce	62	170,298
Curtain roller and bracket, Taylor and Donahue	62	170,205
Dental engines, attachment for, Buckingham, Starr, and White	46	170,342
Dental polishing tool, L. F. Locke	46	170,178
Detergent composition, J. W. Munger	26	170,183
Digger, potato, W. P. Martyn	114	170,387
Door pull, sliding, H. H. Elwell	24	170,357
Drill, coal shelling, P. O. Donohoe	124	170,350
Drill, mining, J. S. Fleming	124	170,249
Dyeing fabrics, A. Schultz	11	170,307
Earthenware, bailed, B. F. Roberts	115	170,192
Elevator, B. T. Babbitt	79	170,327
Engine frame, steam, W. S. Finney	150	170,248
Engine, rotary, W. Haven	150	170,365
Engines, bucket wheel for rotary, B. T. Babbitt	150	170,328
Engines, valve box for, H. W. Adams	152	170,140
Envelope opener, Le Blanc and St. Pierre	146	170,276
Equaliser, draft, H. Cartwright	31	170,232
Eraser holder and pencil point protector, L. L. Tower, (reissue)	146	6,766
Eraser holder and pencil point protector, L. L. Tower, (reissue)	146	6,767
Fabrics for skirts, &c., ornamental, A. Komp	54	170,380
Fare register, Watson and Knowlton	42	170,318
Fence, J. D. and F. Hyberger	52	170,269
Fence, iron, R. Rogers	52	170,302
Fences, tool for putting barbs on wire, W. Dulin	170	170,354
Files and steel, machine for testing, J. Garland	53	170,166
Filter and funnel, druggist's, A. E. Garrison	98	170,167
Fire escape, T. Jingras	30	170,270
Fire escape, J. E. Lindlau	30	170,281
Fire kindler, C. F. Cushing	154	170,158
Fire lighter, G. Elbreg	154	170,356
Fishing rod case, C. Perry	143	170,188
Flower stand, portable, D. M. Reynolds	63	170,399
Fruit jar, E. S. Hunt	58	170,172
Furnace door, puddling, J. Boyland	85	170,225
Furnace, hydrocarbon, H. M. Smith	149	170,198
Furnaces of steam boilers, apparatus for feeding air to the, W. C. Ford	149	170,165
Furnaces, apparatus for superheating air for marine boilers, W. C. Ford	149	170,163
Furnaces, retort for, H. M. Smith	66	170,197
Furnaces, supplying heated air to boiler, W. C. Ford	149	170,164
Furniture caster, L. F. Cerf	24	170,156
Game board, J. G. Thurber, Jr.	143	170,429
Gas conduits, preventing or removing naphthaline deposits in, J. C. Tiffany	66	170,414
Gas lighter, electric, O. A. A. Boillion	64	170,303
Gas lighting apparatus, electric, E. E. Bean	64	170,221
Generator, steam, H. M. Smith	148	170,196
Glass, annealing, J. M. Brookfield	68	170,339
Glassware, manufacture of, T. B. Atterbury	68	170,218

	Class No.	No. of Patent.
Grain drill, J. C. Daman	133	170,341
Grate, J. Schroeffel, Jr	154	170,306
Gravity, machine for separating substances of different specific, A. B. Stanberrie	99	170,312
Halter fastening, J. Thornton	144	170,307
Hame, G. J. Letchworth	72	170,177
Hame, J. Thornton	72	170,298
Hame, J. Thornton	72	170,300
Hame top, E. G. Latta	72	170,176
Harness tug, B. S. Leonard	72	170,382
Harvester, J. O. Brown	74	170,228
Harvester, J. O. Brown	74	170,229
Harvester, L. J. McCormick	74	170,386
Harvester, corn, Townsend and Parr	75	170,315
Harvesters, shock carriage attachment to, J. O. Brown	74	170,230
Harvesting machine, J. O. Brown	74	170,231
Hay loader, Perry and Manley	79	170,189
Heating drum, T. B. Field	154	170,247
Hinge, F. Teedt	24	170,314
Hogshead and barrel horse, J. N. Parker	40	170,186
Horse detacher, D. E. Owen	31	170,389
Horse power, G. W. Gordon	139	170,252
Horse power, A. D. Manley	150	170,386
Horseshoe, A. Dunbar	60	170,245
Horseshoe calking vise, W. Weaver	60	170,319
Hose coupling, W. A. Caswell	167	170,155
Hose, machinery for lining hydraulic, J. U. Braman	81	170,153
Hose pipe nozzle, S. Reid	167	170,397
Hydrant, J. O. Conner	167	170,238
Indicator, speed, M. A. Wier	42	170,213
Infusion and beverage, composition for, W. A. Martin	98	170,246
Iron into steel, converting cast C. L. Jeffords	85	170,173
Iron, refining cast, A. Warner	85	170,420
Jack, hydraulic, M. J. Walsh	79	170,419
Kiln, brick, H. W. Adams, Jr	30	170,148
Kiln, brick, W. N. Weidner	30	170,421
Kitchen utensil, T. S. Page	88	170,295
Lamp chimneys, tool for finishing, J. Lowery	68	170,283
Lamps, manufacture of, T. B. Atterbury	90	170,219
Lamps, wick raiser for, A. Albertson	90	170,428
Latch, locking, J. Druckhieb	93	170,353
Latch, reversible, H. S. Pomeroy	93	170,393
Leather, vat for tanning, O. W. Bean	92	170,330
Lightning rod, I. Johnson	50	170,377
Limb receiver, H. R. Allen	156	170,217
Loom shuttle and shuttle stop, J. Wolfenden	95	170,214
Loom weft stop mechanism, Isherwood and Nuttall, (reissue)	95	6,761
Lounges, device for attaching bolster frames to folding, W. Seng	62	170,406
Lubricator, C. H. Parshall	87	170,296
Lubricator, C. H. Parshall	87	170,297
Macaroons, preserve composition for, Heide and Wirtz	155	170,368
Mail bag fastening, H. M. Smith	162	170,195
Mattress, woven wire, A. Z. Boda	170	170,334
Mattresses, frame for woven wire, W. J. Boda	62	170,333
Measure, adjustable graduated, Young and Davis	132	170,216
Meat mangle, C. C. Kerr	99	170,378
Mechanical movement, E. Leslie	67	170,280
Mill, I. A. Hedges	59	170,367
Mill and press, cider, H. Krumsick	19	170,275
Mills, concentrating tailings from quarts, F. E. Mills	3	170,289
Millstones, bearing for, C. Custer	57	170,346
Mitten, A. P. Smith, (reissue)	38	6,764
Motion, device for converting, M. Crossman	67	170,427
Motor, volute spring, W. S. Shoemaker	67	170,310
Music sheet, electric, W. F. and H. Schmoele, Jr	50	170,402
Needle threader, P. E. Lambert	38	170,278
Ore, method and apparatus for classifying, R. M. Wengler	3	170,422
Paper collar, E. F. Bradford	109	170,336
Paper fastener, Pack and Vanhorn	146	170,394
Paper, machine for perforating, W. Braidwood	108	170,337
Paper weight, E. Dressler	146	170,243
Parchment, vegetable, A. G. Fell	108	170,360
Peat cutter, Newton and Zollner	61	170,184
Photographic background, Taber and Boyd	111	170,204
Photometer, P. Munzinger	157	170,292
Picture frames, corner piece and clamp for, C. P. Poinier	54	170,302
Pill coating machine, A. F. W. and W. F. A. Neynaber	156	170,185
Pipe, blow, C. Rumley	12	170,304
Pipe joint, J. Hyde	167	170,373
Pipe trap, waste, T. Hudson	167	170,268
Pipe, water, W. H. Sampson	167	170,305
Planing machine, hand, Doane and Passel	173	170,349
Planter, corn, J. B. Abbott	133	170,147
Planter, corn and seed, H. P. Sullivan	133	170,412
Planter, seed, G. W. Brown, (reissue)	133	6,755
Planter, seed, G. W. Brown, (reissue	133	6,756
Planter, seed, G. W. Brown, (reissue)	133	6,757
Plow, gang, F. A. Hill	114	170,262
Plows, furrow gage for, B. B. Hawes	114	170,256
Press, power, B. G. Martin	7	170,179
Printing press, J. L. Firm, (reissue)	117	6,760
Prison doors, operating, R. Richter	4	170,400
Pump, &c., beer, D. S. Whitman	118	170,426
Pump bucket, chain, Van Duser and Johnston	118	170,211
Pump, rotary force, A. Carlin	118	170,343
Punch, alarm, and registering implement, conductor's, Hill and Ruger	146	170,170
Purifier, middlings, J. F. Gandolfo	57	170,251
Quartz mills, concentrating tailings from, F. E. Mills	3	170,289
Railroad rail chair, J. Gogerty	120	170,168
Railroad rail joint, R. Long	120	170,384
Register, T. B. Doolittle	42	170,351
Register, G. F. Spencer	42	170,200
Ruler, parallel, J. D. Hall	146	170,257
Sash balance, H. Cutting	24	170,240
Saw, butcher's, W. Millspaugh	25	170,181
Scaffold, D. C. Place	30	170,391
Scales, weighing, W. W. Reynolds	132	170,191
Scoop, sifting, W. S. Boon	88	170,152
Screw cutting machine, G. Emig	14	170,160
Screw tap, E. Reynolds	14	170,398
Seaming machine, W. C. Sharp	136	170,309
Separating substances of different specific gravity, machine for, A. B. Stanberrie	99	170,312
Separator, grain, W. W. Johnston	150	170,376
Sewing machine, F. Chase	134	170,345
Sewing machine, J. W. and R. H. Lufkin	134	170,284
Sewing machine, overstitch, W. A. Polmateer	134	170,390
Sewing machine table, H. R. Tracy	134	170,416
Sewing machine tuck marking attachment, A. Johnston	134	170,375
Ship's berths, swinging, E. P. S. Andrews	137	170,324
Shirt front, W. J. and M. A. Duke	38	170,244
Shoe and stocking, combined rubber, J. M. Bibbins	16	170,332
Shutter fastener, S. C. Tuckerman	24	170,210
Shutter worker, H. A. House	24	170,171
Sizing composition, S. B. Dorlan	108	170,352
Skate, E. Murray, (reissue)	143	6,763
Slate cleaning block, A. H. Bryant	146	170,340
Sofa and table, convertible, C. C. Harris	62	170,260
Solvents, apparatus for the use and recovery of vaporized, Whiting and Lawrence	35	170,424
Spike machine, W. Haddock	103	170,255
Spikes, machine for making split, A. Whittemore	103	170,322
Spinning machines, adjusting spindles in ring, F. A. Sterry, (reissue)	142	6,765
Spirits, apparatus for the manufacture of, P. Griffin	47	170,254
Stage plank and carrier, W. S. Booth	79	170,335
Steam whistle, King and McKiernan	148	170,274
Steel, manufacturing, F. Berchtold	85	170,150
Stove, cooking, R. Thomas	154	170,206
Syringe, W. Molesworth	156	170,182
Table, extension, G. Heyl	62	170,369
Table, ironing, J. S. Hays	91	170,366
Tailor's coat measure, J. S. Church	38	170,157
Telegraph, fac simile, J. C. Ludwig	158	170,385
Tenoning machine, E. H. Rees	174	170,396
Tide and current wheel, submerged, J. J. Hell	168	170,263
Tires, clip for splicing broken, J. W. Hoddinott	60	170,371
Toilet case and towel roller, combined, D. Miller	62	170,288
Trap, fly, H. B Earing	143	170,355
Truss, E. A. Kimball	156	170,273
Tubes, machine for bending metallic, J. M. Reid	125	170,300
Tuck marker, R. G. Bush	134	170,154
Tuyere, H. J. Chandler	12	170 234
Tuyere, P. H. Standish	12	170,313
Type setting machine, J. Hooker	117	170,372
Type writing machine, W. H. Case	117	170,233
Type writing machine, L. S. Crandall	117	170,239
Valve seats, device for refitting, C. F. Hall	64	170,363
Ventilating churches, houses, &c., W. Kingham	166	170,174
Vise, E. Caswell	100	170,344
Wagon body, C. A. Dewolf	31	170,159
Wagon brake, A. L. Bartlett	31	170,220
Washing machine, F. Gittere	91	170,362
Washing machine, J. D. Lawlor	91	170,279
Washing machine, J. I. Shotwell	91	170,311
Watch case spring, A. S. Buckelew	26	170,241
Water ejector, H. Coll, (reissue)	118	6,759
Water meters, register dial for, J. C. Kelley	167	170,272
Water wheel, S. C. Lyons	168	170,285
Well curb, C. M. Minor	51	170,290
Whistle, steam, King and McKiernan	148	170,274
Wind power, J. M. Armour	118	170,326
Windlass for barrels, kegs, &c., friction, A. D. Stout	79	170,203
Window sash bead fastener, J. W. Tripp	30	170,417
Window shade roller, A. Roelofs	63	170,401
Wood boring machines, gage attachment to, G. S. Hudson	173	170,267
Wrench, pipe, D. P. Stanton	100	170,201

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED NOVEMBER 23, 1875.

	Patent No.
Abbott, J. B., Corn planter	170,147
Adams, H. W., Jr., Brick kiln	170,148
Adams, H. W., Valve box for engines	170,149
Albertson, A., Wick raiser for lamps	170,428
Allen, H. R., Limb receiver	170,217
Andrews, E. P. S., Swinging ship's berth	170,324
Armitage, E., Oscillating bed stone	170,325
Armour, J. M., Wind power	170,326
Atterbury, T. B., Manufacture of glassware	170,218
Atterbury, T. B., Manufacture of lamps	170,219
Austin, J., assignee, (reissue)	6,754
Babbitt, B. T., Elevator	170,327
Babbitt, B. T., Bucket wheel for rotary engine	170,398
Babcock, N., assignee, (reissue)	6,760
Bancroft, J. W., and T. Walker, Amalgamator	170,329
Barclay, W. H., assignee	170,331
Bartlett, A. L., Wagon brake	170,220
Bayliss, E., assignee	170,228 170,229, 170,230, 170,231
Bean, E. E., Electric gas lighting apparatus	170,221

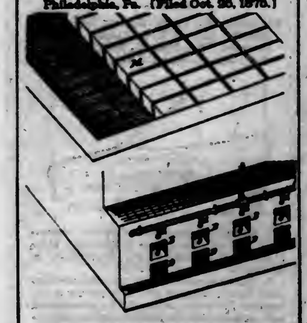
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED NOVEMBER 23, 1875.

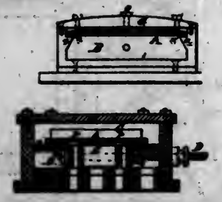


170,167. CORN-PLANTERS. J. R. Abbott, San Jose, Ill. (Filed July 6, 1875.)

Brief.—The seed-slide is operated by rods extending from the pivoted ball-cranks at each end of the drop-beam to a lever centrally pivoted thereon, through which passes a bent rod attached to the seed-slide. A vibratory motion is given, first from one side and then from the other, to the lever by pins on the bearing-wheels striking in their revolution the ends of the ball-cranks.

The combination, in a corn-planter, of the projections or pins c' c', extending inwardly from the wheels D and D', the ball-cranks E and E', pivoted to the cross-bar A, and arranged for contact with the pins c' c' during the rotation of the said wheels, the lever F, pivoted to the said cross-bar, the connecting-pieces F' F', attached to the said levers and ball-cranks, the curved arm E, rigidly attached to the slide-bar G', and engaging the lever F, and the seed-bar G, as set forth, provided with the rest or support I, and hinged to the cross-bar A, all substantially as and for the purposes specified.

170,168. BRICK-KILNS. H. W. Adams, Jr., Philadelphia, Pa. (Filed Oct. 26, 1875.)



1. The combination of the furnaces B B B B-B, the blast-pipes F and G G G G G, and arches I I I I I, and cover M, substantially in the manner and for the purposes set forth.

2. The combination of the furnaces B B B B B, and blast-pipes F, and G G G G G, and arches I I I I I, and the cut-off wall K, substantially in the manner and for the purposes above set described.

170,169. VALVE-BOXES FOR ENGINES. H. W. Adams, Philadelphia, Pa. (Filed July 27, 1875.)

Brief.—A box, with steam and exhaust ports cast in it, is fitted to the cylinder inside the steam-chest. Said box is provided with means for balancing the valve independently of the steam-chest and cover.

1. The valve-box J, in combination with the valve-face of a cylinder, rigidly secured thereto, whereby the valve may be removed without changing the normal position of the same when balanced, substantially as shown and described.

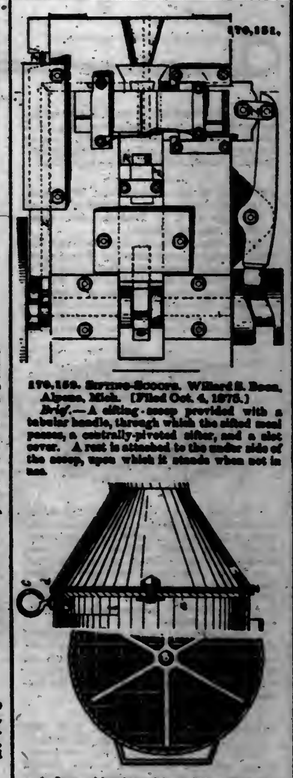
2. In combination with the valve-box, such as described, the shoulders a a, cast thereon, whereby the balancing-plate is supported and adjusted, substantially in the manner and for the purposes set forth.

3. The combination of the valve-box J, top or lid G, plates A, and valve B, independent of the steam-chest or steam-chest cover, whereby the valve is not affected by the screwing down or unscrewing of the bolts or nuts of the said steam-chest or its cover, substantially in the manner and for the purposes set forth.

4. In combination with the cylinder of a steam-engine, the valve-box J, having shoulders a a, lid or cover A and G, the doubly-ported valve B, provided with hollow casting E, all being arranged within the steam-chest of said engine, whereby the valve is balanced, and the weight of live steam removed from it, all operating in the manner and for the purposes substantially as shown and described.

170,170. PROCESSES OF MANUFACTURING STEEL. Fidel Berkhold, Cleveland, Ohio, assignor to himself, T. F. Berkhold, Saml. Thurman, Alois Siskowiner, C. B. Bernard, and John B. Edwards, same place. (Filed Sept. 27, 1875.)

The process herein described of manufacturing steel, consisting of melting together iron and a mass composed of the following ingredients, to wit: Cyanide of potassium, prussiate of potash, borate of soda, silicate of lead, (white glass), bichromate of soda, charcoal, gum-arabic, and linseed-oil, in the proportions and in the manner, substantially as herein set forth.



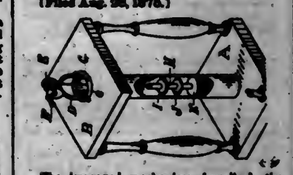
170,171. MACHINES FOR MAKING BOLTS, RIVETS, &c. John B. Richards, Brooklyn, assignor to P. Gerlach and R. P. Gerlach, Cleveland, Ohio. (Filed Oct. 25, 1875.)

Brief.—The improvement consists in a clamping-die so situated as to grasp the rod before it is acted on by the ordinary forming or side dies, in order that the rod, which is cut off by a movement of the forming-die, may be squarely cut, and then pressed as evenly-cut end to the header at the next feeding operation.

The combination of the horizontally-arranged forming and cutting dies, the heading die or dies, and the clamping-die for clamping and holding the bar on their outside of said cutting and forming dies, for the purpose of leaving the end of the bar squarely cut to be presented to the action of the heading-die for the formation of the next pin or bolt, substantially as described.

170,172. SIFTING-SCOOPS. Willard S. Bean, Alpena, Mich. (Filed Oct. 4, 1875.)

Brief.—A sifting-scoop provided with a tubular handle, through which the sifted meal passes, a centrally-pivoted sifter, and a slot cover. A rest is attached to the under side of the scoop, upon which it stands when not in use.

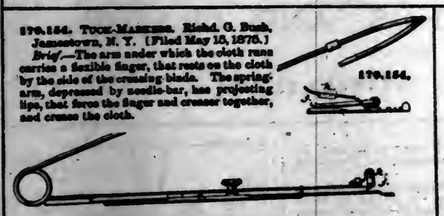


1. In combination with a sifting-scoop, the tubular handle b, for the purpose specified.

2. A combined flour scoop and sifter, provided with a rest, a, substantially as set forth.

3. The agitator a, pivoted at its center, in combination with a scoop having the hollow handle b, substantially as stated.

4. In a sifting-scoop, the combination of the agitator a, handle C, slot-cover f, and hollow handle b, substantially as specified.



170,173. MACHINERY FOR LIFTING HYDRAULIC DOCKS. Jos. U. Brunes, Boston, Mass. (Filed Aug. 26, 1875.)

The improved mechanism described, the same consisting of the frame A B, rod H, disks I J K, drum R, and cord G, arranged to operate, in casting the pipe C, substantially as and for the purpose set forth and specified.

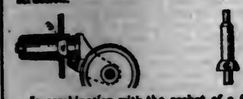
170,154. TUCK-MARKERS. Richd. G. Bush, Jamestown, N. Y. [Filed May 15, 1875.]

Brief.—The arm under which the cloth runs carries a flexible finger, that rests on the cloth by the side of the creasing blade. The spring-arm, depressed by needle-bar, has projecting lips, that form the finger and creaser together, and crease the cloth.

The combination of the blade *a*, over which the goods pass, with the finger or blade *j* and hook A, arranged to pinch the goods lying on the same, all constructed and operating substantially as and for the purpose described.

170,155. HOSE-COUPLINGS. William A. Caswell, Chicago, Ill., assignor of one-half his right to H. B. Preston. same place. [Filed July 26, 1875.]

Brief.—The hose is confined between a tail-piece having a screw-threaded flange at one end, a circular band at the other, and a partly screw-threaded and smooth surface between them, and a sleeve having a screw-thread and shoulder. The sleeve and swivel are connected by a wire inserted in a channel formed in part in the swivel and in part in the sleeve.



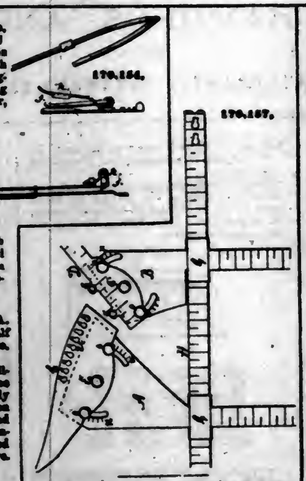
1. The tail-piece of a hose-coupling, having a screw-threaded flange at one end, a circular band at the other, and a partly screw-threaded and partly smooth surface between them, substantially as and for the purpose specified.

2. The combination of the herein-described flanged tail-piece with an encircling sleeve, having a female screw-thread and an inwardly-projecting shoulder, substantially as and for the purpose specified.

3. The sleeve and swivel of a hose-coupling, connected together by a wire inserted in a circular channel formed in part in the swivel and in part in the sleeve, the wire being bayed fast at one end, substantially as and for the purpose specified.

170,156. FURNITURE-CASTERS. L. P. Cort, New York, N. Y. [Filed Apr. 23, 1875.]

Brief.—The conical bearing and recess combining with an additional bearing around the upper end of the spindle, to materially strengthen and improve the details of construction.



In combination with the socket of a furniture-caster a pivot or spindle, formed with the conical bearing *a* around its base, and fitted into a conical recess, *a'*, of the socket, in addition to the bearing around the upper end of the spindle for the purpose of strengthening the caster, substantially as described.

170,157. TAILORS' COAT-MEASURES. John S. Church, Dayton, Ohio. [Filed Sept. 6, 1875.]

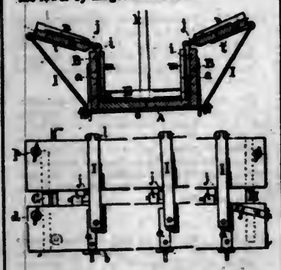
1. The shoulder-plates A and B, having pivotal balance-plates C and D, constructed and arranged to operate substantially as and for the purpose specified.

2. The combination of the shoulder-plates A and B, balance-plates C and D, and breast-measure H, substantially as specified.

3. The combination and arrangement of shoulder-plates A and B, balance-plates C and D, breast-measure H, and the waist-measure K, substantially as described.

4. The combination and arrangement of the bottom A, provided with supports *b b b*, side boards B B, provided with side posts *a a a*, adjustable in the respective sockets of said supports *b*, and with cleats *m m p*, end boards C D, brace-rods *d d*, and socketed cleats *f f f* hinged to the cleats *j j j* of the removable side boards F F, the boards F F, and boards G H, brace-rods *p p*, and adjustable outside braces I I I, operating substantially as and for the purpose described.

170,158. FIRE-KINDLERS. Cyrus F. Cushing, South Braintree, Mass. [Filed Oct. 28, 1875.]



Brief.—The powdered leather serves to prevent the resin cracking and dropping off during handling and transportation.

As a new article of manufacture, the improved fire-kindler described, consisting of the pine core A, prepared by immersion in a solution or compound of kerosene, resin, and leather, substantially as and for the purpose set forth and specified.

170,159. WAGON-BODIES. C. A. Dewalt, Wyoming, Ill. [Filed Oct. 27, 1875.]

Brief.—The upper sections are fastened to the lower by hinges and braces.

1. The box A B C D, provided with cleats *i i*, &c., and with eyes or sockets for the reception of the pins of the cleats *j j j*, &c., of the upper boards F F, and cross-supports or bolsters *b b b*, provided with tongues and sockets at their outer ends for the reception of the braces I I I, substantially as and for the purpose described.

2. The combination, with the box A B C D, by means of the hinged cleats *j j j i i i*, of the removable adjustable upper boards F F, provided with cleats *g g n n*, end boards G H, and braces *p p*, and exterior hinged braces I I I, constructed, arranged, and operating substantially as and for the purposes described.

3. The combination, with the bolsters *b b b*, formed with sockets at ends, of the hinged braces I I I, in the manner and for the purpose described.

170,160. SCREW-CUTTING MACHINES. Geo. Rentz, Cincinnati, Ohio. [Filed Sept. 16, 1875.]

Brief.—The presenting or clamping dies are closed on the bar by means of the wedge O, forced between the friction-rolls *n n'* by lever F. The cutting-dies are mounted in two pivoted plates, I, which are forced together by means of the cone-collar E.

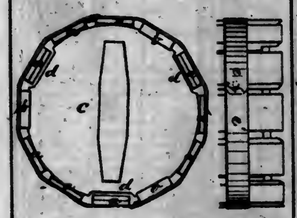
1. In a screw-cutting machine, in combination with the two-part die-plate I I, the two-part counterbored retaining-chuck H H', operating-arms *h h'*, and supporting-plate G, the whole constructed to operate substantially as described.

2. In a screw-cutting machine, the combination of jaws M M', lever N, wedge O, and spring P, all connected and operating substantially as and for the purpose specified.

170,161. WOODEN-SOLED BOOTS AND SHOES. Manuel J. S. Pulsen, Philadelphia, Pa. [Filed Oct. 11, 1875.]

Brief.—Improvement on Patent No. 168,617.

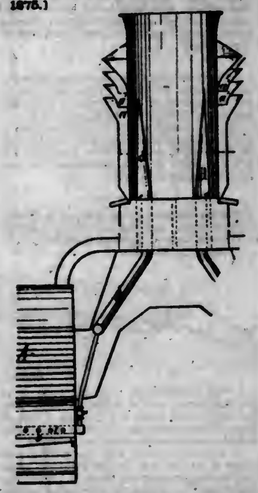
1. The combination, with a jointed wooden-soled boot or shoe, of the India-rubber strip F, having the beaded edge *f*, substantially as and for the purpose described.



2. The combination, with a jointed wooden-soled boot or shoe, of the India-rubber pushing-box D, having wings D' D', constructed and arranged substantially as and for the purpose set forth.

3. The combination, with a jointed wooden sole for boots and shoes, of the metal strips or plates G G and H, substantially as and for the purposes described.

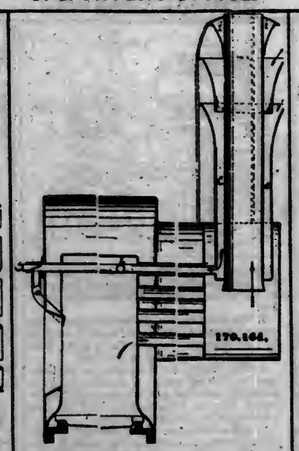
4. A jointed wooden sole for boots and shoes, having the winged pushing-box D D', the rubber strip F, the tapping strips G, and the plate H, substantially as and for the purpose described.



170,162. BARRELS. Luther W. Frye and Charles H. Watson, Boston, Mass., assignors of one-third their right to Edwd. Webb, New Castle, Me. [Filed May 8, 1875.]

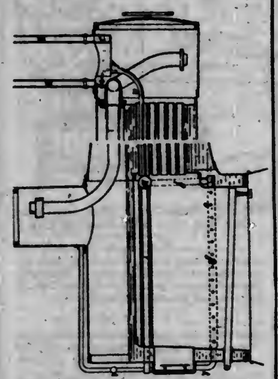
Brief.—A barrel for the transportation of fruit, vegetables, and similar products is so constructed that it can be taken apart and packed in a small compass, and is provided with air-spaces all around its circumference, to insure perfect ventilation through its contents. The heads are secured in alternate recesses and shoulders on the inner ends of the staves.

The improved ventilated fruit-barrel, as herein shown and described, consisting of the heads *c c*, with their recesses *d d d*, grooved staves *b b b*, and staves *a a a*, attached to the hoops *e e' e'*, as and for the purpose set forth.



170,163. APPARATUS FOR SUPERHEATING AIR FOR MARINE-BOILER FURNACES. W. C. Ford, Brooklyn, N. Y. [Filed Sept. 20, 1875.]

The arrangement, substantially herein described, of the superheating-pipes and receiving-drum in relation to each other and to the furnace, smoke-connection, steam-chimney, or smoke-pipe, for the purpose of collecting and forcing down the air by the motion of the vessel, and for the purpose of heating the same in its passage to the fire by the waste heat of the furnace, substantially in the manner described.

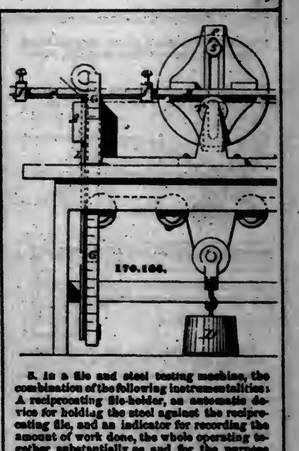


170,164. SUPPLYING HEATED AIR TO BOILER-FURNACES. W. C. Ford, Brooklyn, N. Y. [Filed Sept. 20, 1875.]

In combination with a locomotive or stationary steam-boiler, a superheater, consisting of a flue formed around the smoke-pipe, and connected to a series of pipes arranged in the heating surface and furnace of the boiler, substantially in the manner described, for the purpose specified.

170,165. APPARATUS FOR FEEDING AIR TO THE FURNACES OF STEAM-BOILERS. W. C. Ford, Brooklyn, N. Y. [Filed May 6, 1875.]

Brief.—Air is deflected and forced through a space formed by the stack and an outer casing into a pipe leading to the fire-box. A steam-jet assists in forcing the air to the furnace.

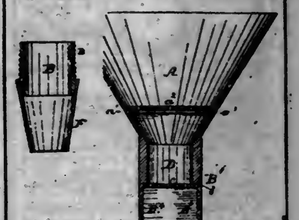


The combination of the smoke-stack and its outer casing, provided with deflectors, with an air-pipe leading to the fire-box, and a steam-pipe, which is inserted in the air-pipe near the stack, substantially as and for the purpose set forth.

170,166. MACHINES FOR TESTING FILES AND STEEL. James Garland, Pawtucket, R. I. [Filed Apr. 7, 1875.]

Brief.—Two files are attached to a horizontally-reciprocating bar, and two bars of steel, passing through holders, are forced up against the files with equal pressure by cords and weights. Graduated bars fall upward by the same means indicate the extent of shortening of the steel bars by the action of the files upon them.

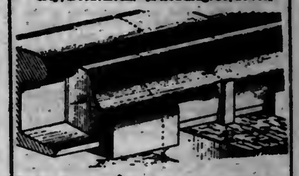
1. The combination of the filing mechanism, in which two files can be operated at a time, and a holder, for holding a piece of metal, with suitable means for pressing or feeding the same equally against each file during the operation, substantially as described.



2. The indicator G, in combination with the metal-holders A A and a suitable pressing or feeding device, as described.

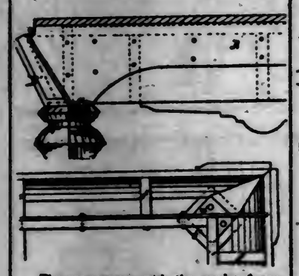
5. In a file and steel testing machine, the combination of the following instrumentalities: A reciprocating file-holder, an automatic device for holding the steel against the reciprocating file, and an indicator for recording the amount of work done, the whole operating together substantially as and for the purpose described.

170,167. DRUGGISTS' FILTERS AND FUNNELS. Abram B. Garrison, Newton, Kans. [Filed Sept. 16, 1875.]



Brief.—Between the removable strainers a chamber is formed for the reception of filtering material.

1. A combined filter and funnel embodying in its construction upper and lower funnel-shaped portions A and F, connected together by a tube, B, having parallel sides, and forming, by means of the removable flat perforated strainers *c'* and C, a chamber, D, for the reception of filtering media E, the whole being constructed as and for the purpose described.



2. A combined filter and funnel embodying in its construction upper and lower funnel-shaped portions A and F, connected together by a divided tube, B, having parallel sides, the halves B^1 B^2 of said tube B being coupled together by screw-threads B^2 B^1, as shown, and holding the lower flat perforated strainer C between their ends, the upper strainer *c'* being supported on a rim, *c*, and forming a chamber, E, for the reception of filtering media E, the whole being constructed as and for the purpose shown and described.

170,168. RAILROAD-RAIL CHAIRS. J. Gogerty, Decatur, Ill. [Filed Aug. 10, 1875.]

A railroad-chair made of one piece of metal, when composed of the bars E B and base-straps F F, substantially as described.

170,169. BILLIARD-TABLES. August Hand, Cleveland, Ohio. [Filed Sept. 27, 1875.]

The construction, with the wooden framework and legs of a billiard-table, of the longitudinal iron sides A and A' as a support for the stone bed C, when constructed and arranged to operate substantially as described.

170,170. GUMMOTORS' PUNCHES, ALARMS, AND REGISTERING DEVICES. George J. Hill and Augustus Roger, Buffalo, N. Y., assignors of part of their right to Jas. W. Roger, same place. [Filed June 26, 1875.]

1. The case A, provided with the slit *g*, in combination with lever C and spring-lock H I, all arranged and operating substantially as and for the purpose specified.

2. The combination, in this device, of drums K K' and drums *p p'*, and printing-wheels *h h' h''*, which operate in connection with a registering paper strip and inking-ribbon, substantially as hereinbefore specified.

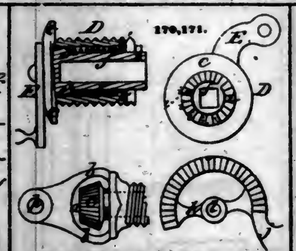
3. The combination of the duplicate number-wheels *h h' h''* and *j j' j''*—one series arranged inside, and the other outside, the case A—each corresponding wheel working on the same shaft or sleeve, whereby, by setting the outside series of wheels, the inside ones are correspondingly moved, so as to be in position to print, as hereinbefore fully explained.

4. The combination of the printing-wheels, having duplex numbers arranged on their periphery, so that the opposite numbers shall correspond, and outside setting-wheels or slides, whereby the inside wheels may be set as desired, with the paper-strip-feeding mechanism, all as shown and described.

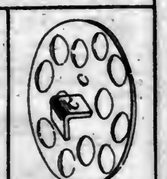
5. The combination of the ticket-face-printing mechanism, the paper-strip-registering mechanism, and alarm-bell mechanism, all substantially as and for the purpose specified.

6. The combination, with the outside setting-wheels *j j' j''* and frame O, of the spring-stops *v v' v''*, as and for the purpose specified.

7. The spring-hanger J, in combination with the wheel-shaft *i* and center plate I, provided with slot *q*, for the purpose of returning the wheels to their original position after being operated, all arranged and operating substantially as and for the purpose specified.



8. In this device, the combination of the pinions *l l' l''*, attached to, or forming part of, the printing-wheels *h h' h''*, the racks *j j' j''*, and the inclined sides *n n' n''*, all arranged and operating as hereinbefore explained.



170,171. SHUTTER-WORKERS. H. A. Howes, Bridgeport, Conn. [Filed Apr. 24, 1875.]

Brief.—A shutter-worker automatically adjustable to jambs of varying thickness.

1. In a blind opener and closer the hinge or eye section G, having screw-threaded shank *g*, head A, neck *f*, and sleeve I, in combination with a suitable bracket or plate section, substantially as and for the purpose set forth.

2. The combination of the rod F, having

170,172. FRUIT-JARS. Elizabeth S. Hunt, Cleveland, Ohio. [Filed Sept. 15, 1875.]

In a reservoir for the preservation of fruit or other matter, the combination of the lid or cover thereof and the detachable immersing plate or piece C, connected therein, substantially as and for the purpose described.

170,173. PROCESSES OF CONVERTING CAST-IRON INTO STEEL. Charles L. Jeffords, Jamestown, N. Y. [Filed Aug. 16, 1875.]

The process of converting malleableized cast-iron into steel by heating the iron to a bright-red color, and then immersing it in a compound or preparation consisting of eleven parts animal charcoal, nineteen parts lampblack, seventeen parts sal-soda, seven parts muriate of soda, five parts black oxide of manganese, three parts pulverized limestone, and eleven parts prussiate of potash, and allowing the iron to remain therein until cold, as hereinbefore set forth.

170,174. VENTILATING CHURCHES, HOUSES, &c. William Kingham, New York, N. Y. [Filed June 30, 1875.]

Brief.—The pure air enters at the bottom of the window, a draft being prevented by a deflector. The foul air escapes at the top of the window through the balanced flaps shown on the outside. The device may be applied and removed at will, requiring no cutting away of the parts about the window.

The combination, with the deflecting-plate arranged on the inside of the sash, of the oppositely-balanced flaps arranged on the outside of the sash at the top of the casing, all substantially as shown and described.

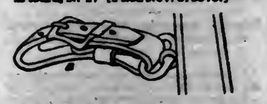
170,175. CAR-STARTERS. George S. Knapp, Chicago, Ill., assignor to Thomas B. Bennett and Fred. H. Ley, same place. [Filed July 28, 1875.]

Brief.—Pawl carried by slide drawn by horses, so as to engage with and turn ratchet fast on axle. Protecting-case for slide, pawl, and ratchet; also, inclines for removing pawl out of engagement on reaching the forward and backward limit of its play; also, retracting-spring.

1. In combination with the ratchet-wheel C, secured upon the car-axle, the tight case D and the sliding bar E, mounted in said case and provided with the dog H, as shown.

2. In combination with the ratchet-wheel C and the sliding bar E, provided with the dog H, the case D, provided with the inclines *a* and *b*, or either of them, substantially as and for the purpose set forth.

170,176. HAME-TOPS. Emmit G. Lotts, Friendship, assignor of one-fourth his right to Pratt & Letchworth, Buffalo, N. Y. [Filed Sept. 22, 1875.]



1. The combination, with the body C of the hame-top, cast of malleable metal, with the stop D and studs *d d* forming rivets, of plate C' for covering the open side of the body C, substantially as hereinbefore set forth.

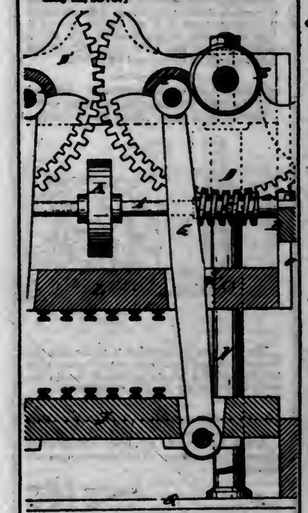
2. The combination, with the plate C' and body C, of the stop D, cast with the latter and having its sides cut away to permit the the sides of the portion C to be closed or contracted, as hereinbefore set forth.

3. In combination with the body A the hollow cast-metal hame-top C, provided with the raised loop or loops B, cast in one piece therewith, substantially as and for the purpose hereinbefore set forth.

170,177. HAMES. George J. Letchworth, Athens, N. Y. [Filed Nov. 6, 1875.]

A loop or other fastening, or any desired form, attached to the inside of a high-top hame, for the purpose of holding the hame to the collar in its proper place, substantially as described and set forth.

170,178. DENTAL POLISHING-TOOLS. I. P. Leeds, Hudson, N. H. [Filed June 22, 1875.]



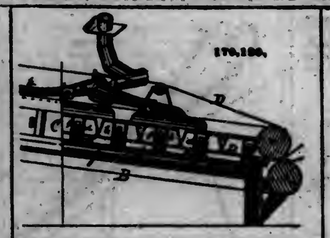
Brief.—The rubber casing or jacket of the tool extends beyond the wooden core, and is covered with sand-paper extending still further. This allows the extreme end of the polishing-tool to readily adapt itself to the small furrows in a dental plate.

1. In the dental polishing-tool described, the conical elastic cushion C, adapted to fit the spindle-head B, and having the cone-shaped projecting beyond the extremity of the spindle B, as and for the purposes described.

2. In a dental polishing-tool, such as described, an elastic conical cushion, C, having its extremity *d* projecting beyond the end of the spindle, and covered by a stand-paper collar, which has a portion, *a*, extending beyond the end of the cushion, substantially as and for the purpose set forth.

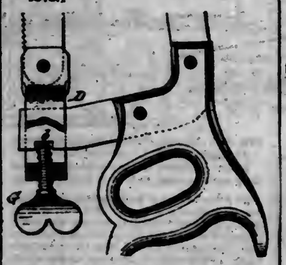
170,179. POWER-PRESSES. Benjamin G. Martin, New York, N. Y., assignor to the United Power-Press Company. [Filed May 13, 1875.]

1. The combination, in a press for cotton and other articles, of the worms O O, their shaft A, segments D D D' D', lifting-rods G, and follower J, substantially as described.



2. The combination of the resisting-block L with the follower J, lifting-rods G, segments D D D' D', shaft A, and worms O O, substantially as described.

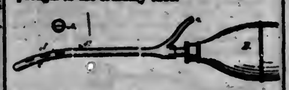
170,180. COMBINATION-SATURATORS FOR BAGASSE. Alfred W. J. Mazza, New Orleans, La. [Filed Apr. 22, 1875.]



Brief.—An endless belt receives the bagasse, and carries it between pressure-rollers placed in a closed chamber, which receives, by means of pipes, hot water or steam.

1. An inclosed chamber, C, carrier B, in combination with the tubes for supplying the saturating agent, the whole being constructed and arranged to operate substantially and for the purpose specified.

2. The inclosed chamber C, carrier B, belt D, pressure-rollers *d d'*, the whole being combined and arranged to operate substantially as described.

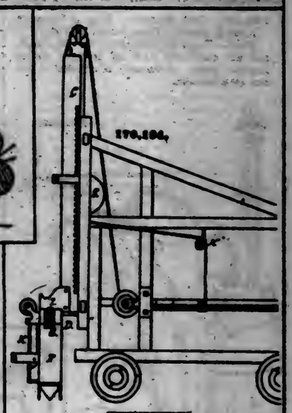


170,181. BUTCHERS' SAWS. William Millspaugh, Middletown, N. Y. [Filed Oct. 1, 1875.]

The combination, with the saw-frame A and blade C, of the loop D, pivoted to the blade, and the thumb-screw G, substantially as and for the purposes herein set forth.

170,182. STRAINERS. William Molesworth, New York, N. Y. [Filed July 12, 1875.]

Brief.—The double connection, to which the syringe-tube is attached, is of flexible metal, and made by inserting a longitudinal diaphragm in the ordinary tube.



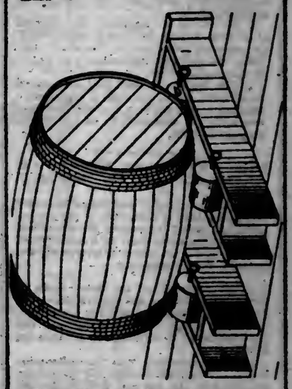
The double connection A, made of flexible and tenacious material as that it may be bent to any required curvature, the same being provided with the longitudinal diaphragm and discharging-holes *e* on one side, and the escape-orifices *d* on the other side, opposite, and the exit *c* near the rubber bulb B, as arranged to operate substantially in the manner as herein shown and described, for the purposes specified.

170,183. DISINFECTANT COMPOSITIONS. John W. Munger, Portland, Me. [Filed July 10, 1874.]

The compound composed of the following-named ingredients, to wit: fused crystallized sulphate of soda, silex, pulverized white castile-soap, arrow-root, borax, rock-salt, water, and sal-soda, in the proportions and for the purposes specified.

170,184. PILL-COATING MACHINES. A. F. W. Neymeier and Wm. F. A. Neymeier, New York, N. Y. [Filed Oct. 9, 1875.]

Brief.—The dipping-needles are bent at the blunt end and secured between two boards, one of which is, of course, perforated to receive the needles. A third board is perforated and passed over the needles, and is used to push off the pills which are upon the needle-points after being dipped in the coating material.



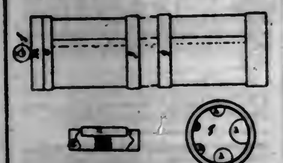
The combination of the needles with boards A B C and heads E for coating pills, substantially as and for the purpose specified.

170,185. HOGSHEAD AND BARREL HOOPS. Joseph M. Parker, Augusta, Mo. [Filed Sept. 9, 1875.]

Brief.—The hoop is made in two parts, with a space between for placing the vessel in opposition with the fastener, which is placed in the side of the vessel instead of the end, as usual.

The combination of the hoop composed of the parts B and B' with the rollers, substantially as described, and for the purposes set forth.

170,187. COW-MILKERS. Wm. H. Pearson, Lowell, Mass. [Filed June 17, 1874.]



Brief.—Teats are inserted in the cow's teats, and are connected with an air-tight can by flexible tubes. A vacuum is created in the can by a bellows.

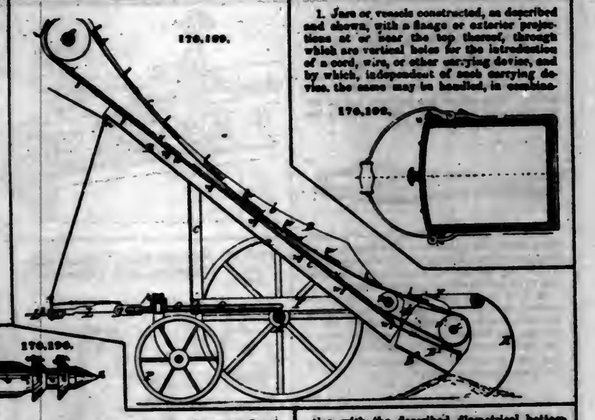
170,187.

The combination of the tubes *d d d d*, elastic rubber tubes *e e e e*, and elastic tube E with the elastic stopper B, bellows C, standard H, levers J and K, and can A, all being constructed and arranged to operate substantially in the manner described, as and for the purposes set forth.

170,188. FISHING-ROD CASES. Chas. Perry, Portland, Me. [Filed May 11, 1875.]

1. The fishing-rod case consisting of a tube of wood or other light material, covered and lined as described, having the rings *g*, the caps *c* and *d*, with cover *m* and spring-bottom *n*, constructed, combined, and arranged as herein set forth.

2. The fishing-rod case, lined and covered as set forth, having the rings *g*, caps *c* and *d*, the cover *m*, and device *e*, the whole combined and arranged substantially as and for the purpose set forth.



3. The fishing-rod case, lined and covered as set forth, having the rings *g*, caps *c* and *d*, the cover *m*, and device *e*, the whole combined and arranged, substantially as and for the purpose set forth.

170,189. HAY-LOADERS. Eli Perry and A. J. Manley, Fox Lake, Wis. [Filed Apr. 7, 1875.]

Brief.—Lower end of bed hinged to permit it to adjust itself to the surface of the ground, and also to shield the teeth of the carrier-belt. Leader supported in front by a caster-wheel, and attached to the wagon by a vertically and laterally pivoted connection.

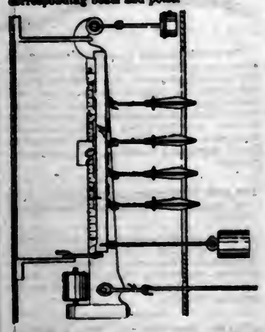
1. The section F of the carrier-frame E, having closed bottom, and pivots *h* joining the fixed bed-frame, and forming a combination of the trough thereof, and combined with the sub-carrier C, substantially as herein set forth.

2. The combination, with the leader-coupling I, having the horizontal and vertical pivots *j k* with the hay-rack Rak D, the caster F, and the spring tube-tenth E, all constructed and arranged substantially as and for the purpose herein set forth.

170,189.

170,190.

170,190.



170,190. BUFFER-STEMS. Philip W. Pratt, Abington, Mass. [Filed Oct. 11, 1875.]

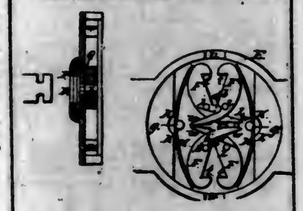
Brief.—A rubber buffer-peg having beveled flanges on its stem, to bind it firmly in place.

As a new article of manufacture, the rubber peg or buffer-stem A, provided with one or more projecting flanges, *d*, having the face *e* perpendicular to the axis of the stem, and the face *f* beveled or sloping from the rim of the flange to the body of the stem, as described, and for the purpose specified

170,191. WEIGHING-SCALES. William W. Reynolds, Brandon, Vt. [Filed Oct. 21, 1875.]

Brief.—A multiplex beam having each scale graduated to indicate weight of material to be used, exclusive of tare, and adjustable slides provided with pendent hooks, having attached to them spring-clamps, in which is placed a fragment of material to be weighed. An attendant enable to read can manipulate the scales by simply looking at the clamp holding the iron, coal, or flux, and then using the corresponding beam and poise.

1. The improvement in scales consisting in the arrangement upon the multiplex beam of sample-holders, substantially as and for the purpose set forth.

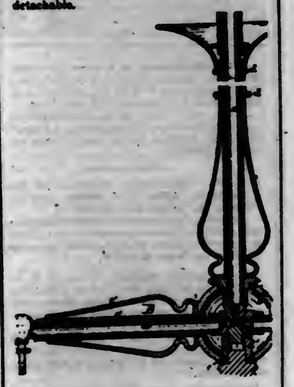


2. The combination of the multiplex beam, furnished with the adjustable slides, carrying the point-holders suspended on knife-edges, the supplemental or tare beam, and the sample-holders, provided to indicate the special use of each scale of the multiplex beam, the whole arranged for joint use in the operation of the apparatus for weighing coal, ore, flux, &c., substantially as and for the purpose set forth.

170,192. BAILED EARTHENWARE. Benj. F. Roberts, Bennington, Vt. [Filed Aug. 10, 1875.]

1. Jars or vessels constructed, as described and shown, with a flange or exterior projections at or near the top thereof, through which are vertical holes for the introduction of a cord, wire, or other carrying device, and by which, independent of such carrying device, the same may be handled, in combination with the described diametrical bottom groove, for the purposes set forth.

2. The described means of protecting and facilitating the handling and transportation of earthen vessels, consisting of the flange C, with perforations M M and bottom groove K K of the vessel, in combination with the reinforce D and bail E, adapted and applied substantially as shown and described.



170,193. LOCKS FOR CAR-SEATS. Edward S. Scofield, Chicago, Ill., assignor to W. Dewey, same place. [Filed Mar. 30, 1875.]

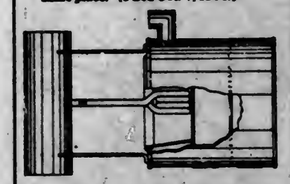
The iron arm B, provided with the cams E, the key-plates F and G, in combination with the levers F F F' F', the springs H H, and the catch S, as and for the purpose set forth.

170,194. CHANDELIERS. F. S. Shirley, New Bedford, Mass. [Filed July 24, 1875.]

Brief.—The elastic substance obviates the effects of concussion. The branch pipes are detachable.

1. As a new article of manufacture, a chandelier composed of the interior metal pipe a and the exterior opal casing *c*, having the branch piece B, provided with the part D, detachable in one piece from the stem A, provided with the part C, together with the nipple-piece E, as described.

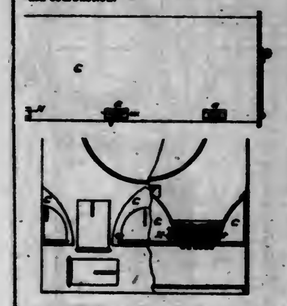
2. The combination of the elastic fixing or cushion *b'*, with the interior metal pipe a and the exterior opal casing *c*, as described, and for the purpose specified.



170,195. MAIL-BAG FASTENINGS. Horatio M. Smith, Chicago, Ill., assignor of two-thirds his right to M. W. Lester and F. Lester, same place. [Filed Oct. 26, 1875.]

1. The mail-bag, provided with a flexible continuous welt or enlargement at both sides of the mouth, and a guide or runway at one side of the bag, in combination with the series of clasps D, substantially as specified.

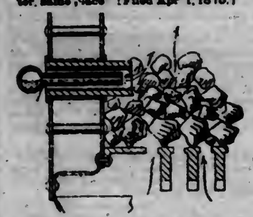
2. The rounded corner E, upon a mail-bag, provided with the welts B B', and series of clasps D, whereby the clasps may be slipped readily down the side of the bag, substantially as specified.



170,196. STEAM-GENERATORS. Horatio M. Smith, Chicago, Ill., assignor of two-thirds his right to M. W. Lester and F. Lester, same place. [Filed Oct. 7, 1874.]

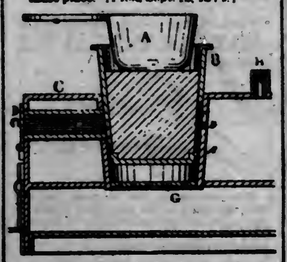
The combination, with a vessel containing an easily fusible metal, of a pipe partly coiled and immersed in the molten metal, the ends of the pipe constituting a water-inlet and a steam-outlet, substantially as and for the purpose specified.

170,197. RETORTS FOR FURNACES. Horatio M. Smith, Chicago, Ill., assignor of two-thirds his right to M. W. Lester and F. Lester, same place. [Filed Nov. 24, 1874.]



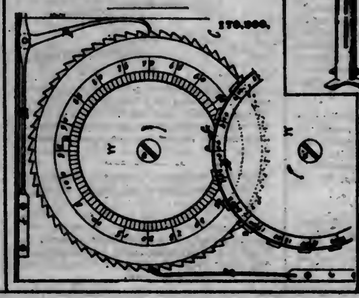
Brief.—The retorts have openings near their bottoms to allow the combustible gases to escape into the fire. Rubber pipes communicating with the air are placed in the retorts close by the openings, and have holes in them to furnish air to the gases as they escape, and so aid combustion.

1. The retorts or ovens G G, having therein the ports a a, opening directly into the burning fuel in the furnace to which the retorts are placed, substantially as shown and described, and for the purposes set forth.



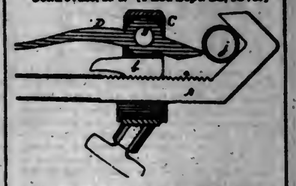
2. The retorts or ovens G G, having therein the ports a a, opening directly into the burning fuel in the furnace in which the retorts are placed, in combination with the perforated pipes or air-flues H H, lying within the retorts and near the ports thereto, and presenting their perforations to the said ports, substantially as shown and described, and for the purposes set forth

170,198. HYDROCARBON-FURNACES. Horatio M. Smith, Chicago, Ill., assignor of two-thirds his right to M. W. Lester and F. Lester, same place. [Filed Apr 1, 1875.]



In a furnace, the combination of a detachable thimble, made of refractory material, and arranged in the wall of the furnace above the grate-surface, with an oil-tube of less diameter than the thimble, and arranged concentrically within the same, whereby an annular air-supply chamber is formed around the oil-tube, and a mixing chamber is formed within the thimble in front of the oil-tube, all being arranged substantially as and for the purposes specified.

170,199. COOKING APPARATUS. Horatio M. Smith, Chicago, Ill., assignor of two-thirds his right to M. W. Lester and F. Lester, same place. [Filed Sept. 12, 1874.]



A portable cooking apparatus, consisting of the outside case C, ash-pit, supply-flue O, grate G, part B'', conical support A', and flue H, combined with the melting-receptacle B, as and for the purpose set forth.

170,200. REGISTERS. George F. Spencer, Francesville, Ind., assignor of one-half his right to J. F. Tarnell, same place. [Filed July 2, 1875.]

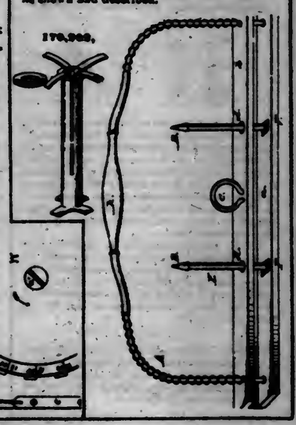
The combination, as a device for registering the measuring of grain, of a ratchet-wheel, W, bearing the dial D, and provided with the pin O, the spring-bar S, with its handle A, the pawl P, the detent S, the wheel W', with the cogs *c* upon its rim and bearing the dial D', all contained in the case C, having the opening *o*, and the openings E and E', provided with the wire *w*, in the door F, as described.

170,201. PIPE-WRENCHES. D. P. Stanton, Centreville, R. I. [Filed Sept. 23, 1875.]

The combination of the levers D and A, the latter being hooked and provided with the teeth *a*, with the strap C, serrated block *b*, and thumb-screw *d*, substantially as described, and for the purpose set forth.

170,202. TEMPORARY BINDERS. Horace B. Stephenson, Troy, N. Y., assignor to Wm. H. Bennett. [Filed Oct. 18, 1875.]

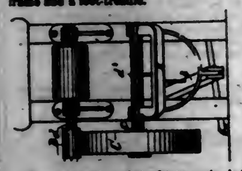
Brief.—The papers are filed upon split tubes, which surround conical-headed needles, secured to a base plate or bar, having an arch-shaped handle, the ends of which pass through a cross-bar parallel to the base-plate, and are encircled by a spring which forces the said bar over the needles, carrying the papers with it. When the file is full, the needles are detached, withdrawn from the tubes, and papers again supplied with other tubes, and attached to the base-plate for further use.



1. The combination of a bar, *a*, slide *b*, pin or pins B, and tube or tubes E, substantially as shown and described.

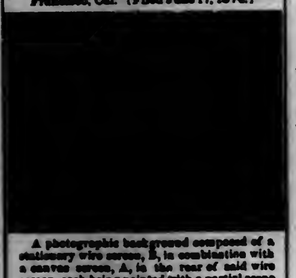
2. The combination of the cross-bar *a*, pin or pins B, and tube or tubes E, substantially as shown and described.

3. The means of binding papers or letters together, consisting of a tube or tubes, E, open at both ends, having projections, washers, or flanges at one end, and split and adapted to receive like projections, flanges, or washers at the other end, substantially as shown and described.



4. The pin or pins B, tube or tubes E, and cross-bar *a*, in combination with the slide *b*, handle A, rods A, and springs S, substantially as shown and described.

170,203.



170,902. FRICTION-WINDLASSES FOR BARRELS, KEGS, &c. A. D. Stout, St. Louis, Mo., assignor to himself and D. W. Jaynes, same place. [Filed July 6, 1875.]

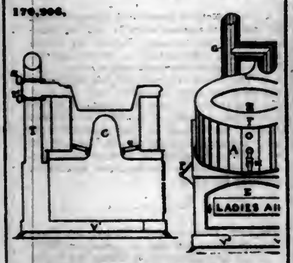
Brief.—The friction-windlass, by which the wire-rope is wound around the barrel, and the staves drawn in to the required form, is immediately released from the power-source, the wire-rope quickly unwound, and the barrel instantly discharged by means of a drop gravity-frame and a foot-treadle.

The combination of the friction-wheels C D, the drop-gravity frame B, its connection to a foot-treadle, E', the rods e^6, said parts being constructed and arranged to form a windlass of the character herein shown and described, and by means whereof said rollers can be instantly placed in or out of friction contact, and the gravity of said frame B is utilized to unwind said rope, in the manner and for the purpose set forth.

170,904. PHOTOGRAPHIC BACKGROUNDS. Josiah W. Taber and Thos. H. Boyd, San Francisco, Cal. [Filed June 17, 1874.]

A photographic background composed of a stationary wire screen, B, in combination with a canvas screen, A, in the rear of said wire screen, each being painted with a partial scene or picture, so arranged that the wire screen, or portion of said screen-surface opposite the painted picture on the canvas background, is partially opaque, such incomplete scenes on the two screens being made to register and harmonize, substantially as and for the purpose described.

170,905. CURTAIN ROLLERS AND BRACKETS. Warren E. Taylor and Thomas Donahue Stamford, Conn. [Filed Nov. 10, 1874.]



1. A curtain fixture or bracket constructed with an extension, b^1, provided with a slot, b^2, and screw-hole b^3, a base-plate, d, formed at right angles to the extension b^1, and provided with a slot, d^1, and having spurs or projections $e\,e\,e\,e$ formed at the extremity of the adjacent ends of the outward faces of the extension b^1 and plate d, and at right angles to each other, the whole being constructed as and for the purpose described.

2. The combination, with a curtain fixture or bracket constructed with an extension, b^1, slot b^2, screw-hole b^3, loop c^1, base-plate d, slot d^1, and spurs or projections $e\,e\,e\,e$, of the semi-circular rim d^2, provided with ratchet-teeth d^3, the whole being constructed as and for the purpose specified.

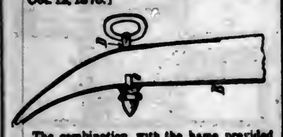
170,906. COOKING-STOVES. Robt. Thomas Toronto, Canada. [Filed Sept. 6, 1875.]

Brief.—Smoke passing by indirect draft through the base can expand into vertical flues at the sides of the oven.

170,906.

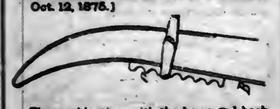
1. The hot-air chambers V V^1 V^2 V^3 V^4, as shown and described, and for the purposes set forth.

2. The descending pipe T, with dampers u u^1, in combination with the raised flue S and chambers V V^1 V^2 V^3 V^4, as shown and described, and for the purposes set forth.



3. The ascending pipe U, leading from the vertical chamber V^3, in combination with the series of chambers V V^1 V^2 V^3 V^4, as shown and described, and for the purposes set forth.

170,907. HALTER-FASTENINGS. Jos. Thornton, Wellsville, assignor of one-fourth his right to Pratt & Letchworth, Buffalo, N. Y. [Filed May 24, 1875.]



The halter-fastening C, constructed with solid supporting-arms $a\,a\,a$ and loops $c^1\,c^2\,c^3$, bent out of the plane of the arms, and adapted to be secured to the straps by rivet d, all substantially as and for the purposes herein described.

170,908. HAMES. James Thornton, Wellsville, assignor of one-fourth his right to Pratt & Letchworth, Buffalo, N. Y. [Filed Oct. 12, 1875.]

The combination, with the hame provided with the hole *f*, of the ring C, screw-bolt D, and nut E, having ears $e\,e$ bent over the sides of the hame, substantially as and for the purpose herein before set forth.

170,909. HAMES. James Thornton, Wellsville, assignor of one-fourth his right to Pratt & Letchworth, Buffalo, N. Y. [Filed Oct. 12, 1875.]

The combination, with the hame and back-strap B, provided with slot *b*, of the plate C, having its outer edge corrugated, and its inner edge tapering or wedge-shaped, substantially as and for the purpose herein before set forth.

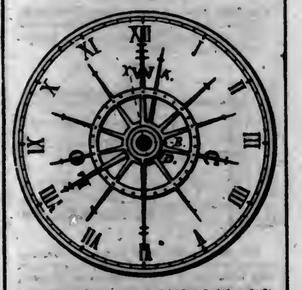
170,910. SHUTTER-FASTENERS. Samuel G. Tuckerman, Cambridge, Mass. [Filed Oct. 16, 1875.]

Brief.—A hasp from lower part of blind-frame passes over a pin set in the window-sill, and furnished with a spring locking-catch. A mortise in sash-frame covers over this fastening, which consequently cannot be unlocked until the window is raised.

1. The slotted locking-pin *a*, constructed, as described, with the pivoted and spring-actuated catch *c*, and rising from the sill E, in combination with and locking the hasp *b*, substantially as described.

2. The pin-covering mortise in the lower edge of the sash-rail H and the notched plate *f*, in combination with the catch-furnished slotted locking-pin *a*, constructed as described, and rising from the window-sill, the mortise and plate covering the pin, and the plate confining the hasp, substantially as described.

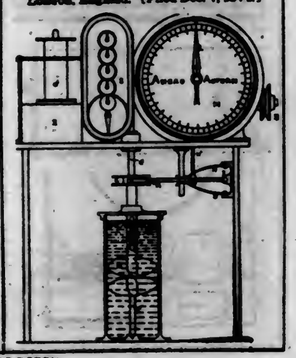
170,911.



170,911. CHAIN-PUMP BUCKETS. Josiah B. Van Duzer and Riley Johnston, Shebocgan, Pa. [Filed Sept. 21, 1875.]

Brief.—The rubber is expanded by screwing in a tapering screw, which passes centrally through it.

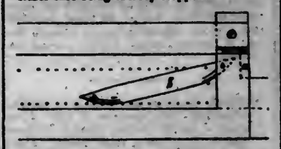
The combination, as a chain-pump bucket, of the rubber bucket A, having the central opening *a*, the tapered screw B, and the link C, as described.



170,912. GEOGRAPHICAL CLOCKS. Samuel J. Wallace, Keokuk, Iowa. [Filed Sept. 20, 1873.]

1. The multiple-pointed index for time-indicators, having one of the points moving together made separate, so that it may be changed and set to show any local time without interfering with the regular indications of the remainder of the points, substantially as set forth.

2. The disks C, with radiating indices and perforated centers, substantially as set forth.



170,913. SPEED-INDICATORS. M. A. Wier, London, England. [Filed Dec. 7, 1874.]

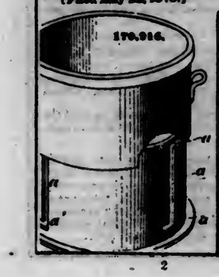
In an apparatus for indicating the speed of machinery, the combination of the cylinder A, fixed revolving shaft C, vertically-movable screw B, collar O, levers H H^1, connected H^2, springs F O, and an indicating or recording mechanism, substantially as herein described, for the purpose set forth.

170,914. SHUTTLES AND SHUTTLE-STOPS FOR LOOMS. James Wolfenden, New Bedford, Mass. [Filed May 24, 1875.]

Brief.—The shuttle is so shaped that an obstruction in the shed will either throw it up and through the upper layer of warp-threads, or cause it to strike against a stop placed in the throat of the shuttle-box, the loom in either case being thereby stopped.

1. The shuttle S, having its points or ends above the longitudinal central line thereof, as described, and for the purpose specified.

2. The combination, with the slay of a loom, of the stops *a*, arranged at the throat of the shuttle-boxes, as and for the purpose set forth.



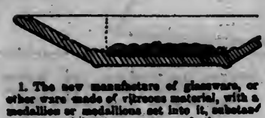
170,916. CORRUGATED WIRE-WORKER AND FANS FOR RAILROAD-CARS. Ambrose W. Woodward, Lancaster, Pa. [Filed Aug. 20, 1875.]

Brief.—Wheel revolves within a case secured by a cross-bar centrally surmounted by a brace forming the upper bearing of the vertical shaft, to which the wind-wheel and the fan are secured. The step rests on a cross-piece that spans the upper draft-chamber. The casing around the wheel has an open space on opposite sides and flared mouth to arrest and direct the currents of air to the wheel. A sleeve is fitted around the shaft, and connected with another short slotted sleeve on a disk under the roof, and is made to rotate by means of two cords.

A wind-wheel having six, eight, or more oblique, wedge-shaped wings, C, within a case, B, which case is made adjustable in its bearings by cords H H^1 and disk E, and is also provided with flared fixed shields *a a*, together with a fixed independent ghost-plate, A, in combination with a fan, F, on a bolt, made adjustable by a set-screw, *f*, on the vertical shaft G of the wind-wheel, the whole arranged and operated as and for the purpose specified.

170,916. ADJUSTABLE GRADUATE MEASURE. Thos. B. Young and Silas A. Davis, Livermore, Ky., assignors of one-third their right to John A. Moore, same place. [Filed May 29, 1875.]

170,917. LIMB-RECEIVERS. H. R. Allen, Indianapolis, Ind. [Filed Feb. 24, 1875.]

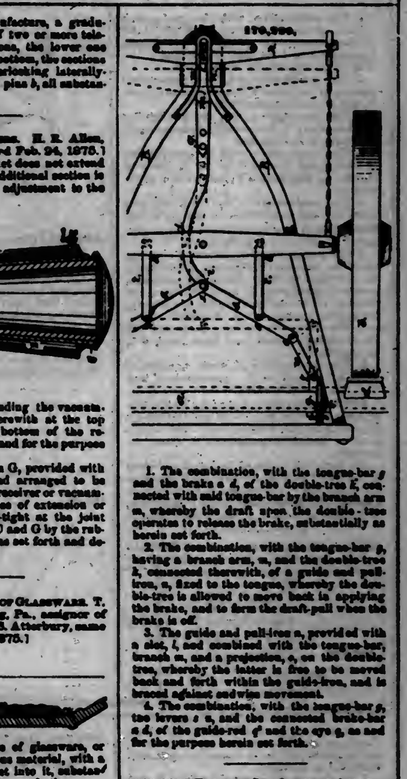


Brief.—The double jacket does not extend over the bottom, and an additional section is used for a more complete adjustment to the limb to be treated.

1. The jacket A, surrounding the vacuum-chamber C, and united therewith at the top and bottom, leaving the bottom of the receiver to project below, as and for the purpose set forth and described.

2. The adjustable section G, provided with a flange, J, constructed and arranged to be used in connection with a receiver or vacuum-chamber, C, for the purpose of extension or adjustment, and made air-tight at the joint between the two sections C and G by the rubber band F, substantially as set forth and described.

170,918. MANUFACTURE OF GLASSWARE. T. B. Atterbury, Pittsburg, Pa., assignor of one-half his right to J. S. Atterbury, same place. [Filed Nov. 6, 1875.]



1. The new manufacture of glassware, or other ware made of vitreous material, with a medallion or medallions set into it, substantially as and for the purpose set forth.

2. A medallion set in glass, made and united to the article in which it is set by the one operation of pressing, substantially as described.

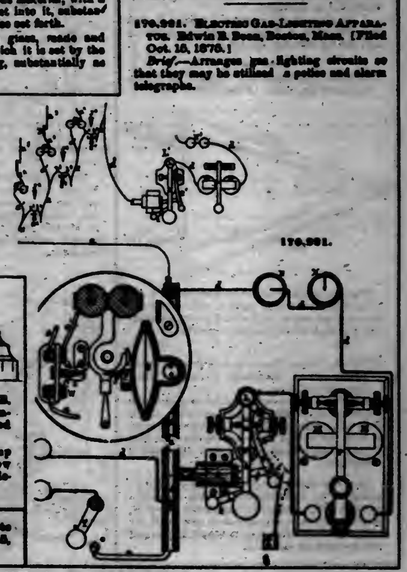
170,919. MANUFACTURE OF LAMPS. T. B. Atterbury, Pittsburg, Pa., assignor to himself and J. S. Atterbury, same place. [Filed Sept. 10, 1875.]

As a new article of manufacture a lamp having a pressed-glass base, A, and a hollow blown-glass pedestal, B, substantially as described.

170,920. WAGON-BRAKES. A. La Fayette Bartlett, Brownsville, Ga. [Filed July 15, 1875.]

1. The combination, with the tongue-bar *f* and the brake a *d*, of the double-tree E, connected with said tongue-bar by the branch arm *m*, whereby the draft upon the double-tree operates to release the brake, substantially as herein set forth.

2. The combination, with the tongue-bar *f*, having a branch arm, *m*, and the double-tree E, connected therewith, of a guide and pull-iron, *n*, fixed to the tongue, whereby the double-tree is allowed to move back in applying the brake, and to form the draft-pull when the brake is off.



3. The guide and pull-iron *n*, provided with a slot, *l*, and combined with the tongue-bar, branch *m*, and a projection, *q*, on the double-tree, whereby the latter is free to be moved back and forth within the guide-iron, and is braced against end-wise movement.

4. The combination, with the tongue-bar *f*, the levers *o o*, and the connected brake-bar a *d*, of the guide-rod *g*¹ and the eye *g*, as and for the purpose herein set forth.

170,921. ELECTRIC GAS-LIGHTING APPARATUS. Edwin B. Bean, Boston, Mass. [Filed Oct. 16, 1875.]

Brief.—Arranges gas-lighting circuits so that they may be utilized a police and alarm telegraphs.

170,921.

1. The combination, with the gas-lighting wires *a*, of the series of circuit-closers H H' H², &c., whereby the circuit is closed at each lamp as it is past out, and broken just before it is reit, substantially as described.

2. The combination, with the gas-lighting wires *a*, of batteries N, keys *h h*, instruments P, and wires *d*, as described.

3. The combination, with the gas-lighting wires *a*, of key K, batteries N, instruments P, and wires *d*, as described.

4. The combination, with the gas-lighting wires *a a'* and magnets G, of key K, batteries N, keys L, instruments P, and wires *d*, as described.

5. The combination, with the gas-lighting wires *a a'* and magnets G, of the key K, batteries N, keys L, keys *h k*, switches *c*, instruments P, and wires *d*, as described.

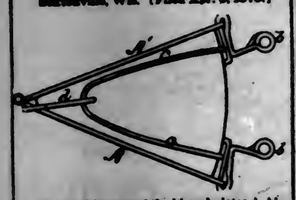
6. The method above described for adapting the wires necessary for lighting street-lamps by electricity to other telegraphic purposes, consisting essentially in using with them the series of wires *d*, batteries N, and suitable signal-making instruments, as described.

7. The combination of air-pipe A and pin-tee Q with the switch *s* and lever *h* of key L, as described.

8. The combination of wires *a*, series of wires *d*, keys *h k*, (or K,) instruments P, and batteries N, as described.

9. The combination of the key B and lamp or lamp-post with the circuit *a d*, instrument P, and battery E, whereby each lamp-post is made a transmitting-station, as above described.

10. The combination of the key B and lamp or lamp-post with the circuit *a' a d*, instrument G, instrument P, and battery N, whereby each lamp or lamp-post is made both a transmitting and receiving station, as above described.

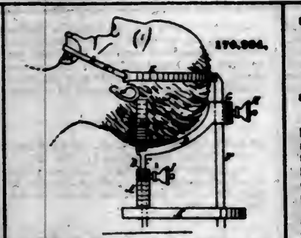


170,903. CHIMNEY-PRESERVER. J. G. Hunt, Sextonville, Wis. [Filed Sept. 20, 1875.]

1. In a chimney-preserver, the section A, subdivided into parts or wings C C', and provided with hook G and spring D, substantially as specified.

2. In a chimney-preserver, the section B, constructed with a recess, H, substantially as and for the purpose specified.

170,904. CHIMNEY-PRESERVER. J. G. Hunt, Sextonville, Wis. [Filed Apr. 2, 1875.]

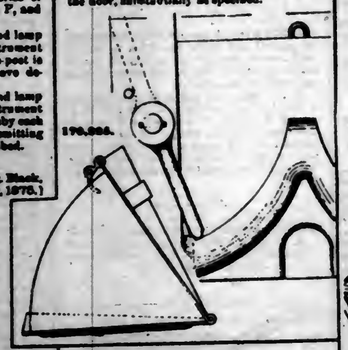


The combination of the hinged plates A A', hook *d*, and an elastic cord, *c*, connecting the free vertical edges of the said plate, substantially as and for the purposes specified.

170,905. HEAD-RESTS FOR CORPSES. Chas. D. Blackford, Hamilton, Canada. [Filed Aug. 10, 1875.]

Brief.—A frame-work which supports the head adjusts vertically upon uprights, and is held in any required position by set-screws. A chin-rest is held by straps to the ends of a curved piece, which passes over the head of the corpse.

The combination of the head-rest A B C, adjusted by thumb-screw I, with the chin-support E F, adjusted by the thumb-screw H, and the chin-straps L, attached to hasp K, for chin-plate M, all arranged substantially as and for the purposes specified.



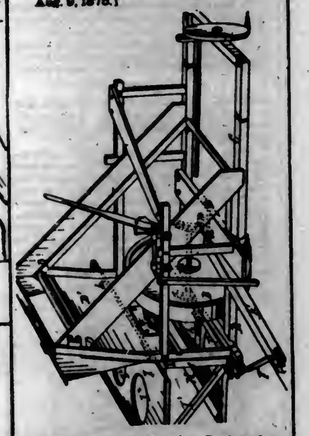
170,906.

170,906. PUDDLING-FURNACE DOORS. Jos. Reyland, Troy, N. Y. [Filed June 8, 1875.]

Brief.—The pins pivoted to the frame swing down the curved surfaces of the ribs on the door, and hold the door when down, and are swung back until stopped by the pins in the frame when it is desired to lift the door.

The combination of one or more swing-stops, A, on the furnace-wall or door-frame, with one or more curved ribs or flanges, B, on the door, substantially as specified.

170,906.



170,907. CAR-COUPLERS. Andrew Brown, Eden Township, (near East P. O.,) Lancaster County, Pa., assignor of one-half his right to J. B. and B. B. Danlinger. [Filed Aug. 26, 1875.]

Brief.—The pin moves with the draw-head, and the link is elevated by the rock-shaft.

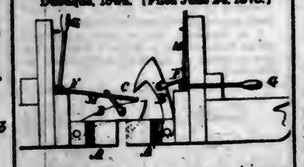
1. In combination with the movable draw-head B and the coupling-pin E, the lever G, mounted on the car-body and provided with the hinged arm F, arranged to allow the pin to move forward and backward with the draw-head, substantially as shown and described.

2. In combination with the draw-head B and the coupling-link D, having the lateral eye *d* formed on its rear end, the rock-shaft M, provided at its outer end with the operating-handle N, and at its inner end with the arm *m*, extending loosely through the eye of the link, as and for the purpose described.

170,908. HARVESTERS. James O. Brown, Macallon, Ohio, assignor of part of his right to Edwin Bayliss, Pliny F. Hodges, and F. T. Lomont, same place. [Filed Aug. 9, 1875.]

1. The platform rail or bar F, pivoted to the main frame in line with the tongue-pivot, in combination with the hinged platform H, substantially as and for the purpose set forth.

2. The adjustable brace F', in combination with the pivoted platform-rail F and pivoted tongue H, arranged and operating substantially as and for the purpose described.



3. The upright frame *f f* on the pivoted platform-rail F, supporting the inner edge of the table I, in combination with the adjusting-bolt *g*, or its equivalent, uniting said frame to the elevator-frame or shield, and permitting the adjustment of the binders' platform, as described.

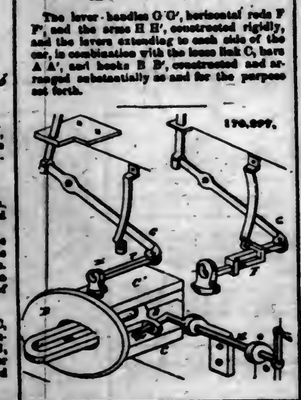
4. The binders' table I and hinged platform H, connected with the pivoted longitudinal rail F, and the upright frame *f f* mounted thereon, in combination with the slotted or jointed brace F', connecting said rail F with the tongue, substantially as and for the purpose set forth.

170,909. HARVESTERS. James O. Brown, Macallon, Ohio, assignor of part of his right to Edwin Bayliss, Pliny F. Hodges, and F. T. Lomont, same place. [Filed Aug. 9, 1875.]

Brief.—A short apron is used to start the grain up between the elevator and its compressing-cover.

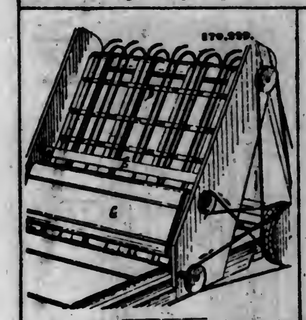
The combination, with the elevator and its stationary cover or compressing device, of the short independently-revolving canvas or apron G, arranged at the lower end of said cover or compressing device, and operating in connection therewith and with the elevator, substantially as and for the purposes set forth.

170,909.



170,910. CAR-COUPLERS. Jacob Brinkerhoff, G. B. Bennett, and La Fayette Selder, Dubuque, Iowa. [Filed June 24, 1875.]

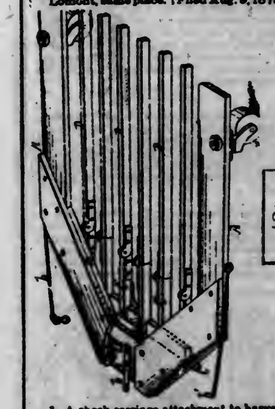
The lever-handles C C', horizontal rods F F', and the arms H H', constructed rigidly, and the levers extending to each side of the car, in combination with the loose link C, bars A A', and hooks B B', constructed and arranged substantially as and for the purpose set forth.



170,911. HARVESTERS. James O. Brown, Macallon, Ohio, assignor of part of his right to Edwin Bayliss, Pliny F. Hodges, and F. T. Lomont, same place. [Filed Aug. 9, 1875.]

Brief.—Arrangement of the parts of the machine by which the relations of the elevator-frame, belts, &c., are preserved.

1. The platform-frame, united to the main frame by means of the braces *b b'*, hinged to the main frame, in line with the crank-shaft, and to the platform in line with the shaft of the lower-platform apron-roller, as described.



170,910.

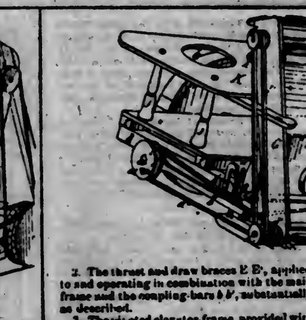
170,909.

170,909. SHOCK-CARRIAGE ATTACHMENTS TO HARVESTERS. James O. Brown, Macallon, Ohio, assignor of part of his right to Edwin Bayliss, Pliny F. Hodges, and F. T. Lomont, same place. [Filed Aug. 9, 1875.]

1. A shock-carriage attachment to harvesters, provided with a slatted dropper and a horizontal platform partially surrounding said dropper, and left open at the rear to permit the unobstructed escape of the standing shock, whereby the attendant is enabled to form and discharge the shock without stopping the machine, substantially as described.

2. The dropping slats or bars D, jointed to the vibrating arms C, and operating substantially as described, whereby their parallel relations to the ground is preserved, for the purposes and substantially as specified.

3. The jointed dropping slats or bars C' D, united to the carriage or frame through the medium of the transverse rocking shaft or bar C, substantially as described.



4. The shock-carriage or frame A, supported at its rear by the caster-wheels B B, and at its front by the pivoted bolt or pin *k*, in combination with the jointed draft-rods *b' b'*, permitting said carriage to maintain a parallel relation to the ground, as described.

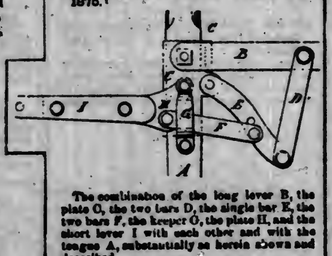
5. The slatted platform D, pivoted to the platform or frame A, in combination with the lever-arm and latch for controlling said platform, substantially as described.

170,910. HARVESTING-MACHINES. James O. Brown, Macallon, Ohio, assignor of part of his right to Edwin Bayliss, Pliny F. Hodges, and F. T. Lomont, same place. [Filed Aug. 9, 1875.]

Brief.—A short apron is used to start the grain up between the elevator and its compressing-cover.

The combination, with the elevator and its stationary cover or compressing device, of the short independently-revolving canvas or apron G, arranged at the lower end of said cover or compressing device, and operating in connection therewith and with the elevator, substantially as and for the purposes set forth.

170,911.

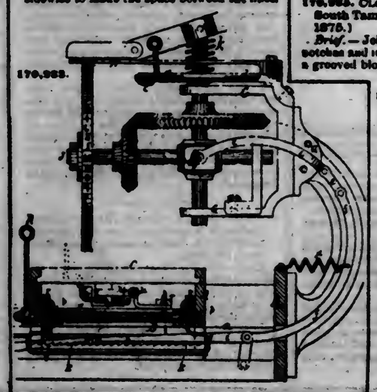


---

2. The thrust-and draw-braces E E', applied to and operating in combination with the main frame and the coupling-bars *b b'*, substantially as described.

3. The pivoted elevator-frame, provided with the separating board O', applied and operating in combination with the table K, as described.

4. The platform and elevator frames, hinged to each other on the line of the inner-platform apron-roller, and to the main frame, as described, in combination with the driving-pulleys *a' a²*, arranged upon the centers, coincident with the pivotal centers of said frames, substantially as and for the purpose set forth.



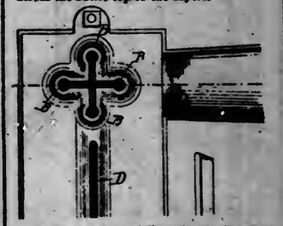
170,912. DRAFT-EQUALIZERS. Hiram Cartwright, Owatonna, Minn. [Filed Oct. 23, 1875.]

The combination of the long lever B, the plate C, the two bars D, the single bar E, the two bars F, the keeper G, the plate H, and the short lever I with each other and with the tongue A, substantially as herein shown and described.

170,913. TYPE-WRITING MACHINES. W. H. Cone, Dansville, N. Y. [Filed Dec. 6, 1874.]

Brief.—The key is turned until the indicator is over the desired character, when it is depressed, carrying with it the type-wheel, which has been rotated by the bevel-gear, making the impression on the paper, which is moved with the table the space of one letter by the upward movement of the key. When the line is completed the dogs are operated, so as to move the table backward to commence another line, and at the same time it is moved sideways to make the space between the lines.

170,913.

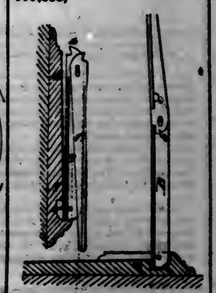


---

1. In combination with the sliding table B, the jointed levers *e f*, the dogs or catches *i n*, the rack K, and spring *x*, operated by the key M for moving said table, substantially as described.

2. The combination, with the table B and desk C, the shaft P, provided with an arm, R, at one end, by means of which the same may be partially rotated, and with lugs or pins *p p*, adapted to raise the levers *r r*, and lift the ends of the dogs *n i* out of the racks in through the medium of a bail, S, extending from said levers down under the dogs, in order to allow the desk to be moved, substantially as described.

170,914. TUYERS. Horace J. Chandler, Dummer, assignor of one-half his right to Merrill C. Forist, Berlin, N. H. [Filed May 26, 1875.]

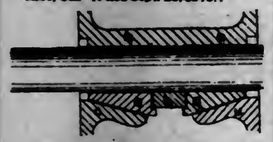


Brief.—The long slot is closed by the damper when a small fire is required, and is left open when it is desirable to have the fire extend across the entire top of the tuyere.

A tuyere, substantially as herein described and shown, formed with the oval-ended slots B B, long slot D, damper C, and slide E, as set forth.

170,915. CLOTHES-DRIERS. Frank M. Clark, South Tamworth, N. H. [Filed Sept. 20, 1875.]

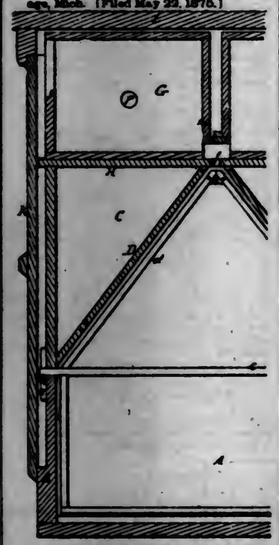
Brief.—Jointed arms, held together by notches and inclined shoulders, are pivoted in a grooved block or standard.



170,915.

1. An improved clothes-drier, formed by the combination of the grooved and mortised block A and the pivoted jointed arms B C with each other, in substantially the manner herein shown and described.

2. The jointed arms B C, having inclined shoulders *b' c'* on their adjacent ends, substantially as and for the purpose set forth.



170,926. TAPPET-CLAMPS FOR STAMP-STEMS. Nicholas J. Colman, San Francisco, Cal. [Filed Sept. 23, 1875.]

1. The tappet A, having the boxes B B, with their inclined grooves or chambers, in combination with the corresponding gibs D and the wedge or key F, substantially as and for the purpose above described.

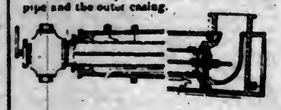
2. An improved tappet-clamp, consisting of the tappet A, provided with two oppositely-inclined chambers, in each of which a tapering wedge or gib, D, is placed, and the two wedges or gibs D are forced in opposite directions, so as to tighten them upon the stem by a wedge or key, F, driven in between them, substantially as above specified.

170,927. BEE-HIVES. Orson Colvin, Vicksburg, assignor, by mesne assignments, of one-half his right to J. L. Hawkins, Portage, Mich. [Filed May 22, 1876.]

1. The combination, with the rabbeted base-section A of a bee-hive, of the inner section C, having projecting top H supported thereon, and the honey-sleeve K, having the corner-stops *i* resting on said projecting top H, substantially as specified.

2. The inner section C, having the angular air-chambers, in combination with the comb-frames, having the bars *d* inclined toward each other in angular form, substantially as specified.

3. The inner section C, having the angular air-chambers bounded on the inside by the perforated inclined walls, the passages through the top of the section between said inclined walls, and the bridge over said passages, substantially as specified.



4. The combination, with the bridge above the passages through the top H, of the honey-boxes having the lateral openings, and fitting against said bridge, substantially as specified.

5. The combination, with the lower or base-section A and the inner section C, of the corner guards *a* and the incasing sleeve K, substantially as specified.

6. The two-chamber top section C, having air-chambers bounded by inclined sides, having perforations through their lower portions and at their upper edges, and the air-opening *h* through the vertical wall of said box-chamber in the angular space between said air-chambers, substantially as specified.

170,928. HYDRANTS. John O. Connor, Buffalo, N. Y. [Filed Mar. 15, 1875.]

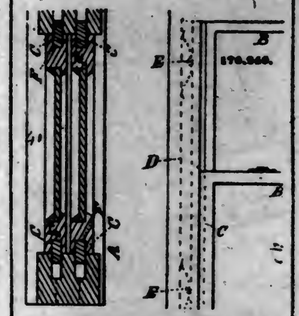
Brief.—The jacket and outlet pipe are rigidly connected at the bottom, and provided with a stuffing box at the top, so as to form a slip-joint, for the purpose of allowing for the difference of expansion between the outlet-pipe and the outer casing.

The outlet pipe and jacket or outer casing, rigidly connected at the bottom through the valve case, in combination with a stuffing-box encircling the outlet-pipe where it passes through the upper end of the jacket, substantially as and for the purpose set forth.

170,929. TYPE-WRITING MACHINES. L. S. Crandall, New York, N. Y. [Filed Aug. 20, 1875.]

Brief.—The platen is vibrated transversely to the line of printing, to form different printing-points. The key is pushed outward to print one letter, and inward to print another.

1. A type-writer constructed of a vibrating platen, with a series of swinging compound type-bars and oscillating finger-levers, substantially in the manner and for the purpose set forth.



2. In a type-writer, a platen or printing-cylinder vibrated in a direction transverse to the line of printing by means of mechanism substantially as described, for the purpose of creating additional printing points or centers.

3. The combination of the vibrating platen with the swinging compound type-bars, provided with types corresponding to each vibration on printing-point of the platen, substantially as specified.

4. The combination of the swinging type-bar with the oscillating finger-lever, and with mechanism, substantially as described, for imparting a double action to the type-bar, so that the same may be thrown a fixed distance in forward or backward direction, and compel two adjoining types to strike the same printing-point of the platen, substantially as described.

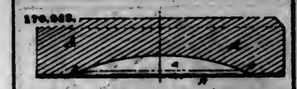
170,930. SASH-BALANCES. Henry Cutting, Buffalo, N. Y., assignor of one-half his right to Harvey A. Cutting, same place. [Filed June 29, 1875.]

Brief.—Playing in grooves extending the whole length of both casing and window-casing, with springs behind them, serve as guides upon which the sash slides up and down, while the construction is such that by simply pressing the strips back into the grooves of the casing, the sash can be readily taken out for cleaning, or like purposes, and as readily replaced in normal position.

The window-casing provided with grooves D, extending its entire length, and the sash B, having corresponding grooves F, in combination with the springs E and the friction-strips C, placed loosely in the grooves in the casing, and pressing against the bottom of the grooves in the sash, for which they also serve as guides, whereby the sash can be removed by pressing back the strips only, all arranged and operating substantially as and for the purpose specified.

170,931. GRAIN-DRILLS. James C. Dunbar, Elk Point, Dak. [Filed Aug. 14, 1875.]

Brief.—The seed is deflected from V-shaped plates to the hopper-bottom, and thence into drill-tubes by inclined plates, one of which receives a vibratory movement from a rock-shaft.

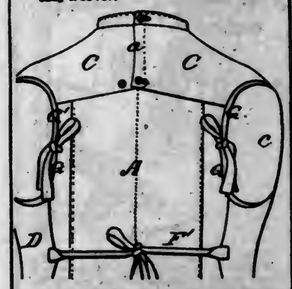


1. The division-blocks E, inclined plates F, and movable plates G, combined with rock-shaft, pawl, and ratchet, as and for the purpose set forth.

2. The inclined plates F G H', combined with hopper, as and for the purpose specified.

170,932. BUTTER-PACKAGES. Andrew J. Dibble, Franklin, assignor to himself and David O. Landon, Delhi, N. Y. [Filed Feb. 6, 1875.]

As a new article of manufacture, a butter-firkin, H, constructed of a single block of wood, having conical cavity, in which the butter is packed, said firkin being adapted to be packed together and transported, to be afterward sold, separately or substantially, as herein set forth and described.



170,933. PAPER-WHEELS. Edward Dressler, Gablonz, Bohemia, Austria, assignor to Alfred J. Cottebrune, Philadelphia, Pa. [Filed Sept. 17, 1875.]

170,934.

A paper-weight formed of a glass block, A, having a rounded concavity, *a'*, in its lower side, a picture, B, attached to said lower side, and a bordering, C, attached to the outer part of the surface of said concavity, substantially as herein shown and described.

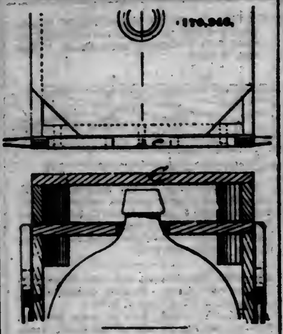
170,935. SHIRT-FRONTS. Wm. J. Duke and Mary A. Duke, Booneville, Miss. [Filed May 1, 1875.]

As a new article of manufacture, the shirt-front herein described, consisting of the bosom A, concave side pieces D D, constructed to extend under the arms, and partly around the body of the wearer, cords G F G' F', yokes G G, and collar E, as set forth.

170,936. BOOMERANGS. Alexander Dupbar, Brockville, Canada. [Filed June 22, 1875.]

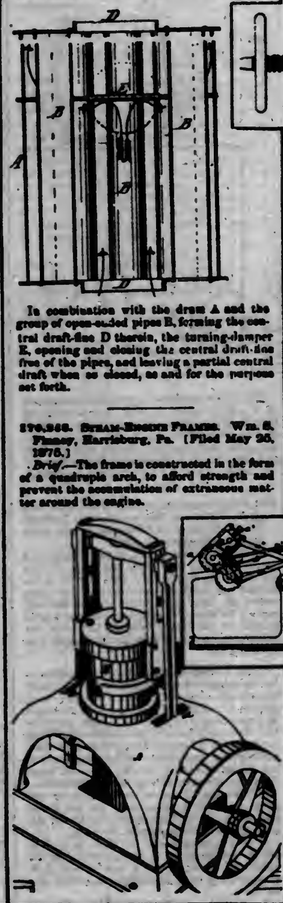
The improvement in horse-shoeing, the same consisting in nailing the shoe to the heel on each side of the toe and at the heel, so as to leave the sides of the heel free to expand, substantially as specified.

170,937. CARBOYS. Alex. H. Pottinger, New York, N. Y., assignor to himself and J. McFarlane, North Bergen, N. J. [Filed Oct. 29, 1875.]



Brief.—The carboy is protected by box and cover. The neck of the carboy passes through a centrally-perforated removable partition. The cover has four downward-projecting pins, passing between the horizontal partition at the corners and the casing. The cover has three cleats on opposite sides, so that the handle may be placed vertically or horizontally.

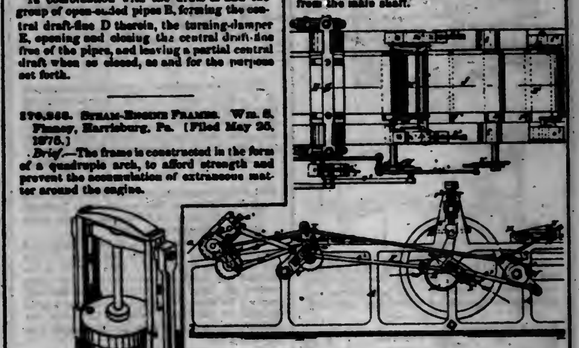
1. The combination, with a carboy-box having a top part or neck-guard, with guiding corner recesses, of a detachable cover, provided with corresponding corner-pieces for readily securing or taking off the cover, substantially in the manner and for the purpose set forth.



2. The combination of a carboy-box, provided with vertical corner-strips and central horizontal strips at opposite sides, with pivoted handles that may be thrown into vertical or horizontal position, for the purpose set forth.

170,938. BEATING-DRUMS. Thos. B. Field, Corning, N. Y., assignor to Mary E. C. Field, same place. [Filed Sept. 22, 1875.]

Brief.—The turning damper, when in horizontal position, deflects the products of combustion in part outward between the air-pipes



170,938.

In combination with the drum A and the group of open-ended pipes E, forming the central draft-flue D therein, the turning-damper K, opening and closing the central draft-flue free of the pipes, and leaving a partial central draft when so closed, as and for the purpose set forth.

170,939. STEAM-ENGINE FRAMES. Wm. S. Pinney, Harrisburg, Pa. [Filed May 20, 1875.]

Brief.—The frame is constructed in the form of a quadruple arch, to afford strength and prevent the accumulation of extraneous matter around the engine.

170,940. DRILLING-MACHINES. J. S. Fleming, Steubenville, Ohio. [Filed Apr. 17, 1875.]

Brief.—The drill-frame can be lengthened or shortened, adapting it to vessels or cases of various of different dimensions. The drill shaft and tool are carried upon the frame within an adjustable tubular screw passing through a socket, which hold adjustably in position by means of clamps.

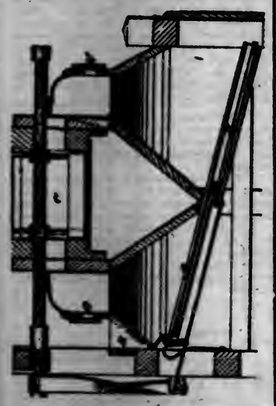
1. The vertically adjustable and oscillating tubular screw threaded socket F, adjusting tubular screw G, socket I, shaft *d*, and crank-arm *a*, combined and arranged substantially as specified.

2. The combination of a detachable clamp, J, and connecting-rod *d*, with a vertically-adjustable and oscillating socket, F, and a frame supporting the same, substantially as specified.

3. In a drilling-machine, the threaded tubular adjusting-screw G, having upon one end the hand-wheel *f*, in combination with the screw-threaded socket F and boring-auger shaft *d*, operating substantially as herein described.

170,941. CRACKER-MACHINES. C. S. Fowler, Brooklyn, N. Y. [Filed Dec. 28, 1874.]

Brief.—The apron delivering the dough to the cutters is caused to travel somewhat faster than the apron upon which the dough falls from the feed-rolls, in order to remove the "crawl" from the sheets of dough. The fingers at the foot of the scrap apron are pivoted to a rod, which is secured at its ends to jointed links pivoted to the edge bar, over which the scrap-apron passes. The dough-rollers receive a double intermittent motion by means of ratchets and pawls, operated by crank arms, receiving motion, through suitable mechanism, from the main shaft.

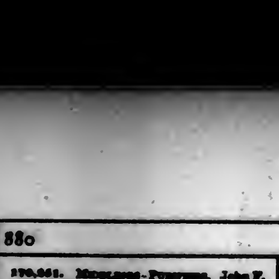


1. In a dough-cutting machine, the combination of the apron D and apron F, the former traveling faster than the latter, as described, for the purpose specified.

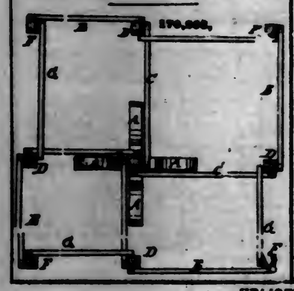
2. The combination of the pivoted fingers M, the rod m^1, and the jointed bars m^2, pivoted to the ends of the edge bar, over which the scrap-apron is carried, substantially as shown and described.

3. The combination of the adjustable crank-arm U, and its three connecting-rods r^1 r^2 r^3, the two arms V, the two pawls v^2, and the ratchet-wheels v^3, with the adjustable crank T attached to the driving-shaft Q, and with the journal of one of the dough-rollers B, to give a double intermittent motion to the said dough-roller, substantially as herein shown and described.

170,861. MIDDLINGS-PURIFIER. John F. Goodale, Dubuque, Iowa. [Filed July 17, 1875.]



Brief.—As middlings pass first over a fine sieve, thence upon coal over a coarse sieve, they are subject to a current of air through coal bed, which carries off the impurities.

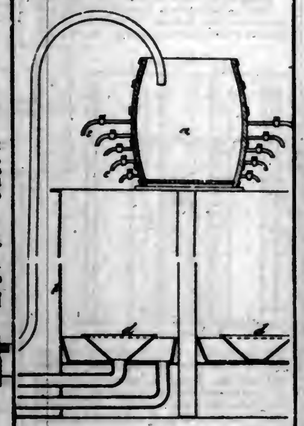


The combination of the successive inclined sieves A B—the former fine, the latter coarse, and both covered by hoods—with a fan, C, a finishing-shoe at head B, and valves D G, all arranged substantially as and for the purpose specified.

170,862. HOMINY-PULVERIZER. Geo. W. Gordon, Beverly, Ohio. [Filed Apr. 21, 1874.]

Brief.—The main shaft revolves continuously, the weight raised being lowered by the disengagement of the drum from the shaft, while a brake is applied to prevent too rapid descent.

The combination, with the rotary cross-shaft A, having arm F, of the adjustable weighing-drum C, having cords E, the brake-lever I, the rod H, and lever I, all constructed and arranged to operate as shown and described.



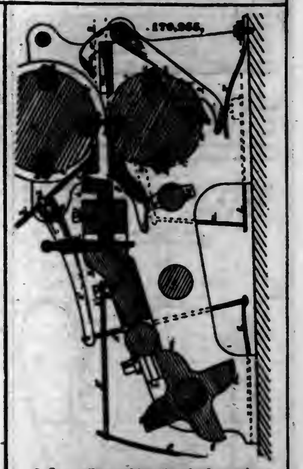
170,863. CLOTHES-DRIERS. Geo. W. Green, High Point, N. C., assignor of one-third his right to O. S. Causey, same place. [Filed Oct. 8, 1875.]

The combination of the pivoted bars E, posts F, and pivoted notched locking-bars G, with the posts D, pivoted bars C, central post B and pedestal A, all constructed and relatively arranged as herein set forth and shown, for the purpose specified.

170,864. APPARATUS FOR THE MANUFACTURE OF STRAWS. Patrick Griffin, Cork, Ireland. [Filed June 5, 1874.]

Brief.—The whisky falls in drops from the taps in the vat on top of the tower down through the latter to the receivers at the bottom. Air is admitted to the tower through openings in the side.

The herein-described apparatus, consisting of a supply-vessel, a, with outlet-passages therefrom, provided with cocks for regulating the dropping of the liquid drop by drop, surmounting and combined with a high column or tower, b, and a receiver at the bottom of the tower, as and for the purposes set forth.



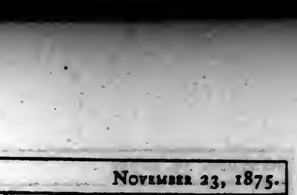
170,865. SPIKE-MACHINES. Worcester Haddock, Pittsburg, Pa., assignor to himself, Henry Gording, and Thomas Johns, same place. [Filed Apr. 6, 1875.]

Brief.—The face of one of the finishing and pointing rolls is cut away just back of each pointing-die, so that the head will be turned, to permit of the finishing of one spike before the rolls again catch on the bar and carry it forward. A griping-lever is arranged in front of the rolls to hold the bar while one spike is finished, and until the rolls again bite upon the bar.

1. In a spike-machine, the combination of the pointing and covering rolls B and C, having a continuous motion, the stationary die g, gripers E and F, and the header D, arranged and operating with relation to each other, so that the iron is fed into the machine, the blank for the spike pointed and severed from the bar, and bar and blank held in a fixed position during the operation of forming the head upon the spike, substantially as herein described.

2. The yielding and adjustable stripper and guide h, in combination with the roll B and stationary die g, substantially as herein described, and for the purpose set forth.

3. In a spike-machine, the cams m, spring-rod f, and header D, in combination with the rolls B C, stationary die g, and gripers E F, substantially as herein before described and set forth.



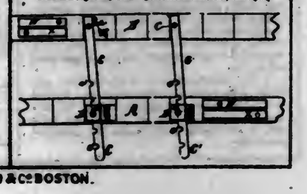
4. In a spike-machine, the wheel e, spring r, and griper E, in combination with the rolls B C and header D, substantially as and for the purpose herein before described and set forth.

5. In a spike-machine, the griper F, operated through the medium of the cams s, lever v, rod v, and spring t, in combination with the stationary die g, header D, and rolls B C, substantially as and for the purpose herein before described and set forth.

6. In a spike-machine, the griper E, in combination with the roll C, having recesses w and dies x, and the roll B having dies g, said rolls having a continuous motion, substantially as and for the purpose herein before described and set forth.

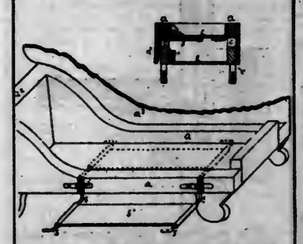
170,866. FURROW-GAGES FOR PLOWS. R. B. Haven, Morrisville, Vt. [Filed Sept. 20, 1875.]

Brief.—Devices for vibrating the draft of a side-hill plow from side to side, and for holding and releasing it from the handles.



1. The combination, with the V-shaped plate C, having rags c, curved arm h, and box E, of the vertically-movable plate D and operating-lever B, substantially as specified.

2. In combination with a horizontally-vibrating draft-rod, F, the vertically-movable plate D, and slotted box E, substantially as specified.



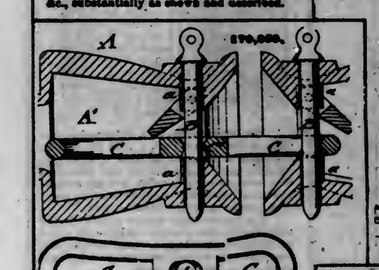
3. The V-shaped plate C, having slots c, lugs a, slotted arm h, and the rectangular box E, open in front and rear, and slotted at top and bottom, substantially as specified.

170,867. PARALLEL RULERS. John D. Hall, New York, N. Y., assignor to H. L. Hall, Philadelphia, Pa. [Filed Mar. 13, 1875.]

The pieces A B of a parallel rule, connected together by the parallel rods O O', having notches g in their edges, to indicate and fix the exact distance the edge of the rule B is set out from the rule A, the said rods O O' being pivoted to the rule B by the pin e, and to the rule-piece A by the spring-latch D d d', as described and set forth.

170,868. SOFA-BEDSTEAD. W. R. Hamilton, Pittsburg, Pa. [Filed May 5, 1875.]

1. The herein-described two halves of a folding sofa, connected together by a bent book-hinge constructed as described, and rendered separable from each other by means of the adjustable connection of said hinge with one of the said halves, substantially as shown, and for the purpose set forth.



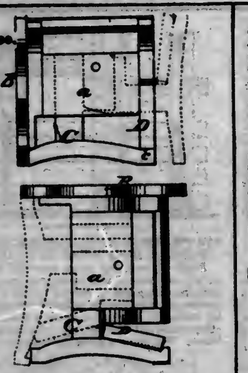
2. In combination with the herein-described two halves of a folding sofa-bed, the connecting-hinge, constructed with bent arms e and brace-plate e', the shorter arms of said hinge being removably connected with frame c, and bent in place by removable stop f, substantially as and for the purpose specified.

3. The combination of the herein-described folding frame with the stationary frame, having its foot and head boards a' a'' raised somewhat above the side rails c, whereby the space c is left between said frames when folded together, for the purpose of bolting bedding, &c., substantially as shown and described.

170,869. ELECTRICAL LOW-WATER AND HIGH-PRESSURE ALARMS. Theodore Hess, New York, N. Y. [Filed Nov. 16, 1872.]

1. The circuit-closer for low-water indicators or alarms, consisting of the two conductors f and d, one of which is terminated in a spring, a, lying over and adjacent to the top of the other, and the ball disc g, arranged within a gage-tube, substantially as above set forth.

2. The combination, with the low-water alarm circuit $a f d b i$, passing through the low-water indicator, of the branch circuit m n, connecting through the pressure-indicator needle, and operating an alarm independently of the water-alarm circuit, substantially as and for the purpose set forth.



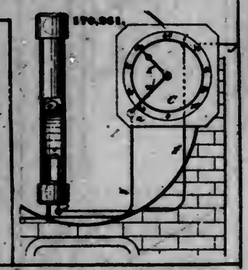
170,870. GAGE-COUPLINGS. Davenian Harper, Houston, Tex. [Filed Oct. 9, 1874.]

Brief.—The link, with a central stay, rests upon the projecting bean, and is held by the pin.

The link C, having the central stay C', with perforation b to receive the pin B, in combination with the draw-head A, having the bean projection a, upon which said link is supported, as shown and described.

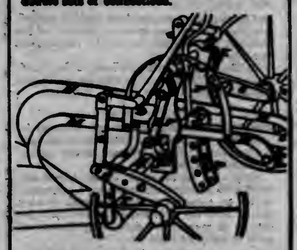
170,871. CONVERTIBLE SOFAS AND TABLES. Charles C. Harris, Washington, D. C., assignor of one-half his right to L. C. Heth, and said Harris and Heth assignors of one-third their right to R. A. Boyd, same place. [Filed Mar. 20, 1875.]

Brief.—The legs of the sofa are pivoted in the ends thereof in such a manner that they can be turned on their pivots, and adjusted at right angles to their former position, where they are held by latches. The whole structure is then turned over on the legs in their new position, thus changing the seat of the sofa from a vertical to a horizontal position, and making a table thereof.



The legs O O, pivoted between pieces c c at the ends of the sofa body A, and notched at e e, in combination with the latches D D and the board B, substantially as and for the purpose described.

170,872. ELECTRICAL LOW-WATER AND HIGH-PRESSURE ALARMS. Theodore Hess, New York, N. Y. [Filed Nov. 16, 1872.]

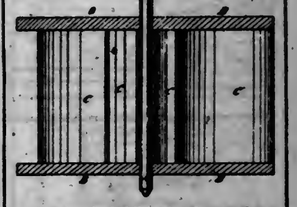


1. The circuit-closer for low-water indicators or alarms, consisting of the two conductors f and d, one of which is terminated in a spring, a, lying over and adjacent to the top of the other, and the ball disc g, arranged within a gage-tube, substantially as above set forth.

2. The combination, with the low-water alarm circuit $a f d b i$, passing through the low-water indicator, of the branch circuit m n, connecting through the pressure-indicator needle, and operating an alarm independently of the water-alarm circuit, substantially as and for the purpose set forth.

170,873. GANG-PLOWS. Frank A. Hill, San Leandro, Cal. [Filed Aug. 19, 1875.]

Brief.—Crank-axle and rock-shaft with double sets of connections.



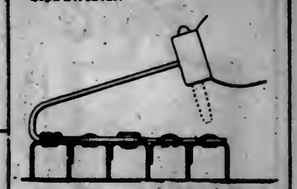
1. The standards F F, which support the axle D, and to which the beams E E are secured, having the slots h, through which the axle A passes, in combination with the cranks K K, connecting-bars I I, shaft D, and lever L, substantially as and for the purpose set forth.

2. The lever L, crank-shaft D, link e, and crank-axle A d d, in combination with the slotted standards F F, cranks K, links I, and plow-beams E E, all constructed and arranged substantially as and for the purpose described.

170,874. SUPERIMPOSED TIRE AND CURRENT WHEELS. John J. Hill, Hayden's Ferry, Ariz. [Filed July 24, 1875.]

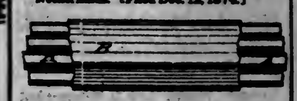
Brief.—The inner ends of the buckets do not extend quite to the center of the shaft, so as to leave a clear space around the shaft, which enables the water to enter at one side of the wheel, and escape at the other side, giving it an impulse both times, and rotating the wheel in the same direction that the water is moving.

A water-wheel, B C, having the curved vertical buckets tapered toward the outer edge, and having the thicker inner edge coming short of the shaft, a space being thus left around the shaft, as and for the purpose specified.



170,875. BILLET-LOOPS. Kirk W. Holmes, Winona, Minn. [Filed Sept. 30, 1875.]

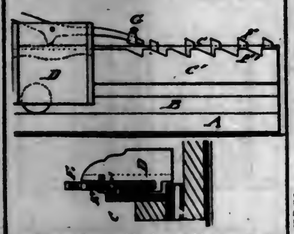
1. The combination of the bifurcated shank A, for a buckle or analogous article, and plate B, having latch g, substantially as described.



2. The combination of the bifurcated shank A, plate B, having latch g, and the removable billet-loop D, substantially as described and shown.

170,876. COMET-COMBS. C. H. L. Holmes, New York, N. Y., assignor to the Lawrence Curry-Comb Company, same place. [Filed Sept. 27, 1875.]

The metallic connection extending from the handle to the curry-comb, attached to the comb at the forward part, bent upward and backward over the comb, and leaving space for the user to grasp such metallic portion immediately at the back of the comb, substantially as specified.

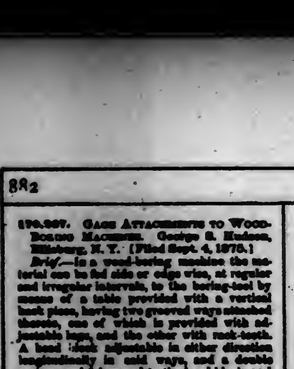


170,877. HEATING CABLES AND CONDUCTORS. Geo. W. F. Hoogeveen, Haarlem, Netherlands. [Filed Dec. 13, 1874.]

A flexible cable-cover, B, permeated with a mixture of paraffine and glycerine, provided on the outside with a coat of coal-tar and rubber, and having on the inside a coat of rubber varnish and bunting, all as and for the purpose specified.

170,967. GAGE ATTACHMENTS TO WOOD-BORING MACHINES. George S. Hudson, Hamburg, N. Y. [Filed Sept. 4, 1875.]

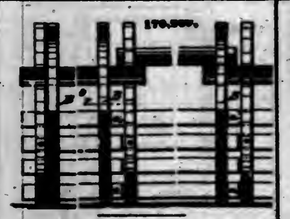
Brief.—In a wood-boring machine the material can be fed side or edge wise, at regular and irregular intervals, to the boring-tool by means of a table provided with a vertical back piece, having two grooved ways attached thereto, one of which is provided with adjustable lugs, and the other with rack-teeth. A head block adjustable in either direction longitudinally in said ways, and a double spring-pawl fulcrumed to the head-block, and provided with detachable end sleeves, for engagement with the lugs or rack-teeth of the ways, as may be required.



1. A gage for wood-boring machine, constructed of table A B, grooved ways C C', with lugs F and ratchet F', sliding head-block D, with double spring-pawl E, and detachable side projecting sleeves G, to guide the articles in an certain manner to the boring-bit or auger, substantially in the manner and for the purpose set forth.

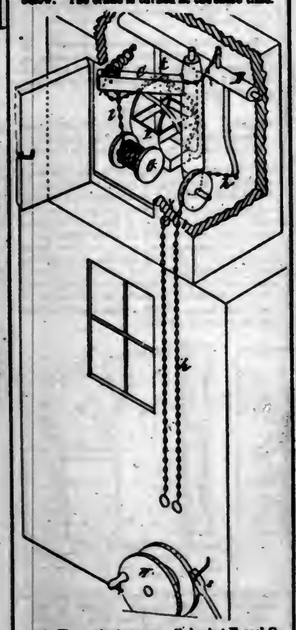
2. The grooved ways C C', of which one has adjustable lugs F, the other rack-teeth F', in combination with the double spring-pawl E, being adjustable to either way and direction, substantially in the manner and for the purpose set forth.

170,968. WASTE-PIPE TRAPS. T. Hudson, Brooklyn, N. Y. [Filed Feb. 7, 1874.]



Brief.—A conical valve is suspended from the arm of a lever within an opening made in the top of the trap. The outer arm of the lever is provided with an adjustable weight, so as to allow instant admission of air to prevent the gurgling sound or siphonic action.

The combination, with a steam-trap, A, provided with top vent-hole E, of the conical suspended valve J, and the pivoted lever M and adjustable weight N, all constructed and arranged as shown and described, to operate as specified.

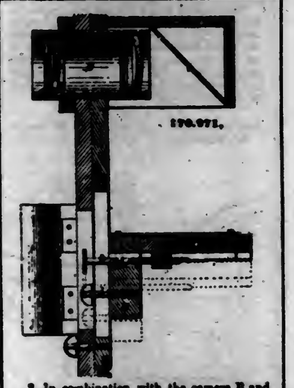


170,969. PIPING. John D. Ryberger and Frank Ryberger, Timber Ridge, Tenn. [Filed Oct. 1, 1875.]

In combination with the post A, the external bars B of the panel-boards C, cut to form lap-joints a, substantially as and for the purposes set forth.

170,970. FIRE-ESCAPES. Thine-the-Jingren, Fall River, Mass. [Filed Oct. 16, 1875.]

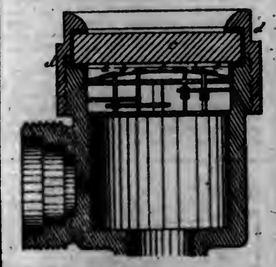
Brief.—A swinging crane provided with a pulley, and hooked in a housing on top of the building, supports a basket or crib. The basket and rope are swept out of the housing by means of arms secured to a roller, said roller being operated by ropes or chains from below. The crane is turned at the same time.



1. The swinging crane C, basket F, rod G, and chain I, in combination with a throwing-out mechanism, actuated by a chain, J, accessible from the various floors or bottom of the building, substantially as and for the purpose described.

2. The drum H, with its brake a, in combination with the crane C, basket F, rod G, and chain I, as and for the purpose specified.

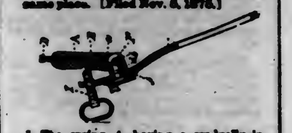
170,971. CAMERA-OBSCURAS. Thomas A. Kellett, Wells, Minn., assignor of one-half his right to T. S. Fellows, same place. [Filed Sept. 23, 1875.]



Brief.—A combination of an adjustable table with a camera and reflector, by means of which an enlarged image of a small picture placed upon the table will be thrown upon the canvas in rear of the camera by the aid of solar or artificial light.

1. The combination of a table, a mirror or reflector, and a camera, by which a direct image of any desired size for painting, of any photograph or other picture placed on the table, may be thrown upon a canvas placed at a correct focal distance behind the lens, substantially as herein set forth.

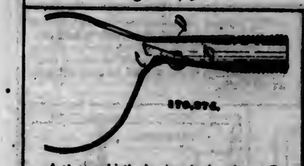
2. In combination with the camera B and reflector D, the adjustable table G, bracket E, slide H, and set-screws a b d, whereby the table may be adjusted in any direction, as herein set forth.



170,972. REGISTER-DIALS FOR WATER-METERS. John C. Kelley, Pearsall's, N. Y. [Filed Apr. 16, 1875.]

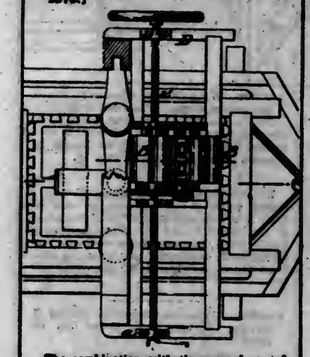
1. The combination, in a water-meter, of a glass or transparent dial, c, with the indicating-hands c in positions back of said dial, whereby mud and sediment are prevented from settling upon the dial, and the relative positions therewith of the hands thereby easily read, substantially as herein set forth.

2. The combination, with a glass dial, c, of a plain white face-plate or background, e, and the indicating-hands c, working between said face-plate and a front transparent dial, substantially as herein set forth.



170,973. TROUSERS. Hiram A. Kimball, Philadelphia, Pa., assignor to Benj. C. Everett, same place. [Filed Nov. 6, 1875.]

1. The spring A, having a gradually-increased lateral curvature from its ends to the middle thereof, whereby to gradually increase the stiffness of the spring as the point a is drawn the strength of the leverage of the spring by the change of curvature, substantially as set forth.



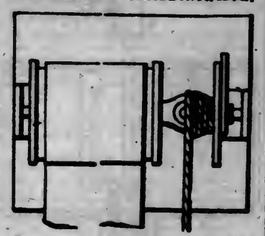
2. The combination of the pad-holder C, slide B, pins F and f, and set-screws H and I, for an inward, outward, and a lateral adjustment of the pad-holders, substantially as set forth.

170,974. STEAM-WHISTLES. Henry B. King and Christopher McElheran, Paterson, N. J. [Filed Sept. 23, 1875.]

A steam-whistle having in its throat B a detachable plate, D, for conveniently inserting or removing the gage C, as shown and described.

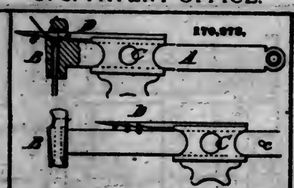
170,975. CORN-SHELLS AND PLANTERS. Henry Kruesicke, Monticello, Ill. [Filed Sept. 11, 1875.]

The combination, with the press-box and main posts or standards of a cider-press, of a detachable supporting-frame, on which the mill and operating crank-shaft are placed, to be worked directly in connection with the press, substantially in the manner and for the purpose set forth.



170,976. ENVELOPE-OPENERS. John Le Blanc and Xavier St. Pierre, Ogden City, Utah. [Filed June 19, 1875.]

1. The combination, with an arm A, of the elastic guides B B, to receive envelopes of different thicknesses.

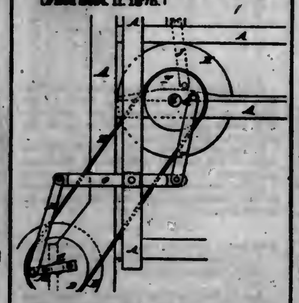


2. The guides B, eraser-head C, and attaching-socket D, constructed of rubber, and arranged substantially as specified.

170,977. CURTAIN-FIXTURES. R. B. Lake, Tom's River, N. J. [Filed Dec. 14, 1874.]

The weighted curtain, angle-cord pulley, single cord, pearl, and stop combined, said pearl being pivoted to the cord-pulley, substantially as described, and for the purpose specified.

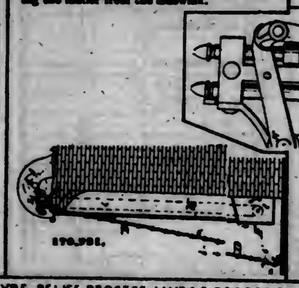
170,978. WRINGER-TUBS. Peter R. Lambert, New Orleans, La. [Filed Apr. 27, 1875.]



A suds-thrower, composed of the steam-A, provided with the stop a and perforated cone portion B, having elastic jaws, in combination with the slide C, having the turned upper D, substantially as and for the purpose set forth.

170,979. WASHING-MACHINES. John D. Lawler, Montreal, Canada. [Filed Oct. 12, 1875.]

In a washing-machine, constructed as herein before described, the spring-rod a', constructed with a screw-thread on its upper end, provided with the thumb-screw K, and connected at its lower end to the block in which the shaft B of the washing-roller is journaled, substantially as and for the purpose set forth and described.



170,980. MECHANICAL MOVEMENTS. Hiram Leslie, Brown's Cross-Roads, Ky., assignor to himself and G. W. Hunt, same place. [Filed Sept. 11, 1875.]

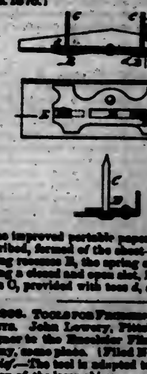
The combination of the cranks M G, the pitmen N P, and the lever O, with the pulleys D F and belt E, that connect the power-shaft with the working shaft, substantially as herein shown and described.

170,981. FIRE-ESCAPES. John H. Lindlau, New York, N. Y. [Filed Oct. 25, 1875.]

Brief.—A flexible chain ladder, the rounds of which are iron tubes, is secured to a roller in a housing on top of the building. The roller is operated by rag-wheels and a chain. The chain is inclosed in the conductor-pipe of the crane. In the bottom of the conductor-pipe is a lock-box, in which is located one of the rag-wheels, and other devices for operating the ladder from the sidewalk.

170,981.

1. The combination of the shaft A, hung on the roof of a house, with the flexible fire-ladder attached thereto, and with the operating band or chain A, shaft I, and hooked strap-bar F, all arranged as that in case of fire the ladder can be let down by persons on the sidewalk, without requiring their admission to the house, substantially as specified.



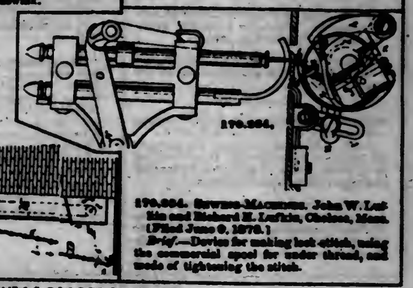
2. The flexible fire-proof ladder D, constructed of tubular rungs b b and chains a, substantially as described.

3. The combination of the endless belt or chain A, shaft A of a fire-ladder, an winding-shaft I, and bent F, with the gutter H, within which said chain is inclosed, substantially as specified.

4. In combination with two or more flexible fire-ladders, D D, that are fastened to the same shaft A, the bottom bar b connecting the lower ends of all said ladders, substantially as herein shown and described.

5. In a fire-escape, the combination of the stand-box, F and connecting chain A with the shaft I, pronged wheel n, spring-stopper o, and gong P, all combined within said box, substantially as herein shown and described.

170,982. TEMPORARY BINDERS. Charles D. Lindsay, Cincinnati, Ohio. [Filed Apr. 26, 1875.]



The improved portable paper-holder, herein described, formed of the sheet-metal plate A, having recesses B, the spring clamping-plate, having a closed and open slot, E, and the fasteners G, provided with toes d, as set forth.

170,983. TOOLS FOR FIRMING LAMP-CHIMNEYS. John Lowery, Pittsburg, Pa., assignor to the Keystone Flint-Glass Company, same place. [Filed Nov. 6, 1875.]

Brief.—The tool is adapted to open or turn the top of the lamp-chimney, and at the same operation form or curl up the edges thereof.

A tool for opening and forming lamp-chimneys, said tool having a series of radiating and curved knife-edges, substantially as described.

170,984.

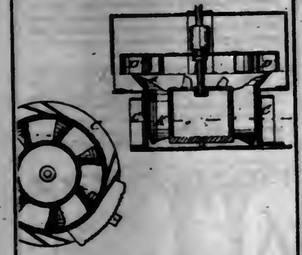
170,984. SEWING-MACHINES. John W. Loftin and Richard H. Loftin, Chelsea, Mass. [Filed June 9, 1875.]

Brief.—Device for making lost stitch, using the commercial spool for under thread, and mode of tightening the stitch.

1. The carrier *g*, rotary shaft C, the disk *d*, yoke *e*, and bracket *f*, constructed, combined, and arranged to operate together, as and for the purposes specified.

2. The combination, with the spool-carrier *g* and its two supports, *e* and *f*, of the rotary shaft C, disk *d*, clamping-lever *h*, and operating mechanism, as described, whereby the said carrier is held in proper relative position to be presented through the loop of the needle-thread, and be intermittently clamped and released, as and for the purposes set forth.

3. The carrier *g*, constructed as described, and provided with the ovelits *n* and *n*, arranged relatively thereon, as and for the purposes set forth.



4. The combination, with the rotary thread-carrier *g* and bracket *f*, of the thread-guard *l*, arranged as shown, whereby the under thread is prevented from entering the path of the said thread-carrier *g* during its rotation, and entangling with the upper thread, as described.

5. The zipper-lever *h*, combined with the rotary plate *d*, eccentric *k*, and connecting mechanism, as described, whereby a rotary and rocking movement is imparted to the clamping-lever, as and for the purposes specified.

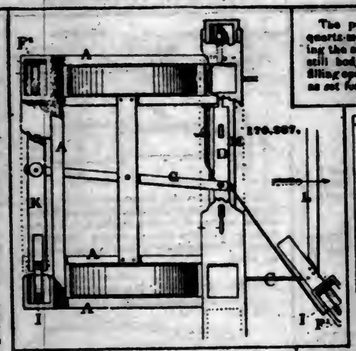
6. The carrier *g*, with its thread-guard *l*, in combination with take-up arm O and intermediate mechanism, as described, whereby said carrier and arm are made to move relatively to each other, as and for the purposes specified.

170,866. WATER-WHEELS. S. C. Lyons, Bennington, Vt. [Filed May 6, 1875.]

Brief.—The water enters through the tangential chutes of the gate directly to the inside of the wheel-surrounding case, and then on the buckets of the wheel. The buckets are curved to pass the water readily upward, and are provided at their upper ends with outwardly extending lips, to which an inverted conical rim is attached, which confines the upper edge of the case. In case of high heads of water, auxiliary top wheels may be employed on the main shaft, and transmitting the power by belt, gearing, or otherwise.

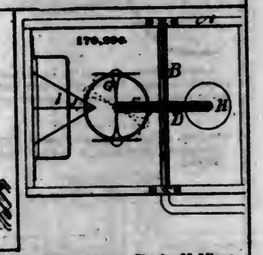
1. The buckets of the wheel, having outwardly-extending lips at upper ends, in connection with a conical wheel-case encircling rim, for conveying water to auxiliary top wheel, substantially as specified.

2. The combination of a water-wheel, provided with conical rim at upper ends of buckets, with one or more floating auxiliary top wheels, having arc-shaped buckets for utilizing power of issuing water, substantially as and for the purpose set forth.



170,868. COMPOSITIONS FOR BEVERAGES AND INVIGORANTS. Waldemar A. Martin, Pittsburg, Pa. [Filed Oct. 6, 1875.]

A composition containing figs and the fruit of the cervantia, substantially as and for the purposes described.



170,867. CORN-MARKERS. John McGregor, Princeville, Ill. [Filed July 17, 1875.]

Brief.—Additional boxes are secured upon the frame, to mark the hills of corn planted by a white substance deposited by notched plates operated from the seed-slide.

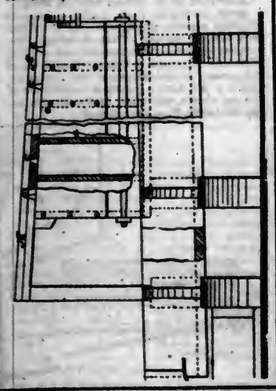
The combination, with the corn-planter frame A, of the rear powder or fertilizing boxes F, slides I, connecting-bar K, connecting-lever G, attached to the corn-dropper bar D, substantially as described.

170,867.

170,868.

The process of concentrating tailings of quartz-mills, consisting essentially in conducting the stream containing the tailings over a still body of water, the same standing in or filling openings in the conduit for said tailings, as set forth.

170,869. COMBINED TOILET-CASES AND TOWEL-ROLLERS. Danl. Miller, Marietta, Ohio. [Filed Apr. 21, 1875.]



1. As an improved article of furniture, a toilet-case, consisting of the frame-work A, the tilting comb and brush case B, and towel-roller C, constructed and combined as and for the purpose set forth.

2. The combination of the box B with the catch *b'* and ledge *b'*, arranged as described and shown.

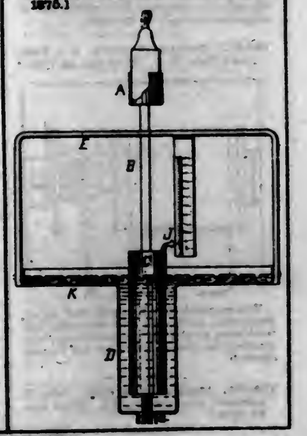
3. The combination of the split roller *c* and *c'*, with the ring D and securing-staples, as described.

170,870. METHODS OF CONCENTRATING TAILINGS FROM QUARTZ-MILLS. Francis B. Mills, Virginia City, Nev. [Filed Mar. 20, 1875.]

Brief.—The material passes in suspension in water into a broad shallow trough, which has slits cut through its bottom, and is seated on a water-tank, the water from which rises through the slits. The heavy material drops through these slits into the tank below. Any valuable material which passes out of the shallow trough is conducted into a deep narrow sluice, in which it settles to the bottom.

170,871. WELL-CURBS. Charles M. Miner, Bridgeport, Conn. [Filed Oct. 8, 1875.]

Brief.—The curb is provided with the triangular tipping-rod shown. When the cam-shaped bail strikes said rod, the basket assumes a proper position for emptying.

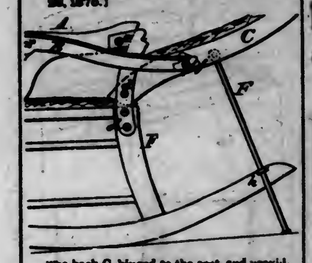


In a well-curb, the combination of the V-shaped pulley D with the common rope or chain E and the cam-shaped bail G, attached to the basket F, and the triangular-shaped tipping-rod J, attached to the curb over the trough I, all constructed and arranged substantially as shown, and for the object set forth.

170,872. GARDNER-CURTAINS. Henry C. Moody, Oswego, N. Y. [Filed Oct. 16, 1875.]

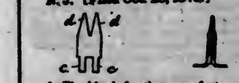
The combination of the curtains E, provided with a fastening-cord, C, with the bow A, having studs D, as and for the purpose set forth.

170,873. PHOTOMETERS. Peter Munninger, Philadelphia, Pa., assignor to Morris, Tasker & Co., same place. [Filed July 6, 1875.]



1. In a pneumatrust apparatus the combination of a float-chamber, D, a guide-tube, G, and a float, K, as shown and described.

2. The combination of a rod, B, float C, frame E, rod F, and guide-tube G, as shown and described.



3. The combination of a socket, A, rod B, float C, chamber D, seats I, and leaden J, as shown and described.

170,890. RECEIVING HOOKING-CHAINS. J. B. Newman, Franklin, Pa. [Filed Aug. 28, 1876.]

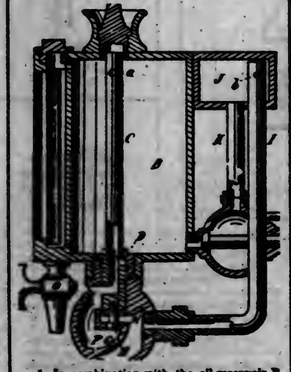
The hook C, hinged to the seat, and provided with the pivoted support F, and the pivoted catch-brace B, having projection *a*, in combination with the arms A, having ratchet-plates *a*, substantially as and for the purpose set forth.

170,891. PAPER-FASTENERS. William H. Peck and Joseph S. Voorhees, Jersey City, N. J. [Filed Oct. 23, 1875.]

1. The blank for the manufacture of paper-fasteners, having the main body or web, as shown, provided with the two sharpened tips *d*, projecting from one end of said web, and two tips, *e e*, projecting from its other end, and in the opposite direction.

2. The described tubular binder, formed from a blank such as described, and having its main body or web bent longitudinally into the form of a tube, and its blunt tips adapted to be bent outward when applied to use, and its sharpened tips adapted to be bent inward toward each other to receive the papers, and to be bent outward to bind and retain them, all as set forth.

170,892. KITCHEN UTENSILS. T. S. Pope, Toledo, Ohio. [Filed Nov. 8, 1875.]



A kitchen utensil consisting of the vessel A and top D, in combination with the rack B, provided with the legs *c c*, and shelves *d d*, and the shell C, all constructed to operate substantially as and for the purpose set forth.

170,893. LUBRICATORS. Chas. H. Parshall, Detroit, Mich. [Filed Oct. 28, 1875.]

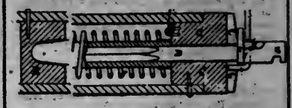
1. In combination with the stem A, constructed with partitioned bulb G G' G², and hand-valve *e* F, the steam-pipe I, closed at top, and provided with opening *h*, communicating from steam-stem A G to top inside of condensing-chamber J, at the top outside of oil-reservoir B, as and for the purpose described.

2. In combination with the stem A G, reservoir B, and steam-pipe I, communicating from stem A G to top of condenser J, the condensing-chamber J, provided with hand-valve L, placed at the outside top portion of reservoir B, and communicating therewith at the top edge through opening *d*, as and for the purposes described.

170,894. LUBRICATORS. Chas. H. Parshall, Detroit, Mich. [Filed Oct. 13, 1875.]

1. In combination with the oil-reservoir B and stem A, the independent separate condensing-chamber J, placed upon the outside of the reservoir, at the top edge thereof, and communicating with the stem A through steam-pipe I, and with the bottom of reservoir B through water-pipe K, as and for the purposes described.

2. In combination with the condenser J and stem A, the steam pipe I, closed at top, provided with discharge-openings *b* below the end thereof, and connecting from chamber H in stem A to condenser J, as and for the purpose described.



3. In combination with the reservoir B and independent separate condensing-chamber J, placed at the outside top portion thereof, the water-pipe K, with hand-valve L, communicating from bottom of condenser to bottom of reservoir, as and for the purposes described.

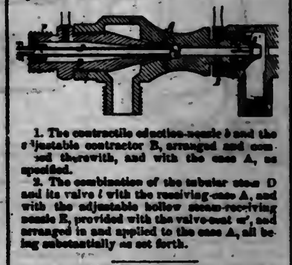
4. In combination with the reservoir B and pipe O, closed at top, and provided with openings *a*, the stem A, with an enlarged or bulbed upper portion, constructed with chambers F H, partition G, and automatic valve E, as and for the purposes described.

5. In combination with the stem A, constructed with chambers F H, partition G, and automatic valve E, the guide-block D, curved down into the stem A, and tube O secured thereto, as and for the purposes described.

6. The improved lubricator, consisting of reservoir B, stem A, oil-tube C, closed at top, and provided with openings *a*, independent condensing-chamber J, placed at the outside top portion of reservoir, steam-pipe I, closed at top, and communicating from stem A to top of condenser, and water-pipe K, with hand-valve L, communicating from bottom of condenser to bottom of reservoir, as and for the purposes described.

170,895. CURTAIN-FIXTURE. George W. Faires, Arlington Heights, Mass. [Filed Sept. 9, 1876.]

1. In a curtain-fixture, the combination of the spring F, cylinder A, slotted head C, perforated hub H, and key K, substantially as and for the purposes set forth.



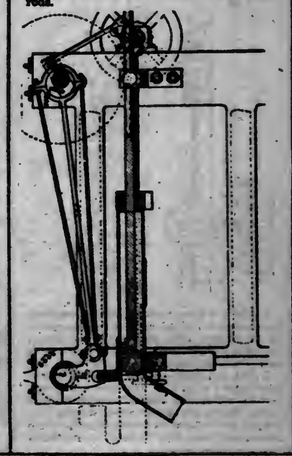
2. In a curtain-fixture, the combination of the spring F, spindle D, slotted head C, perforated hub H, and bent key K, substantially as and for the purposes set forth.

3. The combination of the slotted head C, bent key K, and flanged hub H I, substantially as set forth.

4. In a curtain-fixture, the combination of the tube A, head C, spring F, and staple N, arranged and operating substantially as set forth.

170,896. INJECTORS FOR STEAM-BOILERS. Wm. Randall, Salem, Mass. [Filed Oct. 12, 1875.]

Brief.—The slit nozzle is controlled by the cover-collar shown. The rear nozzle may be made to move endwise within the case, and, together with the valve of the hollow stem, to cut off wholly or partially the steam in the space around the stem.

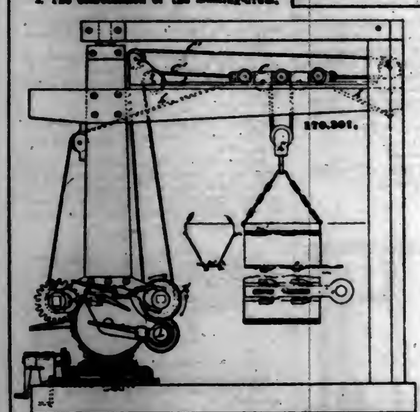


1. The constructile ejection-nozzle *b* and the adjustable contractor B, arranged and combined therewith, and with the case A, as specified.

2. The combination of the tubular stem D and its valve *i* with the receiving-case A, and with the adjustable hollow steam-receiving nozzle B, provided with the valve-seat *a'*, and arranged in and applied to the case A, all being substantially as set forth.

170,899. MACHINES FOR BENDING METALLIC TUBES. John M. Reid, Montreal, Canada. [Filed May 19, 1876.]

Brief.—The swaging die-block is actuated by rod-pieces below to journal-bearings that are free to move vertically in guides, and above to arms that are suspended from journals *i*, adjustable as to height by eccentric sleeves, and which are vibrated by eccentrics on shaft, through the medium of connecting rods.



A compressing-die, swinging upon trunnions or centers corresponding, or nearly so, with the center from which the bend of the pipe is described, in combination with a mandrel to support the tube while being compressed and bent, and mechanism substantially as set forth for actuating the swinging compressing-die, as specified.

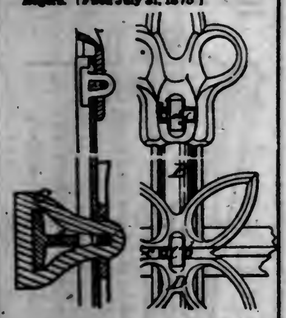
170,891. CRANES, Robt. B. Robison, Pittsburg, Pa. [Filed Oct. 5, 1875.]

1. In combination with the crane-post, the mechanism for operating the jib-truck, provided with a series of fast and loose pinions or sliding gearing, whereby the travel of the truck may be arrested or reversed without arresting or reversing the power mechanism.

2. The combination of the bottle-drum,

170,891.

170,892.



170,894.

the drum and mechanism for causing the travel of the truck, the power mechanism, and the intermediate fast, loose, and sliding pinions, whereby the hoisting mechanism and jib-truck may be operated simultaneously or alternately, substantially as specified.

3. The combination of the barrel power-gearing C E, the latter pivoted or journaled to the crane-post, the winding-drum I, and the intermediate sliding pinion, substantially as and for the purpose specified.

170,892. IRON FENCES. Robert Rogers, Mount Vernon, Ohio, assignor to Timothy Rogers. [Filed July 31, 1875.]

1. The iron fence, substantially as described, comprising a vertical concave-convex picket on its concave side, supporting a T-shaped rail by a bracket keyed on the convex side of said picket, substantially as set forth.

2. The iron fence comprising a vertical concave-convex picket on its concave side, supporting a T-shaped rail by a bracket keyed on the convex side of said picket, having combined with it a boss on the convex side of the picket, said boss, held by said key, resting in a horizontal groove in the face of said boss, and passing through the staple and of the bracket, said staple and forming in relief the center of the boss, substantially as described.

170,893. ELECTRIC GAS-LIGHTERS. Octave A. A. Bouillon, Brooklyn, N. Y. [Filed Oct. 29, 1875.]

Brief.—Movement of handle allows gas to flow, at same time causing a closure of circuit with a rubbing contact through the roughened platinum wires.

The combination, in an electrical circuit, of corrugated or otherwise notched or ridged platinum wires A C, or their equivalents, said wires being arranged for one to be moved along the other crosswise when making contact, substantially as specified.

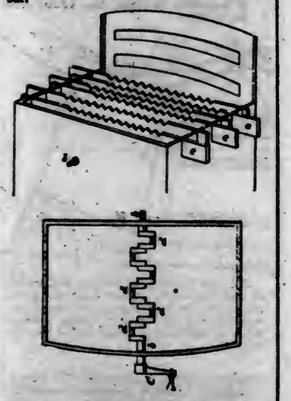
170,894. BLOW-PIPES. Charles Stanley, Helena, Mont. [Filed Sept. 25, 1875.]

Brief.—This blow-pipe has a globe or chamber, having a diametrical plate or diaphragm for collecting moisture, and an exit-opening for expelling the same.

A blow-pipe made with induction and eduction pipes, projecting into a globe part or chamber, having a diametrical strip or diaphragm and an exit-opening, for collecting and expelling the moisture, substantially as specified.

170,895. WATER-PIPES. Wm. H. Sampson, Chicago, Ill. [Filed July 15, 1875.]

Brief.—The sections of the supply-pipe are made with double walls, and a chamber between the walls. The barrel of each of the cocks is also made with double walls, and a chamber between the walls. The pipe and cocks are charged with alcohol and then sealed, so that there will be no loss from evaporation. The charging of the chambers with alcohol causes the whole interior wall of the cocks and pipes, as far as practicable, to be surrounded by alcohol, which does not freeze under extreme temperature.



1. The street supply-pipe, having a charging-head, and its main cock, shut-off cock, and the house-cock, which is covered into the supply-pipe, constructed with double walls and communicating chambers between the walls for holding alcohol, substantially as described.

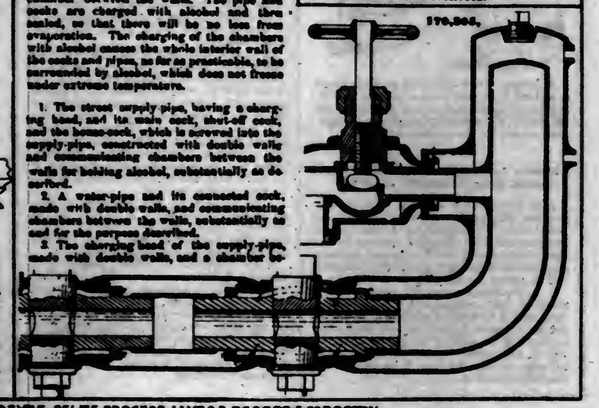
2. A water-pipe and its connected cock, made with double walls, and communicating chambers between the walls, substantially as and for the purposes described.

3. The charging-head of the supply-pipe, made with double walls, and a chamber between its walls, in combination with the house-cock, shut-off cock, main cock, and the gage, substantially as and for the purpose described.

170,896. GRATES. John Schroeffel, Jr., Allegheny, Pa., assignor to O. D. Lewis and W. A. Conklin. [Filed Apr. 12, 1875.]

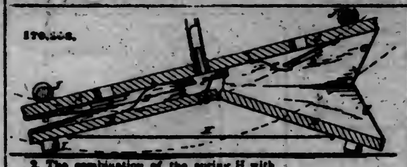
Brief.—The bars are supported by the frame, and alternate reciprocating motion is imparted to them by the compound crank-bar.

The transverse shaft b, provided with a series of short cranks, *d d d*, and winch C, in combination with the serrated and slotted grate-bars *a a a*, substantially in the manner shown, for the purposes set forth.



170,897. PROCESSES OF DYEING FABRICS. Alexandre Schmitz, Paris, France. [Filed Sept. 10, 1875.]

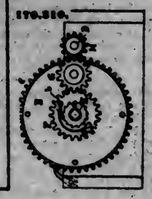
Brief.—The fabric is printed with a mixture of indigo-white, oxide of tin, and gum-senegal, and is then steamed to fix the color.



The within-described process of dyeing vegetable fiber, which process consists, first, in treating the fabric with indigo-white and oxide of tin, in the proportions substantially as named, and then subjecting the so-treated fabric to the action of live steam.

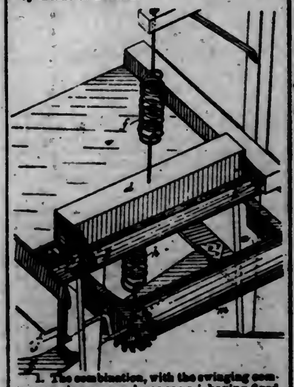
170,898. BELLOWS ATTACHMENTS FOR ROCKING-CHAIRS. Edgar B. Bell, Charleston, S. C. [Filed Sept. 17, 1875.]

1. A bellows attachment for rocking-chairs formed by the combination of the double bellows A B C D E F, the flexible tubes G, and the cross-bars J with each other, substantially as herein shown and described.



170,898.

170,899.

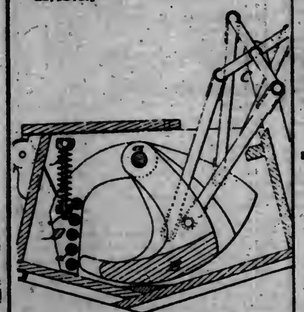


2. The combination of the spring H with the movable plates B of the bellows A B C D E F, substantially as herein shown and described.

170,910.

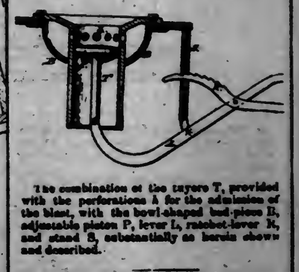
170,900. GRAINING-MACHINES. William G. Sharp, Vineland, N. J., assignor to himself and Joseph B. Sharp, same place. [Filed Aug. 12, 1875.]

Brief.—The compressing-block swings upon fixed fulcrums, and is actuated by a treadle and springs. The take-up roller is operated by means of a crank.



1. In a washing-machine, a series of alternately-swinging plungers, operated by a revolving crank-shaft, in combination with a swinging and spring-acted roller-rock, substantially in the manner, and for the purpose set forth.

2. The combination of the swinging roller-rock, having lateral brass-plate, with the sliding rods and springs of a pivoted top plate of the tub, to produce constant spring-action on rock, substantially as specified.



3. The combination of the swinging spring-rock with a cord and center pivot-lever and fastening-hook for locking the spring-rock to wall of tub, and facilitating the handling of the clothes in the same, substantially as shown and described.

170,911. WASHING-MACHINES. John I. Shotwell, Welland, Canada. [Filed Oct. 20, 1875.]

170,912. TUYERES. Philander H. Standish, Jefferson City, Mo. [Filed June 16, 1875.]

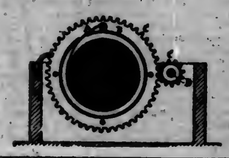
Brief.—The circulation of the air from the blast-pipe in the annular chamber prevents the tuyere from being burned by the fire. As fast as the cinders and coke accumulate, so as to interfere with the fire, the ratchet-lever connected with the piston is let down a notch.

The combination of the tuyere T, provided with the perforations A for the admission of the blast, with the bowl-shaped tool-piece B, adjustable piston P, lever L, ratchet-lever N, and stand S, substantially as herein shown and described.

170,913. IRONING. Friederich Teudt, New York, N. Y. [Filed Sept. 25, 1875.]

Brief.—A fixed inclined washer, centered near the middle of the plate, is interposed between the sleeves or knuckles of the hinge, in such manner that by means of the correspondingly-inclined sleeve a door or shutter is raised when being opened, and automatically closes when the hinge returns to normal position.

170,914. CHURNS. Frederick Teudt, New York, N. Y. [Filed Sept. 25, 1875.]



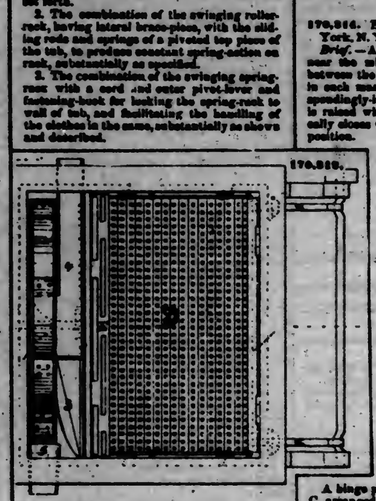
Brief.—A fixed inclined washer, centered near the middle of the plate, is interposed between the sleeves or knuckles of the hinge, in such manner that by means of the correspondingly-inclined sleeve a door or shutter is raised when being opened, and automatically closes when the hinge returns to normal position.

170,915. CORN-HARVESTERS. Joseph Townsend and John H. Parr, Bainbridge, Ind. [Filed Oct. 7, 1875.]

Brief.—The receiving-table is made adjustable by its shaft revolving within a bolster-slotted shaft, to adapt it to cut 1 different heights. The dropper has a section hinged and operated by lever and strap.

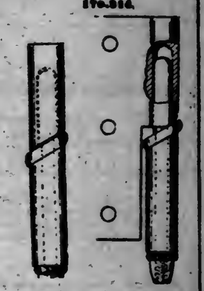
170,916. MACHINERY FOR SEPARATING SUBSTANCES OF DIFFERENT SPECIFIC GRAVITY. Albert B. Stanberrie, Philadelphia, Pa. [Filed Feb. 24, 1875.]

Brief.—The streams of water through the inclined of the screen cause a separation of the lighter from the heavier particles of ore, &c. The lighter particles are washed over the dam into the interior buckets of the wheel, while the heavier pass through the gate E into the exterior buckets.



170,917. VOLUTE-SPRING MOTORS. Wm. H. Shelmer, Baltimore, Md., assignor of two-thirds his right to Sydney C. Long, same place. [Filed Nov. 4, 1875.]

Brief.—The spring operates the shaft on which it is wound, and the drum to which its outer end is attached, and, by gear-wheels respectively connected therewith, imparts the combined motion to the driving-shaft.

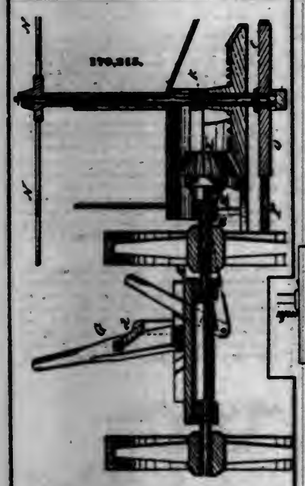


1. The spring A, the two ends of which are connected by means of gearing to the shaft D and moved in the unwinding of the said spring in such manner as to revolve the said shaft D in a common direction, substantially as described.

2. The spring A and shaft E, with the ratchet-wheel a thereon, in combination with the pawl A, gear-wheels F, G, and E, and shaft D, substantially as and for the purposes specified.

3. The wheel C and casing B connected therewith, spring A, having its ends secured, respectively, to the wheel C and shaft E, in combination with said shaft E, wheel F, idler-wheel G, and shaft D, having thereon the pinion O and wheel N, substantially as and for the purposes herein specified.

170,919.



170,916.

A hinge provided with an inclined washer, C, arranged on the pintle between the correspondingly-inclined surfaces of the stationary and movable sleeves, as and for the purpose specified.

170,918. CORN-HARVESTERS. Joseph Townsend and John H. Parr, Bainbridge, Ind. [Filed Oct. 7, 1875.]

Brief.—The receiving-table is made adjustable by its shaft revolving within a bolster-slotted shaft, to adapt it to cut 1 different heights. The dropper has a section hinged and operated by lever and strap.

170,315.

1. The combination, in a stalk-cutter, of the box D, drop bottom E, strap *d*, and hinged lever G, substantially as and for the purposes herein set forth.

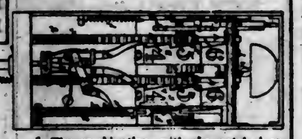
2. In a corn-stalk-cutter, the combination of the hollow slotted shaft A, interior shaft *k*, disk O, with knives P, and rod N, all constructed and arranged to operate substantially as and for the purposes herein set forth.

170,316. SUPERHEATERS FOR STEAM-BOILERS. Tinsley Vernon, Charleston, Mo. [Filed Oct. 26, 1875.]

Brief.—Steam is superheated in a coil of pipe located in a chamber formed on the bed of the fire-door. The temperature of the steam may be regulated by the admission of either fire-flame or cold air.

1. The shield E, in combination with the coiled tube D, substantially as described.

2. The combination of the dampers G and *e*, the shield E, and coil D, substantially as described and shown.

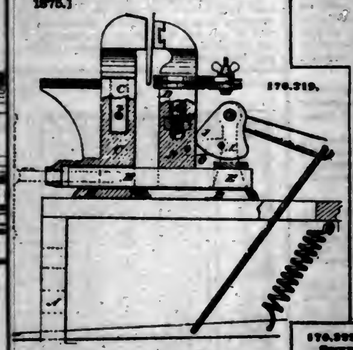


170,317. IMPLEMENTS FOR SETTING COAL-ARMS. John Waldron, New Bedford, Mass. [Filed June 4, 1875.]

The inclined and fixed slave A, provided with spindle B', in combination with the sleeve E, provided with the stirrers C C C C, and the removable handle D' D', constructed and arranged substantially as shown.

170,318. YARN-REGISTERS. W. S. Watson and A. Knowlton, Boston, Mass. [Filed Nov. 11, 1874.]

Brief.—A register to be used by persons in charge of public conveyances, which registers the receipts of fares taken from the passengers on a dial at the side of the case; at the same time numbers are thrown opposite an opening in the front part of the case, by which the passengers can see whether the person in charge has recorded correctly.



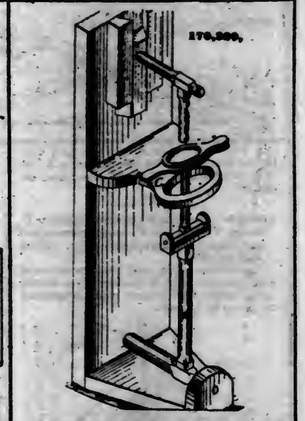
1. The combination, with the notched or toothed display or indicator wheel, of the sliding rack-bar for, operating the same, the dog or detent which engages the notches or teeth on said wheel, and the slide-bar and stud for releasing the hold of the dog on the wheel, substantially as shown and set forth.

2. The wheels B D, mounted on their supporting-shaft, as explained, in combination with rack-bars *e e'* and their retracting-springs, dogs *f f'*, and the slide-bar and stud for actuating said dogs, arranged and operating substantially as shown and set forth.

3. The combination, with the independent wheels D E F, mounted on shaft C, and operated as herein described, of the register-wheel P, and mechanism by which the several wheels, when moved, are caused to operate the register-wheel to register the amounts displayed by the wheels, substantially as herein shown and set forth

4. The bar *o'*, in combination with the sliding bars *s* or *e'*, to constitute a stop to the movement of such bars, substantially as and for the purposes stated.

170,319. HORSESHOE-CALKING VISES. W. Weaver, Greenwich, N. Y. [Filed May 22, 1875.]



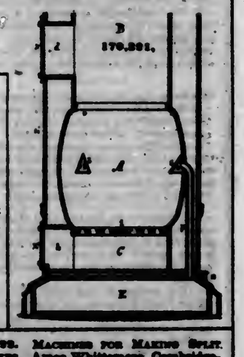
170,319.

The combination, with standard D, foot to slide E, of the cam J, connected with said standard by pivoted straps O O, and pivoted in rigid uprights I, as and for the purpose described.

170,320. MACHINES FOR FORMING BROOM-HANDLES. Washington Wendell, Orange, Mass. [Filed Aug. 16, 1875.]

Brief.—The oval grooving surface on broom-handles and similar articles can be formed by means of an upright semi-conical area, the sections hinged together at right angles to each other and to the main frame, and a platform, upon which the handle is placed, and which is provided with two handles for operating in connection with a suitable cutting-tool and guide-plate.

170,320.

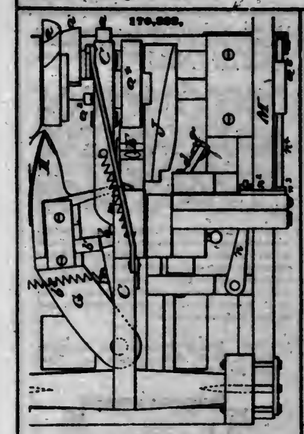


The upright arm, hinged to the frame, and made in two parts, that are hinged together, the two hinges being placed at an angle to each other, so as to give a universal motion, in combination with a guiding plate and a cutter, substantially as shown and described.

170,321. SAFETY CAR-HEATERS. Charles A. West, Richmond, Va. [Filed Mar. 22, 1875.]

1. The water-reservoir E, in combination with the removable securing-straps *a* and the base D, substantially as specified.

2. The heads *b* of the fire-chamber A, in combination with the pipes F, the base D, and the detachable water-reservoir E, substantially as specified.



3. The covering-jacket G, provided with the doors *s s'*, in combination with the base D, the securing-cover *c*, and the pipes F of the water-reservoir E, substantially as and for the purposes specified.

170,321.

170,322. MACHINES FOR MAKING SPLIT SPOKES. Amos Whittemore, Cambridgeport, Mass. [Filed Dec. 28, 1874.]

Brief.—The machine consists, essentially, of the following parts, viz: a table, upon which the rod is placed, and over which it is fed into the die; a cutter, which severs a blank from the rod; a bender, which is thrown (laterally) in front of the die at the same time the feed-table is carried (laterally) out of its way, and is advanced to bend the blank; a holder or clamp above the die; a cutting or shearing mechanism at one side of the die, which is vertically reciprocated to cut one side of the spike, and point and split it to form the prong, which prong is carried below the face of the die by the splitting shear, cut diagonally at the point by another cutter, and replaced by a replacer below; and a receding gage at the rear of the die, to determine the length of the blank.

170,323.

1. The receding feed-gage K, against which the end of the spike abuts, in combination with the levers *b* C, rod *b'*, lever *b²*, and cam *a²*, substantially as and for the purposes set forth.

2. The shearer C', having an inclined cutter, 2, a supporting-flange, 3, and an angular cutting-edge, 4, in combination with the die F, substantially as and for the purpose set forth.

3. The combination, substantially as described, of the die F, the table J, provided with mechanism for laterally moving it, and the bender K, provided with mechanism for moving it longitudinally and laterally, as set forth.

4. The cutter *d*, operating in a diagonal direction by appropriate mechanism, in combination with the die F and shearer C', substantially as described.

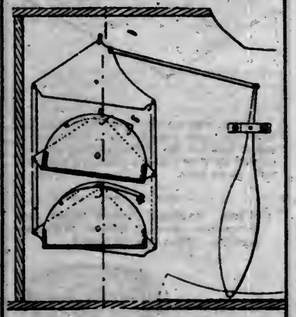
5. In a spike-splitting machine, a horizontal laterally-movable lever, G, carrying the plunger *b'*, which moves forward the bending-tool *k*, and also the tool which cuts the spike-blanks from the spike-rods, in combination with the cams *a a'*, substantially as described.

6. The spring-arm H, applied on the free end of the lever G, in the manner and for the purpose described.

7. The spike-holder E, having its fulcrum in lugs attached to the main frame, in combination with the cam *a²*, lever M, and rod *r*, substantially as and for the purpose set forth.

8. The reciprocating prongs *s s*, arranged at a suitable distance apart, and pivoted to the arm *a'*, in combination with the cam *a²*, angular lever *n²*, connecting-rod *n³*, lever *n⁴*, and grooved die-bed F, substantially as set forth.

9. The replacer N, pivoted at one end to the die-bed F, and having its opposite end connected to link A, in combination with the vertically vibrating lever C, substantially as described.



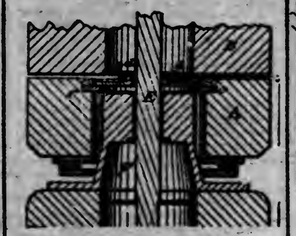
10. The die F, having the angle 5, in combination with the bending-tool *k*, pivoted to the lever G, lever G, and cams *a a²*, substantially as described.

11. The combination, substantially as described, of a bender for forming one side of the point of the spike-blank, a cutter for forming the other side of the same, a shear for splitting the blank to form a prong thereon, a diagonally-operating cutter for beveling the point of said prong, and a replacer for replacing said prong, as and for the purposes set forth.

170,323. CARPET-RAG LOOPERS. William H. H. Wyckoff, Lemon Cross Roads, N. J. [Filed Aug. 21, 1875.

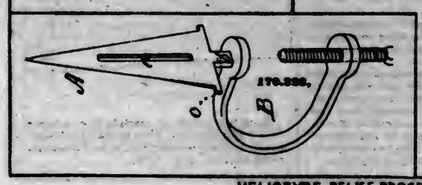
The improved carpet-rag looper herein described, consisting of the triangular blade A, having the vertical slot *a*, side projecting arms *c c'*, and the reduced shank *b*, the U-shaped plate B, having attached at its upper end the blade A, and at its lower end the adjusting-screw *e*, for the purposes set forth.

170,324. SWINGING SHIPS' BERTHS. Edwd. F. S. Andrews, Lisbon, Me. [Filed May 22, 1875.]



1. As an improvement in ships' berths, the combination of one or more pivoted berths, with jointed end plates, swinging on the same pivots by the action of a reformed governing-weight, to retain level position during motion of the vessel, substantially as and for the purpose set forth.

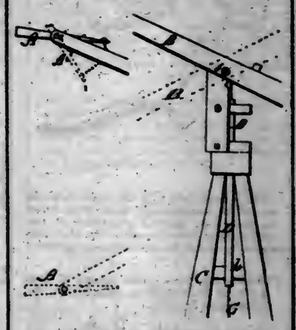
2. The combination of the end piece of a berth, having pivoted and recessed hook-lever, with a fastening device of the end plate and of the cabin-wall, for admitting the swinging of any berth either with weight or ship, substantially in the manner and for the purpose described.



170,325. OSCILLATING END-STOPPERS. Edwd. Armitage, Philadelphia, Pa. [Filed Sept. 6, 1875.]

Brief.—The wings or cleaners of the plate throw the grain or flour out toward the periphery of the bed-stone.

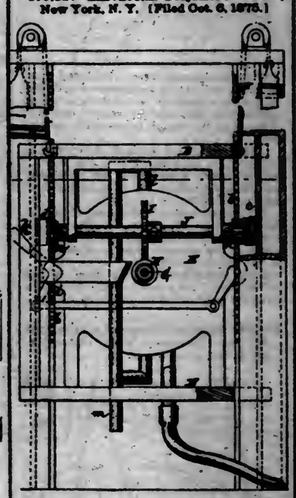
The cap or dust-excluder D, provided with the projecting wings or cleaners *f*, substantially as and for the purpose herein shown and specified.



170,325.

170,326.

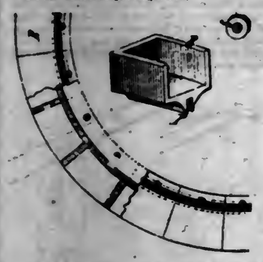
170,326. WIND-POWERS. John M. Armour, Northwood, Ohio. [Filed Apr. 20, 1875.]



Brief.—A fan or a wind-moving surface which has a reciprocating motion up and down, being mounted on one end of a vibrating beam or lever properly balanced on its fulcrum support, so that the wind may act upon the fan with full effect in both the upward and downward movement.

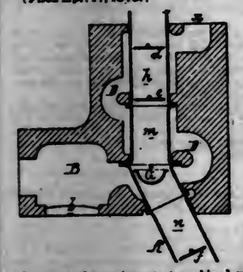
1. A pivoted vibratory fan, A, mounted on an oscillating lever, B, arranged to act in both directions of the lever oscillations, and self-adjusting to the wind at the close of each oscillation, substantially as and for the purpose herein specified.

2. In combination with the fan A and fan-lever B, the pivot-tube D at the top of the support C, and the swiveled fulcrum-rest E, substantially as and for the purpose herein specified.



170,327. ELEVATORS. Benjamin T. Babbitt, New York, N. Y. [Filed Oct. 6, 1875.]

1. The combination, with the car or platform B, of the rotary engine E, the screw H on the engine-shaft G, the worm-wheel I on the hoisting-shaft J, and the pinions *n n*, all carried by said car or platform, for operation in connection with the racks *b b* of the hoistway, substantially as specified.

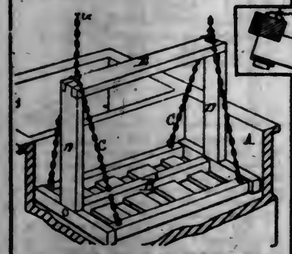


2. The guide-rollers *d d*, which operate in the guideways *c c* of the hoistway, arranged on the hoisting-shaft J, which is carried by the car or platform, whereby not only the car is guided and steadied in its course, but the hoisting-shaft also is steadied and directed in its up-and-down motion with the car, essentially as shown and described.

170,820. BUCKET-WHEELS FOR ROTARY BUCKETS. Benjamin T. Babbitt, New York, N. Y. (Filed Apr. 16, 1875.)

The combination, with the plate A, of the buckets B, constructed of rectangular boxes, provided with grooved projections P, constructed to overlap the edge of the plate, substantially as and for the purposes described.

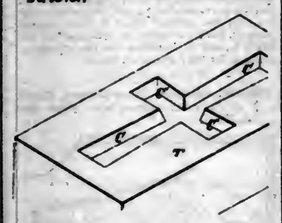
170,829. AMALGAMATORS. Joseph W. Bancroft and Thos. Walker, Philadelphia, Pa. (Filed Apr. 17, 1875.)



1. An amalgamating-retort combined with a furnace, and having a movable valve, G, for superheating a charge of ore while it is being subjected to the vapor of mercury, and for discharging the ore, all substantially as set forth.

2. The cup-shaped valve G, hung within the retort, in combination with the pipe J, through which mercury may be introduced into the receptacle of the valve, all substantially as set forth.

3. The combination, in the retort, of a tight-fitting ore-supporting valve, G, with valves *e* and *f*, for supporting the ore without obstructing the outward passage of the vapor of mercury, as specified.



4. The combination, in the retort, of the valves G and *f*, and a stopper or cap detachable from the lower end of the retort, as set forth.

170,830. VATS FOR TANNING LEATHER. Otis W. Bean, Tecumseh, Mich. (Filed Oct. 27, 1873.)

The combination of the platform B', end posts D D, top cross-bars E, binding-chains G G, and hoisting-chains O O, as arranged, in connection with one or more tan-vats, substantially as and for the purposes herein set forth.

170,831. BUILDING-BLOCKS. B. A. Berryman, St. Louis, Mo., assignor, by mesne assignments, to himself, W. H. Heath, and W. H. Barclay, same place. (Filed July 24, 1875.)

A brick, with cruciform cavities C C' on the upper and under sides B T, so as to retain the mortar and lock the bricks together, whatever may be their relative positions, substantially as set forth.

170,832. COMBINED RUBBER SHOES AND STOCKINGS. John M. Bibbins, Williamsport, Pa. (Filed Nov. 16, 1875.)

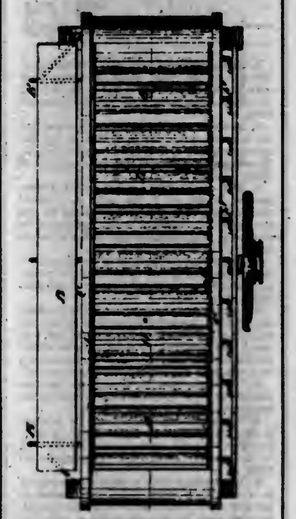
1. As a new article of manufacture, a combined rubber shoe and water-proof stocking, substantially as set forth.

2. The combination, with a rubber shoe of otherwise ordinary or suitable construction, of a stocking made of elastic and water-proof material, substantially as set forth.

3. The combination, with a rubber shoe of otherwise ordinary or suitable construction, of a stocking or top made of an elastic and water-proof material, whose exterior is formed of knit goods or other suitable fabric, substantially as set forth.

170,833. FRAMES FOR WOVEN-WIRE MATTRESSES. William J. Bode, Dayton, Ohio, assignor of one-half his right to Abia E. Bode, same place. (Filed Aug. 23, 1875.)

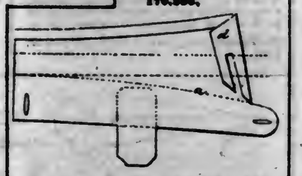
1. In combination with the sections of the frame shown, the blocks B and B', provided, respectively, with the sleeve *b* and bar *b'*, and with the legs *b'''* and *b'''*, and the screw D passing through said leg *b'''* and impinging upon said leg *b'''*, said parts being arranged to operate in the manner and for the purpose substantially as specified.



2. The hereinbefore-described extensible frame, consisting of the rails A and A, blocks B and B', provided, respectively, with the sleeve *b* and bar *b'*, and the cross-rails C and C, extending between the outer ends of said rails A and A, all arranged in the manner shown, so as to form an inverted arch, substantially as and for the purpose set forth.

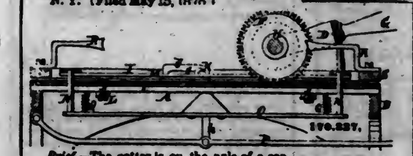
170,834. WOVEN-WIRE MATTRESSES. Abia E. Bode, Dayton, Ohio, assignor of one-half his right to William J. Bode, same place. (Filed Aug. 23, 1875.)

As a new article of manufacture, a woven-wire mattress composed of spiral coils A and A, which are connected together at suitable points by rings or links E and B, that engage with contiguous coils, and are placed with reference to laterally-adjacent links, so as to break joints therewith, substantially as and for the purpose specified.



170,835. STAGE PLANKS AND CARRIERS. Wm. S. Booth, Baton Rouge, La. (Filed Sept. 20, 1875.)

The frame C, having connected rollers D, movable boards A B, and brackets E E, arranged, as shown and described, for transferring cotton.



170,836. PAPER COLLARS. E. F. Bradford, Boston, Mass. (Filed June 24, 1875.)

1. In combination with the frame shown, the blocks B and B', provided, respectively, with the sleeve *b* and bar *b'*, and with the legs *b'''* and *b'''*, and the screw D passing through said leg *b'''* and impinging upon said leg *b'''*, said parts being arranged to operate in the manner and for the purpose substantially as specified.

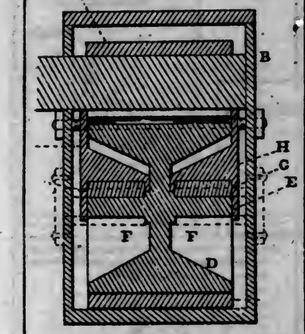
As a new article of manufacture, a paper collar, provided with loops in the folded parts *d*, substantially as described, to hold the neckti in position, as set forth.

170,837. MACHINES FOR PERFORATING PAPER. William Braidwood, Mount Vernon, N. Y. (Filed May 15, 1875.)

Brief.—The cutter is on the axle of a carriage, the wheels of which run in grooved tracks, and may be lifted by adjustable cams on the tracks. The paper is held down by a slotted guide, which is operated by treadle, and rises and falls vertically without losing its horizontal position.

1. A hand-perforator, constructed of the carriage D, wheels E, cutting-tool F, handle G, and shaft H, in combination with the supporting-platform A and its parallel knives O O, substantially as described.

2. In combination with the hand-perforator D E F G H, the clamp M, substantially as and for the purpose described.



3. The clamp M, having the longitudinal slit *g* for the passage of the cutting-tool, in combination with the pins N attached at the ends of the clamp, the beam O carrying the pins and clamp, the treadle P, connected with said beam, and the springs Q arranged between the beam and the frame of the machine, substantially as and for the purpose described.

4. The hand cutting-tool or perforator, constructed of the carriage D, flanged wheels E, shaft H, and rotary cutter F, in combination with the vertically-adjustable guide-rails I, constructed to receive the flanges of the wheels E, all substantially as and for the purpose described.

5. The combination of the rotary perforator and the grooved guide-rails, having cams J for elevating the said perforator to bring it out of contact with the paper, substantially as and for the object specified.

170,838. CAR-AXLE BOXES. Louis Brauer, Philadelphia, Pa. (Filed Jan. 8, 1875.)

Brief.—Plate for preventing escape of oil is made to set into depressions in ends of lubricating wheel or cylinder, so as to occupy but little space.

1. The combination of axle-box, lubricating-wheel bead, and supporting-frame, interposed between the journal A and axis of the wheel D, substantially as and for the purpose set forth.

2. The wheel D, with rotary axial pin E and side depressions F, in combination with the frame H, interposed between the journal A and the axial pin E, and with bearings set in the depressions F, substantially as and for the purpose set forth.

170,839. PROCESSES OF ANNEALING GLASS. Jas. M. Brookfield, Brooklyn, N. Y. (Filed Nov. 3, 1875.)

The within-described process for annealing glass, consisting in the immersion of the hot glass in a bath of melted metal or alloy of metal, substantially as set forth

170,840. SLATE-CLEANING BLOCKS. A. H. Bryant, Chicago, Ill. (Filed Nov. 1, 1875.)

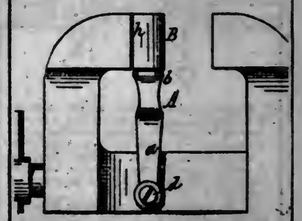
As a new article of manufacture, a slate-eraser consisting of the thin flat body or block A, having a central rib or handle, H, at right angles to said body, and in one piece with the same, and an erasing-cushion, B, of skin, felt, or cloth, attached to the under side of said body, and presenting a set edge flush with the sides or edges of the block, substantially as described.

170,841. WATCH-CASE SPRINGS. Ansel S. Buckalew, Colusa, Cal. (Filed Sept. 18, 1875.)

As a new article of manufacture, the improved spring for watch-case, consisting of the longitudinally-adjustable plate A, spring-ing *a*, and diminutive vertical supports *s s'*, said supports being located, respectively, near the middle and near the rear end of the plate, substantially as shown and described, and for the purpose set forth.

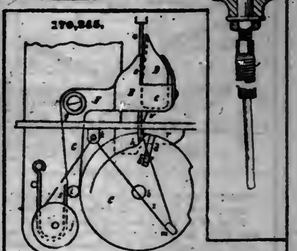
170,842. ROTARY FORCE-PUMPS. Asa Carlin, Stone's Prairie, Mo. (Filed June 10, 1875.)

Brief.—A horizontally-rotating cylinder provided with radial pistons, recessed to pass the water within the said cylinder, and up through discharge-pipe. A fixed abutment in the outer cylinder bears upon the inner cylinder, the pistons receding as they pass it. The pump is submerged, and receives supply through an aperture in the side of the cylinder.



1. The submerged rotary pump, as described, consisting of the cylinder A, provided with cam *a* and water-inlet O in the side thereof, and the wheel C formed with water-passages *f*, and carrying valves N, with recesses *h*, and check-valves *b*, substantially as and for the purpose set forth.

2. In combination with cylinder A the drive-wheel C, provided with recessed valves N, passages *f*, check-valves *b*, discharge-tube D, and nozzle K, connected thereto in a manner that will admit of the rotation of the tube without affecting the position of the nozzle, substantially as and for the purpose specified.



170,844. VISES. Ezra Caswell, Lyons, N. Y. (Filed Apr. 19, 1875.)

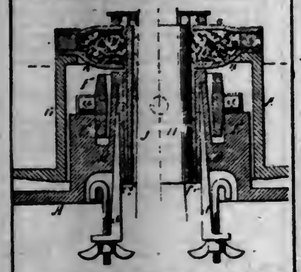
Brief.—A bifurcated upright or support strides the connection between the jaws, and has pivoted on its top a reversible intermediate jaw of plane-convex form.

A vise attachment, consisting of the standard A, having forks *a a*, adjusting-screws *d d*, block *f*, and screw *g*, in combination with the reversible head B, substantially as and for the purpose set forth.

170,845.

170,843. SEWING-MACHINES. Frank Chase, Boston, assignor of one-half his right to Berlin Leavitt, Melrose, and Jas. M. Peant, Weymouth, Mass. (Filed Nov. 15, 1874.)

Brief.—The shuttle and barbed needle are both above the cloth-plate. The needle descends through the material to be sewed, and takes an under thread from the hook below, carries it up through the cloth, and as the needle starts on its downward movement, the thread slips over the nose of the shuttle, and is drawn down by the revolving guide. The shuttle is situated longitudinally with the needle, on a bell-crank lever, the lower end of which is vibrated slightly by the cam, thus tilting the shuttle away from the needle, to allow the thread to pass over.



1. The combination of the disk and cam C, lever G F, provided with the socket C, substantially as and for the purpose hereinbefore set forth.

2. The combination of the hook *h*, finger *d*, extension *p*, stop *r*, needle *a*, and guide *m*, substantially as and for the purpose hereinbefore set forth.

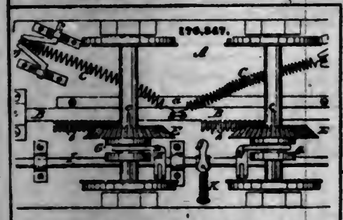
3. A sewing-machine, having a bowed needle, *a*, and a shuttle, D, set longitudinally with the needle, both needle and shuttle being located on the same side of the table B, and arranged to operate as set forth.

170,840. BEARING FOR MILLSTONES. O. Ouster, Philadelphia, Pa., assignor of one-half his right to C. K. Bullock, same place. [Filed Oct. 20, 1875.]

Brief.—The universal bearing within the eye of the lower stone about midway secures a minimum of lateral vibration of stone at its upper surface, and the ring on the upper stone excludes dust and acts as a suction-fan.

1. The combination described of the lower non-revolving stone of a mill with a universal bearing arranged within the eye of the stone, substantially as and for the purpose set forth.

2. The combination of the foundation-plate A and its lugs E E, and the bush B and its blocks G G, with the ring F and its trunnions a a and b b.



3. The sleeve or collar H, having grooves c extending throughout its entire length, as and for the purpose set forth.

4. The revolving ring I, provided with radial plates m, and arranged in line with the space between the upper and lower stones, as and for the purpose described.

5. The receptacle L, attached to and moving with the bush B, and filled with elastic packing material, in combination with the fixed sleeve H, as set forth.

170,847. CAR-STARTERS. August Dahler, New York, N. Y. [Filed Oct. 15, 1875.]

Brief.—The bevel-toothed wheels keyed to axle slide longitudinally thereupon, into or out of position for the bevel-cogs on the draw-bar to reach with them, and so turn the axle.

1. The continuous draw-bar extending from one end of the car to the other, and having bevoled teeth b, in combination with the internally-cogwheeled bevoled gear-wheels E, as and for the purpose described.

2. The combination, with the draw-bar B, having teeth b of the internally-adjustable gear-wheels F, and the symmetrically-arranged springs C C', of independently-adjustable tension, substantially as and for the purpose described.

3. The combination of the draw-bar B, having teeth b', the springs C C', the gear-wheels E, collars G, shaft H, and the rock-shaft I, provided with arms L and hand-levers M.

170,848. STEAM-BOILERS. Robert Dumpster, Buffalo, N. Y., assignor of one-half his right to Jno. M. Comstock, same place. [Filed Oct. 6, 1875.]

The removable steam-chamber A, provided with the opening C, taken or pipes D D', in combination with the annular water-chamber B, forming the body of the boiler, connecting-pipes G G, annular water-chamber, and fire-box F, pipes or connections J J', and partition M, all arranged substantially as and for the purpose described.

170,849. HAND PLANING-MACHINES. Wm. H. Doane and Geo. W. Pennel, Cincinnati, Ohio, assignors to J. A. Fay & Co., same place. [Filed July 17, 1875.]

Brief.—In a hand planing-machine where the cutter-head operates on the bottom of the stuff, between two tables which are independently adjustable, horizontally and vertically, the spindle of the cutter-head is supported in two bearings—one fixed and the other an axially-removable bearing-block, for the purpose of removing or replacing the cutter-head without interfering with the adjustment of the tables. One of the bearings is constructed so that the height of said bearing from the center to the base will admit of the largest-sized cutter-heads being used.

The combination of the both vertically and horizontally adjustable independent tables H and O, cutter-head F, spindle B, fixed bearing C, and axially-removable bearing-block D, substantially as and for the purpose specified

170,849.

170,850. COAL-SHELLING DRILLS. P. O. Donohoe, Peru, Ill. [Filed Oct. 26, 1875.]

Brief.—The screws in the opposed ends of the drills engage underneath the ledge of rock to be drilled, or in the upper part of a cavity dug for the purpose.

1. In a rock-drill, the combination, substantially such as hereinbefore described, of screws with the opposed ends of the drills.

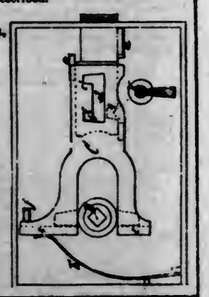
2. The combination, substantially as hereinbefore described, of the drill-stock, the supporting-arches, and the drills.

170,851.

In combination with a conductor's or collector's alarm, register, or punch, a series of surfaces provided with signs, figures, or letters, so arranged within the case or cover of the instrument as to be operated by and record any movement or opening of the door, cover, or case.

170,852. COMPOSITIONS FOR SIZING. Samuel B. Dorian, Upper Uwchlan Township, Dorian's Mills P. O., Chester County, Pa. [Filed Mar. 20, 1875.]

Brief.—Treats the stock with bleaching-powder, and, without washing it out, adds sulphuric acid, together with the other substances mentioned.



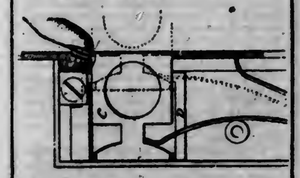
1. In sizing paper-pulp, the process of treating it with chloride of lime and sulphuric acid, substantially as and for the purpose set forth.

2. The complete process of sizing paper-pulp by treating it with chloride of lime and sulphuric acid, in conjunction with clay or other fibrilous paper filling, soap, starch, hyposulphite of soda, alum, and oil, substantially as and for the purpose set forth.

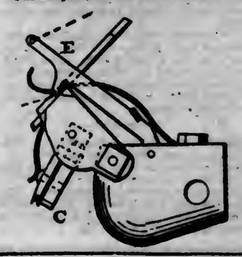
170,853. LOCKING-LATCHES. Julius Druckluh, Jersey City Heights, N. J. [Filed Apr. 29, 1875.]

The combination of the latch-bolt, having the stud b and recess g, with the two-armed tumbler C, constructed with recesses e e', to receive the stud b, and with lips c, for engaging with the arms of the hub D, and the spring E, arranged to act directly upon one of the tumbler-arms, so as to throw out the bolt and hold the tumbler in position, substantially as shown and described.

170,854.

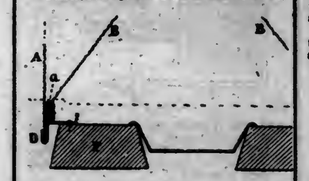


170,854. TOOLS FOR PUTTING BARBS ON WIRE FENCES. William Dulin, Big Grove, Iowa. [Filed Oct. 21, 1875.]



As an implement for putting barbs on wire fences, the rods A A, having flattened ends, with holes through the same, substantially as herein set forth.

170,855. SLIDING-DOOR PULLS. Henry H. Hyatt, Norwalk, Conn., assignor to the Norwalk Lock Company, same place. [Filed Oct. 20, 1875.]



In combination with the face-plate and case, the slide C, working through said face-plate, with suitable guides to control its movement, and a spring to return or hold the said slide within the case, substantially as specified.

170,856. CORRUGATED BURNISHERS AND SEAT-WHEELS FOR BOOTS AND SHOES. Alonzo C. Haworthy and Thomas T. Haworthy, Philadelphia, Pa. [Filed Oct. 26, 1875.]

170,855. FLY-TRAPS. H. B. Baring, Peoria, Ill., assignor of one-half his right to H. C. Ouster, same place. [Filed June 14, 1875.]

1. The cylinder A, having its rim D provided with shoulder a, in combination with the rim c of the cone B, substantially as and for the purpose set forth.

2. The combination of the cylinder A, having the rim D provided with shoulder a, adapted to rest upon the rim c of the cone B, arms f, and base F, as described.

170,856. FIRE-LIGHTERS. George Elberg, Cincinnati, Ohio. [Filed May 10, 1875.]

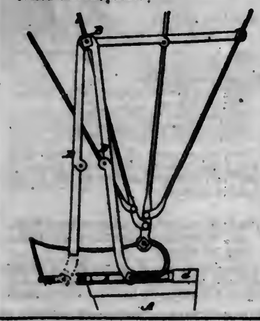
Brief.—The sliding ping serves to protect the head, and also to close the mouth of the can, into which the body of the lighter is to be dipped.

1. The combination of three-part casing a b c, handle A with shoulder X, and extending through the casing to form a rivet or receive a nut, substantially as and for the purpose specified.

2. In combination with the handle A and casing a b c, the sliding plug C, substantially as and for the purpose specified.

170,857. SLIDING-DOOR PULLS. Henry H. Hyatt, Norwalk, Conn., assignor to the Norwalk Lock Company, same place. [Filed Oct. 20, 1875.]

In combination with the face-plate and case, the slide C, working through said face-plate, with suitable guides to control its movement, and a spring to return or hold the said slide within the case, substantially as specified.



170,858. VEGETABLE PARCHMENT. A. O. Pell, New York, N. Y., assignor to himself, Wm. H. Phelps, and Wm. H. Smith, same place. [Filed Mar. 31, 1875.]

Brief.—Treat paper with sulphuric acid. Wash. Bathe for three hours to bath (heated to 180°) of water, eight hundred parts; glue, eighty parts; tungstate soda, two to four parts; acetate lead, eight parts; glycerine, five parts. Immerse suddenly in pyroxyline solution at normal temperature. Dry and calender.

1. As a new article of manufacture, artificial parchment, consisting of gelatinized and colloidinized fiber, substantially as described.

2. The process hereinbefore described for treating vegetable parchment with a solution of glue, tungstate of soda, acetate of lead, and glycerine, and with a solution of pyroxyline, in the proportions and in the manner substantially as and for the purpose described

170,859. SHIFTING CARRIAGE-TOPS. Henry M. Gillespie and Virgil Tyne, Leadeo, Mo. [Filed Oct. 26, 1875.]

1. The combination, with a buggy-seat having a groove near the top, of a detachable top having a horizontal rail adapted to slide into said groove, as and for the purpose described.

2. The combination, with the buggy-top, having rail b, and the buggy-seat having a groove, a, with flanges c c' of the spring-locking key C, as and for the purpose described.

3. The combination, with a buggy-top, of the two knuckle-jointed props, D D, bending in opposite directions, as and for the purpose described.

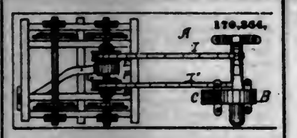
170,860. WASHING-MACHINES. P. Gittere, Buffalo, N. Y. [Filed Mar. 11, 1874.]

The combination, with the tab A, of the hinged cover B', attached to transverse pieces B'', constructed to slide in guides B''' to render the cover removable, substantially in the manner set forth and described.

170,861. REGISTERS. Thomas B. Doolittle, Bridgeport, Conn. [Filed Aug. 26, 1875.]

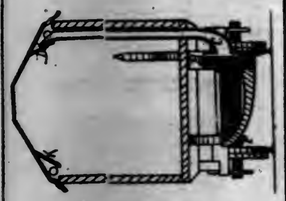
Brief.—In this register cases a train of gears having numbers or letters marked upon their surfaces, and actuated by a pawl placed upon the sliding door of the case. The said door, when moved, allows the pawl to engage with the teeth of one of the gears belonging to the train, and move it one point, each movement being indicated by the change of numbers or letters upon the faces of all the gears.

170,862. DEVICES FOR REFITTING VALVE-SEATS. Chas. P. Hall, Skaneateles, N. Y. [Filed Feb. 16, 1875.]



The combination of the stock A, with differential screw-threaded facets, feed-screw H, jam-nut K, and the refitting-tool E, shank L, and collar M, substantially as specified.

170,863. VENTILATING CARS. Edward B. Hargreaves, Sarnia, Canada. [Filed Oct. 5, 1875.]



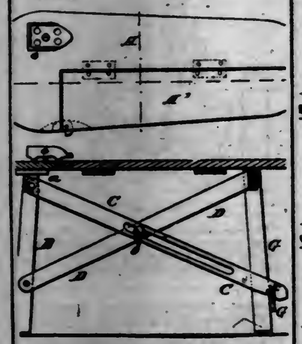
Brief.—By means of the two clutch-pulleys, and their connections with the shaft of the exhaust-fan, the latter may always be operated in the same direction, no matter which way the car is moving.

The axle F, clutch-pulleys E E, rigid pulley G, belts I I', and exhaust-fan B, when combined with the platform or door A of a railway-coach, substantially as set forth.

HELIOTYPE RELIEF PROCESS JAMES R. OSGOOD & Co. BOSTON.

170,864.

170,865. ROTARY ENGINES. Wm. Haven, Clymer, N. Y. [Filed Mar. 24, 1875.]



1. In a rotary engine having two cylinders and pistons, the combination of the two chambers m n, each of which communicates with both cylinders, substantially as shown and described.

2. The space 3 around the rear side of the abutments f, for the purpose of allowing the steam to press it against the piston, as described.

3. The opening t through the shell, whereby the reservoir m supplies both cylinders with steam, as specified.

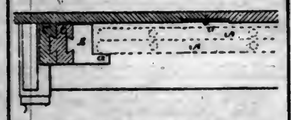
170,866. IRONING-TABLES. Joseph S. Hays, Annapolis, Md., assignor to J. S. Hays and D. W. Dorsey, same place. [Filed Nov. 3, 1875.]

1. The ironing-board A, cut to form a longitudinal leaf, A', hinged to the board, capable of being turned under the same, for the purposes herein set forth.

2. The combination, with an ironing-board, of the legs B B, braces C C, having slots s s, braces D D, and legs G G, with cross-bar G', substantially as and for the purposes herein set forth.

170,867. MILLS. I. A. Hedges, St. Louis, Mo. [Filed June 9, 1873.]

1. The cone having teeth K, vertical at their upper ends and curving in lines so as to approach more and more nearly to the horizontal as they descend, substantially as and for the purpose set forth.

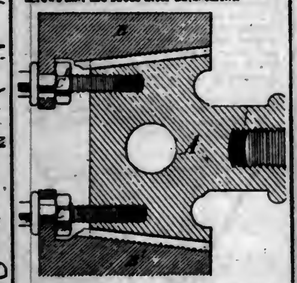


2. The concave having teeth L, vertical at their upper ends and curving in lines so as to approach more and more nearly to the horizontal as they descend, substantially as and for the purpose set forth.

3. The supporting-head D, of the runner or cone, having annular concave bearing d, in combination with driving-frame E, having convex rib e, substantially as and for the purpose set forth.

170,868. PRESERVE COMPOSITIONS FOR MACAROONS. Henry Heide and C. Wirtz, New York, N. Y. [Filed Jan. 29, 1875.]

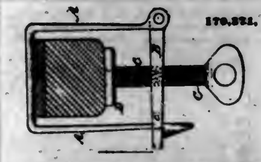
The preserve composition for macaroons, composed of almonds, dried white of egg, sugar, and water, in the proportions specified, the proportion of water being less than necessary for baking, substantially as set forth.



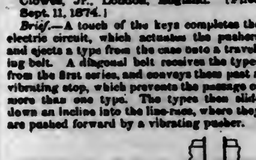
170,869. EXTENSION-TABLES. Geo. Heyl, Newark, N. J. [Filed Sept. 8, 1875.]

An extension-table in which flanges a a' are arranged upon the permanent sides B, to support the folded extra leaves, all as set forth.

170,870. CROSS-HEADS. John W. Hill, Dayton, Ohio. [Filed July 31, 1875.]



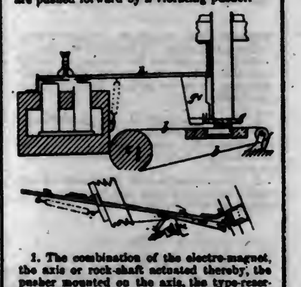
Brief.—The jam-nuts interposed between the cross-head and the ears of the adjusting-shoes on the set-screws are to lock the set-screws and the shoes after adjustment.



The combination of the tapering head, wedge-shaped or tapering shoes, set-screws, and jam-nuts, substantially as and for the purpose specified.

170,871. CLIPS FOR SPLICING BROKEN TIRES. Jno. W. Reddinott, Baltimore, Md. [Filed Oct. 26, 1875.]

The combination of a spring-clip, A, hinged plate B, thumb-screw C, and pad, D, constructed substantially as shown and specified.



170,872.

170,872. TYPE-SETTING MACHINES. John Hooker, Islington, assignor to W. Moore, Beccles, and W. C. K. Clowes and Wm. Clowes, Jr., London, England. [Filed Sept. 11, 1874.]

Brief.—A touch of the keys completes the electric circuit, which actuates the pushers and ejects a type from the case onto a traveling belt. A diagonal belt receives the types from the first series, and conveys them past a vibrating stop, which prevents the passage of more than one type. The types then slide down an incline into the line-rules, where they are pushed forward by a vibrating pusher.

1. The combination of the electro-magnet, the axis or rock-shaft actuated thereby, the pusher mounted on the axis, the type-reservoir, across the mouth of which the pusher vibrates to move one type at a time, and the endless apron which receives the type, these members being constructed and operating in combination, substantially as and for the purpose set forth.

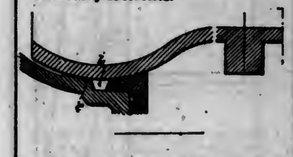
2. The combination, substantially as herein-before set forth, of the traveling tape, the guide, the spring which presses the type against the guide as it is carried forward by the tape, and a stop, whereby, in case of the attempt of two type to pass simultaneously into the receiver, the outer one would be held by the stop until the inner one had passed, and then be pushed into line by the spring to follow the other.

3. The combination, substantially as herein-before set forth, of the traveling tape, the guide, the spring, the stop mounted on the vibratory lever, and a crank-pin on the tape-roller, whereby a backward movement is given to a type out of position to accelerate its return into line.

4. The combination, substantially as herein set forth, of the inclined chute, the type-receiver, inclined downward at right angles to the chute, and the pusher working at right angles to the chute, and at such a distance from its lower end that type coming from the chute into the receiver and striking against the side of the pusher can drop clear of the end of the chute, whereby two or more type may enter the receiver when the pusher is in its forward position.

5. The combination, substantially as herein-before set forth, of a traveling tape, the chute on which it delivers the type, the type-receiver, the pusher acting on the type, and the plate bearing on the type as they pass into the receiver.

6. The combination, substantially as herein-before set forth, of the chute over which the type pass, the vibrating plate under which the type pass, and the vibrating circuit-breaking lever, whereby the machine is thrown out of action by the too rapid collection of the type in the receiver.

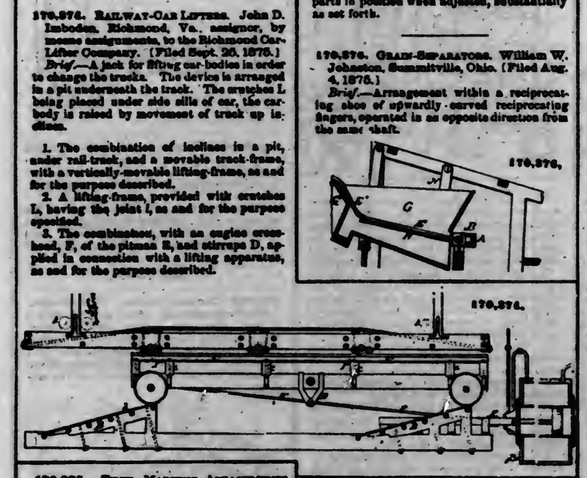


170,873. PIPE-JOINTS. Joseph Hyde, Wilmington, Del. [Filed Sept. 10, 1875.]

Brief.—When the spherical end of one pipe is inserted in the corresponding recess of the other, and the follower is fastened on, a flexible water-tight joint is formed. The space between the inward projection and the follower forms a groove for the packing.

170,873.

The within-described pipe-joint, consisting of the spherical end a of the pipe A, and the bearing d in the socket of the pipe B, in combination with the follower D, adapted to the socket b, and the intervening packing-space c between the said follower and bearing c, all substantially as set forth.



170,874. RAILWAY-CAR LIFTERS. John D. Imboden, Richmond, Va., assignor, by mesne assignments, to the Richmond Car-Lifter Company. [Filed Sept. 20, 1875.]

Brief.—A jack for lifting car-bodies in order to change the trucks. The device is arranged in a pit underneath the track. The crutches L being placed under side sills of car, the car-body is raised by movement of crank up in-clines.

1. The combination of inclines in a pit, under rail-track, and a movable truck-frame, with a vertically-movable lifting-frame, as and for the purpose described.

2. A lifting-frame, provided with crutches L, having the joint l, as and for the purpose specified.

3. The combination, with an engine cross-head, F, of the pitman E, and stirrups D, applied in connection with a lifting apparatus, as and for the purpose described.

170,874.

170,875. TUCK-MARKING ATTACHMENTS FOR SEWING-MACHINES. Allen Johnston, Ottumwa, Iowa. [Filed Oct. 18, 1875.]

Brief.—The gage and marker are connected together, so that the movement of the gage adjusts the marker also, the latter moving twice as fast as the gage.

1. In combination with the shoe C, riddle H, and reciprocating bar B, the fingers E, bent in an upward direction at E', so as to cover and clean the tail-board G', substantially as herein shown and described.

2. In a threading-machine, the combination of the riddle-cleaner, consisting of the reciprocating bar B and fingers E, with the rod D, eccentric C, shaft M, disk, I, rod J, and shoe G, when said parts are arranged for operation in the manner and for the purpose herein shown and described.

170,876. GRAIN-SEPARATORS. William W. Johnston, Summitville, Ohio. [Filed Aug. 4, 1876.]

Brief.—Arrangement within a reciprocating shoe of upwardly-curved reciprocating fingers, operated in an opposite direction from the main shaft.

170,876.

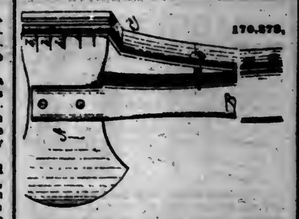
1. In a tuck-marking attachment for sewing-machines, a marker and a gage combined, substantially as described, to move simultaneously in opposite directions, the marker twice as fast as the gage.

2. The combination, with the gage, of a marker, adjustable independently of said gage to regulate the spacing, but connected therewith, so that a movement of the gage in one direction will cause the marker to move twice as fast in the opposite direction, substantially as set forth.

3. The combination, with the base-plate and sliding gage and marker, of the main lever, pivoted to the base-plate, and connected on one side of its pivot with the gage, and on the other side with the marker, substantially as described.

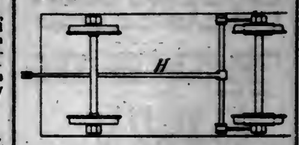
4. The base-plate, sliding gage, and marker, in combination with the main lever, connecting-rods, and set or bending screws, for joint operation, substantially as set forth.

5. The combination, with the main lever, pivoted upon the base-plate, and connected with the gage and marker, substantially as described, of fixed scales of division for determining the adjustment of the gage and marker, and fastening devices for maintaining the parts in position when adjusted, substantially as set forth.



170,877. LEGETHING-BOOTS. Isaac Johnson, Chicago, Ill. [Filed Jan. 19, 1876.]

A tubular lightning-rod made in sections, and indented, substantially as described, in combination with the hollow and correspondingly-indented coupling-pieces B B, open at both ends, and arranged as shown with relation to the sections, substantially as and for the purposes set forth.



170,878. MEAT-MANGLERS. C. C. Kerr, Springfield, Mo. [Filed June 22, 1875.]

The combination of the blade A, handle B, and forked spring-guide C, all constructed substantially as and for the purposes herein set forth.

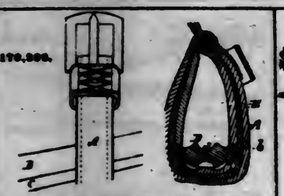
170,878.

170,879. CAR-BRAKES. Paul Klemmgw, Bellinzona, Switzerland. [Filed Oct. 8, 1875.]

In a railway-brake apparatus, a lever, H, or a system of levers, H H', pivoted to the under side of the car-frame, and also to the truck-frame or axles, with a free end adapted to be raised by the brakeman upon the car, for the purpose of employing the weight of the car, when the free end of the lever is released, to apply the brake-blocks to the wheels, substantially as described and shown.

170,880. ORNAMENTAL FABRICS FOR SKIRTS AND OTHER ARTICLES. Albert Kemp, New York, N. Y. [Filed Oct. 7, 1875.]

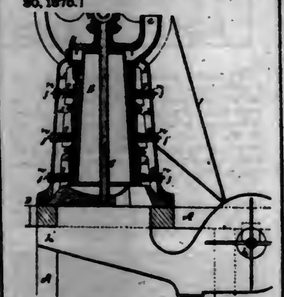
An improved fabric for the manufacture of ladies' skirts and other articles, composed of muslin and felt, or other textile or fibrous materials, which are united by gutta-percha or other cement, and ornamented with mosaics, produced by the combination of pieces of cloth of different colors inlaid in the felt and united with the muslin, substantially as described.



170,881. PLAYING-CARDS. R. R. Landis, Chicago, Ill. [Filed Sept. 6, 1875.]

A pack of game or playing cards, comprising a champion or advantage card, a Philistine or disadvantage card, and forty-eight or other suitable number of cards containing Bible or other stories, said story-cards being arranged to be readily converted into reward-of-merit cards, substantially as shown and described.

170,882. HARNESS-TUGS. R. S. Leonard, Sharon, Mass. [Filed Oct. 5, 1875.]



170,886.

1. In combination, with the harness tug A and the friction-roller D, arranged therein as set forth, the two separate or disconnected metallic ribs or collar and tug supporters E E, arranged with the said roller and in the tug, substantially as specified.

2. The combination of the curved guard or shield C, and the grooved friction-roller D, with the tug A and the thill or shaft B, all being arranged and to operate as specified.

170,887. COFFEE-HULLERS. Daniel Lombard, Boston, Mass., assignor to himself and Livarus Hall, same place. [Filed Sept. 20, 1875.]

1. The combination of the rotary corrugated or fluted center B and the casing I, composed of the series of segmental elastic plates d, substantially as described.

2. The combination, with the bars F, of the series of plates d, hinged thereto, and provided with guide-rods f, springs g, and nuts e, substantially as shown and described.

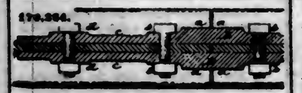
3. The combination, with the corrugated center B and the series of elastic plates d, of the fan or blower, as and for the purpose set forth.

4. The improved coffee-hulling machine, as described, the same consisting of the corrugated core B, provided with the shaft C and means, substantially as described, for putting the latter in rotation, the series of elastic plates d, the bars F, the hopper a, arranged and operating together, substantially as set forth.

5. The improved coffee-hulling machine, consisting of the corrugated core B, provided with a driving-shaft, C, the series of elastic plates d, the bars F, hopper a, and fan or blower H, arranged and operated together, substantially as set forth.

170,888. RAILROAD-RAIL JOINTS. Richard Long, Pittsburg, Pa. [Filed Aug. 4, 1875.]

Brief.—A rail-joint consisting of fish-plates provided with a central re-enforcement, and of different thicknesses along its length, whereby different degrees of rigidity are obtained.



1. A fish plate, constructed with a heavy re-enforcement at its central portion, and extending from the top edge to the bottom thereof, substantially in the manner and for the purposes set forth.

2. A fish-plate, constructed of varying thicknesses, as described, whereby different degrees of rigidity are obtained therein, and capable of being rolled in their manufacture, as stated, substantially in the manner and for the purpose set forth.

3. The fish-plates B B, having the depressions c c formed in the flats thereof, in combination with the rails A A, as described, whereby the rails are allowed to yield, in the manner and for the purposes set forth.

4. The fish-plates B B, constructed with the re-enforcements c c, b b, and d d, and the depressions c c, substantially in the manner and for the purpose set forth.

170,889.

170,889. FAC-SIMILE TELEGRAPHS. John C. Ludwig, San Francisco, assignor of part of his right to Wm. H. Hall, Martin Corcoran, B. D. Murphy, James V. Tisdal, Chas. W. Ashelm, and David B. Moody, San Jose, Cal. [Filed Nov. 27, 1874.]

1. In an autographic telegraphic instrument, the combination, with a suitable conducting-surface, of an oscillating traverser, arranged to move back and forth over the paper passing between the said traverser and conducting-surface, as substantially described.

2. The method of preparing the message-paper by saturating it with a mixture of ferrocyanide of potassium and coal-oil, for the purpose of rendering the same capable of conducting the current through a lead-pencil mark, substantially as described.

3. The combination, with the pivoted oscillating traverser, having an armature upon its axis, and a retracting-spring for the same, of the electro-magnets and a suitable contact-breaker, substantially as described.

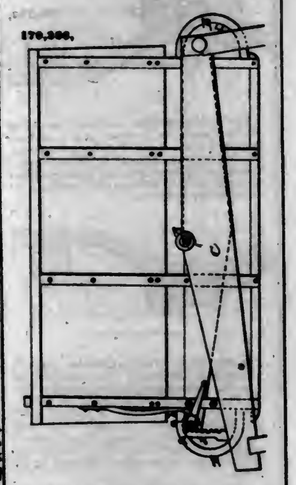
4. The traverser H, having a spring-seated contact-point *f'*, in combination with a spring-seated conducting-plate, K, and suitable feed-rollers, substantially as described.

5. The combination of a slide, operated by an arm of the traverser, with the feed-roller, having a ratchet-wheel, and the contact-points, through which the circuit is formed that operates the traverser, substantially as described.

6. The combination, with the traverser H and armature T, having arm *f'*, of the releasing-magnets E E and the spring-mounted armature M, having a catch, substantially as described.

7. The combination, with the magnets D D and the main line circuit, of the spring-mounted armature *o* and the contact-points *r s*, to insure the passage of the main-line current through the paper while the traverser is being moved by spring-power, substantially as described.

8. The combination of the relay-magnets, the induction-coil, the magnets D D, the releasing-magnets E E, the traverser H, and armature T, having arm *f'*, the spring *p*, and the slide for feeding the paper and breaking the second local circuit, substantially as described.



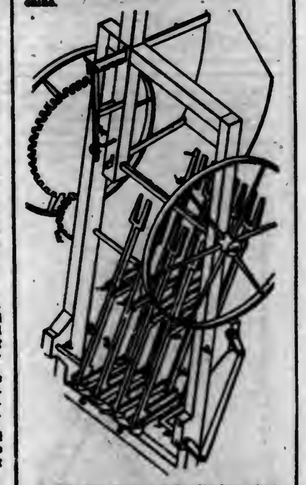
9. The combination of the hook or pawl *b* with the fluted or channeled feed-roller *g*, having a ratchet-wheel, *h*, and the roller *a*, journaled in springs *d d*, substantially as described.

10. The combination, with the second local circuit, of the non-conducting post X, wires *b' b''*, contact-plates *l l*, and the circuit-closing plate *i*, substantially as described.

170,890. HOSES-POWER. A. D. Manley, Washington, Mich. [Filed May 6, 1875.]

Brief.—The main body of the horse-power, being on center hollow bearings within the outside frame, is provided with means of adjusting it to any angle desired.

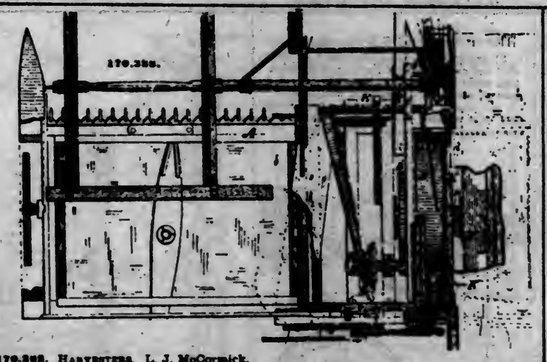
170,890.



1. The combination, in a horse-power, of the body A, having hollow gudgeons B B, frame C, shaft D, cross-bar C', segments E E, shaft *b*, pinions *c c*, and rack-bars *d d*, all substantially as set forth.

2. The bodies A, in combination with the pinions *c* and rack-bars *d*, arranged with a centrally-suspended horse-power body, substantially as and for the purposes herein set forth.

170,891. POTATO-DIGGERS. W. P. Martyn, San Francisco, Cal. [Filed May 26, 1875.]

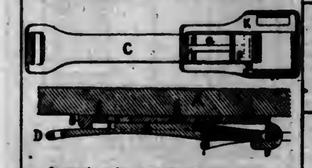


Brief.—Two sets of lifting-forks, operated by two double cranks, work with a digging motion close in rear of the lifting-share. The arms of the forks form a double inclined plane, to convey the potatoes to one side of the machine.

1. The arrangement of the digging-forks *b b* and reciprocating-rakes *e e*, to form a double inclined plane, substantially as and for the purpose described.

2. The reciprocating digging-forks *b b*, having the pins or projections *c c*, substantially as and for the purpose described.

170,892.



170,892. HARVESTERS. L. J. McCormick, Chicago, Ill. [Filed July 19, 1875.]

1. The binding-frame, constructed substantially as hereinbefore set forth, pivoted upon the main frame, and connected therewith by link-connections, whereby the binding-frame may be adjusted to keep it level upon the main frame

2. The combination, substantially as hereinbefore set forth, of the driving-wheel, the grain wheel, the main frame mounted thereon, the tongue pivoted on the frame, the lifting-lever, and crank-shaft, the link connecting the crank-shaft and tongue, the binding-frame pivoted on the main frame, and the link connecting said frame with the crank-lever, whereby the binding tables and platform are kept horizontal while the cutting apparatus is being raised and lowered.

3. The combination, substantially as hereinbefore set forth, of the overhung reel-shaft, the cranked rock-shaft, in which it is mounted, the arm projecting from the rock-shaft, and the adjustable end-wise-moving lever, pivoted thereto, whereby the reel may be raised and lowered.

170,893. HOSES-DETACHERS. Daniel H. Owen, Cambridge, Mass., assignor of one-half his right to Danl. B. Frazier and A. K. Smith, same place. [Filed Mar. 10, 1875.]

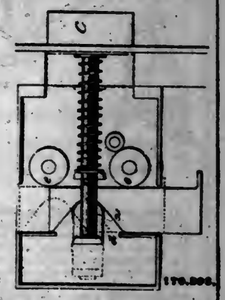
In combination with the shaft A of a vehicle, the grooved plate B, draw bar C, provided with projection E, loop D, hook F, and slot I, hinged lever G, and spiral spring H, constructed to operate with the cross-bar J of the loop K, as described, so as to form an automatic trace-fastener, substantially in the manner as and for the purposes set forth.

170,894. OVERSTITCH SEWING-MACHINES. William A. Palmateer, Johnstown, N. Y. [Filed July 26, 1875.]

1. In an overstitch sewing-machine, the loop-hook H, having the shank *s*, the curved heel *w*, and hook-point *h*, as described, and for the purpose specified.

2. The combination of the needle-bar B, carrying the needle *n*, having plate *c*, irregular groove *d*, and crank-pin *b*, with collar *e*, the loop-hook H, lever L, compound cam G, coil-spring *k*, bar D, fork F, and eccentric E, as described.

3. The combination, with the needle-bar B and needle *n*, carrying thread *t* of the tension T, adjustable guide-loop *m'*, guide-loop *n'*, tension-spring *k'*, pin *p''*, plate *c*, and tension-spring *A'*, as described.



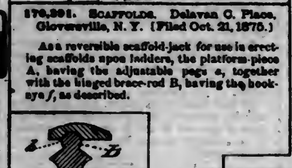
4. The combination of the upper feed-roller R, lower feed-roller R', brake leaf-spring *l*, clutch *o'*, clutch-lever *P*, oscillating cam *G'*, coil-springs *S'* and *s'*, short shaft *b'*, lever *G'*, and spring *D'*, as described.

170,895. REVERSIBLE LATCHES. H Sterling Pomeroy, New Haven, Conn., assignor to the Blake Brothers Hardware Company, same place. [Filed Oct. 6, 1875.]

1. The combination, in a latch-case, of the bolt C, with its tail D, provided with a shoulder, *d*, the vertical slide F, working through the edge of the case, and constructed with an incline or cam shape, substantially as described, and so that the vertical movement of the slide imparts a horizontal movement to the latch-bolt.

2. The combination, in a latch-case, of a horizontal latch-bolt, a vertical slide working in connection with the said bolt, so that the vertical movement of the slide imparts a horizontal movement to the bolt, the said case constructed with an opening to receive the said slide from either edge, substantially as described, and for the purpose of adapting the latch to either a right or left hand door.

170,895.



170,896. MACHINES FOR SLOTTING AND DRILLING CLOTHES-CLAMPS. Milton Pratt, Deep River, Conn. [Filed Aug. 30, 1875.]

Brief.—The jaws of clothes-pins can be slotted and bored for the reception of springs and pivots by means of a reciprocating bed-plate, upon which the blanks are presented to the slotting saw, a boring-tool, which is moved alternately toward or from the work, and an automatic device for clamping and releasing the blank during the movement of the bed-plate, in connection with suitable operating mechanism.

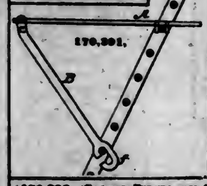
1. In a machine for slotting and drilling clothes-clamps, and for similar purposes, the combination, with a reciprocating bed-plate, which presents the work to the slotting device of a drilling or boring shaft attached to said bed-plate, and having a rotary motion and a longitudinal motion, whereby, during the movement of the bed-plate, the drill or boring-tool is fed to the work, substantially as herein described.

2. The combination and arrangement of the reciprocating bed-plate I, the shaft I, provided with the grooved collar P, and shaft M, provided with the forked arm *n*, said shafts being mounted on, and carried by, said bed-plate, the lever N, connected to the shaft M, and the switch F, attached to the table A, whereby the boring-tool is moved alternately toward and from the work during the movement of the bed-plate, substantially as herein described.

170,897.

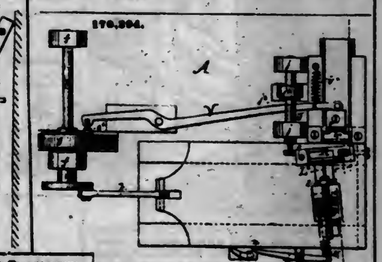
170,897. SCAFFOLDS. Delavan C. Place, Gloversville, N. Y. [Filed Oct. 21, 1875.]

A reversible scaffold-jack for use in erecting scaffolds upon ladders, the platform-piece A, having the adjustable pegs *c*, together with the hinged brace-rod B, having the hooks *e f*, as described.



170,898. CORNER-PIECES AND CLAMPS FOR PICTURE-FRAMES. Charles P. Poinier, Boston, Mass., assignor of one-half his right to Geo. S. Bryant & Co., same place. [Filed July 24, 1875.]

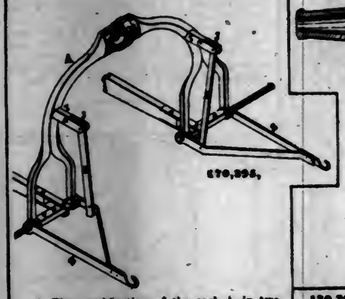
As a new article of manufacture, an ornamental corner-piece and clamp for picture-frames, consisting essentially of the plate A, having a right-angular groove, *b*, upon its under side, adapted to receive the upper bead of a picture-frame, substantially as described, and for the purpose set forth.



170,898.

170,899.

170,899.

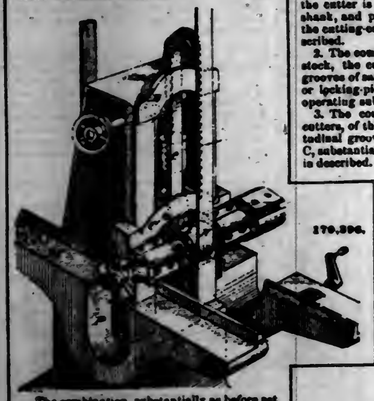


2. The combination and arrangement of the reciprocating bed-plate I, the shaft I, provided with the grooved collar P, and shaft M, provided with the forked arm *n*, said shafts being mounted on, and carried by, said bed-plate, the lever N, connected to the shaft M, and the switch F, attached to the table A, whereby the boring-tool is moved alternately toward and from the work during the movement of the bed-plate, substantially as herein described.

3. The combination of the table A, reciprocating bed-plate I, work carrier K, clamping-dog N, spring e, and set-screw or projection e', for automatically clamping and releasing the work during the movement of the bed-plate, substantially as herein described.

170,395. CULTIVATORS. Thomas J. Price and Almon Hunt, Macomb, Ill. [Filed July 22, 1875.]

Brief.—Devices for a sectional arch and draft attachment, allowing independent longitudinal motion.



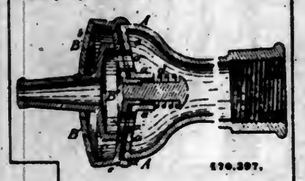
170,395.

1. The combination of the arch A, in two parts, and swiveled to or near its center, with the draft frames S S, rods I I, and pivoted links J J, as and for the purpose set forth.

2. The lock-plate C, with circular grooves d, and overlapping flange c, in combination with the rod a and the sectional arch A, having face-plates and studs d, all constructed substantially as shown and described.

170,396. THROTTING-MACHINES. Edward H. Rees, Mansfield, Ohio, assignor to J. A. Fay & Co., Cincinnati, Ohio. [Filed Dec. 21, 1873.]

Brief.—The rotating cutters, which form the tenons, are made vertically adjustable, passing downward below the table face, so that tenons may be cut on both ends of the material without reversing it.



170,396.

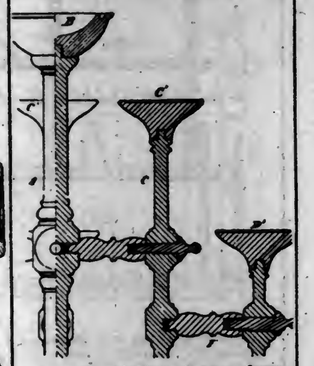
The combination, substantially as before set forth, of two tables, with a rotating cutter adapted to be reciprocated between said tables in the manner stated, so that it may cut through the stuff from either side.

170,397. HOSE-PIPE NOZZLES. Saml. Reid, Chicago, Ill. [Filed Apr. 9, 1875.]

Brief.—This nozzle has a revolving head, as also a chamber within it with openings, besides a central flanged opening, in combination with a pipe having the enlarged part and plate provided with posts. The head and pipe are connected together by a screw-bolt and spring, to form a yielding joint.

The revolving head B B', having chamber C B'' and concave plate c, provided with ports c' c'' and central flanged opening, in combination with the pipe A, having the enlarged part A' and plate a, provided with ports a''' a'', and central flanged opening a'', the head and pipe secured together by screw bolt D and spring d, substantially as described.

170,397.



170,398. SCREW-TAPS. Edwin Reynolds, Providence, R. I. [Filed Oct. 30, 1875.]

Brief.—The cutters, after having had imparted to the face of each of them a curvature forming an arc of a circle drawn from the center of the stock, are removed from the longitudinal grooves and tempered, and are then placed again in said grooves, (being secured therein by wedges,) with their projecting edges overhanging the surface of the stock, in consequence of which the shanks of the cutters are brought nearer to a radial line with relation to the axis of the stock, and their cutting-edges placed a little beyond the original circle, of which their faces formed arcs, each cutter thus presenting a sharper cutting-edge with a greater amount of clearance.

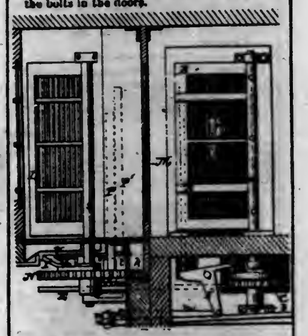
1. A cutter for screw-taps, provided with an overlapping edge, d, whereby the face of the cutter is made wider than its body or shank, and provision is made for sharpening the cutting-edge, substantially as herein described.

2. The combination of the grooved cutter-stock, the cutters laterally movable in the grooves of said stock, and the reversible keys or locking-pieces, the whole combined and operating substantially as herein described.

3. The combination, with the removable cutters, of the stock A, provided with longitudinal grooves B and a transverse groove, C, substantially as and for the purpose herein described.

As a new article of manufacture, a flower-stand, consisting of the vertical parts or standards A C D, the crook-supports C' D', and the horizontal parts or connecting-pieces E F G, the said parts being more or less in number, and adapted, by means of male and female screws forming a part thereof, for attachment to each other for the purposes set forth.

170,399. POSTABLE FLOWER-STANDS. D. M. Reynolds, Chicago, Ill. [Filed Apr. 24, 1875.]



Brief.—The stand is made up of vertical and horizontal pieces, screwed together in a radial form from a common center-piece, the upper end of the vertical posts having disks for the support of flower-pots.

170,399.

170,400. OPERATING PRISON-DOORS. R. Richter, Indianapolis, Ind., assignor of one-half his right to J. R. Thomas, same place. [Filed Oct. 21, 1875.]

Brief.—The doors of prisons are operated, singly or simultaneously, by a horizontal rack-bar and pinions operated from the guard-room. Suitable tripping mechanism, connected by shafts and levers to vertical racks, and operated by cogged levers, release or close the bolts in the doors.

1. The combination, with the door B, having mortised projections k, of the vertical bolt K, with hooks y, for fastening the door, and for detaching the door from the operating mechanism by its weight upon the lever I, substantially as herein set forth.

2. The combination of the door B, shaft a, disk D, pin d, with beveled flange c, and cog-wheel C, with hole n, as and for the purposes herein set forth.

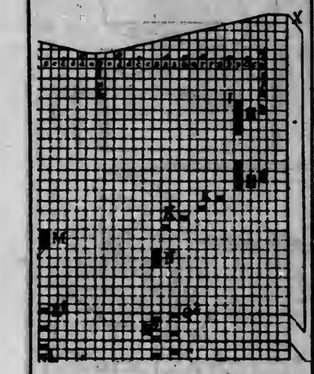
3. The combination, with a series of doors, B, and mechanism for connecting the same with the cog wheels C, of the rack-bar E, wheel G, shaft f, and hand-wheel H, substantially as and for the purposes herein set forth.

4. The combination, with the door B, shaft a, disk D, and pin d, of the lever I, connections m n, rack-bar J, and cogged lever K, substantially as and for the purposes herein set forth.

5. The combination, with the doors L M, of the rack-bar p, cog-wheel N, shaft r, with arm O and pin d', lever O, sliding bars P P', and rocking bar v, with arms t u, substantially as and for the purposes herein set forth.

170,401. WINDOW-SHADE ROLLERS. Anthony Reckoth, Philadelphia, Pa. [Filed Mar. 6, 1876.]

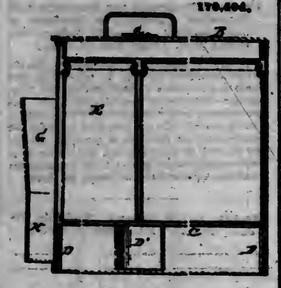
170,402.



1. The combination of a window-shade roller, having a central opening, b, and an end piece or pulley having a central ribbed pin, a, of uniform diameter throughout its length, and adapted to the said opening, as set forth.

2. The within-described ribbed pin a, of uniform diameter throughout its length, and combined with, and forming part of, the end piece or pulley of a window-shade roller, as set forth.

170,403. ELECTRIC MUSIC-SHEETS. Wm. F. Schmoele and Henry Schmoele, Jr., Philadelphia, Pa., assignors of one-third their right to Chas. Schmoele, same place. [Filed May 15, 1875.]

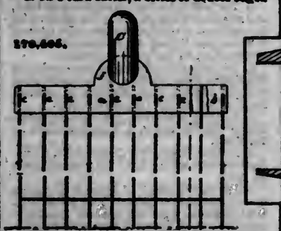


Brief.—Provides for each tune two or more columns removed from one another, whereby long notes may be divided, and those that would otherwise come near together may be scattered, thus obviating in the one case continuous long perforations, and in the other narrow and weak division-strips. Makes a lap or fold along the edge of the sheet, excepting at the points where the sections overlap, so as to present at all points the same thickness of paper to the rollers.

1. The electric music-sheet provided with twin or multiple columns for the superposition of perforated musical notes for electrical performance, substantially as and for the purpose described.

2. The electric music-sheet provided with the flap and joint, substantially as and for the purpose set forth.

170,404.



170,405. CURD-CUTTERS. Alonzo Sedgwick and Edwin H. Sedgwick, Poughkeepsie, assignors to themselves, R. S. Whitman, W. W. Whitman, and D. H. Burrell, Little Falls, N. Y. [Filed Aug. 23, 1875.]

Brief.—The cutter is formed of a series of parallel double-edged knives, secured to the head-bars by means of lugs, and braced by double-edged transverse knives.

1. As a new article of manufacture, a curd-cutter, constructed of a series of parallel blades sharpened on both of their edges, and with transverse blades sharpened in like manner, combined with one or more metallic head-plates, substantially as and for the purpose described.

2. In a curd-cutter, a series of double-edged

170,406.

knives constructed with lugs, combined with slots formed in one or more metallic head-plates, substantially as and for the purpose described.

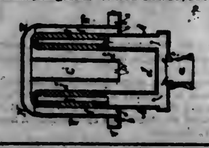
3. In a curd-cutter, formed of a series of parallel double-edged knives, one or more double-edged transverse knives, secured thereto, substantially as and for the purpose described.

170,407. DEVICES FOR ATTACHING BOLSTER-FRAMES TO FOLDING LOUNGES. W. Seng, Chicago, Ill. [Filed Apr. 20, 1875.]

Brief.—The plates, constructed as set forth in the claim, are designed to hold the ends of the bolster-frame in position, and to prevent them from wearing the wood of the side rails of the lounge-frame.

The combination of the plates E F, constructed with slots T, stops F, and lugs S, with the bolster-frame D C, constructed with notched ends, as and for the purpose set forth.

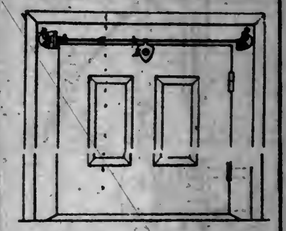
170,408. SOFA-BEDSTEADS. John Schoen, Chicago, Ill. [Filed Oct. 8, 1875.]



The notched rest-frame C, provided with notch p upon the under side, in combination with the plates B, provided with slots s, to engage with the curled ends of the frame, and the upwardly-projecting rib b, to engage with the notches c, for the purposes specified.

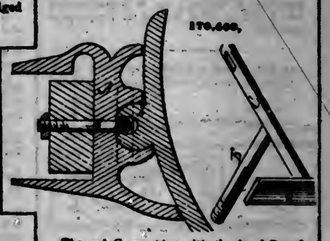
170,409. STEAM-COOKERS. Geo. H. Serfass, Reno, assignee of one-half his right to London F. Terrill, Underhill Centre, Vt. [Filed Nov. 4, 1875.]

The combination of the boiler A, having exterior pipe H and funnel G, with the perforated false bottom C, having supports D D', the vessel E, with perforated bottom, and the lid B, with valve c, all constructed substantially as and for the purpose herein set forth.



170,410. GAS-BURNERS. Albert M. Silber, London, England. [Filed Oct. 19, 1875.]

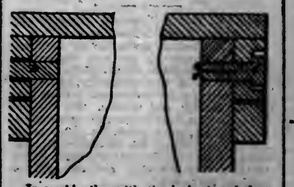
1. The gas-burner, in which air-feeding passages C d' f are combined, substantially in the manner and for the purposes described and shown, respectively, in the figures, inclusively.



2. The combination, with air-feeding tubes or passages, disposed as described, of a cap or dome, H, of conical, semi-spherical, or other convex shape, in the manner and for the purpose described.

170,411. DOOR-ALARMS. David H. Spoor and Edwd. P. Searle, Medina, N. Y. [Filed Aug. 26, 1875.]

A wire or string alarm, arranged in such relation to the door as to be vibrated by a stud or projection thereon in the act of opening or closing the door.

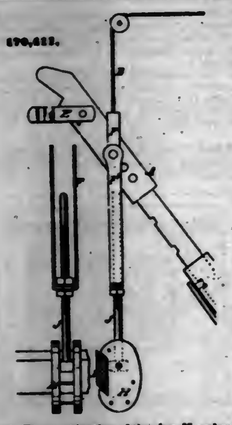


170,412. CAR-BLAKE SHOES. Henry Steets, Harrisburg, Pa. [Filed July 10, 1875.]

170,412.

The rod C, provided with the head D and bolt-arm E, in combination with the brake-shoe A and removable rubber B, substantially as and for the purposes herein set forth.

170,413. BOX-LID FASTENINGS. John L. Stevens, Chicago, Ill., assignor to Billings, Coburn & Co., same place. [Filed Oct. 20, 1875.]

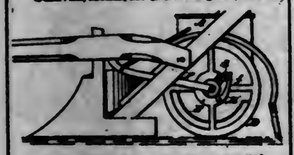


In combination with the body A and cleat C' of the cover, the spring-pressure fastening-pin F, substantially as and for the purpose specified.

170,414. BALE-BAND STRETCHERS. James S. Stocker, Charleston, S. C. [Filed July 2, 1875.]

Brief.—An extensible lever, with a hinged jaw at one end, has, just below each jaw, a hanging stirrup, with a hook and screw-threaded rod therein, for connection with some portion of the press-frame—the whole suspended by a cord and weight; also, a wedge with a cam-wheel recessed in it.

170,412.



1. The combination of the claw H and catch E with the lever A and rigid bar, as and for the purpose specified.

2. The lever A, suspended by a cord, having a counter weight, in combination with the strap F, extensible rod J, and claw H, as and for the purpose specified.

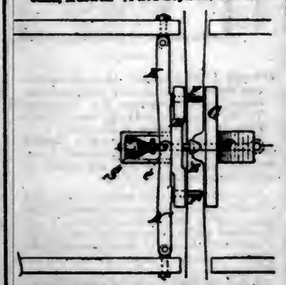
3. The slotted wedge I, provided with serrated cam M, having a slot, *a*, in combination with a sliding rod, K, as and for the purpose specified.

170,413. CORN AND SEED PLANTER. H. P. Sullivan, Xenia, Ill. [Filed Aug. 30, 1875.]

In a seed-planter, constructed as hereinbefore described, the combination of the driving-wheel D, having tilt-lug *a*, operated by the springs *f* and *g*, with the seed-cylinder C, provided with the recess *c* in its inner circumference, said cylinder C being arranged upon the hollow axle of the driving-wheel, substantially in the manner as and for the purpose specified.

170,414. AUGER-HANDLE. James Swan, Seymour, Conn. [Filed Mar. 9, 1875.]

Brief.—A central socket, having a vertical central perforation, is provided with a mortise at right angles to said perforation, for the reception of a correspondingly perforated plate, having a screw-threaded portion projecting through said mortise. The tang of the auger is secured in position by turning a thumb-screw, which draws the plate against the tang and across the perforation, thereby clamping the tang between one angle of the perforation in the plate and the opposite angle of the socket.



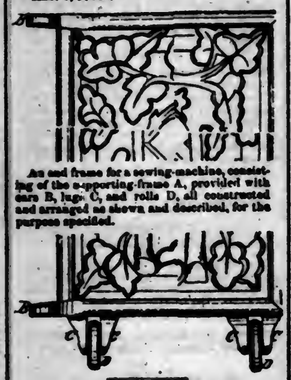
As an article of manufacture, the hereinbefore-described auger-handle, consisting of the socket A, constructed to receive the handle B, and with the perforation C, combined with the transverse perforated plate D, constructed with the screw E extending through one side of the socket, and provided with the nut G outside the socket, substantially as set forth.

170,415. PROCESSES FOR PREVENTING OR REMOVING NAPHTHALINE DEPOSITS IN GAS-CONDUITS. Joseph C. Tiffany, Cozzaukie, N. Y. [Filed Nov. 19, 1875.]

In the manufacture of illuminating-gas, the within-described process for preventing and removing deposits of naphthaline and other similar condensable constituents of gas, and for utilizing such constituents, which consists in introducing into the gas, after it leaves the retorts, gas from paraffine or paraffine oils, for the purpose of absorbing and combining with such naphthaline or other similar condensable products, substantially as herein set forth.

170,416. CAR-PLATFORMS. Emil Tilp, Vienna, Austria. [Filed Sept. 15, 1875.]

1. The bolt E, having a wedge-shaped head, and attached to and carried by the platform A, in combination with the notched rigid bracket or cross-piece D, and the platform B, as herein described, for the purpose specified.

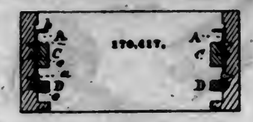


2. The pins F F', sliding in the bracket or cross-piece H on platform A, in combination with the bracket G on platform B, substantially as and for the purpose set forth.

3. The bolt E and the pins F F', in combination with the levers K K', substantially as described.

4. The bolt E, pins F F', levers K K', in combination with spring S, for the purpose herein set forth.

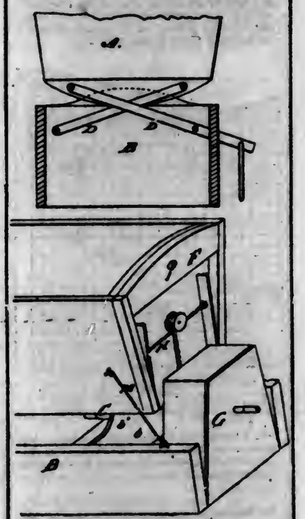
5. The bolt E, pins F F', levers K K', spring S, rod and bracket or cross-piece H on platform A, in combination with the notched bracket or cross-piece G on platform B, substantially as and for the purposes herein set forth.



170,417. SEWING-MACHINE TABLES. Harriet Ruth Treat, New York, N. Y. [Filed Mar. 6, 1875.]

An end frame for a sewing-machine, consisting of the supporting-frame A, provided with ears B, lugs C, and rolls D, all constructed and arranged as shown and described, for the purpose specified.

170,417. WINDOW-SASH-BEAD FASTENERS. John W. Tripp, Bellaire, Ohio. [Filed May 22, 1875.]



Brief.—The parting-beads of the sash are secured in place by a double-headed sliding bolt and staples, so that when the bolt is disengaged the beads can be withdrawn and the sash removed.

The sliding bolts *A*, constructed to fasten both beads C D, in combination with eyes or staples, *c c*, attached to the beads, substantially as set forth.

170,418. CRADLES. Wm. V. Van Dervort and Nicholas W. Van Dervort, New Antioch, Ohio. [Filed July 15, 1875.]

Brief.—The vibrating lever, by which motion is imparted to the cradle, has a cord-pulley at its upper end, around which the rope attached to two springs at the head of the cradle passes. As the cradle is thrown out of level by motion of the child, the rocking lever automatically adjusts itself on the rope without stopping the mechanism. The springs serve to take up the sharp motion of the lever. One of the cross-braces, pivoted to the cradle and the frame, is extended to serve as a treadle.

1. In combination with the cradle A, having the arms D D' pivoted to the rockers and bars, and intersecting the treadle, formed of an extension of the arm D', substantially as shown and described.

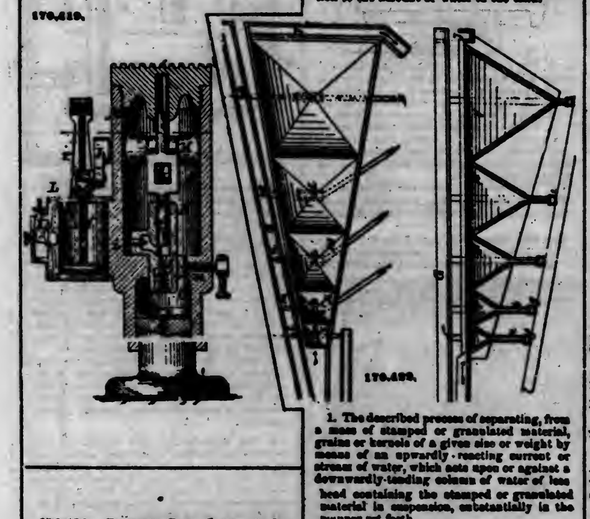
2. In combination with a cradle rocked by automatic mechanism, the lever *g*, cord H, and spool *g'*, for regulating the leverage according to the position of the cradle component, substantially as described.

3. In combination with a cradle and automatic mechanism for rocking the same, an intermediate regulator to automatically adjust the rocking-lever to the position of the cradle, as the latter is varied by the motion of the child, substantially as described.

4. The springs I and connection H, in combination with the cradle A and the cradle-motor G, substantially as described.

5. The combination, with the cradle A and motor G, of the cord H, spool *g'*, stem *g*, rock-beam *d'*, pinions *d'*, and crank *e*, substantially as specified.

170,419. EXTENSIBLE JAMBS. M. J. Walsh, New York, N. Y. [Filed Oct. 6, 1875.]



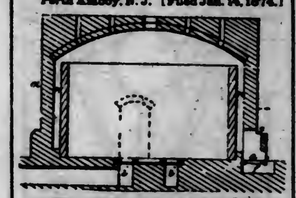
Brief.—The screw-pump is operated by a small engine attached to the head. The piston-rod connects directly with the rocker-arm by slot and pin.

1. The combination, with a hydraulic jack, of an engine mounted directly thereon, and connected with its pump, substantially as herein described.

2. The combination, with the pump-operating rock-shaft H and its attached arm G, of the slotted crank or arm J, the pin *m*, and the piston-rod M, substantially as herein described.

Brief.—Ore is conducted with a stream of water into a series of inverted pyramidal tanks, through the bottom of which a stream of pure water flows upward. The heavy mineral falls in spite of this current, and is conveyed away by the surplus water. The cross-section of the upward stream being for each pan the same, its force and effect is in proportion to the amount of water in the tank.

170,420.



1. The described process of separating, from a mass of stamped or granulated material, grains or barrels of a given size or weight by means of an upwardly-reacting current or stream of water, which acts upon or against a downwardly-tending column of water of less head containing the stamped or granulated material in suspension, substantially in the manner set forth.

2. The method of classifying, with a view to the final concentration, low-grade ores and tailings, by passing the same, mingled with water, through a series of vessels or tanks, in which the downwardly-tending columns of water are acted on by upwardly-reacting currents or streams of water of superior head, whose reacting force is diminished in each succeeding vessel or tank, substantially in manner and for the purposes set forth.

3. The classifying apparatus, consisting of a series of vessels or tanks arranged to communicate, as described, in combination with the feed-pipes, sluices or gates, and pure-water conduits, for operation substantially as shown and set forth.

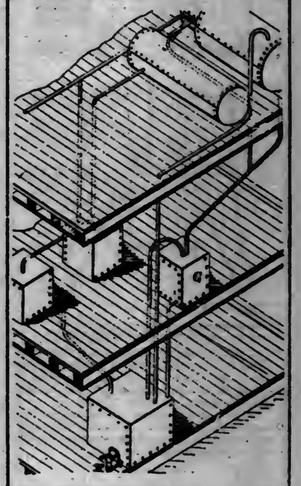
170,421. BRICK-KILNS. Wm. N. Waldner, Perth Amboy, N. J. [Filed Jan. 14, 1876.]

1. The mode herein described of setting a kiln—that is to say, arranging the articles to be burned in the form of an annular wall between the central outlet-flue and the inlet-flues in the wall of the kiln—whereby the heated gases are caused to pass upward outside of said wall, and downward at the opposite side.

2. A kiln consisting of a circular permanent wall, *a*, a series of furnaces, *b*, communicating with the interior of the kiln near the base thereof, a central outlet on a level, or thereabout, with the base, and an inclosed flue between the inlet and outlet openings, as set forth.

170,422. METHODS AND APPARATUS FOR CLASSIFYING ORES. Robert M. Wengler, Freiberg, Saxony, assignor of one-half his right to Francis A. Lowe, Washington, D. C. [Filed Oct. 20, 1875.]

170,423.



170,424. REFINING CAST-IRON. Arthur Warner, Westbourne Crescent, Hyde Park, England. [Filed Aug. 27, 1875.]

Brief.—The soda-ash, being readily fusible, prevents the powdered lime from baking to the bottom of the receiver. Intimate contact with and rapid purification of the iron thought to be effected.

The within-described process of purifying or refining molten cast-iron by treating it in a deep vessel, without extraneous heat, with pulverized limestone and soda-ash, mixed in or about the proportions herein specified, for the purpose set forth.

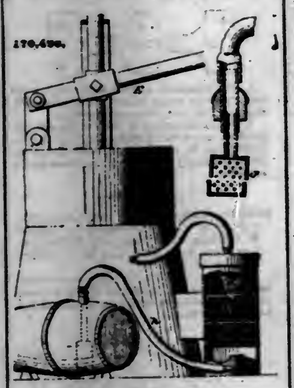
170,425. APPARATUS FOR THE USE AND RECOVERY OF VAPORIZED SOLVENTS. James E. Whiting, New York, and William A. Lawrence, Springfield, L. I., N. Y. [Filed Aug. 14, 1876.]

Brief.—By means of the supplemental condenser vapors of the solvent liquid are collected and saved from the extractor and the holding-reservoir.

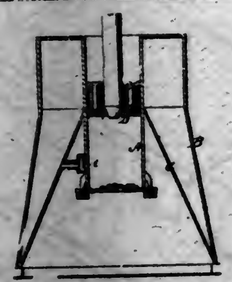
In combination with the apparatus for making extracts by use of vaporizable solvents, a supplemental condenser, G, connected with either or both the extractor A and holder E, substantially as and for the purpose specified.

170,426. SUBMARINE ROCK-CHISELS. A. J. Whitney, Sandusky, Iowa. [Filed June 20, 1873.]

1. In a chisel for channeling, securing the detachable point to the stock by a collar shrunk over the joint and below a shoulder on the stock, and abutting upwardly against said shoulder, substantially as described and shown.



2. In a chisel for channeling the combination of the wrought-iron socket A, steel bit B, transverse pin *a'*, collar C, and shoulder *a*, when the several parts are constructed and arranged substantially as described and shown.

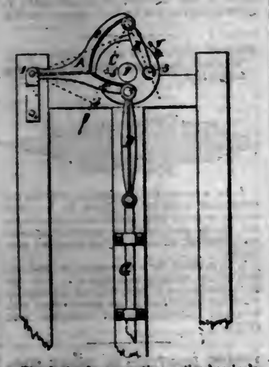


170,427. BRASS-PUMPS, &c. David S. Whitman, Reading, Pa. [Filed July 10, 1875.]

Brief.—The air passes from the pump and receiver to a purifier, thence through a flexible pipe and perforated distributer to the liquid in the cask, &c.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

170,496.



1. The combination of the pump A and receiver B with interior shell C, surrounding the pump, and connected together by a pipe, *k*, having valve *i*, substantially as and for the purposes herein set forth.

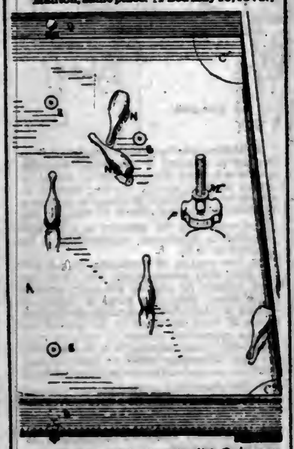
2. The combination of the air-pump A D, receiver B C, purifier G, and air-distributer J, constructed and arranged substantially as and for the purposes herein set forth.

170,497. DEVICES FOR CONVERTING MOTION. Montgomery Crossman, Marshall, Mich., assignor of one-half his right to P. A. Spicer, same place. (Filed Oct. 25, 1875.)

The device for converting motion herein described, consisting of the link B and Y-shaped lever A, in combination with a revolving crank or wrist-pin, 3, and pitman-rod D, when arranged substantially as shown and described.

170,498. WICK-RAISERS FOR LAMPS. Albt. Albertson, Jersey City, N. J., assignor to Philip Corrigan, New York city. (Filed Feb. 3, 1875.)

Brief.—The annulus receives the outer wick-tube between its walls, the outer of which is provided with studs, engaging with studs upon the cone, and the inner with screw threads.

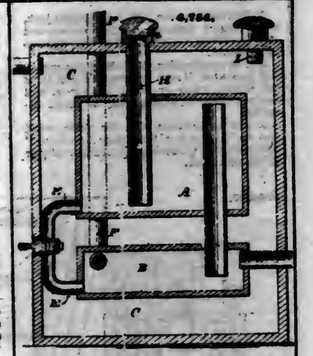


1. The internally screw-threaded sleeve C, carried by the supporting-annulus B, working in the guide *a* of the base A, in combination with the inner and outer wick-tubes D E, substantially as and for the purpose set forth.

2. The internally projecting studs *f* on the removable cone G, in combination with the radial stud *g* on the annulus B, carrying the threaded sleeve C, substantially as and for the purpose set forth.

3. The non-conducting ring H, concentric with and attached to the removable cone G, substantially as and for the purpose set forth.

170,499. GAME-BOARDS. John G. Thurber, Jr., Providence, R. I., assignor to Jos. P. Manton, same place. (Filed May 10, 1875.)



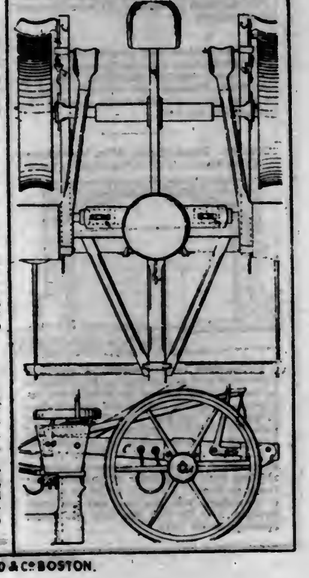
1. The lever E, having the disk D, in combination with the rod G, spring H, and bell F, substantially as and for the purpose set forth.

2. The radially-disposed rods G, operated by the levers and springs, as described, in combination with the bell F, as and for the purpose set forth.

3. The top P, having an irregular or eccentric perimeter, in combination with a game-board provided with pins or bell-ringing device, substantially as and for the purpose specified.

4. The top-holder K, placed as described, and having the slotted arms I J and sheath V, in combination with a game-board, A, having the groove V', substantially as and for the purpose set forth.

4,755.



1. In gas-carburetors, an automatic feed between the chambers A and B, said chambers being surrounded on all sides by water contained within a water jacket or case, for the purposes set forth.

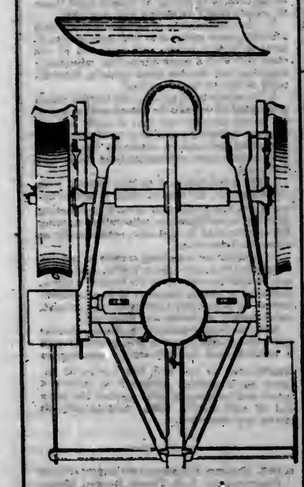
2. In gas carburetors, the chambers A and B, connected together by means of the pipe E, in which pipe is contained a closing device, *c*, combined with the pipes D, F, G, and H, the whole being surrounded by the case or jacket C, filled with water, said case or jacket having its supply-opening I, the whole constructed, arranged, and combined in the manner and for the purpose herein described.

3. The within-described method of controlling the temperature and latent heat of the carbureting fluid, which consists in surrounding the hydrocarbon-fluid tank A and carbureter on all sides with water, substantially as specified.

4. The hydrocarbon-fluid chamber A and vaporizing-chamber B, entirely surrounded by water, and provided with inlet and outlet pipes, having all their joints, cocks, and plugs water-sealed, in combination with a water-tight case or jacket, C, in the manner and for the purpose herein described.

4,755. SEED-PLANTERS. George W. Brown, Galesburg, Ill. Patent No. 99,266, dated Feb. 1, 1870. (Filed Jan. 2, 1875.)

REISSUES.

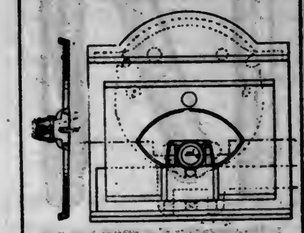


4,756. AUTOMATIC FEED AND ABSORPTION CARBURETERS. Jonathan Austin, New York, N. Y., assignee of E. Hall Covel, administrator of William H. Covel, deceased. Patent No. 91,213, dated June 15, 1869. (Filed Nov. 13, 1875.)

Brief.—The supply-reservoir and carbureter are surrounded on all sides by water, within a water-tight jacket. All the joints, cock, and plugs upon the connecting-pipes are water-sealed. An automatic feed-pipe extends from the supply-reservoir to the carbureter.

HELIOTYPE RELIEF PROCESS JAMES R. OSGOOD & Co. BOSTON.

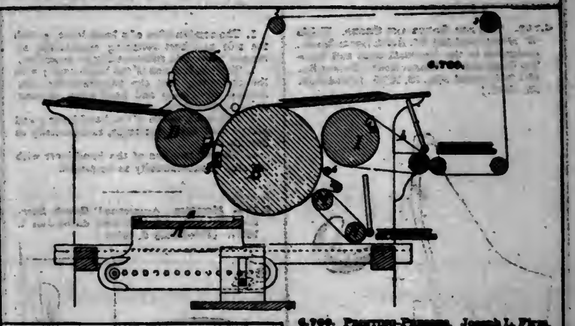
In combination with a seed-planting machine, having a rear main frame and supporting-wheels hinged to a forward frame carrying the seed-hoppers and runners, foot-bars F F, secured at their forward ends to the forward frame and projecting in rear for the purpose of raising and lowering said frame by upward and downward pressure from the rear frame by the driver's feet, substantially as and for the purpose specified.



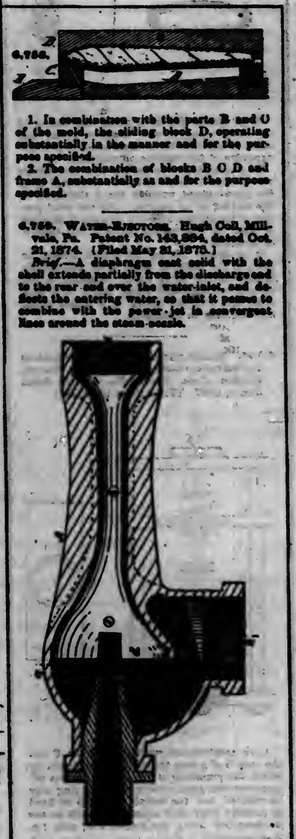
4,756. SEED-PLANTERS. George W. Brown, Galesburg, Ill. Patent No. 99,266, dated Feb. 1, 1870. (Filed Jan. 2, 1875.)

The corn-planter wheel-rim blanks C, constructed, as described, of concave-convex strips of wrought-iron, substantially as described, and for the purpose specified.

4,757. SEED-PLANTERS. George W. Brown, Galesburg, Ill. Patent No. 99,266, dated Feb. 1, 1870. (Filed Jan. 2, 1875.)



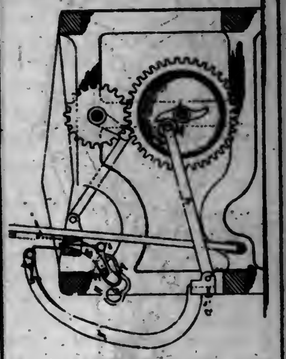
Brief.—Horizontal vibrating seed-disk and yielding oscillating seed cut-off.



In a seed-planting machine, the combination of a seed-cup plate, through which the seed passes, with a spring cut-off having an oscillating as well as yielding movement, substantially as and for the purpose set forth.

4,758. GRAIN-MOLDS. John Chester, Sterling, Ill. Patent No. 110,620, dated July 11, 1871. (Filed Apr. 14, 1875.)

Brief.—The mold in which the cigar is formed is divided horizontally, and the parts held together by hooks and staples. Sliding in the lower half-mold is a plunger, which compresses the bunch, after which it is removed by opening the half-mold.



1. A water-ejector, having an inside diaphragm, cast in one piece therewith, which extends back from the front end of the head, partially across the lower portion of the chamber, forming a solid wall, without opening or communication between the two portions of said chamber at that point, as described.

2. The shell *d*, having a diaphragm, *e*, which, with the upper portion of the shell, forms a circular discharge-chamber, tapering forward of the jet-pipe, down into a discharge-nozzle, substantially as described.

4,759. WAVE-STOP MECHANISMS FOR LOOMS. Thos. Blackwood and Wm. Nuttall, Westerly, R. I., assignors, by mesne assignments, to the National Woolen-Loom Stop-Motion Company, same place. Patent No. 158,808, dated May 12, 1873; reissue No. 6,010, dated Aug. 11, 1874. (Filed May 26, 1875.)

1. The combination, with the lathe, of the wires A and mechanism, substantially as described, for presenting them behind the weft and withdrawing them, said wires being arranged to comb the weft forward toward the cloth, in the manner set forth.

2. The reciprocating wires A and their operating mechanism, as set forth, said wires being adapted to support and carry forward the weft, in combination with the weft-fork and shipping mechanism, substantially as described.

3. The combination of the rock-lever O, arm Q, cam R, and finger and latch with the lever H, for operating the shipper-lever, all arranged to operate in the manner described.

4,760. PRINTING-PRESSES. Joseph L. Firm, New York, N. Y., assignor of one-half interest to Calvert B. Cottrell and Nathan Babcock. Patent No. 146,441, dated Jan. 13, 1874. (Filed July 24, 1873.)

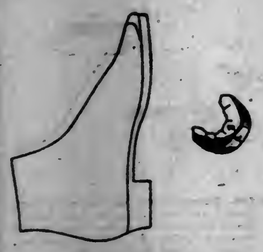
Brief.—Offset sheet is taken by a second set of grippers, and carried round several times, if desired, when it is thrown off upon its verso.

1. The combination, with an impression-cylinder and reciprocating form, of an auxiliary impression-cylinder and curved form, the whole operating together to print both sides of the sheet during its passage through the machine, substantially as set forth.

2. The described method of printing the slip-sheets on the impression-cylinder—that is to say, by feeding them directly into the grippers of the impression-cylinder by hand.

3. The described method of removing the slip-sheets from the impression-cylinder after they shall have been used any desirable number of times, as herein before set forth.

4,761. WEFT-STOP MECHANISMS FOR LOOMS. Thos. Blackwood and Wm. Nuttall, Westerly, R. I., assignors, by mesne assignments, to the National Woolen-Loom Stop-Motion Company, same place. Patent No. 158,808, dated May 12, 1873; reissue No. 6,010, dated Aug. 11, 1874. (Filed May 26, 1875.)



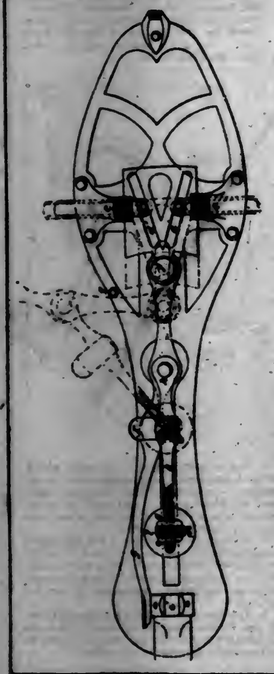
1. The combination, with the lathe, of the wires A and mechanism, substantially as described, for presenting them behind the weft and withdrawing them, said wires being arranged to comb the weft forward toward the cloth, in the manner set forth.

2. The reciprocating wires A and their operating mechanism, as set forth, said wires being adapted to support and carry forward the weft, in combination with the weft-fork and shipping mechanism, substantially as described.

3. The combination of the rock-lever O, arm Q, cam R, and finger and latch with the lever H, for operating the shipper-lever, all arranged to operate in the manner described.

HELIOTYPE RELIEF PROCESS JAMES R. OSGOOD & Co. BOSTON.

6,703. TIPS FOR SHOES AND SHOES. Hollis W. Merrill and Jos. W. Hoitt, Lynn, Mass., assignors to the National Boot and Shoe Tip Company of Connecticut. Patent No. 160,283, dated Mar. 16, 1875. [Filed Nov. 18, 1875.]



1. A boot or shoe tip composed of rawhide permeated with a suitable color, substantially as and for the purpose specified.

2. As a new article of manufacture, prepared rawhide, thoroughly permeated with a suitable coloring material, substantially as herein described.

3. A rawhide shoe-tip dyed black throughout its substance, and molded or formed to present an upwardly-projecting lip to guard the toe of the upper, and an inwardly-bent horizontal flange, adapted to extend between the upper and outsole to receive fastenings adapted to confine the upper, lip, and outsole, substantially as herein described.

6,704. SKATES. Edgar Murray, New York, assignor to Charles W. Dunlap, Brooklyn, N. Y. Patent No. 46,674, dated Dec. 27, 1864. [Filed Oct. 1, 1875.]

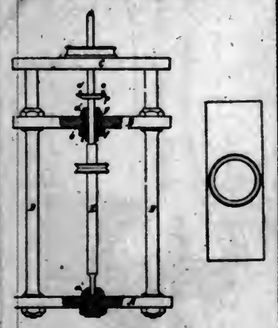
1. The combination of a head-lever, g, with the axle and heel clamping mechanism, arranged to operate substantially as described.

2. The combination of the head-lever g with the heel-clamp and the adjustable bar connecting said clamp and head-lever, substantially as described.

3. The combination of the head lever g and plate c with the axle-clamps, substantially as described.

4. The combination of the head-lever with the stud q, substantially as described.

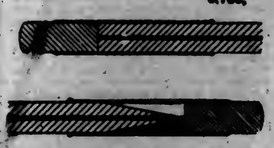
6,705. MITTENS. Augustus P. Smith, Sterling, Ill. Patent No. 60,949, dated Jan 1, 1867. [Filed July 6, 1875.]



1. A mitten, the back, palm, and lining of the hand being formed in three parts, and attached together by a single seam, to prevent exposure of the stitches, specified.

2. A mitten having the inside of the thumb wholly formed from the material taken from the thumb-space, without being detached in the cutting of its junction with the hand portion of the mitten, whereby no seam is exposed to strain or wear on the inside of the thumb, as specified.

3. A mitten having the thumb formed, in part, of the material taken from the thumb-space, without being wholly detached in the cutting, all the parts being united with each other and with the lining by a single seam, substantially as described.



6,706. MEANS FOR ADJUSTING SPINDLES IN RING SPINNING-MACHINES. F. A. Sherry, Boston, Mass. Patent No. 60,302, dated Jan. 1, 1867. [Filed June 15, 1875.]

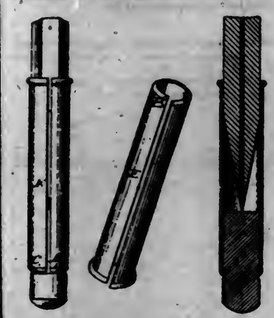
1. In combination with the bolster F and the step G of a ring spinning-frame, means by which the plumbing of the spindle and its adjustment into concentricity with the ring may be effected, and the bolster and step be fixed in position after such adjustment, such means as described being the screws *b b'*, nuts *f f*, and shoulders *d d'*, and holes *e e* of the bolster and step, all as and arranged as set forth.

2. In combination with the bolster and the step of the spindle of a ring spinning-frame, means or devices for adjusting them, so as to bring the spindle into concentricity with the ring.

6,707. BRAIDER-HOLDERS AND PENCIL-POINT PROTECTORS. L. L. Tower, Boston, Mass., assignor to O. Cleveland, Jersey City, N. J. Patent No. 163,272, dated Sept. 28, 1874. [Filed Nov. 6, 1875.]

1. A pencil-point protector and eraser-holder combined, consisting of a tube adapted at one end to receive an ordinary lead-pencil, and provided at the other end with a screw-thread for adjustably retaining an erasive head thereon, substantially as shown and described.

2. The combination of an erasive head, with a holding-tube adapted at one end for attachment to a lead-pencil, and provided at the other end with a screw-thread for adjustably retaining the erasive head thereon, substantially as shown and described.



3. An eraser-holding tube, the body of which is adapted at one end for attachment to a pencil, and at its other end bent or upset so as to form an inwardly-projecting spiral or screw thread for adjustably retaining an erasive head in said tube, substantially as shown and described.

4. The combination of an erasive head, with a holding-tube, the body of which is bent or upset at one end to form an inwardly-projecting spiral or screw thread for adjustably retaining the erasive head in said tube, substantially as shown and described.

5. A holder for attaching erasers to pencils, consisting of a split tube or barrel, having one end shaped to conform to the butt of a pencil, and bent or turned inwardly to form a screw-thread for adjustably holding an erasive head, substantially as shown and described.

6. A pencil-point protector and eraser-holder combined, consisting of a tube provided with a screw-thread for adjustably securing an erasive head in one end, and having an interior surface, which adapts it to receive a pencil and cushion its point against the inner end of said erasive head, substantially as shown and described.

6,708. BRAIDER-HOLDERS AND PENCIL-POINT PROTECTORS. L. L. Tower, Boston, Mass., assignor to O. Cleveland, Jersey City, N. J. Patent No. 163,273, dated Sept. 28, 1874. [Filed Nov. 6, 1875.]

1. The combination of an erasive head with a holding-tube divided longitudinally, and having one end provided with an inwardly-projecting flange, which may be distorted into a spiral form to propel the erasive head within said tube, substantially as shown and described.

2. The combination of an erasive head with a pencil-point protector and eraser-holder combined, consisting of a tube split to adapt it to be held upon a pencil, and provided with means, substantially as shown and described, for receiving said erasive head therein, said tube being adapted to receive a pencil and cushion its point against the inner end of the erasive head.

HELIOTYPE RELIEF PROCESS JAMES R. OSGOOD & CO. BOSTON.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 22. TUESDAY, NOVEMBER 30, 1875. PRICE { $5,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time.

R. H. DUELL, *Commissioner.*

COMMISSIONER'S DECISIONS.

INDIA-RUBBER COMB COMPANY.—*Reference.*—*Trade-Mark.*

[*Reference to the Commissioner. In the matter of the application of the India-Rubber Comb Company, of New York, for registration of Trade-Mark.—Decided November* 24, 1875.]

While the rule obtains that no trade-mark may consist of the mere name of a person, place, or article, or a word indicating kind or quality, which any person might employ with equal justice, it is not intended that the name or mark should be a new creation, or require invention.

It is sufficient that it should have an original and distinctive signification as appertaining to the article.

Held, That Congress intended no new definition of a trade-mark. Also, that a name accompanied by a mark sufficient to distinguish it from the same name, when used by other persons, may be a lawful trade-mark.

When a court of competent jurisdiction has declared that a name first adopted by a firm, and used to denote the origin and ownership of a particular article, is a lawful trade-mark, and has enjoined its use by others, even though the name be unaccompanied by other distinguishing mark,—this Office is concluded in its action.

Under the circumstances of the case, and various cases cited, the words "The India Rubber Comb Company" constitute a lawful trade-mark.

SPEAR, *Acting Commissioner:*

June 2, 1875, the India-Rubber Comb Company, of New York and College Point, State of New York, filed a petition for the registration of a trade-mark consisting of the words and letters—

The India Rubber Comb Company, of New York. I. R. C. Co. Goodyear.

Subsequently the letters "I. R. C Co.," and the word "Goodyear," were stricken out.

The application was rejected and an appeal taken to the Commissioner. August 14, 1875, the Commissioner affirmed the action of the Examiner. In his decision the Commissioner considered the question in the light of the matter set forth in applicant's *fac simile* which contained the following words:

The India Rubber Comb Co.,
New York.
Sole Manufacturers of
Goodyear's
India Rubber and Gutta Percha Combs,
Under
Meyer's Patents, April 4th, 1854, reissued
August 16, 1859, extended April 4, 1868.
1 Doz. Medium S. Fine Goods, No.
Assorted Fancy Patterns.

A copy of a preliminary injunction had been filed by applicant with his petition granted on motion by the superior court of the city of New York on the 15th day of March, 1875, in the case of "*The India Rubber Comb Company* vs. *Isaac T. Meyer.*" This injunction restrained the defendant from using the words "The India Rubber Comb Company" on any combs, or cases, or packages containing combs, &c. No mention was made in the order of the fact that the words in question constituted the plaintiff's trade-mark. The Commissioner, therefore, did not regard the action of the court as an adjudication of the matter in dispute. The conclusion of his decision was as follows:

In the absence of any evidence that the words found in the *fac simile* have ever been declared, by any court, a lawful trade-mark, the Commissioner must be controlled by the specific language of the statute, which certainly and unmistakably prohibits a registration of such a mark as this. The *fac simile* is simply a label, and may be registered as such, but not as a trade-mark.

Since the above decision of the Commissioner the case in court came on for final hearing and disposition. A copy of the final decree has been filed, and, in view

of the matter therein contained, and upon request of counsel, the Examiner of Trade-Marks now refers the case to the Commissioner for review.

There can be no doubt upon the reading of this decree that, in the opinion of the court rendering the same, the words "The India Rubber Comb Company" constitute a lawful trade-mark. The decree sets forth that the suit was brought by the plaintiff against the defendant "for his infringement of plaintiff's trade-mark," and the nature of the previous proceedings, and after further stating that "the suit having been brought on for hearing upon the pleadings and proof, and the said counsel having been heard for the respective parties, and due deliberation being had thereon," proceeds to enjoin and restrain the defendant from infringing the said trade-mark—to wit, "The India Rubber Comb Company," &c.

The question now recurs, whether the words "The India Rubber Comb Company" can be received and recorded by the Commissioner of Patents as a trade-mark under the provisions of the present law. Sec. 4939, Revised Statutes, enacts—

> The Commissioner of Patents shall not receive and record any proposed trade-mark which is not and cannot become a lawful trade-mark, or which is merely the name of a person, firm, or corporation unaccompanied by a mark sufficient to distinguish it from the same name when used by other persons, or which is identical with a trade mark appropriate to the same class of merchandise, and belonging to a different owner, and already registered, or received for registration, or which so nearly resembles such last-mentioned trade-mark as to be likely to deceive the public. But this section shall not prevent the registry of any lawful trade-mark rightfully in use on the eighth day of July, eighteen hundred and seventy.

It was settled law long before the enactment of the present statute, and the year 1870, that no person had the right to appropriate or have the exclusive use of any words, letters, figures, or symbols which, from the nature of the fact they were used to signify, others might employ with equal truth, and therefore have an equal right to employ for the same purpose. (*Amoskeag Co.* vs. *Spear*, 2 Sandford's Supreme Court, 599; *Canal Company* vs. *Clark*, 13 Wallace, 311, and the many cases there cited.) Therefore, the mere name of a person, name of a place, name of the article, or a word simply indicating the kind or quality of an article, and other similar names or words, being those which any person might employ with equal justice, and unaccompanied by some peculiar distinguishing mark, were never allowed to be appropriated exclusively by any particular person or set of persons.

This rule, however, was never construed to mean that the name or mark should be a new creation; that its adoption should evince the exercise of the inventive faculty. It was only necessary that the name or words should have been appropriated for the first time to the article, so that it had a distinctive original signification, or, if not so appropriated for the first time, should have become distinctive by association. (*Canal Company* vs. *Clark*, ante.)

It is in accordance with these elementary principles that the section of the present law, above quoted, must, in my opinion, be construed. It does not appear that it was the intention of Congress to make any radical change in the properties of a trade-mark, and to set up a new definition, but simply to set forth those qualities which had already been regarded as essential by the adjudications of the courts. Now, it is clear from the very language of the section itself that it was not the intention of the law-makers to declare that under no circumstances whatever could the name of a person, firm, or corporation be received as a trade-mark. Its language is that such a name shall not be received and recorded "unaccompanied by a mark sufficient to distinguish it from *the same name when used by other persons.*"

Now, if the Commissioner is convinced by unquestionable proof—such, for instance, as the final adjudication of a court of competent jurisdiction—that such a name was first adopted by the party seeking to record it as a trade-mark, that it has been used as such for many years, that it has come to denote to all the world the origin and ownership of the particular articles to which it has been applied, that no one else can use that name for the same purpose without perpetrating a fraud, and that parties making such an attempt have been restrained by the courts on the ground that they were unlawfully using another's trade-mark, then the reason of the rule falls in that particular instance, for if other persons cannot use it, then it is unnecessary to accompany it with another mark to distinguish it. Itself is the mark. A name which the courts have decided to be the lawful trade-mark of a particular person, the Commissioner, in my opinion, cannot lawfully refuse to record.

I take it that the meaning of the statute simply is that the mere name of an individual, or a firm, or the name of a corporation, as that of some town, cannot, as a general thing, be recorded as a trade-mark, because the names of those individuals or firms may be rightfully used by others who have come rightfully by the same names, or that all persons within the bounds of a corporation have the same natural right to the use of the corporation name.

But in numerous instances have the courts held such names lawful trade-marks, their action therein, of course, resting upon the peculiar circumstances of each case, and which rendered them exceptions to the elementary principles above set forth. In the cases of *Sykes* vs. *Sykes*, 3 B. & C., 541, *Croft* vs. *Day*, 7 Beav., 84, Norvill 5 Man. Gr. & Scott, 109, *Howe* vs. *Howe Machine Co.*, 50 Barb., 236, it was held that parties might be enjoined and restrained from using their *own proper names* which had been previously adopted by others as trade-marks, and which had become such by long association. Many cases could be cited where the name of a firm has been adopted as a trade-mark, and the right to use it as such sustained.

In *Howe* vs. *Howe Machine Co.*, (ante) the court held:

> It is equally clear that the plaintiff could adopt and appropriate the word "Howe" as a trade-mark as *against* Elias Howe, Jr. The plaintiff had a right to adopt and appropriate his surname as a trade-mark, and it cannot be said that Elias Howe, Jr., though his surname was the same, had the right to use his own surname *in such a way* as to deceive the public, and deprive the plaintiff of the benefit of the notoriety and market which his machines had gained. (See the conclusion of the opinion of the Master of the Rolls, in *Croft* vs. *Day*, supra.)

Names of incorporated companies have been in many cases decided to be valid trade-marks. In the case of *Newby* vs. *The Oregon Central R. Co., et. al.*, Deady's Reports, 609, suit was brought to enjoin the defendants from using the name "The Oregon Central Railway Co.," and from issuing bonds bearing said name. A company with the same title had been incorporated at an ealier date. The court held that—

> The corporate name of a corporation is a trade-mark from the necessity of the thing, and upon every consideration of private justice and public policy deserves the same consideration and protection from a court of equity.

But a case more nearly analogous to that of the applicants is that of the *Brooklyn White Lead Co.* vs *Masury*, 25 Barbour, 416. The plaintiffs had been engaged in the manufacture of white lead for more than twenty years, and had been in the habit for that period of marking their kegs with their name, adding the words "premium lead, warranted pure." For a number of years the defendant had been engaged in the same business, at the same place. He at first labeled his kegs "Brooklyn White Lead, pure, 100lbs." To that the plaintiffs did not, and could not, object. But the defendant subsequently changed his mark to that of "Brooklyn White Lead & Zinc Company." The conclusion of the court was that

> the defendant should be enjoined from the use of the word "Company" or "Co." He says others are interested with him in the business. That would justify him in calling his paint by the name of Masury & Co's., but not by a title as of an incorporated company, strongly resembling the plaintiffs. He has within a few years added to his business the making of zinc paint. He may, therefore, continue to use the title of Brooklyn White Lead and Zinc, only omitting the name "Company" or "Co."

The judge had premised—

> *It is to protect the plaintiff's right of selling his own that the law of trade-marks has been introduced.*

In conclusion, the doctrine of the common law is thus summarized in *The Amoskeag Co.* vs. *Spear*:

> The principle is well settled that a manufacturer may, by priority of appropriation of names, letters, marks, or symbols of any kind, to distinguish his manufacture, acquire a property therein, as a trade-mark, for the invasion of which an action for damages will lie, and in the exclusive use of which he may have protection when necessary by injunction. * * * * In all cases where names, signs, marks, brands, labels, words, or devices of any kind can be advantageously used to designate the goods or property, or particular place of business of a person engaged in trade or manufacture, or any similar business, he may adopt and use such as he pleases, which are adapted to that end, and have not been before appropriated, and no other person can lawfully imitate them, and by that means sell his own goods or property, or carry on his business as the goods, property, or business of the former.

To better protect these common law interests in the courts of the United States, and to extend its privileges to citizens of those foreign countries which afford the same protection to citizens of our country, constitute the principal objects of the present law of trade-marks.

But, admitting that the common law definition of a trade-mark has been restricted in meaning by the Act of 1870, so that the words "The India Rubber Comb Company" cannot be recorded as a trade-mark by reason of its being the name of a corporation, I think it clear from the language of the last clause of the section above cited that it can be recorded as being "a lawful trade-mark, rightfully in use on the eight day of July, 1870."

In the complaint filed in the suit in equity, and which was the basis of the decree rendered by the court, the applicants set forth that they were the first to design and adopt the title in question, and which has been in constant use by them for the past twenty-two years, impressed upon combs manufactured by them, and on the boxes, cases, labels, notices, and other devices used by them in connection with the sale of said combs; that the said trade-mark was well known and recognized by the trade, and by the public, who had long acquiesced in the use of the same, and that all importers and dealers throughout the United States had invariably desisted from infringing the same.

The former action of the Office is, therefore, reversed, and the applicants will be allowed to record the trade-mark in question.

GALT AND TRACY.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Thomas A. Galt and George S. Tracy for letters patent for* "IMPROVEMENT IN CORN-PLANTERS."—*Decided November 24, 1875.*]

A corn-covering wheel having raised rims occupying a portion of its peripiery, and serving on hard ground to fill the seed-furrow, while in softer ground the plain surfaces of the wheel prevents the wheel from sinking too deeply into the soil: *Held*, not to be anticipated by a concave-faced wheel, which, by the addition of "supplementary rings" filling the concavity, might be converted into a plain-faced wheel.

SPEAR, *Acting Commissioner:*

The invention set forth by this applicant and made the subject of the first claim is an improvement in corn-planters, consisting of wheels provided with raised rims, which occupy a certain part of the periphery of the wheel, corresponding to the width of the apparatus, which is immediately in front of these raised rims, for the purpose of making the furrow in the earth to receive the seed. These rims serve in hard ground the purpose of filling the furrow without the aid of the broader portions of the rims, which constitute the smaller diameter of the wheels; but in soft ground, where the raised portions would sink too deeply, were the entire wheel only of their thickness, these convex or concave portions of smaller diameter come down to the surface and serve as support to prevent the wheel sinking too far in the soft earth. Now, although in Vandiver's patent there is a wheel shown corresponding in appearance to this, I find no trace of exactly this invention in Vandiver's patent. What Vandiver was aiming at, as he himself states, was to make a wheel which could be used as a concave wheel, or, by the addition of supplementary rings, afford a plain surface. Following his specification, the workmen would make such a rim as would fill the grooved wheel up to form a plane periphery like an ordinary wheel. This is not the invention set forth and claimed by Galt and Tracy, and I think the first claim may be allowed.

The second claim is for the scrapers in combination with their wheel; but there is nothing new in the scrapers or their arrangement. They serve the same purpose precisely, and bear the same relation to the wheel as the scrapers in Vandiver's patent do to his wheel. So far as the scrapers and wheel are concerned the inventions are precisely the same, and in my opinion the claim was rightfully rejected.

I must, therefore, reverse the decision of the Board upon the first claim and affirm it upon the second.

WILLIAM WACHS.—*Appeal.*

[*Appeal from the Examiners-in-Chief in the matter of the application of William Wachs for letters patent for* "IMPROVEMENT IN BAKERS AND ROASTERS."—*Decided November 24, 1875.*]

Baking-pans, having been made with closely-fitting covers, and griddles having been made double and hinged, it is yet—*Held*,—that a baking-pan made in two parts, which are hinged together so as to form one covered pan, or two uncovered pans, which equally rest upon the bottom of the oven,—is a patentable invention.

SPEAR, *Acting Commissioner:*

The device which is the subject of this application is a sheet-iron baking-pan made in two parts, which are

hinged together in such a way that when the pan is open the two parts rest equally on the bottom of the oven, so as to form a double pan, for the purpose of baking bread or any other article not needing to be covered while baking. Further, this pan is so constructed that, when used for the purpose of baking meats or any other article needing to be covered while baking, one part may be closed over upon the other, fitting down with an elastic flange, so as to shut tight and make a closed vessel. There are ribs on the section which forms the bottom of the compound pan, keeping it from contact with the bottom of the oven, and the pan is so hinged and arranged that the upper half rests, as before stated, evenly with the bottom half.

It appears from the record that griddles have been made double and hinged, and also that bake-pans have been made with closely-fitting covers to prevent the escape of the flavors of the roasting meats and the burning of the parts exposed.

The invention under consideration, however, differs from these in this respect, that a single article is made to answer two distinct purposes, and this by a peculiarity of construction not shown in either. It is true there is the hinging in the griddle, and the cover and flange in the bake-pan, but neither can be used in the same way as applicant's device. It does not matter how slight the change which may be made by an inventor, provided the result be new and useful. It is new and useful in this case, in my judgment subserving the purpose of economy and convenience in use.

The claim in the amendment filed September 14, 1874, appears to be limited to the device, distinguishing it from anything shown in the references, and I think should be allowed.

The decision of the Board of Examiners in-Chief is therefore reversed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, DISTRICT OF MASSACHUSETTS.

BAXTER D. WHITNEY *et al.*, COMPLAINANTS, *vs.* ROLLSTONE MACHINE WORKS *et al.*, DEFENDANTS.

[*In equity.—Before* SHEPLEY, *J.—Decided October* 27, 1875.]

A preliminary injunction will not be granted where defendants have manufactured under the sanction of a patent of prior date to those held by complainants, which prior patent has expired, and no proceedings having at any time been instituted by complainants to secure or protect their rights under their patents.

The Kilburn invention embraces all the substantial elements and combinations of the Whitney invention, and the evidence shows that the invention of Whitney antedates that of Kilburn, although the patent granted to the latter is prior in date to that of Whitney.

[*Rice* and *Pratt* for complainants.
D. H. Merriam and *T. L. Wakefield* for defendants.]

SHEPLEY, *J.*:

Complainants claim under Letters Patent granted to William D. Sloan, March 31, 1857, No. 16,936, extended for the term of seven years from March 31, 1871, and also under Letters Patent to Baxter D. Whitney, August 7, 1860, No. 29,534, extended for the term of seven years from August 7, 1874. Defendants are manufacturing automatic lathes for turning and finishing irregular forms like those described in Letters Patent granted to Cheney Kilburn, dated November 22, 1859, No. 26,192.

Complainants, having commenced proceedings in equity for an injunction and account, now ask for a preliminary injunction.

The patent of Cheney Kilburn has expired by limitation, and has not been extended. It was prior in date to the patent of Baxter D. Whitney, but from the affidavits and other documentary evidence it would appear that application of Whitney and the invention of Whitney each antedated the invention and application of Kilburn.

The defendants manufactured machines under the Cheney Kilburn patent, during the term for which the letters patent were granted, and have continued to manufacture the same machine since the patent expired. During the original term of the Kilburn patent no proceedings were instituted by Whitney or his assignees against Kilburn, or the defendants, or any other persons manufacturing, vending, or using the invention described in the specifications of his patent. More than five years since one of complainants notified a party making use of the Kilburn machine that he should treat it as an infringement of the Whitney patent, and should at some then future time endeavor to put a stop to the manufacture. This notice appears to have been communicated to the defendants. They continued the manufacture openly under a claim of rights, and published circulars with an engraved cut of their machine, and a claim that the Kilburn patent antedated the complainants, and have continued, with the knowledge of the complainants, to advertise and manufacture the same machines. No attempts have been made by the complainants to enforce their supposed rights against the defendants until the filing of the bill in this case.

From the evidence to be found in the *ex parte* affidavits, and from a comparison of the two machines, I am satisfied, for the purposes of this hearing, that the Kilburn invention embraces all substantial elements and combinations of the Whitney invention, and that the Whitney invention antedated that of Kilburn; but upon the state of facts exhibited in the record in this case, after the complainants have submitted for so long a space of time to the manufacture and use of the Kilburn machine without enforcing their rights by proceedings at law or in equity, they have lost the right to invoke the summary process of the court by an injunction *pendente lite*, but must await the decree of the court upon a final hearing, when the rights of the parties can more accurately be determined, before summarily putting a stop to a manufacture, which, commenced under the sanction of letters patent, has so long continued without interruption. The complainants do not show any adjudication sustaining the validity of their patent, nor, as against the Kilburn patent or these defendants, do they prove any such public acquiescence or exclusive possession, or any such diligence on their own part, as would entitle them to invoke the *festinum remedium* of a preliminary injunction.

Motion for preliminary injunction overruled.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date November 30, 1875.]

8,811, and **8,812.—Sleeve-Buttons and Studs.**—THOMAS G. BROWN, Newark, N. J.—Cases A and B. Applications filed November 6, 1875. Term of patents 3½ years.

8,813 to **8,815**, inclusive.—**Show-Cases.**—JOSEPH LEHNBEUTER and CASPAR CLAES, St. Louis, Mo.—Cases A, B, and C. Applications filed July 22, 1875. Term of patents 7 years.

8,816.—Tobacco-Bags.—WILLIAM J. CUSSEN, Richmond, Va., assignor to G. W. GAIL and CHRISTIAN AX, Baltimore, Md. Application filed November 5, 1875. Term of patent 14 years.

8,817.—Table-Cutlery.—JAMES D. FRARY, New Britain, Conn., assignor to LANDERS, FRARY & CLARK, same place. Application filed November 2, 1875. Term of patent 7 years.

8,818 and **8,819.—Casing of a Soda-Water Apparatus.**—FRANK H. SHEPHERD, Boston, assignor to JAMES W. TUFTS, Medford, Mass.—Cases E and F. Applications filed November 13 and 18, 1875. Term of patents 14 years.

TRADE-MARKS REGISTERED DURING THE WEEK

[Each certificate bearing date November 30, 1875.]

3,172.—Lamp Chimneys and Shades.—RICHARD DOUGLAS & CO., New York, N. Y. Application filed September 23, 1875.

"a cock or rooster."

3,173.—Furniture-Polish.—ABRAHAM B. DUMM, Zanesville, Ohio. Application filed September 4, 1875.

"A picture of a dressing-case, with female figure, however disposed or arranged, with the words underneath, 'Le Grand's French Furniture Polish.'"

3,174.—Medicated Whisky.—FRANCIS M. EPPLEY, Newark, N. J. Application filed November 13, 1875.

"words 'Eppley's Medicated Whiskey,' in conjunction with the letters 'E. M. W.,' inclosed within the star-like figure."

3,175.—Canned Oysters, Fruits, and Vegetables.—FICK & CHASE, Baltimore, Md. Application filed November 17, 1875.

"representation of the coat-of-arms of the State of Maryland, surrounded by a border supported at its dexter and sinister sides by oysters exposed in the open shell, the said border being surmounted by the representation of an eagle. The motto conceals the bottom of the border, as shown. Over the whole are arranged, in an arch, the words 'Maryland Brand.'"

3,176.—Canned Oysters.—SIDNEY C. JOHNSON, Detroit, Mich. Application filed August 7, 1875.

"words 'Johnson's Oysters,' and an arrow-head."

3,177.—Bottles.—ANDREW KOCH, New York, N. Y. Application filed October 20, 1875.

"representation of the American shield and the letter 'K,' the shield being embellished with stars and stripes."

3,178.—Paints.—NATIONAL MIXED PAINT COMPANY, New York, N. Y. Application filed September 13, 1875.

"word and letters 'National Mixed Paint Co.,' in connection with the words 'Semper Paratus,' and the monogram composed of the letters 'D.' and 'H.'"

3,179.—Spices.—PACKARD & JAMES, New York, N. Y. Application filed September 13, 1875.

"words 'NATIONAL MILLS.'"

3,180.—Cream of Tartar.—PACKARD & JAMES, New York, N. Y. Application filed September 13, 1875.

"words 'NATIONAL MILLS.'"

3,181.—Fertilizers.—CHAUNCEY PERRY, Rochester, N. Y. Application filed November 8, 1875.

"word 'ONODON.'"

3,182.—Manufactured Leather or Rawhide.—HERMAN ROYER, San Francisco, Cal. Application filed August 23, 1875.

"a picture representing an ox or other bovine pursued by a man on horseback."

3,183.—Clothes-Pins.—R. WARNER & Co., Boston, Mass. Application filed November 16, 1875.

"words 'MAMMOTH CLOTHES-PIN.'"

3,184.—Harvesting-Machines.—WHITELEY, FASSLER & KELLY, Springfield, Ohio.—Case A. (Re-registration.) Application filed February 1, 1873.

"word 'Champion.'"

3,185.—Self-Rakes, Droppers, Reels, &c., of Harvesters.—WHITELEY, FASSLER & KELLY, Springfield, Ohio.—Case B. (Re-registration.) Application filed February 1, 1873.

"word "Champion.'"

3,186.—Guard-Fingers, Knife-Sections, &c., of Harvesters.—WHITELEY, FASSLER & KELLY, Springfield, Ohio. Case C. (Re-registration.) Application filed February 1, 1873.

"word 'Champion.'"

3,187.—Grain-Separators.—O. K. WOOD & Co., West Chazy, N. Y. Application filed November 11, 1875.

"words 'KING OF THE HARVEST.'"

3,188.—Grain-Separators.—O. K. WOOD & Co., West Chazy, N. Y. Application filed November 11, 1875.

"words 'QUEEN OF THE HARVEST.'"

3,189.—Plows.—WILLIAM K. HARRELL, THOMAS B. CHAMBERLAIN, and DEWITT C. CHAMBERLAIN, Clarinda, Iowa. Application filed November 1, 1875.

"words 'CLARINDA BREAKER.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date November 30, 1875.]

399.—Title: "**De Bense's Spanish Fever-Drops.**"—D. BENSE, Brooklyn, N. Y. Application filed November 20, 1875.

400.—Title: "**Colby's Asthma! Remedy.**"—LEONIDAS H. BUSH, Des Moines, Iowa. Application filed November 20, 1875.

401.—Title: "**Elixir Peruvian Bark with Protoxide of Iron.**"—BILLINGS, CLAPP & CO., Boston, Mass. Application filed November 15, 1875.

402.—Title: "**Elixir Peruvian Bark with Protoxide of Iron.**"—BILLINGS, CLAPP & CO., Boston, Mass. Application filed November 20, 1875.

403.—Title: "**Elixir Peruvian Bark with Protoxide of Iron.**"—BILLINGS, CLAPP & CO., Boston, Mass. Application filed November 15, 1875.

404.—Title: "**Elixir Peruvian Bark with Protoxide of Iron.**"—BILLINGS, CLAPP & CO., Boston, Mass. Application filed November 20, 1875.

405.—Title: "**Elixir Peruvian Bark with Protoxide of Iron.**"—BILLINGS, CLAPP & CO., Boston, Mass. Application filed November 15, 1875.

406.—Title: "**Calendulene—a glycerine jelly for the toilet.**"—FREDERICK A. BROWN, Indianapolis, Ind. Application filed November 20, 1875.

407.—Title: "**Champion Violet Copying and Record Fluid.**"—LEVISON & BLYTHE, St. Louis, Mo. Application filed March 18, 1875.

408.—Title: "**Vats and appliances for using Jerome Marble & Co.'s Patent Indigo Blue Dye—Worcester, Mass.**"—JEROME MARBLE & CO., Worcester, Mass. Application filed June 11, 1875.

409.—Title: "**Corded End Suspenders—Each pair will be stamped.**"—NATIONAL SUSPENDER CO., New York, N. Y. Application filed November 13, 1875.

410.—Title: "**Hopeful Tobacco, Manufactured by The Merchants' Tobacco Co., Boston, Mass.**"—MERCHANTS' TOBACCO CO., Boston, Mass. Application filed November 12, 1875.

411.—Title: "**Sisters—Sisters' Tobacco, Manufactured by the Merchants' Tobacco Co., Boston, Mass.**"—MERCHANTS' TOBACCO CO., Boston, Mass. Application filed October 30, 1875.

412.—Title: "**Rival—Rival Tobacco, Manufactured by the Merchants' Tobacco Co., Boston, Mass.**"—MERCHANTS' TOBACCO CO., Boston, Mass. Application filed October 30, 1875.

INDEX OF INVENTIONS PATENTED NOVEMBER 30, 1875.

	Class No.	No. of Patent.
Acid for hardening cement, &c., apparatus for treating carbonic	35	170,594
Advertising device, illuminating, W. A. Lilliendahl	54	170,444
Alarm and door fastener, combined burglar, G. Hancock	24	170,555
Alarm, combined fire and burglar, C. A. Maxfield	24	170,485
Animal pokes, bow for, Beckwith and Brown	144	170,511
Apple corer and slicer, H. W. Little	88	170,574
Auger, well, F. A. Montgomery	51	170,445
Baby walker, J. Garcia	62	170,544
Bale tie, A. N. Powell	7	170,589
Bale tie, Sebastian and Gardner	7	170,507
Baling cotton, device for, T. H. Murphy	7	170,446
Barrel lifting machine, A. J. Small	79	170,599
Bed clothes holder, J. Lesh	62	170,573
Bee hives, moth trap for, W. H. Spurlin	9	170,601
Billiard table, F. E. Held	113	170,557
Biscuit cutter, A. P. Ashbourne	88	170,460
Boiler feeder, automatic, S. Cook, (reissue)	148	6,768
Boot and Shoe, F. O. Ward	16	170,611
Boot tree, G. W. Badger	16	170,462
Boots and shoes, machine for sewing, Goodyear and Hadley	134	170,547
Brick machine, Crabtree and Melcher	20	170,526
Bridge, draw, M. Vincent	21	170,650
Brushes, apparatus for securing handles to, J. L. Whiting	23	170,500
Burner, Argand gas, C. D. Gervin, (reissue)	64	6,769
Butter package, H. P. Adams	88	170,501
Caissons, air shaft for pneumatic, W. S. Pope	111	170,588
Camera, E. B. Barker	111	170,465
Camera screen, J. F. Ryder	111	170,453
Car brake, Betteley and Snarer	122	170,509
Car coupling, C. Johnson	122	170,568
Car platform, B. J. La Mothe	122	170,480
Car starter, E. G. Goddard	122	170,546
Car starter, J. D. Pierce	122	170,490
Car starter, L. Wolfley	122	170,459
Carriage axles, machine for turning, J. W. Ellis	31	170,538
Carriage, child's, A. Ropes	31	170,493
Cart, dumping, G. B. Wiestling	21	170,654
Cartridge, G. Smith	32	170,643
Cartridge, blasting, Smith and Egge	194	170,600
Chair fastening, L. D. Craig	62	170,470
Chair, folding, F. Hickman	62	170,502
Chair, reclining, C. M. Alexander	62	170,503
Chair, tilting, L. Heywood	62	170,561
Cleat and hawser clamp, combined, F. W. Hofele	138	170,628
Clevis pins, manufacture of, W. J. Lewis	114	170,481
Clothes drier, T. G. Saint	91	170,495
Clothes pin, H. H. Mason	91	170,579
Coal dust, &c., into blocks, machine for making, M. M. Pettes	51	170,587
Cock, stop, N. Upham	167	170,648
Cock, stop and waste, R. J. Malcolm	167	170,576
Cooler, milk, B. C. Bort	45	170,618
Coolers, &c., cover for water, C. B. Jewett	58	170,477
Corn shield, M. Kelly	156	170,478
Cotton, device for baling, T. H. Murphy	7	170,446
Countersink, R. J. Welles	29	170,653
Couplings to shafts, machine for fixing, G. A. Chapman	87	170,524
Cultivator, H. D. Green	43	170,540
Cultivator, T. J. Lee	43	170,632
Cultivator teeth, self-locking, J. Harris	43	170,627
Curry comb, M. L. Simonson	144	170,455
Digger, potato, N. Rugg	114	170,452
Dish cloth holder, J. M. Brown	88	170,519
Ditching machine, J. E. Landrum	51	170,631
Drilling machine, metal, S. W. Putnam	100	170,591
Drilling machine, rock, A. Kirk	124	170,479
Dumping device for filling graves, J. W. Vannice	51	170,649
Dyeing and printing textile fabrics, J. Harley	11	170,626
Earth boring apparatus, Davis and Mills	51	170,437
Eggs, preserving, F. H. L. C. Sacc	116	170,494
Embroidering fabrics, machine for, R. M. Rose	134	170,596
Engine, caloric, C. Muskov	9	170,447
Engine, rotary, J. W. Blodgett	150	170,512
Evaporating pan, A. W. J. Mason	155	170,484
Expansible tool for cutting holes of different sizes, C. Crammer	173	170,527
Exterminator, ant, M. Barthel	63	170,505
Fabric, elastic, Leonard and Buckley	95	170,572
Fabric, elastic, A. Turner	95	170,606
Fence barb, wire, Brown and Tubbs	52	170,518
Fire brick, manufacture of, J. P. Alexander	20	170,502
Fodder cutter, T. B. Lamb	59	170,569
Freezing apparatus, E. C. Tozer	58	170,498
Furnace for heating steel in tempering, J. B. Armstrong	85	170,430
Furnace grate, J. B. Larkin	149	170,571
Furnace, ventilating and heating, J. A. Young	154	170,615
Furnaces, bottom plate for puddling, S. Dallar	85	170,529
Gas, combined scrubber and condenser for illuminating, T. C. Hopper	66	170,475
Gate, farm, H. S. Moyers	52	170,489
Gate, swinging and tilting, A. Brinkerhoff	52	170,517
Glassware, mold for, B. Bakewell, Jr	68	170,464
Gold and silver ores, apparatus for roasting, R. M. Fryer	99	170,625
Grain binder, J. J. Atwater	74	170,617
Grain tester, Gard and Staughton	57	170,545
Grate, G. Wellhouse	154	170,612
Grist alarm, D. T. Williams	57	170,614
Hair switch, A. R. Smith	161	170,497
Hame, A. F. Davis	72	170,530
Hame coupling, J. H. Carlisle	72	170,521
Harrow, H. Meill	73	170,637
Harvester, J. P. Delseseaux	74	170,438
Harvester cutter, P. Howell	74	170,565
Harvester rake, H. H. Bridenthal, Jr	74	170,433
Harvester rake, S. F. Cranston	74	170,435
Harvester rake, W. N. Whiteley	74	170,613
Harvester seat guard, E. Hale, Jr	74	170,554
Hat ventilator, N. I. Rees	76	170,450
Heating drum, J. S. Lewis	134	170,482
Hides and skins for tanning, preparing, H. Ely	92	170,623
Hinge, J. R. Shields	24	170,598
Hinge, self-closing, C. A. Miller	24	170,486
Honey package, L. Drake	9	170,622
Horse blanket and fly net, combined, L. S. Crittenden	144	170,528
Horse yoke, J. Boyer	144	170,514
Horses from running, device for preventing, C. Guelicher	72	170,552
Horseshoe blank, J. T. Walker	60	170,609
Horseshoe nail machine, J. Roy, (reissue)	60	6,776
Hose coupling, S. White	81	170,457
Hose nozzle, J. Toomey	81	170,604
Ice machine, J. M. Beath	83	170,508
Indicator, station, C. A. Evans	121	170,539
Ink powder, W. A. Bonney	35	170,513
Knitting machine, Burson and Nelson	89	170,468
Lamp, J. W. Carter	90	170,522
Lamp, J. W. Carter	90	170,521
Lamp chimneys, machine for flaring and crimping, P. Zimmerman	68	170,616
Lamp chimneys, &c., tool for flaring and crimping, T. B. Atterbury	68	170,431
Lamp extinguisher, F. Hartman	90	170,556
Lamp pendant, W. M. Underhill	90	170,607
Lantern, H. Beebe	90	170,510
Lantern, E. S. Ritchie	90	170,451
Lathe, engine, W. Tucker	109	170,605
Lock for sewing machine covers, &c., J. B. Logan	93	170,575
Lock, time, L. A. Haines	93	170,553
Lock, time, P. B. Hennessy	93	170,558
Loom for weaving webbing, H. M. Witter	95	170,458
Loom picker, H. McManus	95	170,580
Lubricating compound, J. F. Mendonsa	87	170,521
Lunch box, Hunt and Whitehouse	88	170,441
Milk pail, J. Amole	45	170,504
Milking pail, A. M. Bailey	45	170,463
Mill, pearl barley, H. S. Northrup	57	170,638
Mill, rolling, C. H. Perkins	125	170,449
Millstone driver, W. E. Sergeant	57	170,454
Millstone tram and staff, Greenleaf and Kruse	57	170,550
Mop and brush holder, C. B. Clark	22	170,525
Mop head, W. H. Curtis, (reissue)	24	6,772
Motion, converting, W. Dawes	67	170,531
Neck tie fastener, J. Wachner	38	170,651
Oat meal machine, A. J. Ehrrichson	57	170,536
Oat meal machine, W. Heston	57	170,560
Ore concentrator, J. V. Pomeroy	3	170,642
Ore hoist, C. W. Hunt	79	170,443
Ores, treating, Eames and Patchen	99	170,535
Paint, fire proof, J. Dewitt	107	170,533
Paper box, D. K. Osbourn	109	170,639
Paper wagon body, J. W. Jarboe, (reissue)	109	6,770
Paper wagon body, J. W. Jarboe, (reissue)	109	6,771
Perfume fountain, E. Rath	161	170,593
Piano-forte action, grand, C. F. T. Steinway	112	170,645
Piano forte agraffe, C. F. T. Steinway	112	170,646
Piano fortes, metal frame for, C. F. T. Steinway	112	170,647
Piano fortes, music rack for upright, S. Brambach	112	170,619
Picture holder, Perkins and Dodds	54	170,585
Pipe joint, B. Jennings	100	170,476
Pipes or tubing, coupling sections of, Flagler and Brown	163	170,473
Planing and matching machine, combined, Doane and London, (reissue)	173	6,773
Planter, corn, A. Hearst	133	170,474
Plow, T. E. C. Brinly	114	170,516
Plow, sulky, G. Moore	114	170,487
Press, G. B. Boomer	7	170,467
Press, cotton, W. W. Wallace	7	170,610
Press, oil, C. L. Morehouse	26	170,488
Press, portable hay, H. McCarty	7	170,636
Press, rotary, W. K. Daniels	117	170,436
Press, rotary perfecting, J. L. Firm	117	170,542
Propellers, guard for screw, H. G. Wagner	139	170,608
Pulp strainer, S. E. Crocker	108	170,471
Pump and engine, rotary, R. Patrick	118	170,448
Rail joint, H. Weber	120	170,652
Railway frog, G. Elliot	120	170,537
Railway signal, electric, Farmer and Tyer	120	170,540
Razor strop, J. Maxson	44	170,635
Refrigerator, B. A. Stevens	58	170,602
Ropes, tube for forming, J. Rinck	127	170,595
Saddle, pad, S. Herr	72	170,559
Sash fastener, J. R. Dewecse	24	170,472
Sash holder, H. C. Perry	24	170,586
Saw guide, circular, Bryce and Gronberg	130	170,520
Saw mills, log turner for, G. H. Shearer, (reissue)	130	6,777
Sawing machine, band, W. C. Margedant	130	170,577
Sawing machine, scroll, W. C. Margedant	130	170,578
Sawing machine, scroll, F. D. Smith	130	170,456
Screen, L. Fitzpatrick	62	170,440
Screws, machine for threading, F. P. Sheldon	171	170,496
Separator, grain, C. B. Nichols	159	170,584
Sewing machine, boot and shoe, Goodyear and Hadley	134	170,547
Sewing machine covers, &c., lock for, J. B. Logan	93	170,575
Sewing machine plaiter and tucker attachment, J. J. Fessenden	134	170,541
Shafts, machine for fixing couplings to, G. A. Chapman	87	170,524
Shears, gage for, J. Lamb	44	170,570
Sleeve adjuster, A. Perego	38	170,641
Soda water fountain, C. Greiner	1	170,551
Spectacle frame, J. W. Stewart	157	170,644
Spinning wheel, J. J. Kendall	142	170,630
Spring, rubber, D. R. Pratt	123	170,590
Steel, manufacture of chrome, J. Baur	85	170,507
Stove, heating, R. S. Barr	154	170,506
Straightening machine, J. S. Atkinson	125	170,461
Table, folding, J. Bradfield	62	170,515
Tanning, preparing hides and skins for, H. Ely	72	170,623
Thill coupling, B. S. Porter	31	170,491
Thill, open, C. H. Matthiessen	31	170,634
Tile, C. J. Merrill	126	170,582
Time detecter, watchman's, W. Imhaeuser	36	170,443
Tire tightener, E. I. Moore	31	170,583
Tobacco drier, D. B. Chapin	160	170,469
Tobacco drier, H. R. Farmer	160	170,624
Tongue support, H. H. Briggs	31	170,434
Toy chromotrope, Steel and McCadden	143	170,603
Toy pistol, G. W. Eddy	143	170,439
Truss, S. M. Bayard	156	170,466
Type setting machine, A. C. Richards	117	170,593
Type writing machine, P. Deming	117	170,621
Valve, cut off, W. F. Martin	152	170,483
Vault cover, J. K. Ingalls	110	170,567
Vehicle, hand propelled, W. T. and G. H. Howard	31	170,629
Vehicle seat, J. H. Franklin	31	170,543
Wagon jack, C. Gray	79	170,548
Wash board, W. H. Berger	91	170,432
Watchman's time detecter, W. Imhaeuser	36	170,443
Water coolers, &c., cover for, E. B. Jewett	58	170,477
Water trap supply and connection, J. H. Morrel, (reissue)	167	6,775
Water wheel, I. Mallery	168	170,633
Water wheel, F. Voigt	168	170,499
Water works, portable, J. N. Dennisson	167	170,532
Weather strip, J. Chandler	30	170,620
Weather strip, D. Doan	30	170,534
Well packing, oil, J. H. Hofman	124	170,563
Wheel hub, J. Hyman	31	170,566
Windlass, J. P. Manton, (reissue)	79	6,774
Windmill, A. N. Hollembeak	118	170,564
Windmill, D. L. Osborn	118	170,640
Wrench, H. Port	109	170,492
Yoke, horse, J. Boyer	144	170,514

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED NOVEMBER 30, 1875.

	Patent No.
Adams, H. P., Butter package	170,501
Adriance, J. P., assignee	170,435
Alexander, C. M., Reclining chair	170,503
Alexander, J. P., Manufacture of fire brick	170,502
American Mill and Metallurgical Company, assignee	170,535
Amole, J., Milk pail	170,504
Anthony, E. and H. T. & Co., assignees	170,465
Armbruster, J. H., assignee	170,538
Armor, R. R., assignee	170,563
Armstrong, J. B., Furnace for heating steel in tempering	170,430
Ashbourne, A. P., Biscuit cutter	170,460
Atkinson, J. S., Straightening machine	170,461
Atterbury, T. B., Tool for flaring and crimping lamp chimneys, &c	170,431
Atwater, J. J., Grain binder	170,617
Automatic Boiler Feeder Company, assignee, (reissue)	6,768
Babcock, N., assignee	170,542
Badger, G. W., Boot tree	170,462
Bailey, A. M., Milking pail	170,463
Bakewell, B., Jr., Mold for glassware	170,464
Barker, E. B., Camera	170,465
Barr, R. S., Heating stove	170,506
Barthel, M., Ant exterminator	170,505
Baur, J., Manufacture of chrome steel	170,507
Bayard, S. M., Truss	170,466
Beale, H. A., assignee	170,529
Beath, J. M., Ice machine	170,508
Beckwith, E. G., and G. R. Brown, Bow for animal pokes	170,511
Beebe, H., Lantern	170,510
Bentel, Margedant & Co., assignees	170,577, 170,578
Berger, W. H., Wash board	170,432
Betteley, J. H., and T. Sharer, Car brake	170,509
Blodgett, J. W., Rotary engine	170,512
Bonney, W. A., Ink powder	170,513
Boomer, G. B., Press	170,467
Bort, B. C., Milk cooler	170,618
Boyer, J., Horse yoke	170,514
Bradfield, J., Folding table	170,515
Brambach, S., Music rack for upright piano fortes	170,619
Bridenthal, H. H., Jr., Harvester rake	170,433
Briggs, H. H., Tongue support	170,434
Brinkerhoff, A., Swinging and tilting gate	170,517
Brinley, T. E. C., Plow	170,516
Brown and Beckwith	170,511
Brown and Flagler	170,473
Brown, J. M., Dish cloth holder	170,519
Brown, W. L., and L. G. Tubbs, Wire fence barb	170,518
Bryce, J., and O. Gronberg, Circular saw guide	170,520
Buckley and Leonard	170,572
Burson, W. W., and J. Nelson, Knitting machine	170,468
Carlisle, J. H., Hame coupling	170,521
Carter, J. W., Lamp	170,522
Carter, J. W., Lamp	170,523
Chandler, J., Weather strip	170,620
Chapin, D. B., Tobacco drier	170,469
Chapman, G. A., Machine for fixing couplings to shafts	170,524
Clark, C. B., Mop and brush holder	170,525
Clark, C. B., J. K., and H. R., assignees, (reissue)	6,772
Cook, S., Automatic boiler feeder, (reissue)	6,768
Cottrell, C. B., assignee	170,542
Cox, G. P., assignee	170,464
Cozzens, W. F., assignee	170,615
Crabtree, J., and W. H. Melcher, Brick machine	170,526
Craig, L. D., Chair fastening	170,470
Crammer, C., Expansible tool for cutting holes of different sizes	170,527
Cranston, S. F., Harvester rake	170,435
Crittenden, L. S., Combined horse blanket and fly net	170,528
Crocker, S. E., Pulp strainer	170,471
Crompton, G., assignee	170,458
Crum, J. S. M., assignee	170,533
Curtis, W. H., Mop head, (reissue)	6,772
Dallar, S., Bottom plate for puddling furnaces	170,529
Daniels, W. K., Rotary press	170,436
Davis, A. F., Hame	170,530
Davis, J. R., and J. R. Mills, Earth boring apparatus	170,437
Dawes, W., Converting motion	170,531
Delaseseaux, J. P., Harvester	170,438
Deming, P., Type writing machine	170,621
Dennison, R., assignee	170,573
Dennisson, J. N., Portable water works	170,532
Deweese, J. R., Sash fastener	170,472
Dewitt, J., Fire proof paint	170,533
Dithridge & Co., assignees	170,431
Doan, D., Weather strip	170,534
Doane, W. H., and W. E. London, Combined planing and matching machine, (reissue)	6,773
Dodds and Perkins	170,585
Dow, S. S., assignee	170,471
Drake, L., Honey package	170,622
Durham, D. K., assignee	170,644
Eames, H. H., and A. Patchen, Treating ores	170,535
Eddy, G. W., Toy pistol	170,439
Egge and Smith	170,600
Ehrrichsen, A. J., Oatmeal machine	170,536
Elliot, G., Railway frog	170,537
Ellis, J. W., Machine for turning carriage axles	170,538
Ely, H., Preparing hides and skins for tanning	170,623
Emerson, R., assignee	170,468
Evans, C. A., Station indicator	170,539
Farmer, J. S., and E. Tyer, Electric railway signal	170,540
Farmer, H. R., Tobacco drier	170,624
Fay, J. A., & Co., assignees, (reissue)	6,773
Ferguson, E. L., assignee, (reissue)	6,772
Fessenden, J. J., Sewing machine plaiter and tucker attachment	170,541
Firm, J. L., Rotary perfecting press	170,542
Fisher, H. J., assignee	170,533
Fitzpatrick, L., Screen	170,440
Flagler, H. K., and C. F. Brown, Coupling sections of pipes or tubing	170,473
Franklin, J. H., Vehicle seat	170,543
Freeman, Valentine, and Green	170,540
Fryer Noble Metal Mining Company, assignee	170,625
Fryer, R. W., Apparatus for roasting gold and silver ores	170,625
Garcia, J., Baby walker	170,544
Gard, W. J., and N. Staughton, Grain tester	170,545

	Patent No.
Gardner and Schartan	170,597
Gay, J. G., assignee	170,491
Gervin, C. D., Argand gas burner, (reissue)	6,769
Gilbert, S., assignee	170,483
Goddard, E. G., Car starter	170,546
Goodyear Boot and Shoe Sewing Machine Company, assignee	170,547
Goodyear, C., Jr., and B. H. Hadley, Boot and shoe sewing machine	170,547
Goolsbee, J. N., assignee	170,644
Gray, C., Wagon jack	170,548
Green, H. D., Cultivator	170,549
Greenleaf, M. T., and F. Kruse, Millstone tram and staff	170,550
Greiner, C., Soda water fountain	170,551
Gromberg and Bryce	170,520
Guelicher, C., Device for preventing horses from running	170,552
Hadley and Goodyear	170,547
Haines, L. A., Time lock	170,553
Hale, E., Jr., Harvester seat guard	170,554
Hancock, G., Combined burglar alarm and door fastener	170,555
Harley, J., Dyeing and printing textile fabrics	170,626
Harris, J., Self-locking cultivator tooth	170,627
Hartman, F., Lamp extinguisher	170,556
Hearst, A., Corn planter	170,474
Held, F. E., Billiard table	170,557
Hennessy, P. B., Time lock	170,558
Henning, E. S., assignee	170,533
Herr, S., Pad saddle	170,559
Heston, W., Oatmeal machine	170,560
Heywood, L., Tilting chair	170,561
Hickman, F., Folding chair	170,562
Hofele, F. W., Combined cleat and hawser clamp	170,628
Hoffman, J. L., Oil well packing	170,563
Hollembeak, A. N., Windmill	170,564
Holmes, C. E. L., assignee	170,580
Hopper, T. C., Combined scrubber and condenser for illuminating gas	170,475
Howard, W. T. and G. H., Hand propelled vehicle	170,629
Howell, P., Harvester cutter	170,565
Hunt, C. W., Ore hoist	170,442
Hunt, F. W., and W. A. Whitehouse, Lunch box	170,441
Hunt, W. D., assignee	170,635
Hyman, J., Wheel hub	170,566
Imbaeuser, W., Watchman's time detector	170,443
Ingalls, J. K., Vault cover	170,567
Jarboe, J. W., Paper wagon body, (reissue)	6,770
Jarboe, J. W., Paper wagon body, (reissue)	6,771
Jennings, B., Pipe joint	170,476
Jewett, E. B., Cover for water coolers, &c	170,477
Johnson, C., Car coupling	170,568
Johnson, R. H., assignee	170,532
Jones, B. F., assignee	170,461
Kelly, M., Corn shield	170,478
Kendall, J. J., Spinning wheel	170,630
Kirk, A., Rock drilling machine	170,479
Kruse and Greenleaf	170,550
Lamb, J., Gage for shears	170,570
Lamb, T. B., Fodder cutter	170,569
La Mothe, S. J., Car platform	170,480
Landrum, J. E., Ditching machine	170,631
Larkin, J. B., Furnace grate	170,571
Lee, T. J., Cultivator	170,632
Leonard, M. H., and J. H. Buckley, Elastic fabric	170,572
Lesh, J., Bed clothes holder	170,573
Lewis, J. S., Heating drum	170,482
Lewis, W. J., Manufacture of clevis pins	170,481
Lilliendahl, W. A., Illuminating advertising device	170,444
Little, H. W., Apple corer and slicer	170,574
Logan, J. B., Lock for sewing machine covers, &c	170,575
London and Deane, (reissue)	6,773
Malcolm, R. J., Stop and waste cock	170,576
Mallery, I., Water wheel	170 633
Manton, J. P., Windlass, (reissue)	6,774
Margedant, W. C., Band sawing machine	170,577
Margedant, W. C., Scroll sawing machine	170,578
Martin, W. F., Cut off valve	170,483
Mason, A. W. J., Evaporating pan	170,484
Mason, H. H., Clothes pin	170,579
Matthiessen, C. H., Open thill	170 634
Maxfield, C. A., Combined fire and burglar alarm	170,485
Maxson, J., Razor strop	170,635
McCadden and Steel	170 603
McCarty, M., Portable hay press	170,636
McManus, H., Loom picker	170,580
Meill, H., Harrow	170 637
Melcher and Crabtree	170,596
Mendonca, J. F., Lubricating compound	170,581
Merrill, C. J., Tile	170,582

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED NOVEMBER 30, 1875.

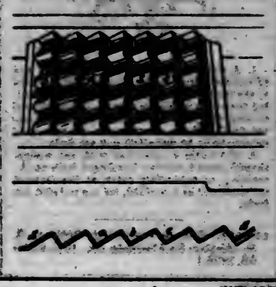
170,480. FURNACES FOR HEATING STEEL IN THE PROCESS. John H. Armstrong, Guelph, Canada. [Filed Apr. 6, 1875.]

Brief.—The blast-pipe consists of an inner and outer tube, the former being perforated spirally, while in the outer tube like perforations are in a right line. By rotating the latter the blast is regulated. Flame conduct the heated products of combustion around the central chamber.

1. The blast-pipe F, consisting of the inner pipe F', perforated with the spirally-arranged holes *f'*, in combination with the outer pipe F', perforated with the holes *f*, arranged and operating substantially as described, and for the purpose specified.

2. The frame H, consisting of the frames H', constructed to leave a margin of brick-work between the inner edge of the furnace and retort openings, and the rim-floor H², fitted in with fire-brick A, arranged and operating substantially as described, and for the purpose specified.

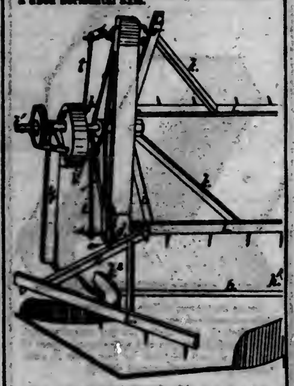
170,481. TOOLS FOR FLANGING AND CHANGING LAMP-CHIMNEYS, &c. Thos. B. Atterbury, Pittsburg, Pa., assignor to Dilbridge & Co., same place. [Filed Nov. 13, 1875.]



Brief.—To obviate the crushed formation of the article by the ordinary flanging further on one side of the mold than the other, the bottom edge is scalloped.

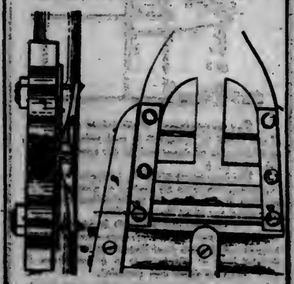
1. The former A, made with a step, *b*, for shaping tubular glassware, substantially as described.

2. The former A, made with separated projections, which form a step, *b*, for forming and shaping tubular glassware, constructed and adapted, to operate substantially as described.



170,482. WASH-BOILER. Wm. H. Berger, Pittsburg, Pa. [Filed July 17, 1875.]

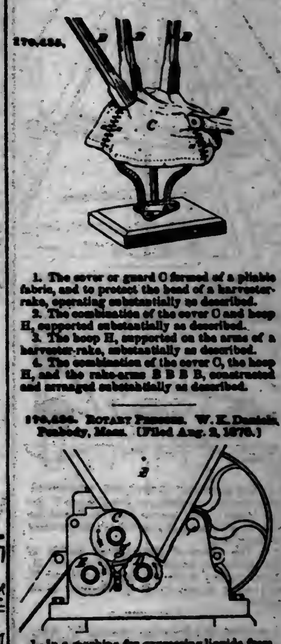
A new article of manufacture, consisting of a wash-board having its metallic covering or rubbing-surface formed to constitute a series of transverse angular grooves, *a b c*, the sides of said grooves being inclined and projected to each other so as to represent two sides of a tuniform triangle, the broad side *c* of which is stamped or pressed into a series of curved elevations and depressions, *d*, extending completely across the side, producing therein a wavy surface, leaving the surface of the opposite or narrow side *f* of each groove smooth and plain, substantially as shown and set forth.



170,483. HARVESTER-RAKE. Harry H. Bettendorf, Jr., Latrobe, Pa. [Filed Aug. 4, 1875.]

Brief.—A horizontal curvilinear motion is communicated to the rake, whereby the grain is swept from the platform by means of an oscillating crank operated by a cam and link. The oscillating crank and another link, governing the motion of the rake, revolve about a fixed horizontal axis.

The combination of the cam-groove plate 6, rods 1 4, arms *d*, links 5, rock-shafts *f*, swinging arms 7 E, and rakes 14, substantially as and for the purposes herein specified.



170,484. TONGUE-SUPPORTS. H. H. Briggs, Olmsted, Ohio. [Filed Aug. 4, 1875.]

In combination with the tongue C and bands D of a wagon, the bent spring I, bolts G, bottom 6, and lugs 5, as shown and described, and for the purpose set forth.

170,485. HARVESTERS. Samuel P. Gamble, Pennsylvania, assignor to John F. Adelman, Poughkeepsie, N. Y. [Filed July 31, 1875.]

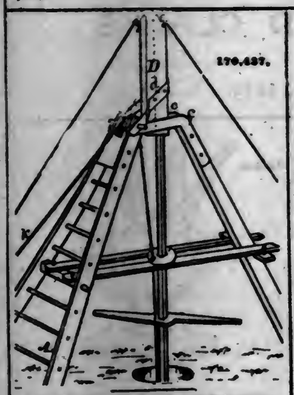
170,486. [illegible]

1. In a machine for expressing liquids from solids the combination, with the bridge F, of a fluting-in roll or rolls constructed with longitudinal grooves or corrugations, serving to force and keep an even feed, and with transverse or spiral seams or grooves, serving to allow the escape of the expressed liquids between the rolls and bridge, substantially as shown and described.

2. In a machine for pressing liquids from moist or wet substances, the combination with the solid bridge H, located as described with reference to the feeding-roll D, and to the upper discharging-roll B, of the rolls C, D, and E, having the described relative differences in circumference, and the described relative position of their axes, but having each the same surface velocity when in action, all as and for the purposes set forth.

170,487. RADIUS-BOARDS APPARATUS. John R. Davis and James R. Mills, Bloomfield, Iowa. [Filed May 6, 1875.]

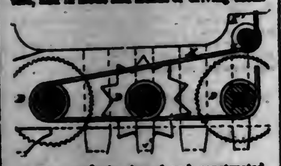
Brief.—The folding derrick is of ladder form, and carries adjustable parallel bars, which sustain a rotating collar in two parts for guiding the auger-shaft. The tubular shaft-guide is double, so that a very long auger-shaft can be used by one coupling only.



1. The folding derrick for well-augers, composed of ladder-form part A A, carrying the adjustable parallel bars *f f* on the shaft *g*, and the post C, carrying the bar L, and hinged to the inner of the part A A by means of the elbow-form plates *z z*, substantially as and for the purposes shown and described.

2. The tubular double-barreled shaft-guide D, in combination with a derrick for well-augers, substantially as and for the purposes shown and described.

3. The sectional and divisible rotating collar and shaft-guide G, having dowel-pins 14, carrying anti-friction rollers *r r*, substantially as and for the purposes shown and described.



170,488. [illegible]

170,437.

170,438. HARVESTERS. Jean P. Dubuysson, Milton, Cal. [Filed Sept. 1, 1875.]

Brief.—Improvement in bars for rotary cutters, and in mode and means of driving them.

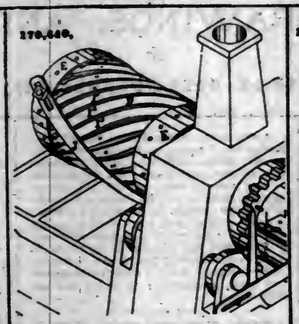
1. The peculiarly shaped and constructed cutter-frame, consisting of lower frame C, the top frame I, with narrow recesses F, and the slide L, with holes H', the whole substantially as described.

2. The means of transmitting motion to the cutters D, consisting of endless belt M, driving-pulley B, the pulleys B, B', E, and F, and spring O, the whole substantially as described.

170,439. TOY PISTOLS. George W. Eddy, New Britain, assignee of one-half his right to Chas. B. Stevens, Granby, Conn. [Filed May 14, 1875.]

1. In a toy pistol the hammer C, having the projection h, in combination with the trigger G, so arranged that the trigger is thrown forward by the cocking of the pistol, substantially as and for the purpose specified.

2. The trigger or bar G, extended above the bolt, in combination with the barrel B, substantially as and for the purpose herein set forth.



3. The combination of the barrel B with interior anvil i, and the extended trigger G, with nipple A, constructed to operate substantially as and for the purposes herein set forth.

4. The combination, in a toy pistol, of the hammer C, having projections d h, the spring D, and extended trigger G, provided with projections i e, all substantially as and for the purposes herein set forth.

170,440. SEEDERS. L. Fitzpatrick, Wheeling, W. Va. [Filed July 14, 1875.]

Brief.—The body of the sower is made up of slats, which are pivoted at their ends to rings or supports, adjustment of the relative position of which regulates the escaping spaces between the slats. A bar extended across the sower, and pivoted at one end, and slotted and screw-bolt at the other, governs the sower in adjusting.

170,440.

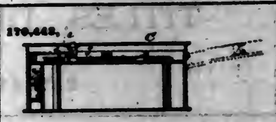
A cylinder-sower, D, composed of adjustable slats F F F, pivoted to end rings E E, and operated by hand or brace J, substantially as shown, and for the purposes herein set forth.

170,441. LOOM-BOXES. Francis W. Hunt, East Orange, and William A. Whitehouse, Newark, N. J. [Filed Mar. 3, 1875.]

As an improved article of manufacture, the herein-described lunch-box, consisting of the receptacle B, provided with the compartment F, adapted to receive the cylindrical vessel C and cup p, and covered by the slide S, substantially as described and shown.

170,442. GIN-HOUSES. G. W. Hunt, West New Brighton, N. Y. [Filed Apr. 10, 1875.]

1. The arrangement of the joints of motion of the trunk H, bracer B B, and cross-piece F, substantially as described in my specification, viz., in Fig. 4.

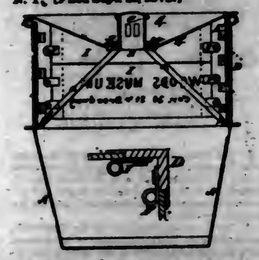


2. The projecting trunk H, swinging or turning horizontally on an axis at or near the supporting frame-work, in combination with the traveling car C or the equivalent.

3. The support and hinge O, in combination with the trunk H, the arrangement of these hinges being such that lines from the vertical axis of P to P' and from O to P and from P to P' shall be equal and parallel.

170,443. WATCHMAN'S TIME-DETECTOR. Wm. Inbusch, Brooklyn, N. Y. [Filed Aug. 14, 1875.]

Brief.—To guard against dishonest watchmen, who open the case and mark the dial without going their rounds. Provides the time-detector with an additional blacker, which marks the dial whenever the case is opened.



170,443.

1. In a watchman's time-detector, the combination of the lid C with the stationary pin e and rotary dial B, all arranged so that the pin e will mark the dial whenever the lid is opened and closed, to detect the picking of the lock that closes the lid, substantially as specified.

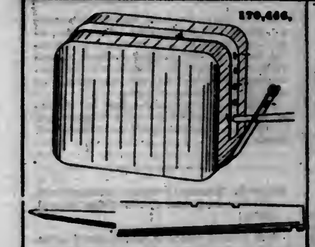
2. The spring-rod d, carrying the pin e, and combined with the catch g on the lid C, to operate substantially as herein shown and described.

170,444. ILLUMINATING APPARATUS. William A. Lillendahl, New York, N. Y. [Filed Sept. 21, 1872.]

1. The reflecting-flaps G, hinged to the center-piece E, and resting at their outer edges upon the bars E, substantially as and for the purpose specified.

2. The illuminating-reverberating device, provided to frame A of the lamp, and comprising the rabbeted corner-pieces, the battered glass panes, the buttons F, and the reflecting-flaps G, hinged to the center-piece E, substantially as and for the purpose specified.

170,445. WELL-AUGERS. Francis A. Montgomery, Baton Rapids, Mich. [Filed Aug. 21, 1875.]

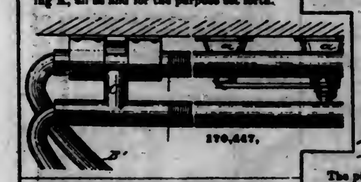


1. A well or earth auger composed of the cylindrical casing A, provided with the cutters b, the central tube B, the spiral flange D, having the valve G' hinged thereto, and a straight cutting-edge, the spiral leaf E, and easy auger-bit drill-point I, all arranged and operating substantially as described and set forth.

2. The worm J, provided with the wedge-shaped point f, curved downward with an increasing or expanding pitch, in the manner substantially as described, for the purpose set forth.

170,446. DEVICE FOR RAISING CATTLE. S. H. Murphy, New Orleans, La. [Filed Oct. 28, 1875.]

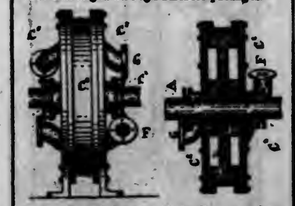
170,446.



The mode of tightening bands on bales by means of slots on each end of the band, and a lever notched on opposite sides, inserted with its slots on said band, and constructed in the manner described.

170,447. CALENDER-ROLLERS. Chas. Mudsey, New York, N. Y. [Filed May 12, 1875.]

Brief.—Levers to which the operating mechanism is connected are reciprocated by the expansion and contraction of metallic tubes.



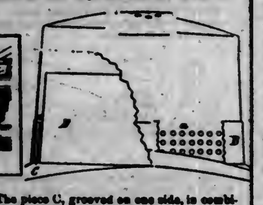
The pipes A B and connection C, in combination with the lever-connection D, and the levers and the pipes, provided at one or both ends with the flexible tubes V D' and covering E, all as and for the purpose set forth.

170,447.

170,448. ROTARY PUMPS AND BLOWERS. R. Patrick, Brockton, Canada. [Filed Aug. 17, 1875.]

Brief.—The cylinder or disk, mounted on a revolving shaft, has sliding blades parallel with its axis, which blades, acting in combination with cams projecting from the inner faces of the disk-containment, produce a perfect or partial vacuum in the chambers between the blades. Into these the fluid or gas is forced by a law of nature. As the disk revolves, the fluid, &c., is carried forward by the blades, and discharged through suitable passages.

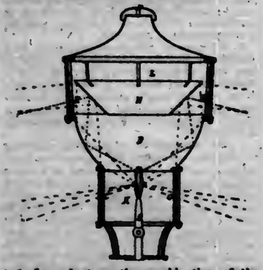
The flanged disk or cylinder B, mounted on the revolving shaft A, and provided with the radially-placed sliding blades E, in combination with the side plates C', provided with the inwardly-projecting alternately-arranged cams D, inlet-ports F F, and discharge-ports G G, arranged and operating substantially as and in the manner set forth.



170,449. ROLLER-MILLS. C. H. Perkins, Providence, R. I. [Filed Jan. 13, 1874.]

Brief.—The guards are placed so as to bridge over and inclosure on all sides, with the exception of an opening for the passage of coals, the space between any two contiguous pairs of rolls placed alternately vertical and horizontal, and the cap and screws are for adjusting the roll centres.

1. The combination of the guards a with rolls having rolling faces or grooves in a portion thereof, which is of greater diameter than that of their shafts, arranged in pairs alternately horizontal and vertical, substantially as described.



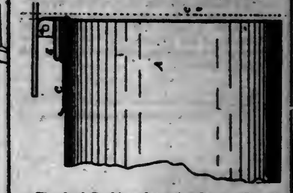
170,450. HAT-VENTILATORS. N. I. Rose, New York, N. Y. [Filed Jan. 13, 1875.]

Brief.—Perforates the band and portion of side crown covered by it, so as to admit air into the grooved piece interposed between the side crown and imperforate sweat-leather.

The piece C, grooved on one side, in combination with the hat band B, perforated body A, and imperforate sweat-leather D, as and for the purposes specified.

170,451. LANTERNS. Edward S. Ritchie, Brookline, Mass. [Filed May 22, 1875.]

1. In a lantern, the combination of the paraboloidal or bowl-shaped or conical reflector D and the auxiliary reflector H, or reflectors, arranged to operate together and with the burner A, substantially as specified.

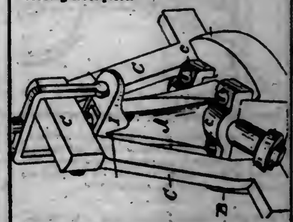


2. The lantern provided with separate light-diffusive chambers K L, the intermediate paraboloidal or bowl-shaped reflector D, and the auxiliary reflector H, all arranged as, and, with the burner A, substantially as, explained.

170,452. POTATO-DIGGERS. Nathan. Rose, Richmond, Mich. [Filed Aug. 4, 1875.]

Brief.—The machine, as usual, is mounted upon two wheels. The digger is vertically adjustable, and delivers the potatoes and soil upon an endless revolving sieve, whereby the soil is separated and the potatoes delivered into a box.

1. In a potato-digger, the combination of the driving-wheels B, provided with half-clutch boxes, the gears C, provided with half-clutch boxes, the spring D, the lever E, the arms F, the horizontal lever e, and the pinions H upon the transverse shaft h, all operating together as and for the purposes described.

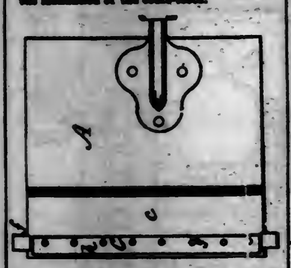


170,453. CAMERA-SCREENS. Jas. F. Ryder, Cleveland, Ohio. [Filed Oct. 4, 1875.]

The leaf B, hinged to the fingers C and spring E, in combination with a camera-tube, A, substantially in the manner as described, and for the purpose set forth.

170,454. MILLSTONE-DRIVERS. Wells B. Sergeant, Pine Island, Minn. [Filed Sept. 18, 1875.]

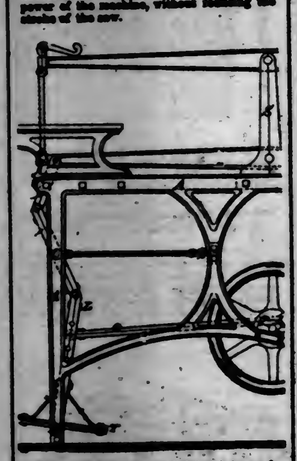
Brief.—The bail is hung on a pivot and locked to the driving-shaft, between rigid shoulders and a bent shaft, so as to make the stone self-adjusting. The damsel-shaft is also made self-adjusting, by having its forked end provided with shoulders, and resting on a rocking cross-piece.



1. A millstone-driver, consisting of the body or stem A, provided with the shoulders B, and having the shaft D, with or without the roller c, mounted thereon, in combination with the bail C, all constructed to operate substantially as described.

2. The spindle A, provided with the shoulders c, in combination with the cross-bar I, arranged to rest and rock on the shoulders c, in combination with the forked spindle B, provided with the shoulders f, and loosely connected to the bar I, all constructed and arranged to operate substantially as described.

170,656. COMBS-COMBING. M. L. Simonson, East Bush, N. Y. [Filed Feb. 11, 1875.]

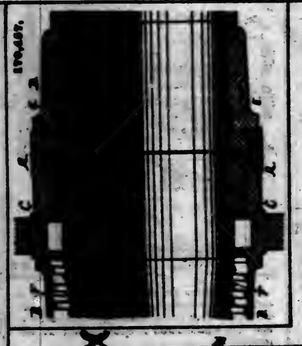


Brief.—The back of the comb is provided with an offset, upon which is a pivoted comb for combing the mane. This offset changes the inclination of the comb-teeth.

The back A of a curry-comb constructed with an angular offset, a, and blocks f f at the sides of the same, in combination with the tooth-bar C, pivoted in the blocks f upon the said angular offsets, substantially as herein shown and described.

170,657. SCROLL-SAWING MACHINES. Fred. D. Smith, Davenport, Iowa. [Filed May 12, 1875.]

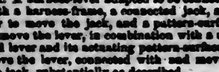
Brief.—The pitmen, which forms a direct connection between the treadle and the inner end of the lower arm of the saw-frame, is composed of three toggle-jointed levers, the middle one connected to the main frame by a rocking lever, and the lower one to a crank-shaft carrying two fly-wheels by a connecting-rod, for the purpose of reducing the angle of deflection of the levers, and increasing the power of the machine, without reducing the stroke of the saw.



The combination of toggle-jointed levers I, D', and D in combination with the rocking lever c, treadle T, connecting-rod e, and crank-shaft c, substantially as and for the purpose set forth in the above specification.

170,657. HORSE-COUPLERS. S. White, Providence, R. I. [Filed Feb. 27, 1875.]

Brief.—Couplers inner expansible hooks for checking the lines made with outer hooks and with the male and female parts of the coupling-cover.



In a horse-coupling, the combination of the following instrumentalities: the collar D and male screw C, cast in one piece, the swivel A and collar B, cast together, and the hooks H and F, all constructed and arranged for operation, substantially as and for the purpose specified.

170,659.

170,658. LOOMS FOR WEAVING WIRE-CLOTH. Henry M. Witter, Worcester, Mass., assignor to George Crompton, same place. [Filed Oct. 6, 1875.]

1. A harness-lever adapted to be connected with a harness-frame, a connected jack, a lever to move the jack, and a pattern-cam to move the lever, in combination with a second lever and its actuating pattern-cam to move the lever, connected with and moving the jack, substantially as described.

2. A harness-lever, adapted to be connected with a harness-frame, a connected jack, two jack-operating levers, and two cams or pattern-cams for actuating the jack-levers, in combination with a lever-controlling pattern, substantially as described.

3. A lever and pins or protuberances on a pattern-surface, for actuating it, in combination with a second lever, provided with a slotted end, and adapted to raise the former lever, and with pins or protuberances for raising, and a pattern-surface for controlling, the slotted end of the latter lever, substantially as described.

4. The combination of harness-operating mechanism controlled by pattern-surfaces adapted to form spaces in warps to receive a tubular fabric, with harness-operating devices adapted to move a harness-frame provided with binding-warp, and with mechanism to move the lever controlling such binding-warp harness-frame, whereby a binding-warp may be introduced into one or both sides of the tubular part, to permit the fabric to remain as a tube, or to connect the regularly-woven sides to form a solid fabric, substantially as described.

170,659. CAR-STARTERS. Lewis Wolfley, New Orleans, La. [Filed Dec. 17, 1873.]

1. In combination with ratchet B, upon a car axle, O, a draw-bar, D, provided with pawls a c, which, with a motion of the bar in one direction, ride freely over the ratchets, and drop by gravity into such a position as to engage with the ratchets when the bar is drawn forward, substantially as set forth.

2. The bar D, provided with flexible pawls a c, secured in sections b b, adjusted to permit the pawls to yield in one direction by turning, and to prevent yielding motion in the opposite direction by the shoulders of the sections against which they bear, substantially as and for the purposes set forth.

3. The combination of the draw-bar D bearing the engaging-pawls a c, the chain or cord J, and shaft F, substantially as set forth and shown.

170,660. BREAST-CUTTERS. Alexander F. Ashbourner, Oakland, Cal. [Filed May 12, 1875.]

The molding-board A and recessed cross-bar C, in combination with the hinged cutter-holder B and cutters D, provided with pivots e and spring F, all constructed to operate substantially as and for the purpose set forth.

170,660.

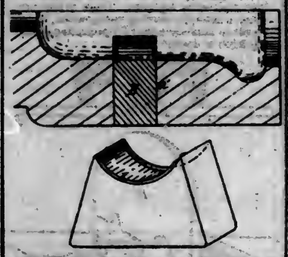
170,661. STRAIGHTENING-MACHINES. Jas. S. Atkinson, Pittsburg, assignor to Benj. F. Jones, Allegheny, Pa. [Filed Aug. 2, 1875.]

Brief.—The rests are adjustable up and down in the rest-blocks through the means of sliding wedges, which are connected with the head and move therewith, as do the rest-blocks. The shaft is tested resting upon the rollers, one set of which is adjustable upon the frame.

170,662. GAMES. Erastus B. Bartow, New York, N. Y., assignor to E. and H. T. Anthony & Co., same place. [Filed Nov. 8, 1875.]

The combination, with the plate-holder carriage and ledge or sill a, of the rollers e below that sill, and the rollers f at the back of the carriage, substantially as and for the purposes set forth.

170,663. TROUSERS. Stephen M. Bayard, Louisville, Miss. [Filed Apr. 7, 1875.]



Brief.—A peculiarly-arranged compression-buckle adjusts the pressure of the pad.

1. The combination and arrangement of the flexible belt A with elastic web B and the compression-buckle K, substantially as described, and for the purposes set forth.

2. A compression-buckle of the form described, when used in combination with elastic webs, for the purpose of increasing and applying its force upon a buttock pad, substantially as described.

170,664. MOLDS FOR GLASSWARE. Benj. Bakewell, Jr., Pittsburg, Pa. [Filed Nov. 5, 1875.]

Brief.—The plug for producing words, figures, &c., upon the glass article is countersunk or recessed at the inner junction formed by it and the mold, so that a border is produced on the lines where the mold-mark would otherwise occur.

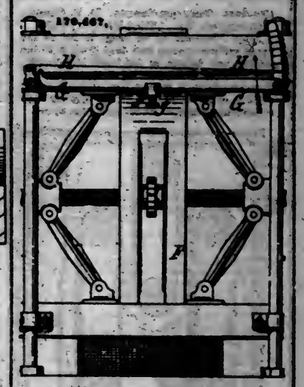
The combination of the mold and interchangeable plug, recessed upon the inner surface at the junction of the two parts, substantially as and for the purpose specified.

170,665. BOOT-TREES. George W. Badger, Malden, Mass., assignor to George P. Cox, same place. [Filed Oct. 26, 1875.]

In a boot-tree for vulcanizing rubber boots, the foot-piece A, provided with the nut A, secured within the foot, and surrounded with wood on all sides, as and for the purpose described.

170,666. MILKING-PAILS. Alfd. M. Bailey, Middlefield, Conn. [Filed Mar. 2, 1875.]

Brief.—A milk-pail of telescopic construction, the inner and upper section carrying the cover, upon which an inclined induction-spout is seated, a window near its upper end, and a filter at its delivery into the pail.

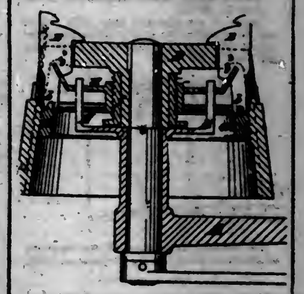


1. The hood C, inclined as shown, to shield the milk from falling dirt, having the vertical induction-port K, in combination with, the cover B and pail A, as and for the purposes herein specified.

2. The window d, in combination with the hooded attachment B C and pail A, as described.

3. The hooded attachment B C, the former having the deep rim b, adapted to slide within the pail A, as and for the purposes specified.

4. The milk-pail cover herein described, consisting of the part B, the hood C, with its vertical induction-port K and window d, the strainer a f g, and the extended flange b, as and for the purposes specified.



170,667.

2. The combination, with the lever G and the head or foot block A, of the bearing f and adjusting-screw g, for the purpose of adjusting the pointer to the zero-mark, as herein described.

170,668. KNITTING-MACHINES. Wm. W. Burson and John Nelson, Rockford, Ill., assignors of one-third (both right to Ralph Emerson and Wm. A. Talcott, same place. [Filed June 10, 1874.]

Brief.—The hooks, which alternate with the needles, and serve to prevent the loops from moving therewith, and obviate the necessity of a weight upon the fabric, are successively swung radially by an adjustable cam as the needles reciprocate, so as to prevent undue strain upon the yarn. The cam which operates the hooks is self-adjusting, so that the latter shall operate in proper relation to the needles, whichever way the machine turns.

1. A series of swinging hooks alternating with the needles of a knitting-machine, and operated concentrically for the purpose of keeping the fabric from being carried forward or back by the needles, and of pressing the loops down close to the needles and causing the same to be properly shed when the needles are drawn back.

2. The swinging hooks B, alternating with the needles in a knitting-machine, in combination with cam R, with inclined sides d, to adjust the pressure of the hooks upon the yarn, the whole operating and constructed as shown and described.

3. The swinging hooks B, combined with cam R, provided with slots d' d, to enable the projection c to retain its position relatively to yarn-carrier in whatever direction the machine may be moving.

4. The swinging hooks B, in combination with the adjustable ring C and cam R, constructed as shown, and for the purposes described.

5. The flapping-cam I, when constructed and arranged as described and shown, and for the purposes specified.

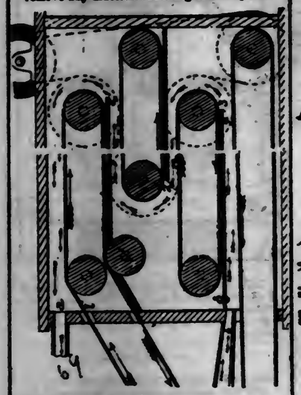
1. In combination with the frame of a straightening-machine a head, adjustable thereon, a plunger, and two rests, substantially as and for the purposes set forth.

2. In combination with a head, D, a rest, a, on each side, both simultaneously adjustable up and down by a single motion, substantially in the manner and for the purposes set forth.

3. The rest-blocks a', each adjustable on a frame, A, to and from the head D, and connected with the head, so as to be moved therewith, substantially as and for the purposes set forth.

4. The combination of vertically-adjustable rests a and rollers r r', arranged on the same frame relatively to each other and to the shaft to be straightened, substantially as and for the purposes described.

5. In combination with a sliding head, D, and endless chain a cam or eccentric, arranged between the lengths or folds of the chain to lead either way, and thereby reverse the motion of the head-block, substantially as set forth.

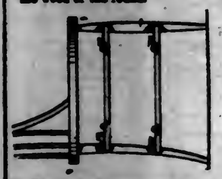


6. In a straightening-machine the bearing-rollers r r, adjustable lengthwise of the machine and along the shaft which drives them, substantially in the manner and for the purposes described.

7. The head-wheel c', in combination with a shaft to transmit motion to the rollers r, and a line of gearing to drive the chain, substantially as set forth.

HELIOTYPE RELIEF PROCESS JAMES R. OSGOOD & Co. BOSTON.

170,469. TOBACCO-DRIERS. D. B. Chezin, Covington, Ky. (Filed Mar. 31, 1875.)



Brief.—Tobacco to be dried is fed to the upper endless apron, and falls from it to the second, and thence to the third and fourth, which carries it out of the drier. The partitions constitute a zigzag flue, through which a blast of air is driven. They also serve to remove any material adhering to the aprons.

The combination, in a tobacco-drier, of the series of alternating horizontal partitions *e*, *f*, and *g*, the alternating endless traveling aprons, the upper feed-apron passing through the casing of the drier, and the lower carrier-apron passing through the casing of the drying-chamber, the whole being constructed for operation substantially as described.

170,470. CHAIR-FASTENINGS. Leo D. Craig, Oakland, assignor of one-half his right to Charles Miller, San Francisco, Cal. (Filed July 24, 1875.)

Brief.—A wrought-iron loop, with a bent end, to be laid in the mortise before the round is inserted, when its outer end is driven into the wood of the round.

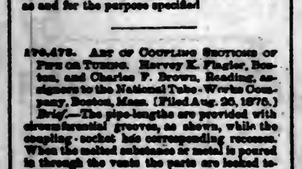
The fastener A, constructed and operated substantially as and for the purposes set forth.

170,471. POLE-STRAPPING. S. B. Crocker, Fitchburg, Mass., assignor to himself and S. S. Dow, same place. (Filed Sept. 21, 1875.)

As an improved manufacture, the described single-plate pulp-screen, having each series of its slots to extend at a right angle with each of the bordering or bounding ends without opening into such, whereby fibers of pulp, &c., by extending across a slot or slots of one series, may be prevented from being removed, and, after passing upon the next series of slots, so much thereof as is readily to be screened through, all being substantially as represented.

170,472. FASTENERS FOR THE MEETING-RAILS OF SASHES. Jos. R. Dowson, Dayton, Ohio. (Filed May 11, 1875.)

Brief.—A pair of semi-elliptical or cam-shaped bearing-plates are attached, one to the top of each meeting-rail, and combined with them is a pivoted and notched swinging latch, which, when turned, overlaps the edges of the plates, acting as a clamp to draw and bind the sashes together. There is also provided a laterally-moving spring-catch, which serves to hold the upwardly-projecting swinging latch in desired position.



The pivoted and notched swinging latch B, arranged as described, in combination with the semi-elliptical or cam-faced bearings A and B, and the spring-latch G, substantially as and for the purpose specified.

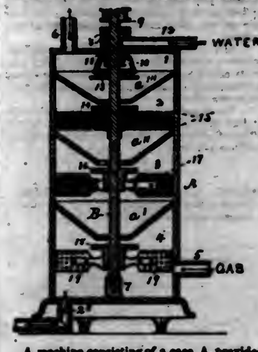
170,473. ARC OF COUPLING SECTIONS OF PIPE OR TUBING. Harvey K. Flagler, Boston, and Charles F. Brown, Reading, assignors to the National Tube-Works Company, Boston, Mass. (Filed Aug. 26, 1875.)

Brief.—The pipe-lengths are provided with circumferential grooves, as shown, while the coupling-socket has corresponding recesses. When the melted substance or metal is poured in through the vents the parts are locked together.

In a pipe-coupling, the annular molds C C, located between the socket A and the inclosed peripheries of the lengths B B on each side of the joint of the lengths, each mold being composed of an annular recess or half-mold, 1, made in the interior of the socket, and a coincident annular recess or half-mold, 2, made in the inclosed periphery of one of the lengths, the molds being provided with vents D, and rendered tight by the contact of the socket with the peripheries of the lengths on each side of the molds, and thus adapted to receive and retain a fused substance when the pipe is laid horizontally.

170,474. CORNICE-FASTENER. Alex. Hearst, Peoria, Ill. (Filed Sept. 7, 1875.)

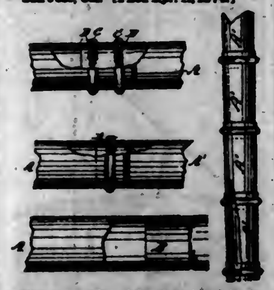
1. The frame F, provided with the ledges *g* and openings A, in combination with the sashes and valves a, constructed and operating substantially as set forth.



2. The combination of the frame F, provided with the ledges *g* and cup B, provided with the opening *f*, with the valves a, substantially as specified.

3. The combination of the cup B, provided with the pins or studs *c* and valves a, provided with the pins or studs *d*, with the springs *p*, substantially as and for the purposes specified.

4. The combination and arrangement of the frame F, valves a, cup B, and springs *p*, with the box A, plate D, and slide C, and bed-plate B, all constructed and operating substantially as set forth.



170,475. COMBINED SCRUBBERS AND CONDENSERS FOR ILLUMINATING-GAS. Thos. C. Hopper, Philadelphia, Pa. (Filed Nov. 8, 1875.)

Brief.—The wash-water enters at the top through a seal-cup, and passes down through the perforated disks and beaters, while the gas passes up. The disks and beaters are secured to a central shaft and revolve with it.

A machine consisting of a case, A, provided with inlet and outlet pipes, for gas and water, respectively, and a series of communicating chambers, separated by partitions *a' a'' a'''*, in combination with a rotary shaft, B, carrying several series of beaters, 10 17 18, and disks 13 14 16 18, substantially as and for the purposes hereinbefore described.

170,476. PIPE-JOINTS. Byron Jennings, San Jose, Cal. (Filed Apr. 11, 1874.)

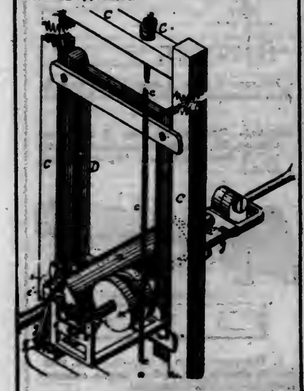
The combination of the pipes A and A', the former provided with corrugations C C, and the latter with corrugations D D, forced into the corrugations C C, for the purpose of forming a joint, substantially as shown and described.

170,477. COVERS FOR WATER-COOLERS, &c. Edgar B. Jewett, Buffalo, N. Y. (Filed Nov. 1, 1875.)

As an improved article of manufacture, a combined cover, waste-water receptacle, tumbler-stand, and drain-pipe, consisting of the cover-top A, having the knob B centrally in its apex, surrounded with an annular depression or gutter, C, of a curved or concave transverse section, provided with perforations D, and the bottom E, having its rim sunk below its horizontal edge, the parts being united substantially as described.

170,478. CORN-SHELLS. Michael Kelly, New York, N. Y. (Filed Oct. 28, 1875.)

Brief.—A ring of soap is covered with oil-silk. A piece of the silk also extends across the central opening of the pad.



1. An annular pad, having a body of soap or other plastic or semi-plastic material, and having a covering envelope of oiled silk entirely inclosing the same, substantially as set forth.

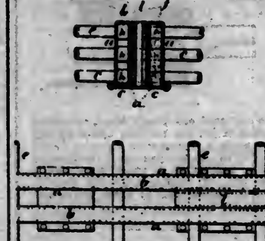
2. A pad, having a rim of soft material, A, and a thin extension or webbing across the central space, and an envelope, B, entirely covering the material A, as herein specified.

3. The within-described pad of soap or analogous semi-plastic material, completely enveloped in strong and adhesive tissue or covering, with the stitching, gluing, or analogous confining means C, as herein specified.

170,479. ROCK-DRILLING MACHINES. A. Kirk, Pittsburg, Pa. (Filed Nov. 12, 1875.)

Brief.—Within the main frame is pivoted a secondary frame, the lower end of which has freedom to swing toward and from the rock to be drilled, and within said swinging frame is arranged a sliding frame, which carries the drilling apparatus.

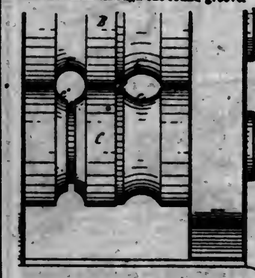
1. In combination with a drill, the derrick B, swinging frame C, and adjustable frame D, provided with the friction-pulley and rope, or similar device for operating the frame, substantially as specified.



2. In combination with the drill-cylinder and its swinging and sliding frames C D, a friction-roller, *d'*, substantially as and for the purpose specified.

3. The combination of the frame D, rod *g* and its crank-arm, pinion *e'*, and pawl *a*, substantially as and for the purpose specified.

4. The combination of the spool or drum *e'*, rope *c*, and spring C', or equivalent weight, substantially as set forth.



170,480. GAS-PLATFORMS. R. J. La Motte, New York, N. Y. (Filed Oct. 11, 1875.)

The transom-beam of a car-platform, made of plate-iron, with the metal tubes or rods *a* of the platform running through the sides *a a* of such transom-beam, substantially as set forth.

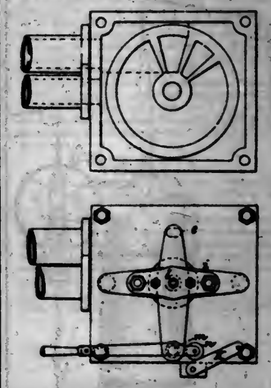
170,481. MANUFACTURE OF CLEVIS-PINS. William J. Lewis, Pittsburg, Pa. (Filed Oct. 23, 1875.)

Brief.—The rod is first passed through the oval and then through the round groove.

1. As an improvement in the manufacture of clevis-pins, the combination of the following steps: first, rolling a rod or bar with a longitudinal web or fin; and, secondly, shearing up the blank to form the head of the pin, and cutting off or swaging in those portions of the web not required in finished article by means of suitable dies, substantially as specified.

2. The rolls B C, provided with the grooves *b c d*, substantially as specified.

3. The rolls B C, provided with the grooves *b' c' a*, substantially as and for the purpose specified.

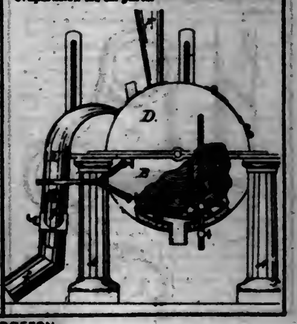


170,482. HEATING-DRUMS. John S. Lewis, Bluport, Iowa. (Filed Oct. 7, 1875.)

Brief.—The air from the ovens can be drawn down through the central openings.

170,483. CUT-OFF VALVES. W. F. Martin, Philadelphia, Pa., assignor of one-half his right to S. Gilbert, same place. (Filed July 14, 1875.)

Brief.—The valve is attached to the connecting-rod of the engine through intermediate mechanism, which is arranged with reference to an arm, the position of which is controlled by the governor to cut off steam at any desired point of the stroke of the piston.



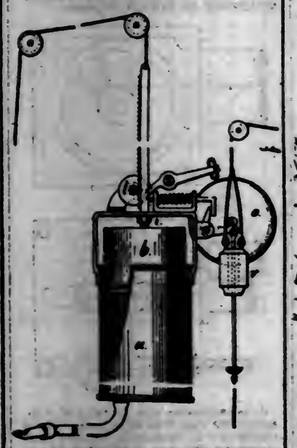
1. In combination with the valve B, as described, the stem F, to which is attached the cross-arms G H, connected by the bars *e f*, and the independent stem *g*, supported by the frame h, clamp i, and set-screws k and l, substantially as shown.

2. As means for supporting the independent stem *g*, the frame h and clamp i, provided with the set-screws k and l, substantially as specified.

3. In combination with the bar *f*, in which is formed the pin *n*, the rod I, fitted with the roller *n*, and movable finger K, actuated by the governor, substantially as and for the purpose set forth.

170,484. EVAPORATING-PANS. Alfred W. J. Mason, New Orleans, La. (Filed Apr. 26, 1875.)

Brief.—The pan is steam-jacketed, with pipes to carry off the vapor of condensation. Either hot or cold air is injected. Revolving disks operate within the pan to keep the juice from carbonization, and to admit of equal evaporation for all parts.



1. In combination with an evaporating-chamber, a pipe, E, having its mouth fastened to provide a narrow discharge, the width of which is nearly equal to the length of the vessel, and an escape-tube, F, the whole being constructed for delivering currents of air into an evaporating-pan for escaping the exciban of the liquid and expelling the evaporations thereof, substantially as described.

2. The pipe E F, cover D, pan B, provided with pipes a b, and revolving disks d, the whole being constructed and combined to operate, substantially as described.

3. The cover D of an evaporating-pan, pipe E, and air-entrance c f g, the whole being combined to operate substantially as described.

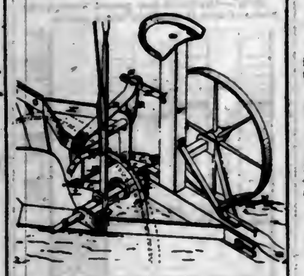
170,686. CHECKED PIPE AND BUNGLAR ALARM. Chas. A. Maxfield, New York, N. Y. (Filed May 10, 1875.)

1. The air-cylinder a and weighted piston b, in combination with the whistle c and the alarm-ball e, operated by the movement of the piston, substantially as set forth.

2. The combination, with the air-cylinder, weighted piston, and alarm, of a cord, g, weight e, and disconnecting mechanism, as set forth, so that the alarm is given by the weight, if the string or cord is turned off, as set forth.

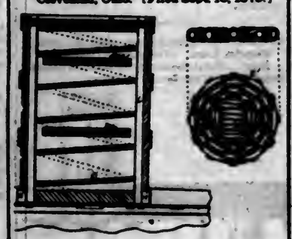
170,687. SELF-CLOSING HINGE. Charles A. Miller, Urbana, Ohio. (Filed Aug. 30, 1875.)

Brief.—A metal ball is introduced into and confined within an enlarged head or knuckle of the hinge, and a spirally-grooved plate passing through the grooved and chambered knuckle, a channel or way is formed, up which the ball rolls; the construction being such as to insure friction, and provide for automatically self-closing hinge by the force of gravity alone.



An improved self-closing hinge, consisting of plates H H', one carrying the projecting pin or plate A, having a spiral groove, C, and the other an enlarged and spirally-chambered head or knuckle, E, in which is confined a metal ball, D, running upon the grooved plate, all substantially as herein shown and described.

170,688. SULKY-PLOWS. George Moor, La Fayette, Ore. (Filed June 18, 1875.)

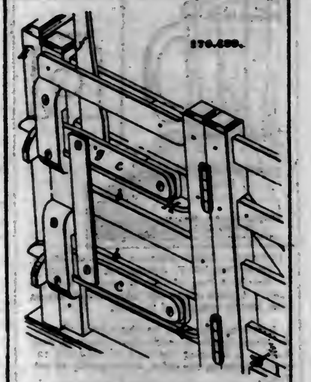


Brief.—The plow is held in a horizontal position at any depth in the ground or when raised. In connection with the yoke, devices for leveling the plow.

1. In a sulky-plow, the branched and curved plow-beam E, having the slots J' L, in combination with the rods J and K and the sleeve or spreader I, substantially as shown and described.

2. In combination with the axle and frame, the branched beam E, curved hangers D, pivoted bar F, arms G, and rigid lever A, whereby the plow is held or raised in a horizontal or level position, substantially as shown and described.

170,689. OIL-FURNACE. G. L. Morehouse, Cleveland, Ohio. (Filed Sept. 18, 1875.)

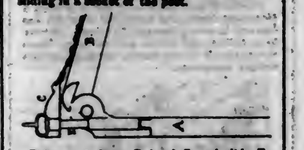


1. The spiral spring O, in combination with the cylinder N, substantially in the manner as and for the purposes specified.

2. The screw follower o', in combination with the solid follower m, spring O, and cylinder N, for the purposes herein specified.

3. In oil-furnaces, the toggle-joints or lever mechanism of the press, in combination with the cylinder N, spring O, disk m, and follower o, substantially as set forth.

170,690. FARM-GATES. Harold E. Mayers, Wythesville, Va., assignor to himself and Thomas L. Mayers, same place. (Filed Sept. 6, 1875.)



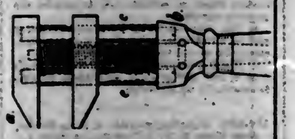
Brief.—Guards are secured to the under edge of the cross-bars, to which the latches are attached, and extend out flush with the outer surface of the latches, to prevent them being elevated by stock.

The guard H, in combination with the lifting-latch c of a gate, substantially as and for the purpose described.

170,690. CAR-STARTERS. James D. Pierce, Milwaukee, Wis., assignor of one-half his right to John B. Smith, same place. (Filed Sept. 10, 1875.)

Brief.—The raising of the end of a lever hinged to the top of the fulcrum-post has the effect of thrusting against the car a block sliding in a socket of the post.

Fulcrum A, lever B, head C, and slide E, all in combination, substantially as described.



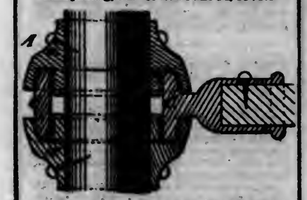
170,691. TELL-COUPLINGS. R. S. Porter, Ottawa, Ill., assignor of one-half his right to J. G. Gay, same place. (Filed Sept. 20, 1875.)

1. The combination of the axle-clip A, thill-iron D, strap G, and shaft or tongue, substantially as shown and described.

2. The combination of the thill-iron D, having shoulder d and notch c, with thread-strap G, substantially as shown and described.

170,692. WHIFFLETREE. Henry Fort, Stapleton, N. Y. (Filed Jan. 4, 1875.)

The round parallel rods c, uniting the socket b and jaw a, and open within the jaw d slides, in combination with the screw f, that passes through the socket b and jaw d, and the handle g that receives and is united with the top of the screw, as and for the purposes set forth.



170,693. CHILDREN'S CARRIAGES. A. Rogers, Montpelier, Vt. (Filed Mar. 26, 1875.)

A carriage with adjustable top A, attached to the end of a jointed rod, C, by means of a ball-and-socket joint, substantially as and for the purposes set forth.

170,694. PROCESSES OF PRESERVING EGGS. Frederic H. L. O. Esco, Neuchatel, Switzerland. (Filed Nov. 4, 1875.)

The process of preserving eggs by coating them with siccative oils, substantially in the manner set forth.

170,695. CLOTHES-DRIERS. Thos. G. Saint-Sharpsburg, Pa. (Filed June 14, 1875.)

The combination of a clothes-drier hinge, A, provided with collars c c', lips d d', having groove b b', said groove being of a V or other shape, as above b, with circular or semicircular ring C, all constructed, arranged, and operating as shown and described.

170,696. MACHINES FOR THREADING SCREWS. Frank P. Sheldon, Providence, R. I. (Filed June 8, 1875.)

Brief.—Fingers on the end of a rocking and laterally-shiftable lever carry the blank up against a revolving screw-driver, which catches into the nick and turns the blank until the nick stands at right angles to the faces of the griping jaws, into which, by subsequent movements of the fingers, the blank is inserted. The revolving die is brought up to the blank, against the constant force of a spring, by a cam operating indirectly on the die-holder, and the latter carries a collar, adjustable, which, as it is carried backward and forward by the holder, strikes alternately two lugs that depend from a slidable bar, whose collar is, by means of levers, to alternately raise and lower two pins that pass through a cloth-lever blank, and that are acted on alternately by opposite sides of a double-faced cam, the effect being to throw the cloth to contact with oppositely revolving gear wheels, that impart rotation to the holder, and then reverse its motion.

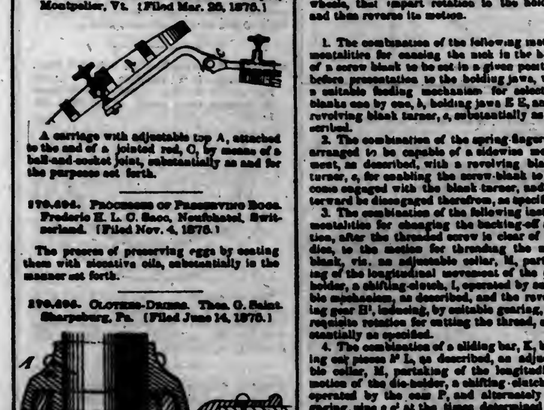
1. The combination of the following instrumentalities for causing the nick in the head of a screw blank to be set in a given position before presentation to the holding jaws, viz: a suitable feeding mechanism for selecting blanks one by one, b, holding jaws E E, and a revolving blank turner, c, substantially as described.

2. The combination of the spring-fingers b, arranged to be capable of a sidewise movement, as described, with a revolving blank-turner, c, for enabling the screw-blank to become engaged with the blank turner, and afterward be disengaged therefrom, as specified.

3. The combination of the following instrumentalities for changing the backing-off motion, after the threaded screw is clear of the die, to the motion for threading the next blank, viz: an adjustable collar, M, partaking of the longitudinal movement of the die-holder, a shifting-clutch, I, operated by suitable mechanism, as described, and the revolving gear H', indexing, by suitable gearing, the requisite rotation for cutting the thread, substantially as specified.

4. The combination of a sliding bar, K, having one pinion F' L, as described, an adjustable collar, M, partaking of the longitudinal motion of the die-holder, a shifting-clutch, I, operated by the cam F, and alternately engaging pins o o' at the times determined by the said sliding bar and collar, and gears H H', revolving in opposite directions, substantially as described, for the purpose of automatically changing the direction of rotation of the die-arbor, as specified.

5. The combination of the sliding bar K, constructed as described, the levers S N', and the spring-latches n n', substantially as specified.



6. The combination of the adjustable collar M, partaking of the longitudinal motion of the die-holder, with the system of cams on the hollow shaft O, by means of a vibrating clutch-gear connecting such shaft with the source of motion, and the lever U, controlling a stop-catch, u t, whereby the said cam-shaft may be stopped while a blank is under the action of the cutting-die, and be started again after a blank has been discharged from the jaws, or in case a blank has not been presented to the die, substantially as described.

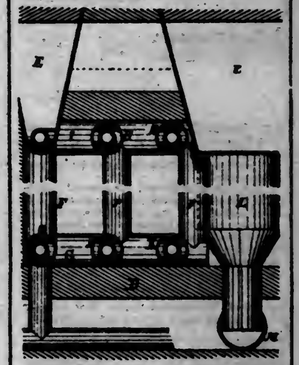
7. In combination with the gears J J', whose direction of rotation is alternately changing to reverse the motion of the die-arbor, the friction-pulley V, and double-acting spring-brakes, described, for giving an easy initial movement to the gearing for changing direction, substantially as specified.

8. The combination, in an automatic screw-threading machine, of the bifurcated die-charger, the griping-jaws, and the feeding-fingers, arranged and operating together substantially as described, whereby the finished screw is ejected from the jaws, and the way cleared for the advance of the fingers with a blank, as set forth.

9. The combination, substantially as described, of the feeding-fingers b b, with the stationary holding-jaws E E, when the latter are arranged to open in a plane which is intersected by the path of movement of the fingers, whereby the blank can be presented so as to be gripped by the jaws without the requirement of any sidewise movement on the part of the fingers.

170,696.

170,697. HAIR-SWITCHES. Annie B. Smith, Gaston, assignor of one-half her right to Alvah Sweetland, Memphis, N. Y. (Filed Feb. 5, 1875.)



1. The process of bending hair for switches and other similar articles for personal wear, consisting, essentially, in first spreading out the hair, as shown at A, in the drawing; then sewing it in two or more rows of stitching, as at A', and then doubling the hair and sewing it, as at B, and again doubling it in the center and sewing as before, by which it is brought into the form represented at C, substantially as and for the purpose set forth.

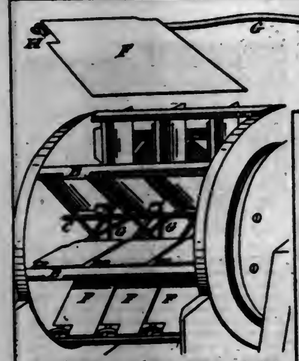
2. As a new article of manufacture, a hair-switch or similar article for personal wear, formed of a bending constructed as above specified, and twisted and sewed substantially as described, and represented in Fig. 3 of the drawing.

170,698. FREEZING APPARATUS. Edmund C. Teare, Newcastle, Canada. (Filed Mar. 10, 1875.)

Brief.—The pipes for receiving and conducting the freezing-mixture are surrounded by larger perforated pipes, for collecting and conducting away the products of condensation to a pipe between the lower double walls, which leads to the outside of the walls.

1. The horizontal double pipes H I under the ceiling, in combination with troughs E, as and for the purposes set forth.

2. The horizontal double pipes J K near the door D, in combination with horizontal pipes O, substantially as and for the purposes set forth.



3. The waste-water pipe M beneath the floor D, in combination with the horizontal pipes O, vertical pipes F, and cylinder or cylinders L, and ventilating-pipes E, as and for the purposes set forth.

4. The combination and arrangement of troughs E, vertical pipes F, horizontal pipes O, double pipes H I J K and cylinders L with a preserving or freezing chamber, as set forth.

170,699. WATER-WHEELS. P. Velat, Jeffersonville, Ind. (Filed Nov. 6, 1875.)

Brief.—The buckets are made of iron, and hinged at right angles to the ends of round bars of iron extending across the entire wheel. The ends of the bars are made to work in bearings on the cross-pieces at the verge of the wheel, and they constitute the shafts to which the buckets are attached and hang in the wheel.

170,499.

The oscillating buckets F F F, with their shafts G G G, as above described, in combination with the bearings H H H, in which they work, and the cross-pieces I I I and bars C C C, on which the buckets rest, when arranged, constructed, and operated substantially as and for the purpose hereinbefore set forth.

170,500. APPARATUS FOR SECURING HANDLES TO BRUSHES. John L. Whiting, Boston, Mass. [Filed Aug. 24, 1875.]

Brief.—The bristles are clamped between two grooved blocks, while the handle is driven into the ferrule as it rests upon the blocks.

1. The combination of the clamps a a' with one or more grooves, b b', having projections c c and recesses d d on each side, and the holder handle e, substantially as and for the purpose set forth.

2. In combination with the grooved clamps a a', with their grooves b b', projections c c, and recesses d d, the adjustable perforated plate e, as and for the purpose set forth.

3. In combination with the clamps a a' and their grooves b b' and plate e, the holder handle e, as and for the purpose set forth and described.

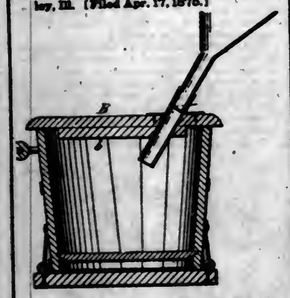
170,501. BUTTER-PACKAGE. H. P. Adams, Cleveland, Ohio. [Filed July 31, 1875.]

As a new article of manufacture, the butter-package, constructed of the casing A, with metallic lining C, terminating in the flange c, in combination with the lid B, clamps E c, and interposed pasteboard packing, substantially as and for the purpose described.

170,502. MANUFACTURE OF FIRE-BRICK. J. Park Alexander, Akron, Ohio. [Filed July 12, 1875.]

Brief.—The pulverized pebbles are mixed with from one to twenty per cent. of lime, melted, subjected to great pressure, thoroughly dried, and then burned in an intense heat.

The compound for the manufacture of fire-brick, consisting of pure pulverized white pebbles and lime, prepared and compounded in the proportions substantially as and for the said purposes described.



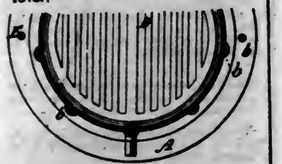
170,503. RECLINING-CHAIRS. Charles M Alexander, Washington, D. C. [Filed Oct. 4, 1875.]

1. A serrated or notched metallic shoe upon the base of a folding or reclining chair, in combination with a metal tip of plate upon the moving bar of said chair, the tip having a ling or suitable device to engage with the shoe, as is her— fully set forth, for the purpose specified.

2. The square base A A of an adjustable folding and reclining chair, in combination with the bars B B and C C, the bars C being pivoted or hinged to the base, and bars B adjustable in notches or mortises in same, substantially as and for the purpose set forth.

170,504. MILK-PAILS. John Amole, Bushley, Ill. [Filed Apr. 17, 1875.]

In combination with a milk-pail, the elliptical cover B, having the downward circular projection b, adapted to be used with pails of different sizes, and to serve as a seat for the operator, substantially as described and shown.



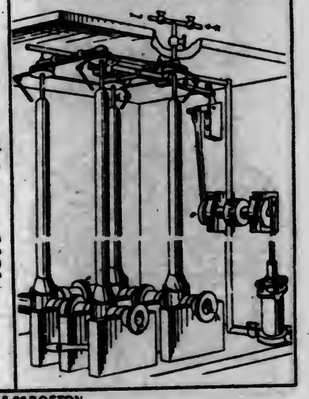
170,505. ANT-EXTERMINATORS. M. Berthel, Milpitas, Cal. [Filed June 12, 1875.]

Brief.—A mixture of sugar and cobalt is placed in the bottom of the box, and a sponge or other absorbent (saturated with water) placed upon the mixture to keep it soft. The ants enter the holes in the sides of the box.

In combination with the box A, with its openings c, arranged to contain a poisonous compound, the absorbent material E, substantially as and for the purpose specified.

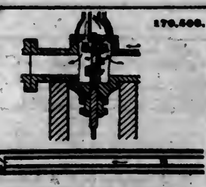
170,506. HEATING-STOVES. Robert S. Bay, Munnsville, N. Y., assignee of two-thirds his right to William Stringer and William H. Stringer, same place. [Filed Sept. 23, 1873.]

The exterior drum or cylinder B, which is composed of a series of vertical staves, having spaces b between them, in combination with the base A, top C, and tie-rods E, substantially as specified.



170,507. MANUFACTURE OF CHROME-STEEL. Julius Baur, Brooklyn, N. Y. [Filed May 19, 1875.]

1. The process herein described of manufacturing chrome steel, the same consisting in mixing a quantity of graphite and borax with the chrome-ore and also iron to be converted into steel, substantially in the manner and for the purpose specified.



2. A compound from which to manufacture chrome-steel, consisting of an alloy produced from chrome-ore, borax, graphite, and metallic iron, substantially as and for the purpose described.

170,508. ICE-MACHINES. John M. Booth, San Francisco, Cal. [Filed Aug. 5, 1874.]

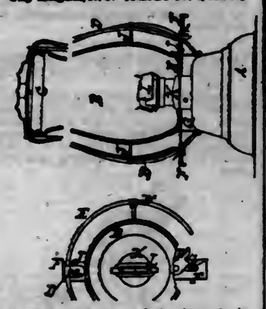
Brief.—Liquid refrigerant admitted directly from the lower or liquid portion of the condenser into the top of any of the vertical congealers, and thence into a supply-pipe common to each of a series of vertical congealers, and having diaphragms with ports increasing oversally in area. Thus liquid refrigerant is more or less gasified in the first congealer, and the more volatile part of the refrigerant passes through congealers, while the remainder continues along the horizontal supply-pipe. Valves may cut off each congealer from supply pipe. Each successive congealer may be of larger sectional area. Ports may be adjusted in size by a movable gate. Ice may be loosened on the congealers by admitting gas from upper part of condenser downward through any one of the congealers. Water to be frozen pumped up and conveyed into pans, rotated horizontally and intermittently by the connections with the pump-shaft. Ice detached from congealers by passing gaseous refrigerant of high temperature from upper part of condenser down into any congealer.

170,508.

1. In a congealing apparatus, a series of vertical congealing-pipes, in combination with and connected to a supply-pipe which is common to all of the congealing-pipes, and which delivers the liquid and gaseous ammonia to each of the congealing-pipes, and receives the same after circulating therein, substantially as described.

2. The combination, with a refrigerant-supply pipe, having diaphragms and ports, of vertical congealers, having double connections with the supply-pipe, substantially as described, whereby the refrigerant will be partially diverted from its direct course through the congealers, and return to the supply-pipe.

3. In a volatile refrigerant-supply pipe, one or more diaphragms or partitions, provided with openings of less area than the sectional area of said pipe, substantially as described, whereby the gaseous and fluid portions of the refrigerant may be brought into close relation with each other by their passage through such opening, as specified.



4. The vertical congealers, having independent interior passages for conducting the refrigerant, the supply-pipe, and the diaphragms or partitions with ports, combined to operate substantially as described.

5. A vertical congealer for artificial ice manufacture, composed of an exterior casing, having a closed end, an interior condenser with an open end, located adjacent to the closed end of the casing, and a refrigerant-supply pipe connected with pipe and casing, substantially as described, whereby the refrigerant will be conducted into the congealer by way of the interior pipe, and from the congealer to the supply-pipe, for the purposes specified.

6. In a congealing apparatus, having vertical congealers immediately supplied from a pipe common to them all, the combination, with the congealers and supply-pipe, of a cock or cocks for controlling the passage of ammonia to each congealer, and a diaphragm in the supply-pipe opposite each congealer, provided with a port or ports, which are thus guarded by valves or cocks, substantially as described.

7. The combination of a cylindrical vertical congealer, having plates fronting cavities, with a revolving water-distributer, substantially as described.

170,510. LANTERNS. Henry Backe, Jersey City Heights, N. J. [Filed Nov. 4, 1875.]

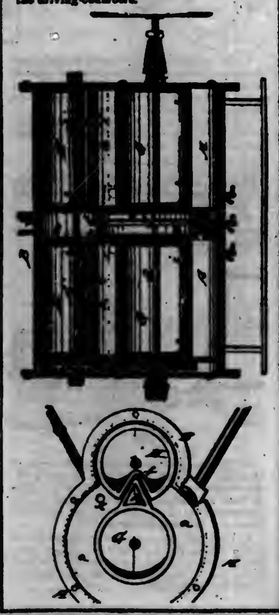
1. The combination of the base A, its pierced and slotted arms F F, the vertical branches D D of the lantern-guard, and the globe E, substantially as described.

2. In combination with the base A, its pierced and slotted arms F F, the vertical branches D D of the lantern-guard, and the globe E, the latch J, substantially as described.

3. The brass J, in combination with the lantern-guard D D D' D' E E, and with the globe E, substantially as described.

170,509. CAR-BRAKES. Joseph H. Setterley and Thomas Sharer, London, England. [Filed Dec. 30, 1873.]

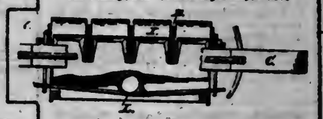
The continuous brake-bar G and cross-bar G', in combination with the bevel-wheels H' and H H, the lever E, attached to the beam S, and the threaded bar T, for throwing either of the wheels H H into contact with the wheel H' to automatically shift the brakes, substantially as described.



170,511. BOWS FOR ANIMAL-POKES. Erwin G. Beckwith and Harriet W. Brown, (administratrix of Geo. B. Brown, deceased,) Stronsville, assignors to J. G. A. Oliver and Eldred H. Phillips, York, Ohio. [Filed Sept. 4, 1875.]

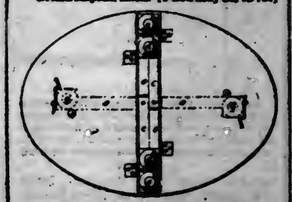
The herein-described bow for animal-pokes, in two pieces, united at their upper extremities by the hinge C, while their opposite ends engage with the pin B, in combination with the coiled and angular catch D, the whole constructed substantially as described, whereby the bow may be adjusted to the animal without removing the bow-pin.

170,512. ROTARY ENGINES. J. W. Hodgett, Nashville, Tenn. [Filed Mar. 30, 1875.]



Brief.—The cut-off wheel is provided with a concentric passage on one side near the periphery, which extends half-way round, and a smaller passage on the other side around the other half, to change the steam alternately in the driving-chambers.

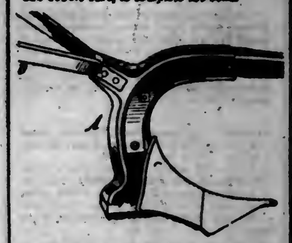
170,513. INK-POWDERS. William A. Bonney, Hyde Park, assignee to Daniel Sweet, Wakefield, and Samuel D. Miles, Reading, Mass. [Filed Aug. 6, 1875.]



An ink-powder, composed of extract of logwood, bichromate of potash, prussiate of potash, gum-arabic, and copperas, in or about the proportions herein set forth.

170,514. HORSE-YOKES. Jacob Boyer, Boyal Valley, Pa. [Filed Apr. 20, 1875.]

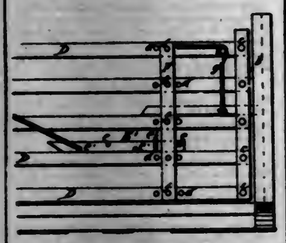
The above-described horse-yoke, provided with the bow C, star-shaped hasps D, the guard I, and spring i, all arranged substantially in the manner and for the purposes set forth.



170,515. FOLDING TABLES. John Brookfield, Grand Rapids, Mich. [Filed May 21, 1875.]

A folding table consisting of the narrow top a, leaves A, the supports c c, having the legs secured to their ends, and catches to hold the legs in position, substantially as described.

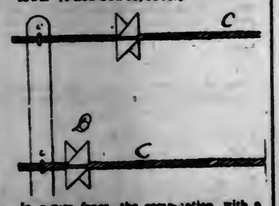
170,516. PLOWS. Thomas R. C. Brisly, Louisville, Ky. [Filed July 31, 1875.]



Brief.—The rear section of the beam is cast with flanged parts or seats, to receive the working parts of the plow, and the handles and double bars, to complete the beam.

A plow combining in its construction the curved cast-iron halve A, having flanges on the edges forming recesses on each side, to receive the beams, the correspondingly-curved parallel beams E, and handles D bolted in the recesses formed to receive them, substantially as set forth.

170,517. SWINGING AND TILTING GATES. Amos Brinkerhoff, Golden Corners, Ohio. [Filed Sept. 3, 1875.]



Brief.—The latch end may be elevated, a spring holding the latch in a groove in the post from base to top. A sliding bar, adjustably fixed to the gate, is connected with a gir-brace secured to the top of the rear stile, its inclination being variable with the ascent and descent of the latch end.

1. The combination of the sliding bar E', the gir-brace E, the pin e^2, and the stop-bars F, substantially as set forth.

2. The combination of the adjustable stop-bars F with the rails D, substantially as set forth.

170,518. WIRE-FENCE RAILS. Warren L. Brown and Laurence G. Tubbs, Dunlap, Iowa. [Filed Oct. 16, 1875.]

In a wire fence, the combination, with a twisted wire cable, C, of the four-pointed barbs D, formed of two flat plates, d, of the forms of an isosceles triangle, and having the slot e, substantially as and for the purpose set forth.

170,519. DUST-CLOTH HOLDERS. James M. Brown, Salem, Mass. [Filed Feb. 27, 1875.]

In a wooden tongs or dust-cloth holder, the pivoted levers A A', having enlarged obcordated heads c upon the grappling arms b', and a strap, d, cut away from their inner edges, whereby angular grappling-edges are formed, and the handles b' of the said levers are made to coincide, substantially as and for the purpose set forth.

170,520. CIRCULAR-SAW GUIDES. John Bryce and Otto Gronberg, Grand Haven, Mich. [Filed Oct. 20, 1875.]

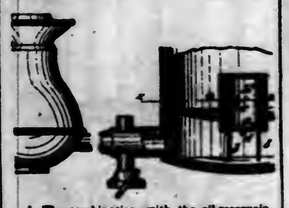
Brief.—The lateral vibration of a circular saw is prevented, and the lateral strain resisted, by means of a guide, in which either one or both of the guide-arms can be adjusted to the size of the saw or the nature of the work.

1. The guide-arms C C', carrying F F', worm-wheels d^2, worm-screws e^2, and shafts D S, combined and operating in the manner and for the purposes described.

2. The retaining-plate f and latch e, in combination with worm-wheels d^2, and guide-arms C C', as and for the purposes described.

170,520.

170,521. HAME-COUPLINGS. J. H. Carlisle, Craigsville, Va. [Filed Oct. 20, 1875.]

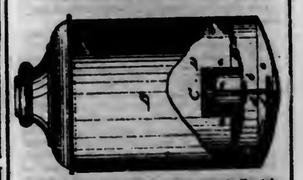


1. The combination in a hame-fastening apparatus, substantially as described, of a footed lever and curved bar with a friction-plate and a bar, formed square at one end and round at the other, to work over the same.

2. The footed lever A, secured to the plate D by the hinged bar C, and adapted to operate substantially as described.

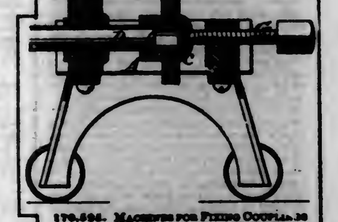
170,522. LAMPS. J. W. Carter, Brooklyn, N. Y., assignor to B. B. Schneider, New York city. [Filed Nov 10, 1875.]

Brief.—The rotation of the oil-reservoir covers and uncovers the apertures through which oil passes toward the burner.



1. The combination, with the oil-reservoir D, of the concave bottom D^1, inverted cup D^2, with apertures e, and hollow cylindrical valve E, with apertures e^1, constructed as shown and described, to register from the side, substantially as herein set forth.

2. The combination of the valve E, arranged in the bottom of the oil-reservoir D, and provided with the arms b b, and the pin or wire d in the cup C, substantially as and for the purpose herein set forth.



170,523. LAMPS. J. W. Carter, Brooklyn, N. Y., assignor to B. B. Schneider, New York city. [Filed Nov. 10, 1875.]

Brief.—When the oil-reservoir is raised the piston is drawn below the apertures in the cup, which prevents escape of oil. By rotating the reservoir, the hook is disengaged, and the reservoir may be entirely removed.

The combination of the oil-reservoir B with inverted cup C, having apertures e, the piston D, and rod d with hook e^1, with the hook f in the bottom of the cup A, substantially as and for the purposes herein set forth.

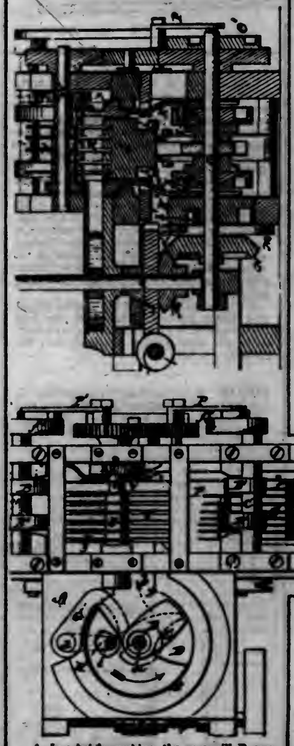
170,524.

170,524. MACHINES FOR FIXING COUPLINGS TO SHAFTS. George A. Chapman, Woonsocket, R. I. [Filed Oct. 20, 1875.]

1. In combination with clamping-blocks C C or their equivalent, the clamping-cap F and the screw G mounted in a frame, substantially in the manner described.

2. In a machine for forcing couplings on shafts, the cap F in combination with a clamping device and a screw, G, substantially as described.

170,525. MOP AND BRUSH HOLDERS. Chas. B. Clark, Buffalo, N. Y. [Filed Nov. 10, 1875.]



Brief.—The two rows of teeth upon the jaws alternate to interlock and clamp the mop-cloth. The movable jaw has a single plain edge, and a short bent tenoning within the operating-nut, so that the jaw can be readily opened to any extent, or clamped upon each other.

1. The mop and brush holder herein described, consisting of the fixed jaw A, thumb-nut F, and the movable jaw B, having on arm connected with a single plain bearing-edge, G, so that by the action of the nut on one and the same bearing-edge the jaws can be closed for holding either a mop or a brush, the whole being constructed and operating substantially as shown and described.

2. The jaws A B, each having a series of teeth, a, alternating with each other, and with a series, d, so that the former permit the latter to close upon each other, substantially as described.

170,526. BRICK-MACHINES. John Crabtree and Wm. H. Meleher, Philadelphia, Pa., assignors to themselves and Wm. Crabtree, same place. [Filed Nov. 4, 1875.]

1. In a brick-machine, the pug-mill B, provided with the segmental false bottom D and the die or mouth-piece b, in combination with a mold placed against said mouth-piece, so that the clay is forced on a horizontal line directly from the pug-mill into the mold, substantially as herein set forth.

2. In a pug-mill for brick-machines, the combination of the pusher E and step G, constructed and operating substantially as and for the purposes herein set forth.

3. The combination of the step G, vertical rod d, arm H, with roller e, and the cam I, having semicircles e^1 e^2 and straight parts f^1 f^2, substantially as and for the purposes herein set forth.

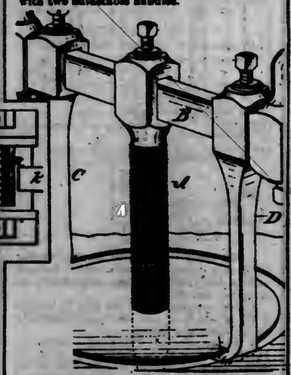
4. The molds E E upon the ends of the movable carriage F, said molds being open on one side, a solid abutment, f, on the opposite side, and the ends and bottom slotted and grooved, substantially as and for the purposes herein set forth.

5. A series of knives, Y, attached to a revolving shaft, W, and operating in combination with the slat-work V and slotted molds E E, substantially as and for the purposes herein set forth.

6. The combination of the carriage P, having notches t, and the pointed bars K I, provided with studs and rollers s, and operated by means of the cams J', having quarter-circles f^3, curves h^1, and straight parts f^4, all substantially as and for the purposes herein set forth.

7. The combination of the cam L', having segmental and irregular grooves h^2 m^2, the pivoted hook w, with stud and roller x, and the pin v on the side of the carriage I', substantially as and for the purposes herein set forth.

8. The combination of the grooved follower S, with pins i i projecting from its sides, and the cams T, attached to a rocking shaft, p, and provided with eccentrically-curved flanges s^2 s^3, substantially as and for the purposes herein set forth.



9. The combination of the cam N', having curved and straight grooves n^2, s^2, and s^3, as described, the levers M', with studs and rollers S^1, rods s^1, and arms x on the rocking shafts p, for operating the cams T, substantially as and for the purposes herein set forth.

10. The combination of the cross-bar Z, sliding heads A', links A, and arms B', attached to the rocking shaft C, substantially as and for the purposes herein set forth.

11. The combination of the cam O', having segmental groove f^5 and inclined groove n^3, the elbow-levers F', with studs and rollers s^4, the links s^5, and arms f^7 on the rocking shafts O', substantially as and for the purposes herein set forth.

170,527. EXPANSIBLE TOOLS FOR CUTTING HOLES OF DIFFERENT SIZES. Christopher Cranmer, Turner's Falls, Mass. [Filed Sept. 9, 1875.]

Brief.—For cutting circular holes of various sizes in wood, a central screw-stem is slotted at its upper end to receive a transverse bar, on which are secured two adjustable cutting-tools, said bar being provided with two adjustable handles.

The herein-described tool for cutting circular holes of various sizes, the same consisting of the bar B, having the screw-stem A, cutters C D, and handles H, adjustably secured thereto, substantially as shown.

170,528. CORRUGATED HOSE-BLANKETS AND FELT-SKIRTS. Louis S. Crittenden, Angelica, N. Y. [Filed Oct. 20, 1875.]

The blanket A, provided around its edges with a fringe, B, and constructed with a head and a body section, which are combined by means of the elastic webbing A', substantially as and for the purpose specified.

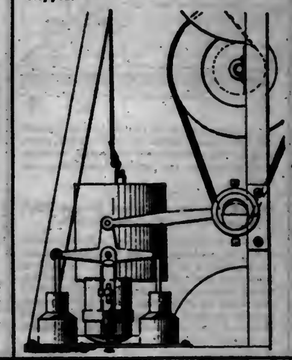
170,529. BOTTOM PLATES FOR PUDDLING-FURNACES. Samuel Dallar, Parkesburg, Pa., assignor to himself and H. A. Beale, same place. [Filed Mar. 1, 1875.]

A tool-plate consisting of a group of hollow sections, D, closed at the outer edges, excepting where air, water, or steam is admitted and discharged, and rabbeted at the joints, as set forth.

170,530. HAMES. Abram F. Davis, Lacomb, Iowa. [Filed May 3, 1875.]

The same A, having the cavity B, the perforated plate or metal strap a a, covering the cavity B, the plate b b, having the series of projecting pins 1 2 3, and the concealed spring c, when arranged and combined substantially as and for the purposes shown and described.

170,531. CONVERTIBLE MOTIONS. William Darwen, Leeds, England. [Filed Sept. 1, 1875.]



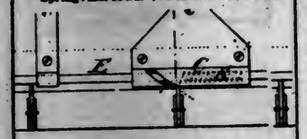
Brief.—Each of two elastic connecting-rods attached to a treadle is, at its other end, pivoted to an arm oscillating on the center of and inside the pulley. The other extremity of each arm covers elastic bafts, which grips the inner periphery, to revolve the pulley in one direction of its movement, being free in the reverse movement.

1. The combination, with a wheel, of the pivoted levers a a, and rollers or balls d, operating in the manner described and shown.

2. The combination, with a wheel, of the pivoted levers a a, rollers or balls d, and elastic connecting-rods c c, operating in the manner described and shown.

170,532. PORTABLE WATER-WORKS. John M. Danielson, Newark, N. J., assignor of three-fourths his right to J. Danielson, R. E. Johnson, and Wm. W. Russell. [Filed Oct. 9, 1875.]

Brief.—The pump is operated by a wright and power-transmitting mechanism. Connected to the pump is a chamber having induction and eduction pipes. When the stop-cock of the eduction-pipe is turned off, the pump as well as the flow of water is at once stopped.



In combination with a pump or pumps, and a spring or weight power, a chamber, connected to the pumps, which is provided with an induction and an eduction pipe, the eduction pipe being provided with a regulating stop-cock, substantially as herein set forth, for the purpose specified.

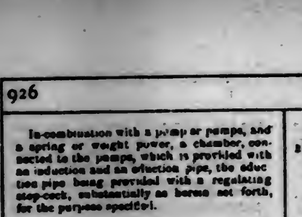
170,585. FIRE-PROOF PAINTS. Jas. Dewitt, Kansas City, Mo., assignor to himself, J. S. McCrum, B. S. Henning, H. J. Fisher, and S. Dewitt. [Filed Oct. 8, 1875.]

The described composition of coal tar, lampblack, gum-copal, turpentine, salt, lye, and hydraulic cement, substantially in the proportions and compounded as set forth.

170,586. WEATHER-STRIPS. Daniel Dean, Springville, Iowa. [Filed Oct. 30, 1876.]

1. In a weather-strip, the combination, with a tubular obliquely-slotted sheath, C, of the rotating and endwise-movable shaft E supporting the weather-strip, substantially as specified.

2. In combination with an endwise-movable and axially-rotating rod, E, and the obliquely-slotted sheath C, the spring S, arranged in the said sheath, substantially as specified.



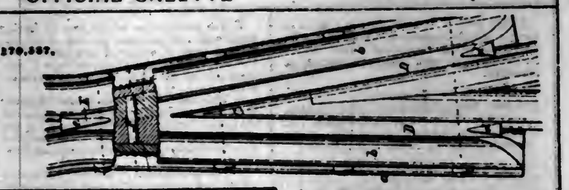
3. The combination, with the rotating and endwise-movable shaft C, having arm *b'*, of the sheath C, having oblique transverse slot *b*, substantially as specified.

170,587. PROCESSES FOR TREATING ORES. H. H. Hames, Oakland, and Abel Patchen, San Francisco, assignors to American Mill and Metallurgical Company, San Francisco, Cal. [Filed Aug. 27, 1875.]

1. The process of treating ore-pulp with the protochloride of iron and the dichloride or subchloride of copper simultaneously in the same pan, tub, or vessel, substantially as above specified.

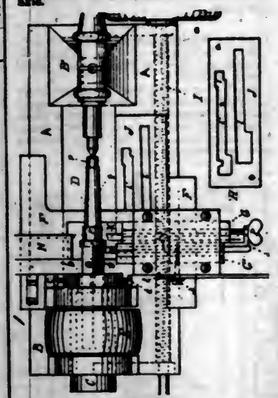
2. The process herein described of treating ore-pulp by grinding the ore with the protochloride of iron and dichloride of copper, substantially as and for the purpose described.

170,588. OATMEAL-MACHINES. Andrew J. Harrisheam, Akron, Ohio, assignor to F. Schumacher, same place. [Filed Sept. 11, 1876.]



The combination of the perforated plate O and horizontal knives D, or their equivalents, both or either adapted to be moved, substantially as and for the purpose herein before set forth.

170,589. RAILWAY-FROGS. George Elliot, St. Louis, Mo. [Filed Feb. 2, 1876.]



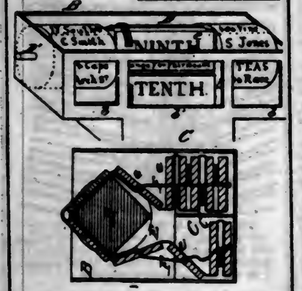
The V-frame D D E, having inclined grooves *d' d'*, the said frame being constructed in one piece, adapted to fit in the side chairs of the rails, and extending lengthwise of the frog, wholly supported by and rigidly secured to said rails by transverse bolts, and the said grooves adapted to guide the flanges of the wheels on the frame, substantially as and for the purpose set forth.

170,590.

170,590. MACHINES FOR TURNING CARRIAGE-AXLES. Jos. W. Hits, Philadelphia, Pa., assignor of one-half his right to J. H. Armbruster, same place. [Filed Mar. 10, 1875.]

Brief.—Two sliding stocks or holders, each having a cutter placed side by side on a carriage fed by a rotating screw, and a double pattern plate for guiding the stocks, in such manner that the two cutters are, by means of a hand-lever, so manipulated as to cause them to turn successively different members of the axle.

1. The combination, with a metal-turning lathe, of a carriage, tool-box, cutter-holders, cutters, and pattern-plates, substantially as described and shown.



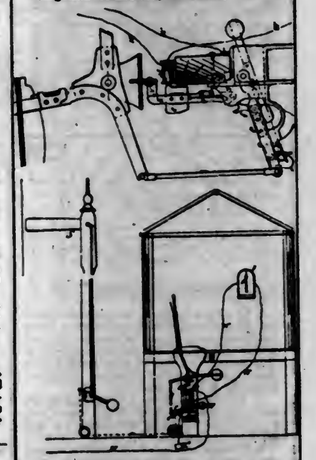
2. The combination of the box H, holders O O', cutters K K', and lever L, substantially as described and shown.

3. The combination of the cutter-holder O', having an arm, O, in combination with the cutter-holder O, having an adjustable screw, P, for giving outward and inward movements to the latter, substantially as set forth.

4. The swivel N, having gages M and M', in combination with the carriage F and cutters K and K', for adjusting the same, substantially as set forth.

170,591. STATION-INDICATORS. Clarence A. Evans, Upland, Pa. [Filed Apr. 28, 1875.]

Brief.—A cylinder carrying cards for station-indicators, and advertisements on its ends, is inclosed in a box having windows for each advertisement.



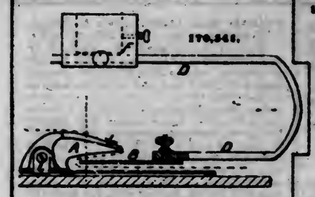
1. In a street or station indicator, a horizontal roller, displaying at different points upon its periphery, respectively, the names of streets or stations and advertisements, in combination with a box, B, having separate openings or windows *b'*, through which the streets and advertisements are, respectively, exhibited, substantially as described.

2. The elastic ribbon or cord F, in combination with the folding cards, as described.

3. The combination, with the indicator-rollers D, arranged horizontally within a car, and displaying the names of streets or stations, of the mechanism for imparting motion thereto, consisting of the pulleys *f*, attached to the roller-shafts, the intermediate pulley *f'*, cords *g*, and crank-shaft, substantially as shown and described.

4. The roller D, having the central polygonal portion holding the indicator-card, and the cylindrical end portions displaying advertisements, substantially as shown and described.

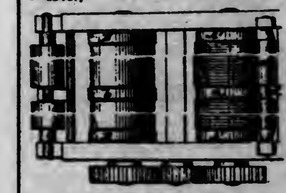
170,592. ELECTRIC RAILWAY-SIGNALS. J. S. Farmer, Canterbury Road, Kilburn, and Edward Tyer, No. 4 Old Street, Finsbury, England. [Filed May 24, 1875.]



1. The combination of the counterweighted semaphore and hand-lever with an interposed mechanism, consisting of the levers C D E, catches *e* and *f*, connections *l* and *p*, magnet M, and wire W, as and for the purposes described.

2. The combination, for effecting the connection or disconnection of the lever and signal, of the levers C D E and catches *e* and *f* with the electro-magnet M, and wire W, and make-and-break indicator I, substantially as herein described in reference to the accompanying drawings.

3. The combination of the spring-contact T with the lever E, for the purpose of economizing the electrical force, substantially as herein described.

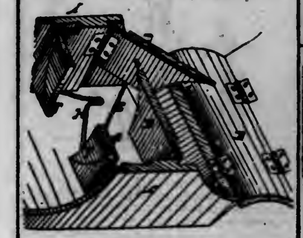


170,593. PLAITER AND TUCKER ATTACHMENTS FOR SEWING-MACHINES. John J. Fennessden, Boston, Mass. [Filed May 7, 1875.]

170,594.

The curved arm D, provided with the adjustable pivoted guide E, and adjustable clutch F, in combination with the pivoted guide A and plate C, substantially as and for the purpose described.

170,595. ROTARY PERFECTING-PRESSES. J. L. Firm, New York, N. Y., assignor of one-half his right to C. B. Cottrell and N. Babcock, Westerly, R. I. [Filed Sept. 28, 1870.]

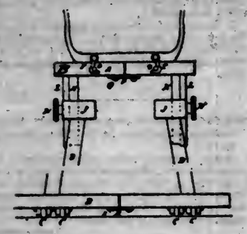


1. The combination of two or more independent paper-supply cylinders or rolls arranged side by side in an axial direction at the same end of the press, and serving to feed two or more independent webs side by side, a form-cylinder, having two or more circular forms side by side in direction of its length, and an impression-cylinder, having a corresponding number of impression-surfaces similarly arranged, substantially as described.

2. A form-cylinder, constructed as described, with one or more intermediate annular bearings, *a*, between its forms, in combination with an impression-cylinder, constructed with one or more intermediate and similarly-arranged annular bearings, *b*, between its impression-surfaces, for operation the one against the other, essentially as herein set forth.

3. The combination of one or more lever supporting-rollers, *s s'*, with the intermediate annular bearings *a* or *b* of the form and impression cylinders, substantially as specified.

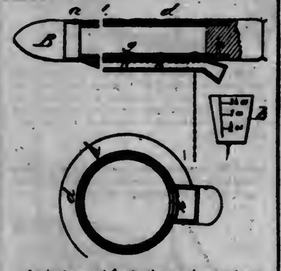
170,596. VEHICLE-SEATS. J. H. Franklin, Avoca, Wis. [Filed Oct. 20, 1876.]



1. The buggy or vehicle body, having the hinged section B, to which is hinged the seat C, by which a single or two-seated vehicle may be formed, substantially as and for the purpose set forth.

2. In combination, with the buggy or vehicle body A, having the hinged section B, provided with the hinged seat C, the hinged folding sections D D, and fastenings E *e d*, substantially as and for the purpose set forth.

3. The convertible single and double seated vehicle or buggy body, consisting of the body A, hinged folding sections F F, seat C, hinged folding sections D D E, seat C, and fastenings E *d* and H A, substantially as shown and described.



170,597. BAND-WARMERS. Jane Garcia, New York, N. Y., assignor, by mesne assignments, of one-half his right to Benoit Wasserman. [Filed July 20, 1876.]

1. The vertically-divided breast-piece A and vertically-divided foot piece B, in combination with the cross pieces J J and legs D D, and provided with the pivots H H and fastenings P Q and R S, substantially as and for the purpose herein described.

2. A combined baby-walker and chair, embodying in its construction a removable seat, E, provided with fastenings F, a vertically-divided breast piece, A, having studs G G, vertically-divided foot-piece B, cross-pieces J J, and legs D D on pivots H H, and fastenings P Q and R S, the whole being constructed and arranged to operate in the manner and for the purpose as shown and described.

170,598. GRAIN-TESTERS. William J. Gard and Neville Staughton, Winona, Minn. [Filed Oct. 20, 1876.]

An instrument for testing grain, consisting of the perforated tubes *a a*, and wire-cloth covering the perforations A, in combination with a condensor, substantially as described.

170,599. CAR-STARTERS. Ezra G. Goddard, East Saginaw, Mich. [Filed Sept. 4, 1876.]

Brief.—Sliding weight acts so as to resist draft after strain on ratchet ceases, and thus prevents any sudden release and shock.

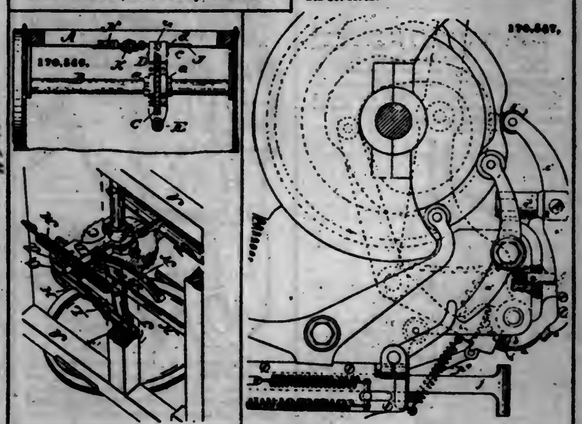
1. The combination of the ratchet-wheel C, secured upon the car-axle, the rocking frame D, provided with the sliding weight F, and the pawl G, pivoted in the frame D, and connected with a movable draft-bar, substantially as shown and described.

2. The combination of the wheel C, frame D, sliding-weight F, pawl G, bar H, lever J, draw-bar K, and spring M, substantially as shown.

3. The combination of the frame D, pawl G, bar H, and pivot-pin, passing through the bar and the dog, and having its ends extended longitudinally in the frame.

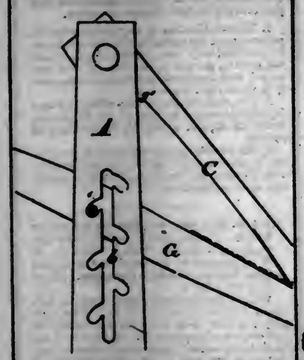
170,600. MACHINES FOR SEWING BOOTS AND SHOES. Charles Goodyear, Jr., New Rochelle, and Benj. H. Radley, Brooklyn, N. Y., assignors to the Goodyear Boot and Shoe Sewing-Machine Company. [Filed July 20, 1873.]

Brief.—Improvement upon machine patented July 11, 1871, No. 116,947. The main object in view is to bring the chain-stitch on the outside of the seam, or next to the upper or welt, instead of laying it in the inside channel, as in the case in the above mentioned patented machine. The needle is reversed, so that it points outwardly, and the positions of the needle guard or brass and barb shield are correspondingly changed. The looper is mounted on a bracket, and a device similar to a cast-off is added, which is, however, used solely to prevent the needle from catching the lining of the shoe.



1. A sewing mechanism for boots and shoes, in which the channel-gage and back gage are combined with and arranged relatively to a circularly-curved needle, substantially as set forth, so that the operation of sewing therewith places the loop or chain stitch on the outside of the seam, instead of in the channel in the sole.

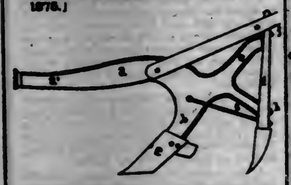
2. In combination with the circularly-curved needle, the channel-gage, and the back-gage, or welt-guide, arranged together for operation as set forth, we claim the looper arranged and mounted relatively to the needle and guiding devices, as herein shown and set forth.



3. The combination, with the curved outwardly-pointed needle, operating substantially as described, of a vibratory work-protector, moving to and from the work at proper intervals, as set forth, the same being placed close to the needle on the barbed side thereof, and arranged to press upon the work at the time the needle is retreating, and until the needle-barb is fully withdrawn therefrom, substantially as and for the purpose shown and set forth.

4. The work-protector carried by an independent toothed segment mounted on the axis or shaft of the needle-segment, in combination with a lever-segment, cam, and spring, for operating the same, substantially in the manner set forth.

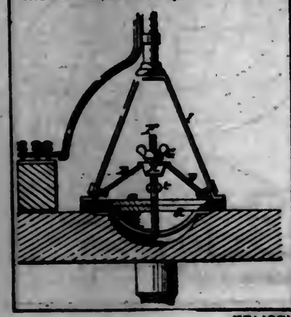
170,600.



170,546. WAGON-JACK. Charles Gray, Greene, N. Y. [Filed Nov. 18, 1875.]

In a wagon-jack having standards A A, slotted and notched as described, the lever C and pawl G, formed so that they can be folded in between the said standards, as shown in Fig. 2.

170,547. CULTIVATORS. Herman D. Green, Ithaca, N. Y., assignor to Freeman, Valentine & Green, same place. [Filed May 27, 1875.]



1. The beam a, cast in one piece, and consisting of the extensions or parts a', b, c, and g, as shown and described.

2. The beam e, constructed as shown and described, in combination with the crown beam f and h, standards i i, and handles k k', as and for the purpose set forth.

3. In a shovel-cultivator, the beam a' b and arm c, cast in one structure, in combination with the front shovel-plow, and the two rear beam and their standards l, the arm c supporting said rear standards near their top, as set forth.

170,548. MILLSTONE TRAMS AND STAFFS. Miller T. Grandstaf and Frederick Kruse, Quincy, Ill. [Filed Sept. 18, 1875.]

Brief.—By means of the set-screws the plates are adjusted, regulating the stem and cross-bar to an exactly vertical position, by which the spindle may be kept true, and the stone dressed with accuracy.

1. The bean q, cast in one piece, and consisting of the extensions or parts a', b, c, and g, as shown and described.

2. The beam e, constructed as shown and described, in combination with the crown beam f and h, standards i i, and handles k k', as and for the purpose set forth.

3. In a shovel-cultivator, the beam a' b and arm c, cast in one structure, in combination with the front shovel-plow, and the two rear beam and their standards l, the arm c supporting said rear standards near their top, as set forth.

170,549. MILLSTONE TRAMS AND STAFFS. Miller T. Grandstaf and Frederick Kruse, Quincy, Ill. [Filed Sept. 18, 1875.]

Brief.—By means of the set-screws the plates are adjusted, regulating the stem and cross-bar to an exactly vertical position, by which the spindle may be kept true, and the stone dressed with accuracy.

1. The bean q, cast in one piece, and consisting of the extensions or parts a', b, c, and g, as shown and described.

2. The beam e, constructed as shown and described, in combination with the crown beam f and h, standards i i, and handles k k', as and for the purpose set forth.

3. In a shovel-cultivator, the beam a' b and arm c, cast in one structure, in combination with the front shovel-plow, and the two rear beam and their standards l, the arm c supporting said rear standards near their top, as set forth.

170,550. MILLSTONE TRAMS AND STAFFS. Miller T. Grandstaf and Frederick Kruse, Quincy, Ill. [Filed Sept. 18, 1875.]

Brief.—By means of the set-screws the plates are adjusted, regulating the stem and cross-bar to an exactly vertical position, by which the spindle may be kept true, and the stone dressed with accuracy.

1. The beam q, cast in one piece, and consisting of the extensions or parts a', b, c, and g, as shown and described.

2. The beam e, constructed as shown and described, in combination with the crown beam f and h, standards i i, and handles k k', as and for the purpose set forth.

3. In a shovel-cultivator, the beam a' b and arm c, cast in one structure, in combination with the front shovel-plow, and the two rear beam and their standards l, the arm c supporting said rear standards near their top, as set forth.

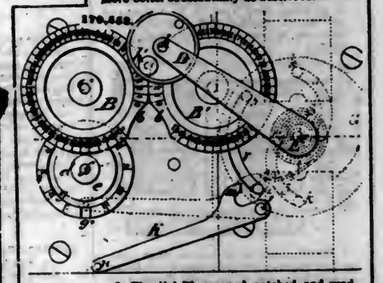
1. The plates or rim wheels a d, one of which is provided with the pawls D D, and the set-screws f f, in combination with a device for transmitting milestones erected thereon, substantially as set forth.

2. The hooked screw-rod F provided with the flanged collar H, and nut G, in combination with the pawls D D, and rims a d, with the transmitting device thereon, substantially as set forth.

170,551. SODA-WATER FOUNTAINS. Chas. Greiner, New York, N. Y. [Filed Nov. 2, 1874.]

Brief.—Securing to the cylinder portion or main body of the fountain, at each end, a metallic ring or collar by brazing or otherwise, which may be removed and renewed when worn, said ring having on its periphery the threads for holding the heads.

170,551.



The combination of the screw ring C with the head and body of a soda-fountain, said screw-ring being interposed between the head and body of the fountain, substantially as herein shown and described, for the purposes specified.

170,552. DEVICES FOR PREVENTING HORSES FROM RUNNING. Charles Gmelicher, Newark, N. J. [Filed Sept. 20, 1874.]

The blinders D D', provided with the studs d d', in combination with the strap E, provided with the rings F G, and straps H, H', and I, the whole constructed, arranged, and operated in the manner set forth

170,553.

2. The dial F', grooved, notched, and graduated, in combination with the studded and hooked arm K, and the pin p on spring-plate O, substantially as described.

3. In a time-lock, the circular plates G G', cam-slots j j, pins h h, and spring S, as and for the purposes described.

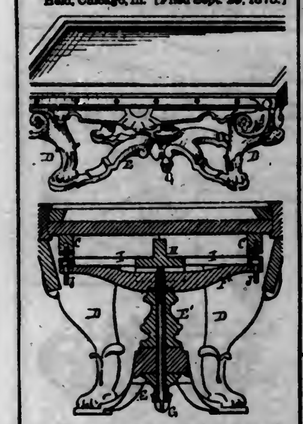
170,554. SEAT-GUARDS FOR HARVESTERS. Edward Hale, Jr., Chicago, assignor, by mesne assignments, to John H. Shay and J. E. Putman, Beardstown, Ill. [Filed Aug. 12, 1875.]

Brief.—A driver's seat for harvesting-machines, provided with an arm extending from one side partially across the seat, and a short distance in front of it, which permits the driver protected by it to enter and leave the seat without difficulty, and to stand upon the frame without danger of falling.

The guard-arm B, arranged substantially as shown and described with relation to the driver's seat A, for the purposes set forth.

170,555. TIME-LOCKS. Lewis A. Haines, Westminster, Md. [Filed Oct. 16, 1875.]

Brief.—Two graduated dials, actuated by time mechanism, and having notches in their peripheries, which will, at the proper time, release a weighted arm, and allow the bolts to be unlocked by the turning of a cam-plate. An auxiliary graduated dial, having a groove and notch in its face, combined with a gravitating-arm having a pin on one end, adapted to enter the groove in said dial, and a hooked extension on its pivoted end, which, with a stud on a spring cam-plate, will hold the bolts unlocked, and, at the expiration of a given time, will release the said stud, and allow the bolts to be locked by the recoil of the cam-plate.



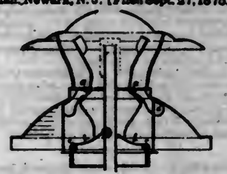
1. Graduated and numbered dials B B', adjustable on shafts C, and notched as described, in combination with weight W, pin h', arm D, shaft E, plates G G', spring S, and one or more bolts, substantially as described.

170,556. TIME-LOCKS. Lewis A. Haines, Westminster, Md. [Filed Oct. 16, 1875.]

Brief.—Two graduated dials, actuated by time mechanism, and having notches in their peripheries, which will, at the proper time, release a weighted arm, and allow the bolts to be unlocked by the turning of a cam-plate. An auxiliary graduated dial, having a groove and notch in its face, combined with a gravitating-arm having a pin on one end, adapted to enter the groove in said dial, and a hooked extension on its pivoted end, which, with a stud on a spring cam-plate, will hold the bolts unlocked, and, at the expiration of a given time, will release the said stud, and allow the bolts to be locked by the recoil of the cam-plate.

1. Graduated and numbered dials B B', adjustable on shafts C, and notched as described, in combination with weight W, pin h', arm D, shaft E, plates G G', spring S, and one or more bolts, substantially as described.

170,557. BILLIARD-TABLES. Frederick H. Held, Chicago, Ill. [Filed Sept. 29, 1875.]



1. The combination, with the legs of a billiard-table, of the frame C binding rigidly the upper ends of the said legs, and the vertically-adjustable frame C, connecting with the said frame C by set-screws, and supporting the cushion-frame and bed, substantially as described and shown.

2. The combination, with the legs of a billiard-table, of the frame F, connecting rigidly the lower ends of the said legs, the frame C connecting rigidly the upper ends of said legs, the vertically-adjustable frame C supporting the cushion-frame and bed, substantially as described and shown.

3. The pillar E', cross-brace F, screw G, center-block H, levers I, and screws J J', in combination with the frames C C' E and legs D, for leveling the bed of a billiard-table, substantially as described.

170,558. LAMP-EXTINGUISHERS. F. Hartman, Newark, N. J. [Filed Sept. 27, 1875.]

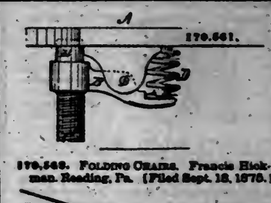
The combination, with the spring-arms a, hung to the burner and closing over the wick, of secondary arms b b, operated by shafts c, provided at their outer ends with arms or tips e, extending downward, as and for the purpose specified.

170,559. PAD-SADDLES. Simon Herr, Bluffton, Ohio. [Filed Nov. 6, 1875.]

The flexible pad-saddle, having the separated upwardly-flanged metallic plates for the reception of the back strap or band, and held in place as herein shown and described.

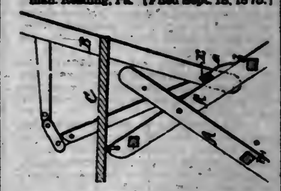
170,560.

170,560. OATMEAL-MACHINES. W. Heston, Akron, Ohio, assignor to F. Schumacher, same place. [Filed Sept. 11, 1875.]



1. The bars D, applied in relation to the plate G and knives C, substantially as and for the purpose herein before set forth.

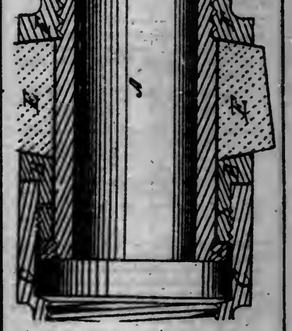
2. The combination of the bars D with the knives C and plate G, substantially as and for the purpose herein before set forth.



170,561. TILTING CHAIRS. Levi Heywood, Gardner, Mass. [Filed Jan. 7, 1875.]

In a revolving tilting chair, the combination of the arm B, step B, and swivel C with the spring D and spider A, said spider and arm being secured together at f by jointed ears, and provided with steps, constructed substantially as described.

170,561.

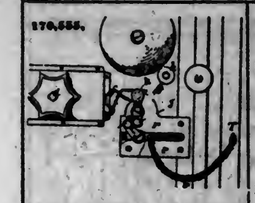


170,562. FOLDING CHAIRS. Francis Hickman, Reading, Pa. [Filed Sept. 18, 1875.]

The combination of the legs A', having catching devices a, and connected by links to the front of the seat C, the legs A hinged to the bars B, the seat C pivoted to the back-bars B, and the extended back-bars B having brace E, for engaging with the catches a, all substantially as set forth.

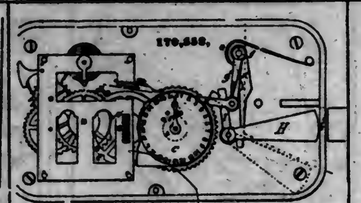
170,563. OIL-WELL PACKINGS. J. L. Hoffman, Oil City, Pa., assignor to R. R. Armor, same place. [Filed Apr. 17, 1875.]

Brief.—A rubber packing-ring applied upon a short section or joint of pipe connecting two sections of an oil-well tubing at a point intermediate to the oil and water springs, which ring is supported from below by an annular ledge, and is compressed by a suitable sliding coupler on the end of a tubular section above, actuated by the weight of the sections above, whereby the said ring is forcibly thrust against the wall of the bore, effectually closing the space between it and the tubing.

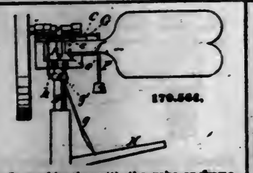


The combination of the tube A, screw-threaded at its ends, and provided with a screw-threaded flange, a, the screw-threaded annular ledge F, having an upper inclined face, packing-ring E, with inclined faces, the screw-threaded sleeve B, having an inclined flange on its lower end, and screw-threaded coupler C, all constructed and arranged as shown and described.

170,564. WINDMILLS. A. N. Hollenbeak, Genoa, Ill. [Filed Oct. 2, 1875.]



Brief.—The wheel is brought to the wind by the guide or tail vane. To stop or decrease the ordinary force or speed of the wheel, the lever or pedal is operated, which, by a chain, draws the tail-vane around, and causes the wheel to turn around and present an oblique face to the wind, thus decreasing its speed.

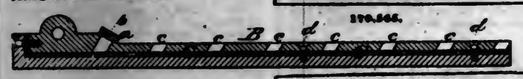


1. In combination with the brace C and friction-rollers e thereon, the chain G, united at one end to the head-operating mechanism, and at the other to the tail-vane and gravity-lever, as and for the purposes described.

170,555.

170,552.

2. In combination with the yoke or frame C O', the bent arm or brace O', secured at each end in the top part of the yoke, and provided with friction-rollers e and bearing r for the tail-vane, as described.

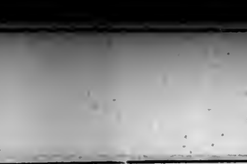


3. In combination with the frame or yoke C, the arm f', secured to the frame C, forming the lower pivot-bearing r' for the tail-vane and pivot-bearing for the gravity-lever F W, as described.

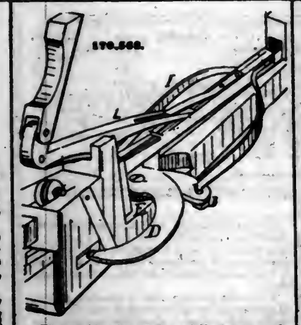
4. The controlling or guiding mechanism, consisting of lever H, connection g, yoke f', arms h, chain G, connected to tail-vane and gravity-weight, and pivoted lever gravity-weight F W, all constructed, arranged, and adapted to operate substantially as described.

5. The combination, in a windmill, of yoke C, brace O', and arm f', for supporting the tail-vane and wind-wheel upon its support, as described.

170,565. HARNESS-CUTTERS. P. Howell, Buena Vista, Pa. [Filed Oct. 2, 1875.]



Brief.—Improved means for detachably securing the knives to the bar.



1. In combination with the bar A, constructed with inclined legs c, the locking-bar B and blades C, substantially as described.

2. The adjusting-screw f and fastenings e b d, combined with the bars A B, substantially in the manner and for the purpose described.

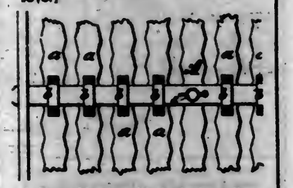
170,566. WHEEL-HUBS. John Hyman, Belvidere, N. J., assignor of two-thirds his right to Almon Warner, same place. [Filed Oct. 26, 1875.]

The wooden hub or box A, having the wedge-shaped partitions a a a, embraced by the spokes C, in combination with the band B, having the wedge-shaped partitions b b b, uniting with the partitions a a a in securing the spokes in place, substantially as and for the purpose set forth.

170,568.

The combination of the rod K, three-armed lever L, springs l, spring m, and levers D D', as described.

170,569. FODDER-CUTTERS. T. B. Lamb, Lowell, Mich. [Filed Sept. 16, 1875.]



1. The combination of the hook-plates c, pin f, L-shaped pawl p, pawl h, and spring t, when the several parts are constructed and arranged substantially as described and shown.

170,569.

2. The braces s s' s'', their adjusting-bolts r, and spring-catch v on the wheel D, in combination with the loops v v' v'' on the knife F, for securing the latter to said wheel, substantially as described.

3. In a fodder-cutter, substantially as described, the combination, with the frame A and box B, of the following elements: the shaft C, journaled on one side of the frame and having the cutter-carrying wheel on its outer end, the cross-shaft a, the adjustable crank e, attached to one end of the said cross-shaft, the rod f, the rocker h, and the rods j, when the several parts are constructed and arranged to operate substantially as described and shown.

170,570. GRATES FOR FURNACES. John B. Larkin, Pittsburg, Pa. [Filed Aug. 26, 1875.]

1. In combination with the horizontally-reciprocating bars of a grate, having openings formed therein, as described, the detachable vibrating and retaining lever B, passing through said openings from the front.

2. The combination of the fulcrum-bar A, horizontally-reciprocating bars a, having openings b, and the vibrating and retaining lever B, pivoted to the bar A, passing through the openings b from the front, and detachable from the grate, substantially as described.

170,572. BLASTO FANNER. Moses H. Leonard and John H. Buckley, East Hampton, Mass. [Filed Nov. 1, 1875.]

Brief.—By dispensing with the ordinary terry warp-threads over the selvage-cord, it is held more securely by the weft-threads, and a corded edge on the fabric is avoided.

A fabric having its central elastic cords covered by auxiliary warp-stock, substantially as described, and its edge-cords by weft-threads only, substantially as described.

170,569.

170,571. BED-CLOTHES HOLDERS. James Lamb, Warren, Pa., assignor of one-half his right to R. Dennison, same place. [Filed Aug. 27, 1875.]

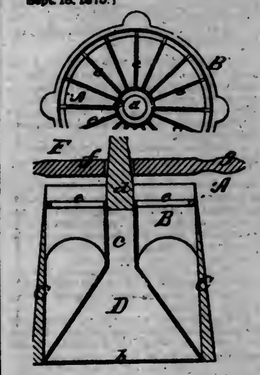
170,567. VAULT-COVERS. J. K. Ingalls, New York, N. Y. [Filed Nov. 2, 1875.]

In a vault-cover composed mainly of metal and glass, the combination of the lenses B B, having a concave upper surface, and the safety-rings b b, surrounding said lenses, and rising above their level, as shown, to protect them from abrasion, and prevent the loosening of the cement, substantially as specified.

170,573. CAR-COUPLERS. Chas. Johnson, Leesburg, Iowa, assignor of one-half his right to Wm. Schuls, same place. [Filed Aug. 21, 1875.]

Brief.—The sliding rod works the spring-jaws.

170,574. GAGES FOR SHEARS. John Lamb, Jeffersonville, N. Y. [Filed Jan. 16, 1875.]



1. The within-described gage, consisting of the double bar A, having graduations on its upper surface, and a groove at one end, substantially as and for the purpose set forth.

2. The graduated double bar A, provided with the slide D and spring-jaw E, substantially as shown and described.

170,575. BED-CLOTHES HOLDERS. James Lamb, Warren, Pa., assignor of one-half his right to R. Dennison, same place. [Filed Aug. 27, 1875.]

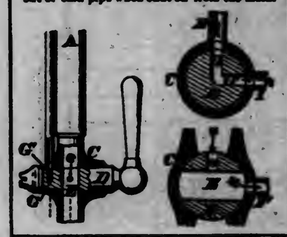
The improved device hereinbefore described, consisting of the elastic band A, rings a a', tapes or cords B, and spring-guard hook C, said parts being connected for use in the manner set forth.

170,576. APPLE CORERS AND SLICERS. H. W. Little, Limestone Farm, Va. [Filed Sept. 18, 1875.]

1. The forcing implement F, consisting of a flat centrally-perforated portion, f, and the operating-handles g, adapted for use substantially as set forth.

2. In combination with a stand, B, having radial cutting-blades c, the conical deflector D, provided with stem e d, substantially as specified.

3. The combination of the tubular stand B, having notched annulus A, and the conical deflector D, having grooved stem d, with the radial blades c, substantially as specified.

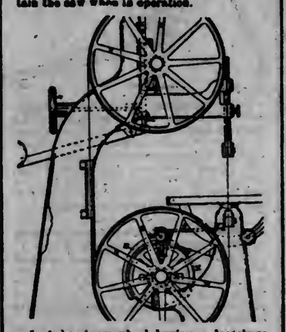


170,578. LOCKS FOR SEWING-MACHINES. Chas. Oppen, &c. John B. Logan, Baltimore, Md. [Filed Apr. 30, 1875.]

In a lock, the combination of the bent plate a and countersunk plate b, forming the latch-case, with the lever-bolt d, cam f, and screw k, said screw forming the pivot of the lever-bolt, uniting and holding in position the parts of the lock, securing it to the article upon which it is used, and regulating the action of the bolt, substantially as specified.

170,579. STOP AND WASTE COCKS. Robert J. Malcolm, Cincinnati, Ohio. [Filed Oct. 6, 1875.]

Brief.—The cock is provided with a waste-opening and with a vent leading to the upper part of the pipe, so that the water may flow out of said pipe when shut off from the main.



The combination, with a common water-pipe, A, of the stop, vent, and waste valve or cock C D E a G G', exits F and I, and air-passage H, the whole being adapted to operate as set forth

---

170,577. BAND SAWING-MACHINES. Wm. O. Margedant, Hamilton, Ohio, assignor to Bentel, Margedant & Co., same place. [Filed Nov. 16, 1875.]

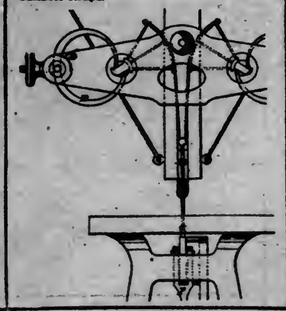
Brief.—One of the pulleys of the band-saw is provided with a loosely-revolving ring, upon which the saw is carried, and a brake bearing upon the outer and inner sides of the pulley is attached to and is operated by the belt-shifter. The saw guide is provided with a series of spherical bearing-surfaces, which sustain the saw when in operation.

1. A band saw wheel having a loosely-revolving face, periphery, or rim, as and for the purpose described.

2. The combination, with the driving-pulley and actuating mechanism of a band-saw, of the double-acting brake F, arranged to clamp the wheel upon opposite sides of its periphery to avoid straining the shaft, substantially as described.

3. The combination, with the brake F and the lever f', of the link G, band-shifter E', and rod E, as and for the purpose described.

4. The combination, with the band-saw blade, of one or more spherical back-thrust guides, for the purpose described.



5. The combination, with spherical back-thrust guides i, of the eccentrically-located book screws, as and for the purpose described.

6. The combination, with the spherical guides i and the eccentrically-located back screws, of perforated intermediate washers K, as and for the purpose described.

7. The combination of the idler band-saw wheel-shaft with the sliding carriage a', the toothed plate O, and the worm or screw b', as and for the purpose described.

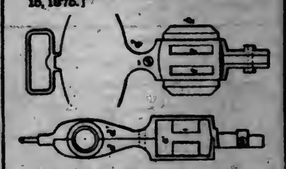
170,580. SCROLL-SAWING MACHINES. Wm. O. Margedant, Hamilton, Ohio, assignor to Bentel, Margedant & Co., same place. [Filed July 28, 1875.]

Brief.—The saw is strained by means of springs, the connection between the springs and saw being made by vibrating levers and suitable straps.

---

1. In a scroll-saw, a straining or spring device consisting of a bar of steel or other suitable material, bent in such a form that both ends of the spring are in close proximity, in combination with a lever of suitable form inserted between the ends of the spring, as described, so that the action of the spring is transmitted to the lever, and transformed thereby into a reciprocating motion, substantially as described.

2. In a scroll-saw, a spring formed of a bar of steel or suitable material, bent as described, so that the ends of the bar come in close proximity, in combination with a lever which swivels on an independent fulcrum, while one end of the spring is active in front, and the other end of the spring is active on the opposite side of the fulcrum of the lever, substantially as described.



3. The slides formed of plates M M', in combination with the hollow pitman-pin, having holes a, the washers O, and screws X', as arranged, and for the purpose specified.

170,582. CLOTHES-PINS. Henry H. Mann, Springfield, Vt. [Filed Oct. 4, 1875.]

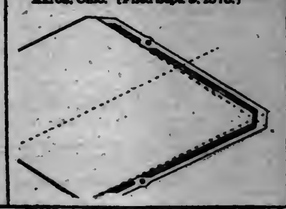
The herein-described clothes-pin, having the recessed parts A combined with a V-shaped spring, B, by means of pins passed through said parts A, and fitting in indentations in said spring, the whole constructed substantially as shown and described.

170,583. LOOM-PICKERS. Henry McManus, New York, N. Y., assignor to himself and C. H. L. Holmes, same place. [Filed May 15, 1875.]

1. The beating-block for pickers formed of paper or paper composition, as set forth.

2. The paper beating-block b, detachable from the shell, as set forth.

3. The shell consisting of sections d d', inclosing sockets e e', as described.



4. A bearing-block consisting of paper or papier-maché, adapted to the ends or shell of a picker, as specified.

5. A picker in which the bearing or beating block, or both, consist of paper or paper composition, as described.

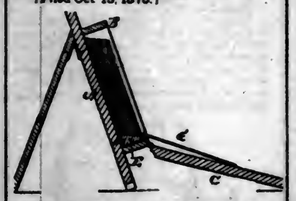
170,581. LUBRICATING COMPOUNDS. John F. Mendonca, Springfield, Ill. [Filed Oct. 11, 1875.]

The lubricant, prepared in the manner and consisting of pure soft water, lye, borax, tallow, fire-clay, sulphur, black lead, and rock-salt, substantially in the proportions named.

170,582. TILES. Calvin J. Merrill, Upper Alton, Ill., assignor to Henry R. Merrill, Akron, Ohio. [Filed Sept. 9, 1875.]

An earthenware roofing-tile, the lower half whereof, with reference to a central transverse line, has a flange projecting downward along its edges, and a corresponding upward flange along the edges of the upper half, the sides of the lower half projecting downward at a certain angle with said central transverse line, and meeting in a point at the bottom, forming a triangle, and the sides of the upper half project upward at a greater angle with said central line, so that they do not meet at the top, but form a triangle truncated at its summit, for the purpose described.

170,582. TIRE-TIGHTENER. E. I. Moore, Niles, Ohio. [Filed Oct. 23, 1875.]



1. The combination of the jaws A A', adapted to be clamped around the spoke of a wheel, with the jack-pins D' D', adapted to set under the edges of the felly, and cam-levers F F, for operating the same to raise the felly for the purpose of applying a washer to the spoke, substantially as described.

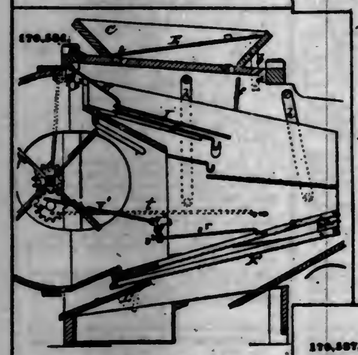
2. The combination of the stationary and movable jaws A A', the ways B B, the removable cross-head C, and screw D for the purpose of clamping the apparatus to the spoke, substantially as described.

3. The combination of the jaws A A', the ways B B, the cross-head C, and screw D, the jack-pins D' D', and the cam-levers F F, the whole constructed and arranged to operate substantially as described.

170,583. PICTURE-HOLDER. Francis P. Perkins and Walter S. Dodds, Elgin, Ill. [Filed Oct 13, 1875.]

1. In a photograph or other picture receptacle, the triangular block or bar E, having the leaves O attached to the inclined top thereof by means of flexible hinges *e*, substantially as and for the purposes herein set forth.

2. The combination of the back A, box B, front C, triangular block E, flexible hinges *e*, and leaves O, all constructed substantially as and for the purposes herein set forth.



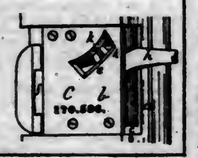
170,584. SAW-HOLDER. Henry C. Perry, Wilkesbarre, Pa. [Filed July 14, 1875.]

Brief.—A suitable case contains a presser-bar, having a notched shank and an operating-lever, and is provided with a sliding key, which works in a mortise or carved slot in the outer shell of the case, serving as a ready means of locking the device.

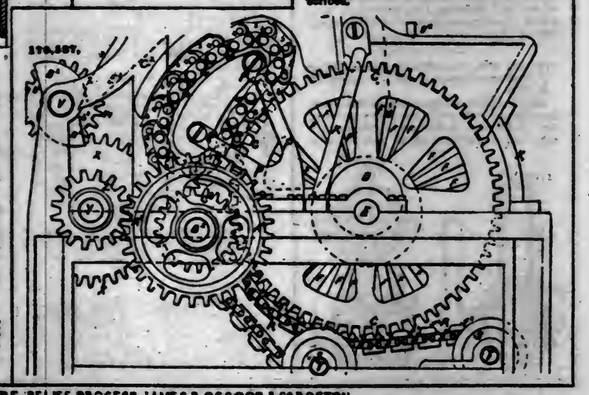
The combination, with the presser-bar D, having the shank *f* and notch *g*, and the lever A, of the plate *c*, having chamber *d*, the cap *b*, having mortise *e*, and the sliding key E, all arranged and operating substantially as and for the purpose set forth.

170,585. GRAIN-SEPARATOR. Charles B. Nichols, Troy, Pa. [Filed Oct. 20, 1875.]

Brief.—Improvement in the feeding devices, and means for actuating the moving parts of a grain-separator.



1. In a grain-separator, the hinged hopper C, provided with front and rear discharge-openings *d d* and hinged bars *b b*, in combination with the plate *a a*, substantially as and for the purposes herein set forth.



2. The reversible inclined false bottom E, having opening *e*, in combination with the hinged hopper C, having front and rear discharge-openings, substantially as and for the purposes herein set forth.

3. The combination of the screw K K', rocking arms *o o* connecting the same, rod *o'*, rocking shaft *p'* with arms *r' r'*, pinion *r'*, and plates *q*, all substantially as and for the purposes herein set forth.

4. In a flouring-mill, the combination of the fan-shaft *n* and the bar N, provided with a central tube, *k*, placed loosely on the shaft and movable and when thereon, for the purposes herein set forth.

170,587. MACHINES FOR MAKING COAL-DUST, &c., INTO BLOCKS. Moses M. Potter, Worcester, Mass. [Filed July 15, 1875.]

Brief.—Molds are arranged in lateral series around the periphery of a drum revolved by tooth-gearing. An inner eccentric operates the plungers. The material, received from the hopper, passes under a tilted presser to places on an endless chain revolving round a block, to resist the outward pressure of the plungers, and is finally expelled into troughs carried by another endless chain.

1. The combination, with a continuous rotating mold-wheel, of a driver for filling its molds, which is arranged for a reciprocating movement toward and away from the mold-wheel, and without contact with and entrance into the molds of the mold-wheel, all substantially as described.

2. The combination, with a continuous rotating mold-wheel, in the molds of which plungers are arranged to act, substantially as herein described, of an endless series of pans or troughs E, for receiving the molded blocks as discharged from the mold-wheel by the plungers, which series of pans is arranged to lie about the wheel, and to move continuously along and in the same direction therewith, substantially as herein described.

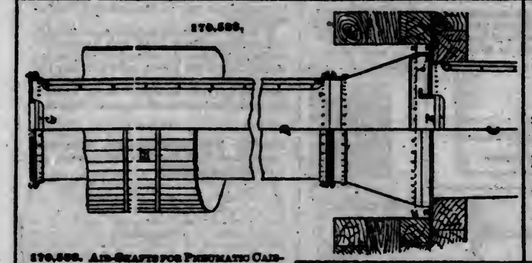
3. Blades *d'*, arranged to channel the material in the hopper in advance of walls or partitions *e'* therein, substantially as and for the purpose described.

4. A continuous rotating mold-wheel, in combination with plungers adapted to move through its molds, and to be operated by the eccentric rotation of their carrier relatively to the axis of rotation of the mold-wheel, substantially as and for the purpose specified.

5. The combination, with a continuous rotating mold-wheel, of a continuous rotating carrier for the plungers of the mold-wheel, which rotates about an axis eccentric to that of the mold-wheel, and is connected with its mold-wheel by an interlock, constructed and arranged substantially as herein described, and for the operation of the plunger-carrier relatively to the mold-wheel herein described, for the purpose specified.

6. The combination, in one machine, of a continuous rotating mold-wheel, B, which has plungers F arranged to travel in its molds, a driver, I, an endless series of pressure-plates, *c*, and an endless series of pans or troughs, E, each and all arranged together for a co-operative action, substantially as described, for the purpose specified.

7. The rolls *o*, extending across the width of the pressure-plates *c*, and interposed between each plates and blocks *c*, around which the plates travel, substantially as described, and for the purpose specified.



8. The pressure-plates *c*, having the extensions or legs for an interlock, by which to drive them about the block or form, substantially as described.

9. The angular working-faces *o* of the plunger, substantially as and for the purpose specified.

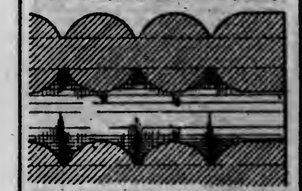
10. The beveled edges *g* of the plungers, substantially as described, for the purpose set forth.

11. The cam D' and lever F', in combination with a driver, I, substantially as described.

170,588.

170,589. AIR-SHAFTS FOR PNEUMATIC CAISSONS. Willard S. Pope, Detroit, Mich. [Filed Nov. 19, 1875.]

1. The combination of the exterior enveloping tube or barrel H with the air shaft or lock, substantially as and for the purposes set forth.



2. The combination of an air shaft or lock, D, provided with a cap-plate having a man-hole and gate, G, with an exterior barrel, H, the several parts being constructed and arranged substantially as described and shown.

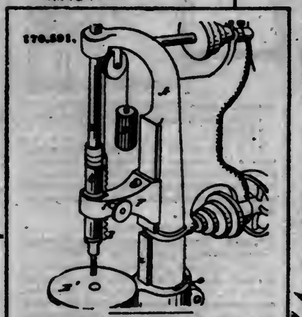
170,590. BALE-TIES. Amos N. Powell, Alvarado, Tex. [Filed Oct. 23, 1875.]

A pair of hooks, *b b'*, attached to the respective ends of a hoop-iron band, E, so as to project on opposite sides at the extremities of the same, in combination with slots *c c'* behind the respective hooks in both ends of the band, substantially as herein shown and described, for the purposes set forth.

170,590. RUBBER STRAINER. Daniel B. Pratt, New York, N. Y. [Filed Nov. 8, 1875.]

1. As a railway-car spring, the double ribs or projections *a a* and *a' a'*, of circular or spiral form, when constructed or arranged in the manner and for the purpose herein described.

2. As a car-spring, the combination of the ribs *a a a' a'*, with the web *a''* operating the two, in the manner and for the purpose herein described.



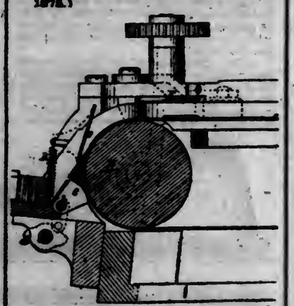
170,591. METAL-DRILLING MACHINES. S. W. Putnam, Fitchburg, Mass. [Filed Oct. 12, 1875.]

Brief.—The bearings for the pulley-shafts are split, and are adjusted to take up wear by screws. A flexible wedge is placed between the split portion of each bearing, and said wedge being an absorbent, it will set, when compressed, so as automatic lubricator to the shaft. Adjustable gibs are provided to take up wear between the post and the bearing to the work-holding table.

1. In an upright drill the combination, with the spindle, of a balancing device, consisting of the collar C and weight B, connected by a cord, the collar *c* and nut *b*, whereby the drill is prevented from dropping, substantially as above described.

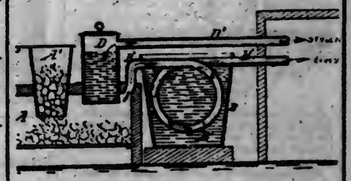
2. The drilling-table E', provided with the supporting-arm F', in combination with the frame A and gibs *e e'*, substantially as and for the purpose set forth.

3. The split boxes *m*, in combination with the flexible wedge *n*, substantially as and for the purpose set forth.



170,592. PERFUME-FOUNTAINS. Emil Roth, Hoboken, N. J. [Filed Nov. 4, 1875.]

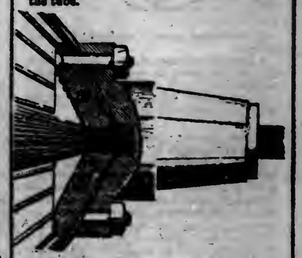
Brief.—The circumferential groove and the outlet shown permit the liquid ascending between the plunger and the barrel to return to that in the bottle.



The combination, with a bottle, A, of the barrel B, provided with a waste-hole, F, the plunger C, spring H, suction-pipe K, discharge-spout G, and valves L K, all constructed and operating substantially as described.

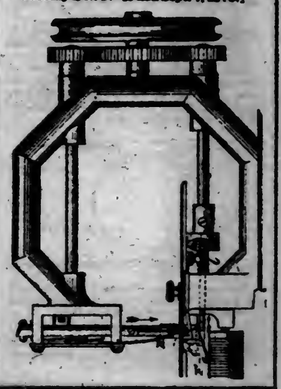
170,593. TYPE-SETTING MACHINES. A. C. Richards, New York, N. Y. [Filed Feb. 9, 1875.]

The combination, with the type-receiving channel F, of the oscillating finger *e*, inclined plane *b*, and vibrating stop *c*, for preventing the type sliding down the inclined plane while the oscillating finger is delivering the type received into the type-channel, substantially as and for the purpose described.

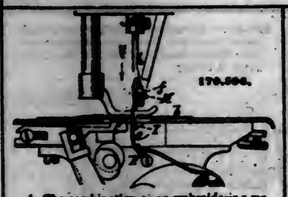


170,594. APPARATUS FOR TREATING CARBONIC ACID FOR HARDENING CEMENT, &c. Geo. Richardson, Milwaukee, Wis. [Filed Aug. 3, 1871.]

In an apparatus for hardening or curing artificial stone, the tank or vessel B, intervening between the gas-generating furnace A and the hardening-chamber C, and containing flowing water, in combination with the gas-conducting pipe D', in part immersed therein, substantially as and for the purpose specified.



170,595. TUBES FOR FORMING HOSES. John Rimer, Easton, Pa. [Filed May 3, 1875.]



Brief.—In addition to the ordinary gage-plate provided with holes, there is combined with the condensing-tube of a rope-machine an annular plate, having its inner circumference corresponding in size to the bore of the tube. The outer strands pass over the periphery of this plate, while the inner ones pass through the central opening. The former are then prevented from winding upon the latter, as the same are twisted prior to entering the tube.

In combination with the condensing-tube A, having a flaring mouth, the annular plate D, arranged between the central and outer series of strands forming the cord, to prevent the outer series from winding upon the central strands as the same are twisted prior to entering the condensing-tube, as specified.

170,596. MACHINES FOR REMOVING FABRICS. Reuben M. Rees, Williamsburg, Brooklyn, N. Y. [Filed Sept. 7, 1875.]

1. The combination, in an embroidering-machine, of the pointed latch-needle, with the latch-opener H and latch-closer I, for catching and releasing the thread, substantially as described.

2. The combination of the needle G, provided with reversible latch, the latch opener and closer, and the reciprocating thread-guide F, the whole constructed to operate substantially as described.

3. The combination with the reciprocating latch-needle, and latch opener and closer, the reciprocating thread-guide F, and the feed device C, the whole constructed and arranged to operate substantially as described.

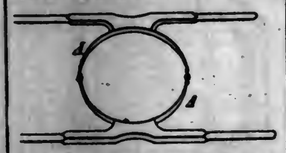
170,597. BALE-TIES. Elbert O. Schorten and John H. Gardner, New Orleans, La. [Filed Nov. 6, 1875.]

1. The slotted collar D, substantially as described.

2. The combination of the clamping-lever B with the collar D, substantially as described.

3. The measure gage E, combined with the collar D, substantially as described.

170,598. HINGES. John B. Shields, Norfolk, Va. [Filed Sept. 20, 1875.]



Brief.—A recess extending to the tip of one leaf receives a lug upon the pintle, and when this leaf is folded against the other one, the lug is held under a projection upon it. Thus the pintle is prevented from working up.

In a butt-hinge, the combination of the recess *e*, extending to the top of the leaf A, the lug *a* on leaf B, and the lug *p* on the connecting-pin, substantially as specified.

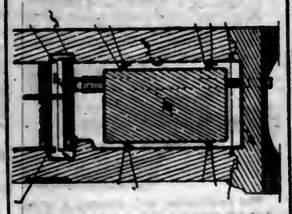
170,599. BARREL-LIFTING MACHINE. A. J. Small, Woodstock, Canada. [Filed June 21, 1875.]

Brief.—The hoop is hinged, as shown, allowing of motion toward the barrel on each side. The handles for leverage to the hoop hold firmly to the barrel below the bulge, and permit easy transportation.

The combination of the hinged hoop A and the handles A, substantially as described, and for the purposes herein before set forth.

170,600. BLASTING-CARTRIDGES. Friend W. Smith and Fredrick Egge, Bridgeport, Conn. [Filed Nov. 18, 1875.]

A blasting-cartridge, made of flexible material in tapering form, having an interior cup of rigid material formed down into the same, substantially as set forth.

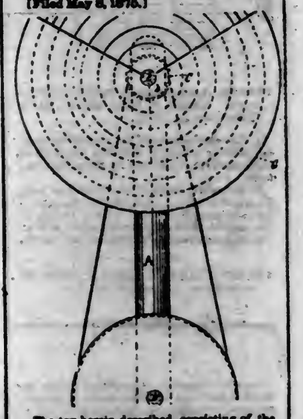


170,601. MOTH-TRAPS FOR BEE-HIVES. W. H. Spurlin, Hawkinsville, Ga. [Filed Oct. 17, 1873.]

As a new article of manufacture, a moth-trap to be attached to a bee-hive, consisting of the box A, provided with the downwardly-inclined moth-stop B and moth-entrance tubes *c*, the top of the box A being closed by a reticulated cover, *d*.

170,602. REFRIGERATORS. B. A. Stevens, Toledo, Ohio. [Filed Sept. 16, 1875.]

Brief.—Central partition and shelves removable, and detachable ice-pan set in recesses in the side, to catch drip therefrom, also removable downward through the casing and door. The lining turned into the joints, which are also rabbeted.

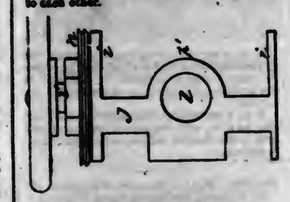


1. The combination, substantially as hereinbefore set forth, of the side walls, having recesses *f f*, and the removable ice-pan inserted in the recesses, and projecting therein beyond the surface of the walls, to catch the drippings.

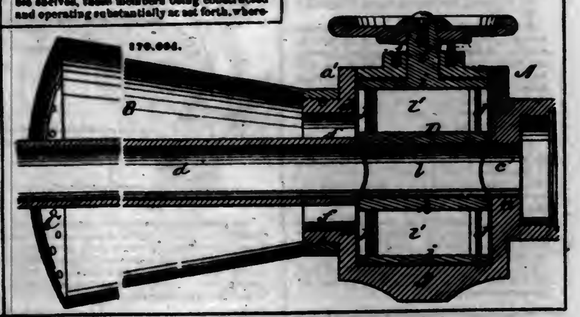
2. The combination, substantially as hereinbefore set forth, of the recessed side walls, the ice-pan inserted in the recesses, the lips projecting downwardly from the recesses, the end walls, and the hoods overhanging the ends of the pan, whereby the drippings are caught, while allowing the air to circulate freely around the ends of the pan.

3. The combination of the box or case, its side walls, the ice pan supported thereby, the removable central partition, and the removable shelves, these members being constructed and operating substantially as set forth, whereby the ice-pan may be removed and inserted from below.

4. The refrigerator constructed, substantially as herein before set forth, with a bottom recessed on its upper side, a flanged lining resting thereon, side walls jointed upon the base, and the flanged lining secured upon the walls and abutting against the bottom lining, whereby the lining-joint is formed above the bottom.



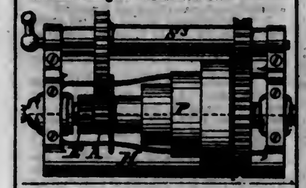
170,603. TOY CHROMATROPES. Robt. Steel and Thos. P. McCadden, Philadelphia, Pa. [Filed May 6, 1875.]



The toy herein described, consisting of the disk F, segmental disk G, pulley O, hub S, and band-wheel D, all constructed and arranged to operate substantially as and for the purpose set forth.

170,604. HOSE-NOZZLES. Jeremiah Toomey, Woonsocket, R. I. [Filed Sept. 20, 1875.]

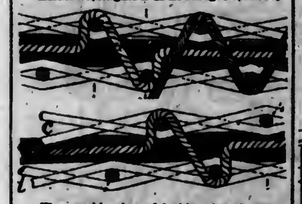
Brief.—The body of this hose-nozzle consists of two tubular branches, crossing each other at right angles, and communicating. One of them is provided at one end with a female screw thread, by means of which it is coupled to a hose-pipe. To its other end is attached a rose-sprinkler and jet-pipe. Within the other branch is introduced a valve having openings at right angles to each other, and semi-cylindrical surfaces, also at right angles to each other.



In a cut-off hose-nozzle the combination, with the body A, having inclined *o'*, induction-openings *p'*, and piped, and thereto chamber B, of the rotating valve D, having openings *l* and *l'* on equal angles to each other, and the semi-cylindrical surfaces *p p'*, also at right angles to each other, substantially as specified.

170,605. BOOTH-LASTER. William Tucker, Philadelphia, Miss. [Filed May 17, 1875.]

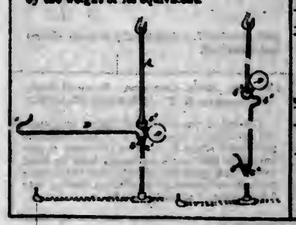
Brief.—The gear-wheel is fast to the spindle, and may, at will, be fastened to the cone-pulley. The gear-wheel A is integral with the cone-pulley, and the feed-gear B may, by virtue of pins projecting one from each side, be connected, at will, either to the pulley-gear A, or to a flange on a sleeve that is fast to the spindle. The gears are upon an eccentrically-journaled shaft, and may be removed from contact with gears when desirable.



1. The feed-gear B, adapted to be attached at will either to the primary spindle or to the cone direct, substantially as described, for the purpose set forth.

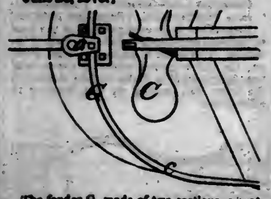
2. The combination, in an engine-lathe, of a primary spindle, A, a cone or cone-pulley, F, back gears A B O D, and a feed-gear B, adapted to be attached at will either to the spindle or to the cone direct, as herein described, for the purpose specified.

3. The bushing F, having the perforated flange *b* and groove *g g'*, the spring *c*, having the detent-head *f*, the double-ended clutch-pin *e*, and the detent-hole *o* in the cone-gear A, in combination with the primary spindle, cone, and feed-gear of an engine-lathe, as herein shown and described, for the purposes set forth.



170,606. ELASTIC FABRICS. Archd. Turner, Leicester, England. [Filed Aug. 20, 1875.]

The combination of locking-threads with the binder warp-threads, the fine or back warp weft-threads, and rubber strands, as herein set forth, for the purpose of locking the rubber strands in their tubes, and preventing them from running up in the fabric when broken, as above described.



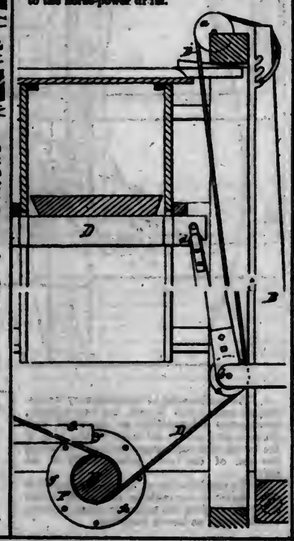
170,607. LAMP-PENDANTS. W. M. Underhill, Oconto, Wis. [Filed July 10, 1875.]

Brief.—The pendant may be pendent from either the loop or the hook. In the former case the rod is kept in a horizontal position by the weight or its equivalent.

The rod B, provided with an eye, *b'*, a head or loop, *b'*, a hook, *b'*, and a balancing-weight, D, or its equivalent, in combination with the stem A, by which it is suspended, and with the pendent C of a lamp, substantially as herein shown and described.

170,608. GUARDS FOR SCREW-PROPELLERS. H. G. Wagner, Georgetown, D. C. [Filed June 26, 1875.]

The feeder G, made of two sections, *e e*, attached at their outer ends to the lower end of the stern-post E, and at their inner ends to the lower part of the hull, and surrounding and guarding the screw-propeller C, substantially as described.



170,609. HORSESHOE-BLANKS. James T. Walker, Albany, N. Y. [Filed Aug. 20, 1875.]

A horseshoe-blank formed with a longitudinal raised projection at or near the center, longitudinally and transversely, to form a register to insure its proper position in the bending-machine, substantially as set forth.

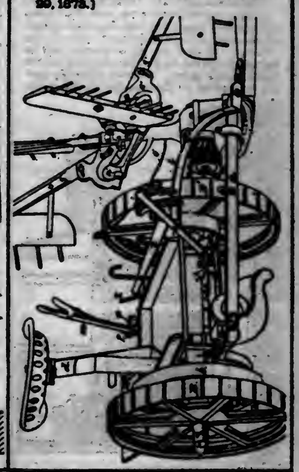
170,610. COTTON-PICKERS. W. W. Wallace, Meshaneville, Tex. [Filed Nov. 3, 1875.]

Brief.—The fallower is raised by the ends of levers pivoted thereto, their other ends being pivoted to points below the center of other levers of the full height of, and pivoted to the bottom of the press. The winding-ropes, being attached to the top of these long levers, pass around pulleys on them at their intersection with the short levers, thence to the horse-power drum.

170,611. BOOTS AND SHOES. F. O. Ward, Philadelphia, Pa., assignor of one-half his right to L. Murr, same place. [Filed Nov. 15, 1875.]

Brief.—A small piece of elastic gore-cloth is inserted in the heel portion just above the counter, to prevent the breaking of the upper at that point.

The combination, with the upon A, of the elastic gore B inserted in the hind quarter at the top of the heel or heel-stiffening, as herein set forth, and for the purpose described.



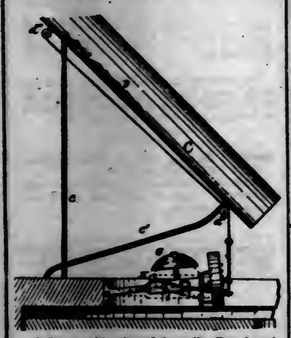
170,612. GRATES. Geo. Wellhouse, Akron, Ohio. [Filed Nov. 9, 1875.]

Brief.—The catch acts automatically to retain the drop plate or door when raised to a horizontal position.

The combination, in a stove-grate, of a rim adapted to rotate for shaking out the ashes, and having inwardly-projecting arms *f* and recess F, with the drop-plate B, pivoted in said recess, and having a rearwardly-projecting arm, and the pivoted gravitating-catch G, substantially as shown and described, for the object herein set forth.

170,613. HARVESTER-RAKES. William H. Whitsley, Springfield, Ohio. [Filed Dec. 20, 1875.]

1. The combination of the shaft *c* with the bevel-wheel *n*, and the column *r* provided with arched feet *t*, and the bridge-plate *q*, whereby the lower stop or bearing of said shaft is in said bridge-plate and below said bevel-wheel, as set forth.



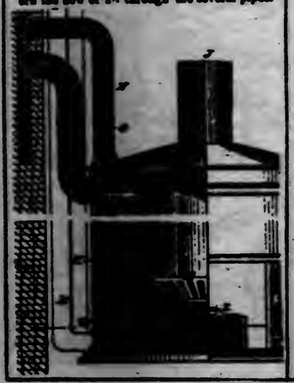
2. The switch *f* and the bridge *h* moving upon an oblique axis, which, if prolonged, would cut the orbit of the joint-bolt *f*, as and for the purposes set forth.

3. The switch *f* and the bridge *h*, constructed with a hinge-joint and mounted upon a single stud, as set forth.

4. The combination, with the bevel-wheel *n* and its bearings in the bridge-plate, of the bevel sprocket-pinion *p*, and its spindle *o'*, secured to and projecting laterally from the edge of said bridge, as set forth.

170,614. GRIST-ALARMS. D. T. Williams, Hennepin County, Minn. [Filed Oct. 12, 1875.]

Brief.—When grain ceases to bear on pallet in the conduit-pipe, the suspended wheel falls upon ratchet, and by contact therewith revolves and gives the alarm by means of a projecting staple and hammer of bell.

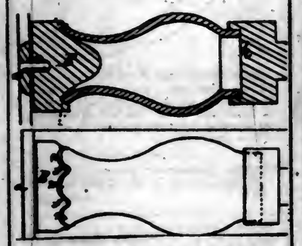


1. The combination of the pallet *D* and cord *d* with the wheel *E* on bisqued axle *F*, constructed to operate as described.

2. The combination of the pallet *D*, cord *d*, wheel *E*, with staple *c*, and millstone *A* with the hammer *H* and gong *G*, and their intermediate actuating parts, substantially as described.

170,615. VENTILATING AND HEATING FURNACES. John A. Young, St. Louis, Mo., assignor of one-half his right to Wm. F. Cozzens, same place. [Filed Sept. 9, 1875.]

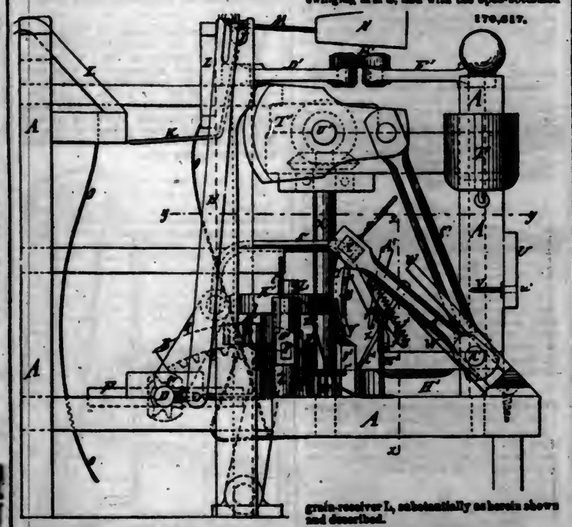
Brief.—Air is drawn from near the bottom of the room, passes through the outer or foul-air chamber of the furnace, and thence to the chimney. In case the air be pure it may be delivered into the hot-air chamber, and thence to the rooms above. Suitable dampers govern the flow of air through the several pipes.



---

1. The foul-air chamber K, surrounding wholly or in part the warm-air chamber G and fire chamber C, with its pipes M and N, in combination with the pipes H and J, substantially as and for the purposes set forth.

2. The combination of chambers G and K, air-pipes H J M N, and dampers I O U with a furnace, E B, substantially as set forth.



170,616. MACHINES FOR FLARING AND CURLING LAMP-ORNAMENTS. Paul Zimmerman, Pittsburg, Pa. [Filed Nov. 11, 1875.]

Brief.—The inner configuration of the head of the tool corresponds to the outer form of the article. This latter is made on a fluted mold, and the tool is passed onto it in a true axial line, by reason of a round handle thereon in the same line, resting on and working in guide-posts.

The combination of the snap or tool C, guide-frame A, and "former" or cone B, substantially as and for the purpose described.

170,617. GRAIN-BINDERS. John J. Atwater, Medford, Minn. [Filed Feb. 20, 1875.]

1. The combination of the stationary wedge-shaped rest or arm X with the twine-clamp, constructed substantially as described, and the swinging arm S, for inserting the body of the twine into said clamp without releasing the end of the twine, substantially as set forth.

2. The combination of the spring-stop P R with the revolving table or rock-shaft D and crank Q, carrying the twine-clamping devices, substantially as herein described.

3. The combination of the grooved standard Z, the plate A', the hook-bar L F, spring M', crank-wheel K', and gear-wheel F' with each other, for forming the loop in the twine, substantially as herein shown and described.

4. The combination of the clamp O', sliding bar E', and the eccentric J' with the grooved standard Z and the gear-wheel F', for holding the loop in place upon the standard Z, substantially as herein shown and described.

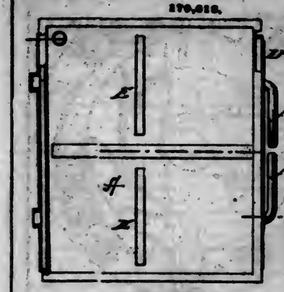
5. The slotted needle Y, and its stationary stop *p'* and spring *p'*, the needle-frame P' Q' R' S', the crank T', and the inclined guide-rock W, in combination with the grooved standard Z, for passing the ends of the twine through the loop, substantially as herein shown and described.

6. The combination of the spring S' with the grooved standard Z and with the needle Y, for pushing the loop from the said standard and holding the ends of the twine, substantially as herein shown and described.

7. The combination of the inclined guide-stop *p'* with the needle Y, and its stationary guard-stop *p'*, and spring *p'*, for uncovering the slot of said needle, substantially as herein shown and described.

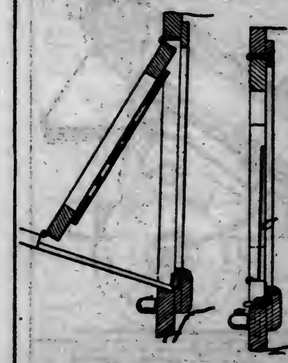
8. The combination of the pivoted U-bar B' and the stops *b'* C' D' with the grooved standard Z, the clamp O', the needle Y, and the needle-frame P' Q' R' S', for withdrawing the ends of the twine from the eye of the needle, substantially as herein shown and described.

9. The combination of the rack B, the segmental gear-wheels B' H', the upright shafts C' G', the cranks D' F', and the connecting-rod E' with the gear-wheel I', for operating the hook-bar L' and the clamp O', substantially as herein shown and described.



10. The combination of the segmental gear-wheel Y', the upright shaft X', the bevel-gear wheels W' V', and the horizontal shaft U' with the segmental gear-wheel H' and the crank T', for operating the needle-frame and needle, substantially as herein shown and described.

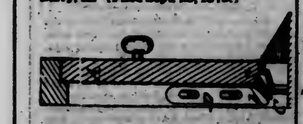
11. The combination of the cranks G I, the slotted connecting-rod H, the rock-shaft J, the weighted arm M N, and the heel arms K with the shaft D, that carries the crank Q and the swinging arm S, and with the open-bottomed grain-receiver L, substantially as herein shown and described.



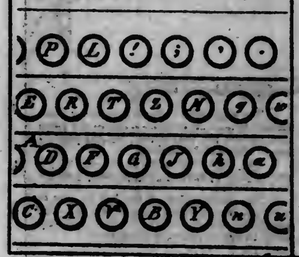
170,618. MILK-COOLERS. Bruno C. Bort, Chateaugay, N. Y. [Filed Oct. 28, 1875.]

The vat A, provided with hollow longitudinal partition O, reservoirs D D', and laterally-perforated strips B, whereby the water is permitted to flow down uniformly from its head to the feet, spreading evenly over the bottom surfaces, and passing out without leaving any "dead water," all substantially as set forth.

170,619.



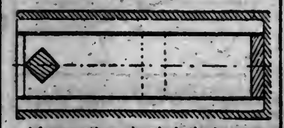
170,619. MUSIC-RACKS FOR UPRIGHT PIANO-FORTES. Stephen Brambach, New York, N. Y. [Filed Oct. 6, 1875.]



The swinging desk or stand at the front of an upright piano case, provided with a hinged base-strip and extension-legs for supporting jointly the music-book and holding-desk in inclined position, substantially as specified.

170,620. WEATHER-STRIPS. J. Chandler, Derry, Ill. [Filed Sept. 25, 1875.]

The combination of the hinged weather-strip with an adjustable stop-plate, having an inclined cam part at the door-casing for retaining the strip securely on the sill, substantially as described.



170,621. TYPE-WRITING MACHINES. Philander Deming, Albany, N. Y. [Filed May 22, 1875.]

1. The herein-described method of indicating the separate words written upon a type-writer, by substituting capital letters for the usual spacing, whereby the time usually consumed in spacing is saved, substantially as specified.

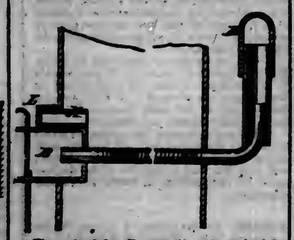
2. The combination and arrangement of the groups of lower-case letter keys and the capital-letter keys in the key-board of a type-writer, as shown and described, for the purpose specified.

170,622. HONEY-PACKAGES. L. Drake, New York, N. Y. [Filed Oct. 28, 1875.]

A honey-package, in which the honey, as originally deposited in its frame, is incased, with its frame, in a glass receptacle of appropriate dimensions and strength, substantially as and for the purpose specified.

170,623. PROCESSES OF PREPARING HIDES AND SKINS FOR TANNING. Homer Sly, Ballston Spa, N. Y. [Filed Apr. 23, 1875.]

1. The treatment of the hides or skins with an acid solution before liming, for the removal of salt or other matters, and for plumping the hide, as herein described and set forth.



2. The treatment with the mixed sal-soda and soft-soap solution after the first use of sulphuric-acid solution, as herein described.

3. The treatment with the mixed sal-soda and soft-soap solution after the second treatment with the sulphuric-acid solution, as herein described.

4. The treatment with saltpeter, as herein described, and for the purpose herein set forth.

5. The process of preparing hides and skins for tanning by treating them with the ingredients named, in the order stated, substantially as and for the purposes herein described.

170,624. TOBACCO-DRYING. H. R. Farmer, Kinggold, Va. [Filed Aug. 21, 1875.]

The valved flue B, extending through the back of the furnace and into a tobacco-curing chamber, in combination with a cold-air passage, K, having the damper L, all arranged to regulate the temperature of a curing-room in the manner described.

170,625. APPARATUS FOR ROASTING GOLD AND SILVER ORES. Robert M. Fryer, New York, N. Y., assignor to the Fryer Noble Metal-Mining Company, of New York. [Filed May 20, 1875.]

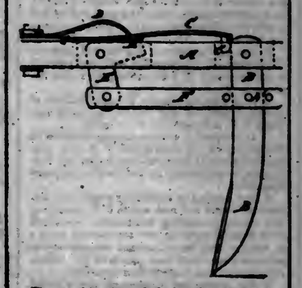
Brief.—The fuel and quartz are fed in through the door. The heat of combustion generates steam in the jacket, which passes up and, issuing through the circular perforated pipe in the stack, causes a draft. The metallic vapors, as they issue from the furnace, are condensed by water falling from the cone, and are collected in the upper water-jacket. The movable bottom is lowered, and carries the reduced charge to any point desired.

The combination of furnace A, portable bottom B, contact condenser and chamber I, substantially as described and operated, for the purpose above set forth.

170,626. DYEING AND PRINTING TEXTILE FABRICS. James Harley, Lowell, Mass. [Filed Nov. 27, 1875.]

Brief.—Prints the aniline tints upon the fabric at the same time with the mordants, for the madder colors. The "carrier" solutions of the aniline colors are such as resist the action of the dye-baths, and thus prevent bleeding and blearing.

1. The improved process herein described for dyeing in madder and garancine styles, in combination with aniline purples and violets, consisting in first fixing the latter upon the cloth with the mordants, and then passing the cloth through the dye-bath, whereby it is then dyed up in madder and indigo styles, substantially as specified.



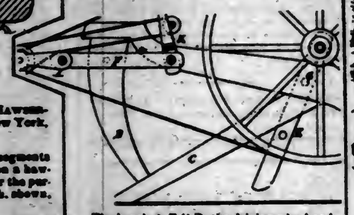
2. The combination of aniline greens and purples upon cloth with mordants suitable for dyeing up in madder colors, substantially as specified.

3. The new fabrics herein described, having an aniline purple, substantially such as described, in combination with one or more madder colors.

4. The combination of aniline purple upon fabrics with mordants suitable for dyeing with garancine, alizarine, and similar dye-stuffs, substantially as set forth.

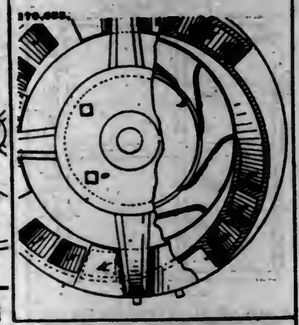
170,627. SELF-LOOSING CULTIVATOR-TEETH. John Harris, Marquette, Wis. [Filed July 10, 1875.]

Brief.—Sufficient strain upon the teeth turns the elbow-lever, which throws up the spring-catch, releasing the teeth.



The combination of the catch-spring C *c*, the re-enforcing-spring D, the bent lever E, and the bar or beam F, with the beam A and the pivoted cultivator-teeth B, substantially as herein shown and described.

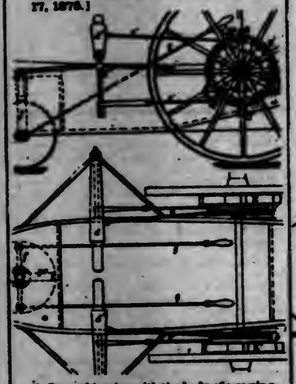
170,632.



170,633. SPRINGS-WHEELS. John J. Kendall, Greensborough, N. C. (Filed Apr. 24, 1875.)

Brief.—To enable the driving-wheel and spindle to be raised or lowered, so that the operator may either stand or sit at work.

The bench A B C D, the driving-wheel and its standard E, the head F, having pivoted sections K L, the spindle I, and pulleys J, all constructed and combined substantially as and for the purpose specified.



170,634.

170,635. COMBINED CLEATS AND HAWSER-CLAMPS. Purdind. W. Hobbie, New York, N. Y. (Filed July 31, 1875.)

A metallic cleat having clamps or segments B B pivoted thereon, and swing upon a hawser rope or cord, in the manner and for the purposes substantially as herein set forth. shown, and described.

170,636. HAND-PROPELLED VEHICLES. W. T. Howard, Baltimore, Md., and George H. Howard, Washington, D. C. (Filed Nov. 17, 1875.)

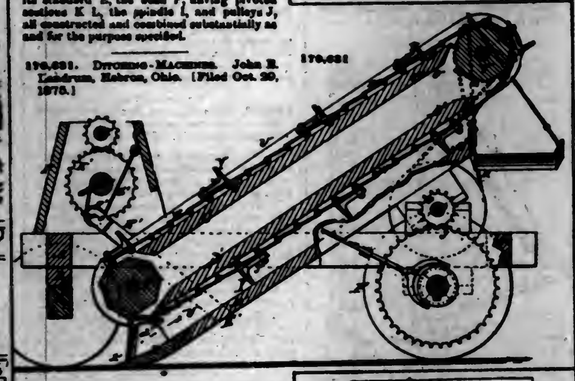
1. In combination with the body of a reversible wagon, having a seat suitably arranged for the occupant, the inclined end-bevers *d d* loosely pivoted to the respective sides of the wagon, substantially as specified.

2. In combination with the end-bevers *d d*, pivoted at the respective sides of the wagon-body, the cords *e e*, for communicating the motive force of the occupant to the rotating mechanism of the driving-wheels, substantially as herein described.

3. The inclined end-bevers *d d* and cords *e e*, combined with the seat-spools *b b*, shackles B B', dishes D D', and driving-wheels B B' and their axles, all arranged as parts of a reversible or convertible wagon, substantially as and in the relation herein specified.

4. The inclined shackles B B', combined with the spools *b b*, having the fingers *c c*, and adapted to operate upon the pins *d' d'* of the parts *b b*, substantially as and for the purpose set forth.

5. The combination of the flanged dishes D D', shackles B B', provided with the parts *b b*, and spools *b b*, substantially as herein described.



6. In a wheeled vehicle, the combination of the end-bevers *d d* and the contiguous or supporting F F, substantially as specified.

7. In a wheeled vehicle, the combination of the end-bevers *d d*, cords/guys F F', and spoke-connections between said bevers and cords/guys, substantially as and for the purposes specified.

8. In a reversible or convertible wagon, the inclined end-bevers *d d* and spools *b b*, operated by the rotary propelling mechanism, combined with endless propelling and steering cords *e e*, having their ends secured respectively to said end-bevers and fixed points in the wagon, substantially as hereinbefore described.

9. The pedestaled bottom of the wheeled vehicle, in combination with the steering-wheel F, vertical and inclined shaft *f*, and wheel-axle *f'*, adapted to receive the guiding-cords *g*, substantially as specified.

170,637. DITCHING-MACHINES. John R. Lenderman, Hebron, Ohio. (Filed Oct. 20, 1875.)

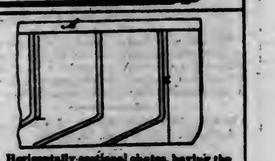
1. The box formed of the plate Y, provided with a slotted cheek, *y'*, and a socket, *y''*, and the perforated leg Z, provided with a socket, *z'*, in combination with rod adjacent links of the endless chain W, substantially as herein shown and described.

2. The combination of the straps E', pulley F', rope or chain O', chains H' M', gear-wheels K' L', and frame I' with the forward end of the elevator box or spout U A' B' C', and the forward end of the main frame A, substantially as herein shown and described.

3. The combination of the suspended spout O' and the suspended chains F' with the rear end of the elevator box or spout U A' B' C', and with the bars Y *y' y'* Z *z'* of the endless chain W, substantially as herein shown and described.

170,638. CULTIVATORS. T. J. Lee, Pender County, N. C. (Filed Oct. 8, 1875.)

Brief.—A surface-scraper attached to a plow-beam, to operate in advance of the tar-plow, and a hilling-scraper secured to the land-side.

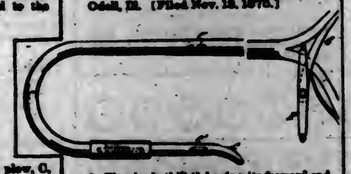


170,639.

In combination with an ordinary plow, C, the front and rear blades A and B, substantially as and for the purposes set forth.

170,640. WARM-WHEELS. James Mallory, Dryden, N. Y. (Filed Nov. 6, 1875.)

Brief.—Sectional cheese with mortise opening in the top of the wheel-cone, in combination with a horizontal rotating gate, with its adjusting bearing-ring and beehive continuous from top to bottom.



1. Horizontally-sectional cheese, having the mortise opening in the top of the wheel-cone, in combination with a horizontal rotating gate, substantially as specified.

2. The combination of the adjusting bearing-ring E and adjusting-screws O, with the horizontal gate, substantially as specified.

3. The combination of horizontally-sectional cheese, with a wheel having buckets, C, continuous from top to bottom, substantially as specified.

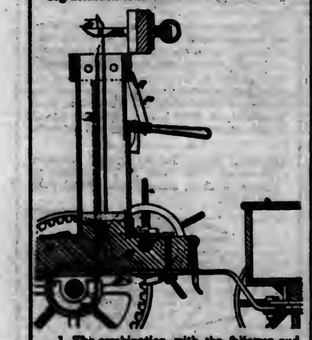
170,641. OPEN TRAIN. C. H. Middlemore, Odell, Ill. (Filed Nov. 10, 1875.)

1. The single thill C, having its forward end curved to pass around the breast of the horse and receive the thill-carrier, substantially as herein shown and described.

2. The joint formed in the free end of the curved thill C, substantially as herein shown and described.

3. The combination of the bar or arm G with the bracketed rear end of the open-side thill C, to receive the whiffletree F, substantially as herein shown and described.

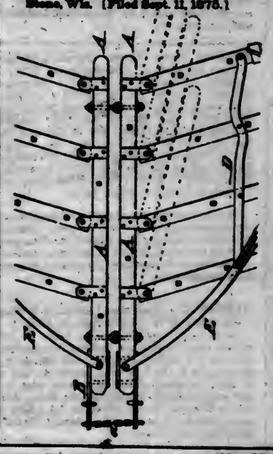
170,642. RAISE-STOPES. John Manson, Scott, N. Y., assignor to himself, Morgan Manson, and Wm. D. Hunt, same place. (Filed Sept. 4, 1875.)



1. The combination of the flexible hose A, the strap B, and a suitable handle, said strap being attached substantially as described, so that it can be retained at either side of the hose, for using the same in a straight or curved form, for the purposes set forth.

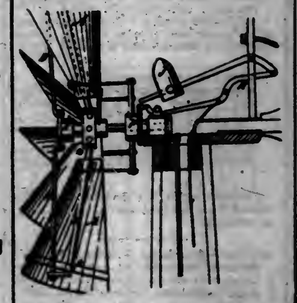
2. The combination of the flexible hose A, the strap B, the ring C, the hook D, and the lever E, and its hooks *e'* and pivoting-bracket F, with each other, substantially as herein shown and described.

170,643. PORTABLE HAY-PRESSES. Michl. McCarty, Pueblo, Colo. (Filed Oct. 23, 1875.)



Brief.—The bars operating the follower are jointed to allow it to swing from over the press. A chain, provided with legs for bearing against the door, is held in position by a dog attached to a lever-arm.

1. The combination, with the follower and vertical press-case, of the bars D, jointed at L, as shown and described, to enable said follower to tilt, in the manner specified.



2. The chain M, legs M, lever O, and locking-bar P, combined and arranged with the door, substantially as specified.

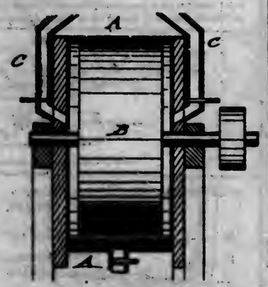
170,644. HARROWS. Henry Moll, Yellow Stone, Wis. (Filed Sept. 11, 1875.)

170,645. HARVESTING. David L. Osborn, Ashland, Nebr. (Filed Aug. 21, 1875.)

Brief.—The vanes are hinged by straps to arms that are outwardly inclined from the hub, so that the vanes, being thrown a little back of the arms by their hinges, are made both tangential and inclined forward or toward the wind, and thus approximating the form of a screw to a greater extent than when arranged exactly radial, and in the transverse plane of the wheel.

1. The vanes A, hinged by straps to arms B, the latter being inclined outwardly from the hub, as and for the purpose specified.

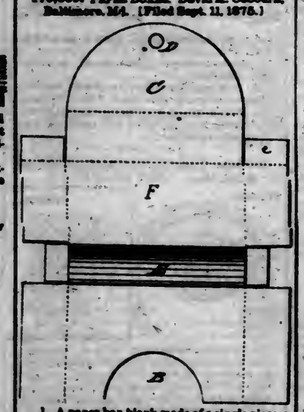
2. The combination of the inclined arms B, rods D, and the extension E of the hub, substantially as specified.



170,646. WINDMILLS. David L. Osborn, Ashland, Nebr. (Filed Aug. 21, 1875.)

Brief.—The vanes are hinged by straps to arms that are outwardly inclined from the hub, so that the vanes, being thrown a little back of the arms by their hinges, are made both tangential and inclined forward or toward the wind, and thus approximating the form of a screw to a greater extent than when arranged exactly radial, and in the transverse plane of the wheel.

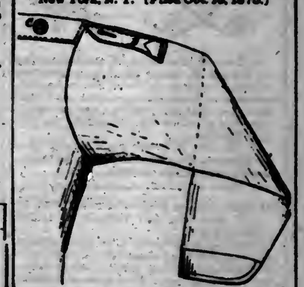
1. The vanes A, hinged by straps to arms B, the latter being inclined outwardly from the hub, as and for the purpose specified.



2. The combination of the inclined arms B, rods D, and the extension E of the hub, substantially as specified.

170,647. PEARL-BARLEY MILLS. Henry S. Northrup, Quasqueton, Iowa. (Filed July 31, 1875.

The combination of hopper D, having side channels C C, and stationary case A, having slots, raised edges, and bottom outlet, with the vertical grinder B, as and for the purpose specified.



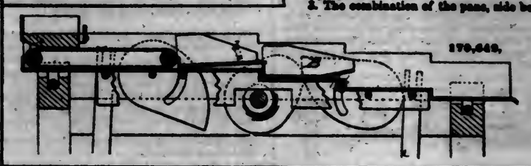
170,648. PAPER BOXES. David K. Osborn, Baltimore, Md. (Filed Sept. 11, 1875.)

1. A paper-box blank made of a single piece, having edge-lapped and bottom-connected parts F F', with aperture B on the latter, and extension C, having aperture D, on the former, all as shown and described.

2. A one-piece paper box provided with back-extension C D and bottom-stiffening-block E, as and for the purpose specified.

170,649. SLEEVE-ADJUSTERS. A. Perago, New York, N. Y. (Filed Oct. 16, 1875.)

The tab B, arranged at the top or shoulder of sleeve and fastening on the yoke of shirt, as and for the purpose specified.



170,650. ORE-CONCENTRATORS. James V. Pomeroy, Boulder, Colo. (Filed Aug. 21, 1875.)

Brief.—Ore is delivered into a hopper, from which it is fed, upon raising the gate, upon an endless belt. This, in turn, delivers it to a series of step-like adjustable pans. The whole is mounted on standards, and receives motion from a cam upon the central shaft.

1. In reciprocating ore-concentrators, a step-shaped table, having a series of levels at different elevations, as and for the purpose described.

2. The combination in an ore-concentrator, with a series of levels at different elevations, of a head-level, made longer than the others, and provided with an endless belt, as and for the purpose set forth.

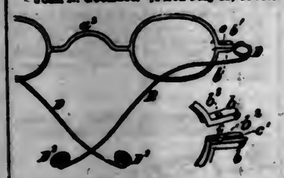
3. The combination of the pans, side belts,

170,649.

and nuts with the slotted side walls of the table, to adjust the pans to any inclination, substantially as set forth.

4. The standards pivoted to slide-beam, as and for the purpose specified.

5. The combination, with concentrating-table and endless belt, of the hopper, pivoted and moving gate, as and for the purpose specified.

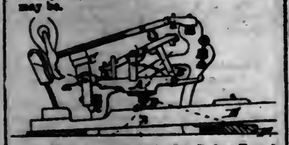


170,642. CARTRIDGE. Geo. Smith, Brooklyn, N. Y. [Filed Nov. 13, 1875.]

Brief.—The metallic wad at the outer end of the paper shell engages with the interior thereof, and thus the shell is expelled with it.

The combination, in a cartridge, of metallic wads B C and the paper shell A, substantially as specified.

170,644. SPECTACLE-FRAMES. John W. Stewart, Woodville, Tex., assignor of two-thirds his right to James K. Durham and John M. Goolsbee. [Filed July 15, 1875.]



1. The bow D, coiled at D^1, and terminating in the end d, curved at d^1, in combination with the lens-loop A, having flanges b and b^1, provided with straight grooves c^1, and intersecting semicircular grooves c, and the clamping-cover a, substantially as and for the purpose specified.

2. The bow D, turned into a volute, D^2, at its extreme outer end, substantially as shown, and for the purpose set forth.

170,645. GRAND PIANO-FORTE ACTIONS. C. F. T. Steinway, New York, N. Y. [Filed Oct. 20, 1875.]

Brief.—The adjustable pilot bears against and supports the balance-lever at a point in line between the key-fulcrum and balance-lever pivot, to reduce the friction as much as may be.

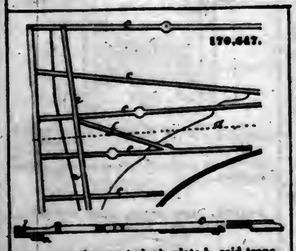
1. The screw-threaded pilot D, key E, and balance-lever A, combined and arranged to operate substantially as described.

2. The adjustable pilot D, combined and arranged to operate with the pivot-pin of the key E, and the pivot a of the balance-lever A of a piano-forte action, substantially as described.

170,646. ATTACHMENT FOR PIANO-FORTES. C. F. T. Steinway, New York, N. Y. [Filed Oct. 20, 1875.]

Brief.—Besides the usual agraffe, there is an additional one mounted on the under side of a transverse bar of the metal frame, giving a duplex agraffe-bearing near the hammer-line.

1. A capodastro secured from below in a bar cast solid with the metal frame, in combination with agraffes secured in the wrest-plank, or in a portion of the metal frame bearing against said wrest-plank, substantially as shown and described.



2. A capodastro made of a screw-shank, b^2, and head b^3, which is provided with a groove to give a hold for a screw-driver and to receive a steel face, b^4, substantially as set forth.

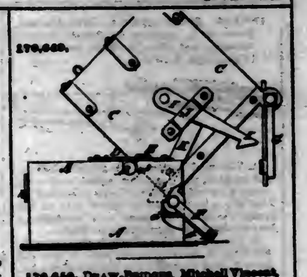
170,647. METAL FRAMES FOR PIANO-FORTES. C. F. T. Steinway, New York, N. Y. [Filed Oct. 20, 1875.]

Brief.—To increase the strength of the structure, and enable it to withstand the strain of the strings.

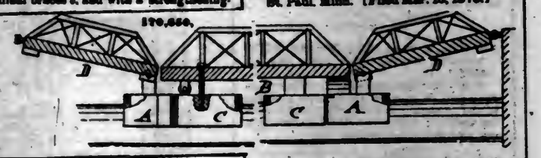
1. In a metal frame for piano-fortes, the combination of a transverse brace, c, with longitudinal braces a, and with a strengthening-rib, a, so as the wrest-plank plate b, said transverse brace running parallel, or nearly so, to the strengthening-rib, substantially as shown and described.

2. In a metal frame for piano-fortes, the combination of the oblique brace f with the hitch-pin plate d, transverse brace c, and longitudinal braces a, constructed and arranged substantially as set forth.

170,648. STOP-COCKS. Nehemiah Upham, Athol, Mass. [Filed Oct. 2, 1875.]



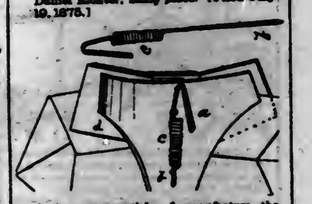
1. A valve, constructed of a valve-casing, a sector-shaped and pronged spindle slightly eccentric thereto, a sliding and pronged segment-valve, and an intermediate friction-roller between valve and spindle, arranged and operated substantially in the manner and for the purpose set forth.



2. The spindle-extension, having lateral recess, and a spring or equivalent device for retaining the roller and sliding valve in partially open position, substantially as set forth.

170,649. DUMPING DEVICES FOR FILLING GRAVES. John W. Vannice, Crawfordsville, Ind. [Filed Oct. 23, 1875.]

The combination of the base A, made with close sides and back, and provided with the bottom a^1, the inclines a^2, the arms K, and the notches a^3, and the tilting box C, made with an open top and front, and provided with the shaft B, the two-part door F G, hinged to the upper and lower corners of its front, the catch-bars H, the latches I, and the bar and hooper I, M, with each other, substantially as herein shown and described.



170,650. DRAW-BRIDGES. Mitchell Vincent, St. Paul, Minn. [Filed Mar. 18, 1875.]

The combination, in a pontoon draw-bridge, of the stationary pontoons A A, hinged self-adjusting approach-sections D, floating draw-section S, cam-bar and chain E, and supporting-pontoon C, the pontoon at one end of the draw-section serving as a pivot-pier, and the opposite pontoon being left free to float, so as to enable the draw to be opened and closed, in the manner herein described and set forth.

170,651. NECK-TIE FASTENERS. Johann Wehmer, New York, N. Y., assignor to Daniel Richter, same place. [Filed July 19, 1875.]

1. As a new article of manufacture, the elastic suspending-hook device composed of the parts a, b, and c, as described and set forth.

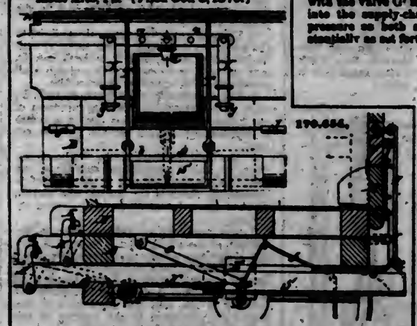
2. In combination with the shield d, the fastener composed of the parts a, b, and c, substantially as and for the purpose described and set forth.

170,652. RAIL-JOINTS. Hermann Weber, New York, N. Y. [Filed Oct. 23, 1875.]

Brief.—A rail-joint in which the fish-plates are secured to the rails by means of a slotted and toothed plate resting against one of the first bars; said slots in the plate bearing against a wedge-shaped slot in the bolt, the bearing-surface on plate being also wedge-shaped, whereby the rails are securely clamped by driving up the plate, which is prevented from jarring loose by a pawl on fish-plate taking into notches on sliding plate.

An improved railroad-rail coupling, formed by the combination of the notched bolts E, the slotted and toothed plate F, and the pawl G with the plates C D and the adjacent ends of the rails A B, substantially as herein shown and described.

170,653. CORN-PLANTERS. Richd. J. Weller, Kenosha, Wis. [Filed Sept. 11, 1875.]



Brief.—The counterbalk is made in two parts, each having an interior longitudinal groove, and provided at the lower part with a cutting-bit in the form of a quarter-section of a cone, for clearing the chips and adapting the counterbalk to hills of various sizes. It is firmly clamped to the bit-shank by means of a set-screw on each side passing directly through each part.

170,655.

As improved countersink attachment herein described, clamped to a tool by a set-screw on each side, and passing directly through each part, whereby the shank of the tool is pressed from each side, and the sides drawn firmly together.

170,656. DUMPING-CARTS. G. B. Wiestling, Mont Alto, Pa. [Filed Oct. 6, 1875.]

1. The extra frame E, combined with the cart-body and the axle, and having the rear end of the body hinged to its rear end, substantially as specified.

2. The combination of the ratchet mechanism, shaft M, chain N, and toggle-bar with the cart-body, hinged at its rear end, as described.

3. The combination of the slide-beam K and a of the two gates with the suspended lever I, as shown, to fasten one door by one and the same movement that unfastens the other.

4. The loop d in the staple b, in combination with the chain B and suspending-rods T, substantially as specified.

5. The toggle-bar O, jointed to the cart-body, and arranged in combination with the chain B, to hold it steady by the chains N, substantially as specified.

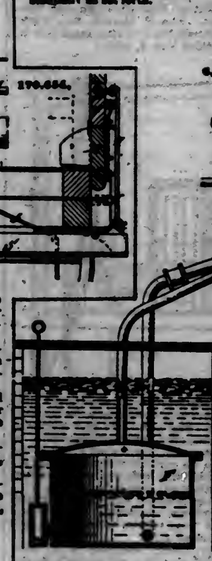
170,657. WATER-SUPPLY FOR STEAM-BOILERS. Silas Chick, Marquette, assignor, by mesne assignments, to the Automatic Boiler-Feeder Company, Dubuque, Iowa. Patent No. 97,261, dated Nov. 30, 1869; reissue No. 6,276, dated Feb. 11, 1873. [Filed Aug. 12, 1875.]

Brief.—The water is raised from a tank to the heater, from which it flows into the heating-chamber, and raises a float. The movement of the float operates a weighted vessel, through which the movement is transmitted to the valves, shutting off steam from the lower tank, and equalizing the pressure between the heater and tank, and also opening communication between the feeder and the boiler, so that the water may flow by gravity into the boiler.

1. The valve E, operating substantially as described, to control the communication between the steam-pipe and the cistern, and also the communication between the steam-feeder and the cistern.

2. The combination, in a boiler-feeder, of the valve E and a float, F, operating substantially as described, to control the entrance of steam into the cistern or tank, and then automatically regulate the supply of water to the feeder, by opening it at regular intervals by the direct pressure of the steam, substantially as set forth.

3. The combination, in a boiler-feeder, of the steam-chamber B, the water-chamber D, and the float-chamber Y, substantially as described.



4. The combination, in a boiler-feeder, of a water-chamber and inclosing steam-space, and a waste-pipe for the relief of condensation, and waste-pipe connecting with the water-tank or cistern.

5. The combination of the steam-space B and the float-chamber Y by means of the valve V and ports f, f^1, substantially as and for the purpose set forth.

6. The float F, operated in the manner described, in combination with the arm J and the weighted wheel K, having pins r, r^1, r^2, r^3, S^1, and S^2 thereon, to operate the valve-gear, in the manner specified.

7. In combination with the pipe I' N, the intermediate valve G^1, actuated, in opening and closing for the admission of feed-water into the boiler, by the rise and fall of the float F', and the valve V simultaneously actuated with the valve G^1 for the admission of steam into the supply-chamber Y, to equalize the pressure on both sides of the valve G^1, substantially as set forth.

6,655. DUMPING-CARTS. G. B. Wiestling, Mont Alto, Pa. [Filed Oct. 6, 1875.]

1. The extra frame E, combined with the cart-body and the axle, and having the rear end of the body hinged to its rear end, substantially as specified.

2. The combination of the ratchet mechanism, shaft M, chain N, and toggle-bar with the cart-body, hinged at its rear end, as described.

3. The combination of the slide-beam K and a of the two gates with the suspended lever I, as shown, to fasten one door by one and the same movement that unfastens the other.

4. The loop d in the staple b, in combination with the chain B and suspending-rods T, substantially as specified.

5. The toggle-bar O, jointed to the cart-body, and arranged in combination with the chain B, to hold it steady by the chains N, substantially as specified.

6,700. ASPHALTO GAS-BURNERS. Charles D. Gervis, Williamsburg, N. Y. Patent No. 107,262, dated Dec. 1, 1874. [Filed Nov. 9, 1875.]

Brief.—The elastic bar holds the shoulder of the plug against the shoulder of the neck.

1. The combination of a burner, B, and a plug, E, having a shouldered lever and to fit beneath a shoulder in the neck d, and formed with one or more recesses, e, substantially as and for the purpose set forth.

2. The combination of a burner, B, a plug, E, and an elastic bar, C, constructed and operating substantially as and for the purposes described.

3. The combination of a burner, B, plug, E, and lever H, constructed and operating substantially as described, and for the purpose indicated.

6,700. PAPER WAGON-BODIES. John W. Jarboe, Green Point, N. Y. Patent No. 98,681, dated July 18, 1860. [Filed June 18, 1874.]

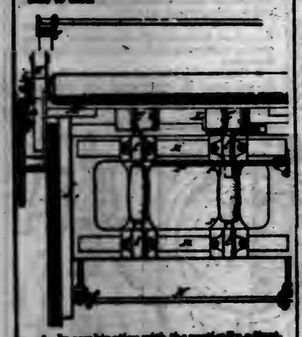
A body for wagons and other vehicles, constructed of stiff paper, with the ends secured by the dovetail-joints, as set forth and described.

6,771. PAPER WAGON-BODIES. John W. Jarboe, Green Point, N. Y. Patent No. 98,681, dated July 18, 1860. [Filed June 18, 1874.]

A wagon or vehicle body made in part or in whole of paper treated with water-proof material, substantially as described.

6,772. MOP-HEADS. Wm. H. Curtis, Chicago, Ill., assignor to Chas. B. Clark, John K. Clark, E. L. Ferguson, and H. B. Clark. Patent No. 140,966, dated Apr. 22, 1874. [Filed Nov. 10, 1875.]

Brief.—The stationary jaw has a trough-shaped face, into which a point upon the movable jaw enters to clamp the mop-cloth.



1. The combination of a fixed trough-shaped jaw, A', with a movable jaw, having an edge constructed to enter the angle of the fixed jaw, for clamping the mop, substantially as described.

2. The trough-shaped jaw A', having the openings a', in combination with the jaw A, having the projections a, constructed to enter said openings, substantially as and for the object specified.

3. The combination of the fixed trough-shaped jaw, having a slotted shank and a socket secured to the handle B, with the movable jaw A, pivoted in the slotted shank of the fixed jaw, and having a reservoir-projecting lever, constructed to be operated by a screw-rod for causing the movable jaw to approach and recede from the fixed jaw, and the said movable jaw having an edge constructed to enter the angle of the fixed trough-shaped jaw, for clamping a mop thereto, substantially as described.

6,772. COMBINED PLANING AND MATCHING MACHINES. Wm. H. Deane and Wm. B. Lenox, Cincinnati, Ohio, assignors, by mesne assignments, to J. A. Fay & Co., same place. Patent No. 96,502, dated Nov. 11, 1869. [Filed Nov. 11, 1875.]

Brief.—The matching cutter-heads are made vertically adjustable by means of screws operated by bevel-gears connecting them with a horizontal shaft crossing the machine from side to side.

1. In combination with the vertically-adjustable matcher-spindles O O', the cross-shaft H, as connected thereto as that an operator stationed outside of the frame of the machine is enabled to conveniently raise or lower said spindles, substantially as and for the purpose specified.

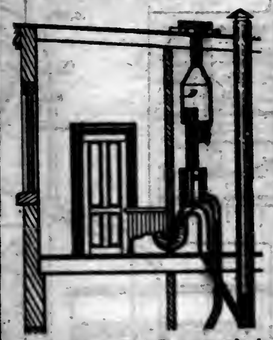
2. In combination with the vertically-adjustable matcher-spindles O O', operated by a cross-shaft, H, bearing in the outside of the frame of the machine, the cross-shaft H', arranged to be rotated also from the outside of the frame of the machine, and operating to laterally adjust the matcher-spindles relatively to each other, substantially as and for the purposes specified.

3. In a combined planing and matching machine, having fixed but A' A' and vertically-adjustable matcher-spindles, the main frame provided with removable sides or X X, for the convenient removal of fixed-rail B', substantially as and for the purposes specified.

4. The sliding guard-fence L and its spring *g*, arranged and operating substantially as and for the purpose specified.

5. The combination of the lever feed-roller F and its bracket, with devoted stud in close with the devoted grooved sector-bolts *d* and their nuts *e*, the whole arranged and operating substantially as and for the purpose described.

6. The arrangement of the checking-lever segment I I, constructed as described, in combination with the system of expansion-gearing for feed-rollers of a planing-machine, substantially as and for the purpose described.



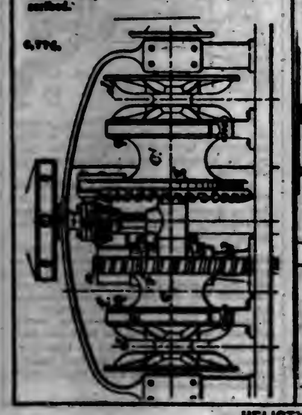
6,773. WHEELBARROW. Joseph P. Manton, Providence, R. I. Patent No. 169,182, dated Oct. 26, 1875. [Filed Nov. 19, 1875.]

Brief.—When great power is desired the worm-gear is used. When rapidity is desired the bevel-geared wheels are operated by the capstan and the worm-gear disengaged.

1. The combination of the worm *c* and worm-gear *b* with the windlass, consisting of the barrel C, the wild-cat *d*, and brake E, and the bevel-gear A and pinion *a*, substantially as and for the purpose specified.

2. The combination, with the windlass operated by means substantially as described, of the worm *c* and worm-gear *b*, as an auxiliary appliance, substantially as and for the purpose herein set forth.

6,774. WATER-TRAP SUPPLIES AND CONNECTIONS. John H. Morrell, New York, N. Y. Patent No. 168,400, dated Oct. 5, 1875. [Filed Nov. 6, 1875.]



1. The water-reservoir D, constructed substantially as herein described, so as to serve as a storage-reservoir as well as a distributing-reservoir, provided with an injection, in combination with a pipe, leading to and opening through the roof, and another leading to and communicating with one or more traps below, substantially as specified.

2. The combination of said reservoir D with one or more traps, substantially as described, so that said traps will be both supplied and ventilated, as set forth.

3. The partitioned chambers K K', constructed and operating substantially as described.

4. In a water-supply, the combination of the water-supply pipe with the trap, so arranged that the former subserves the double purpose of a supply-pipe and ventilator, substantially as specified.

6,775. MACHINE FOR SETTING NAILS IN HORSESHOES. John Hall, Jr., Boston, Mass. Patent No. 168,401, dated Oct. 5, 1875. [Filed Nov. 6, 1875.]

1. In combination with the vertically-adjustable matcher-spindles O O', the cross-shaft H, as connected thereto as that an operator stationed outside of the frame of the machine is enabled to conveniently raise or lower said spindles, substantially as and for the purpose specified.

2. In combination with the vertically-adjustable matcher-spindles O O', operated by a cross-shaft, H, bearing in the outside of the frame of the machine, the cross-shaft H', arranged to be rotated also from the outside of the frame of the machine, and operating to laterally adjust the matcher-spindles relatively to each other, substantially as and for the purposes specified.

3. In a combined planing and matching machine, having fixed but A' A' and vertically-adjustable matcher-spindles, the main frame provided with removable sides or X X, for the convenient removal of fixed-rail B', substantially as and for the purposes specified.

4. The sliding guard-fence L and its spring *g*, arranged and operating substantially as and for the purpose specified.

5. The combination of the lever feed-roller F and its bracket, with devoted stud in close with the devoted grooved sector-bolts *d* and their nuts *e*, the whole arranged and operating substantially as and for the purpose described.

6. The arrangement of the checking-lever segment I I, constructed as described, in combination with the system of expansion-gearing for feed-rollers of a planing-machine, substantially as and for the purpose described.

6,776. MACHINE FOR SETTING NAILS IN HORSESHOES. J. Roy, Philadelphia, Pa. Patent No. 169,044, dated Oct. 19, 1875. [Filed Nov. 17, 1875.]

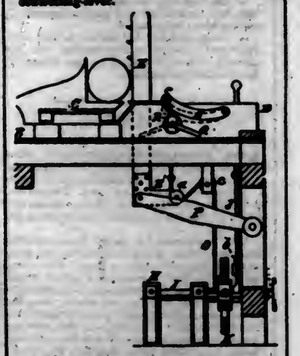
Brief.—To the brief that accompanies the original patent, it is only necessary to add that the fortress *g* is of peculiar construction, and adapted to the use of gas only as fuel.

1. In a nail-machine, the combination of the rod V, spool U, and rollers *x y* with mechanism for feeding the nail-rod to the fortress and hammers, for the purpose of passing on an uninterrupted feed, as specified.

2. The combination of the fortress or forebay *g*, the lever *f*, and mechanism for imparting to it a lateral oscillating movement, with the hammers E D and anvil H, as and for the purpose set forth.

3. The apparatus for feeding the nail-rod to the hammers, consisting of the lever T, with its fortress *s*, rod S, slide R, lever Q, cam P, with its stud, and the revolving clutch *t*, all constructed and operating as described.

4. The combination, with the hammers E D, anvil H, and laterally oscillating fortress *g*, of the stationary cutter *m* and revolving cutter *l*, substantially as and for the purpose set forth.



5. The combination, with the two hammers, the anvil, and the oscillating fortress, of the automatically-revolving and longitudinally-reciprocating clutch *t*, for turning and feeding forward the rod, as and for the purpose described.

6. The combination, substantially as described, of the sliding step *o*, hammer E, arm S, and cam *n*, as and for the purpose described.

7. The combination, with automatic mechanism for the manufacture of wrought-nails, of a fortress or other device for the reception and heating of gas, and the application of the heat thus generated to the heating of the nail-rod, substantially as set forth.

6,777. LOG-TURNERS FOR SAW-MILLS. Geo. H. Shearer, Bay City, Mich. Patent No. 147,128, dated Feb. 3, 1874. [Filed Apr. 20, 1874.]

Brief.—The lower end of the turning-bar is pivoted to and guided by radius-rods, and the friction-gear upon the upper end is so arranged as to be thrown out of gear with the driving-pulley, and into contact with a stationary brake, by a single movement of the controlling-lever.

1. In combination, the toothed bar R, with an angular foot, the radius-bars P P, pivoted to the angle of the foot, and the pulley *o* at the end of the foot, for the purpose of simultaneously raising and tilting the toothed bar, substantially as described.

2. In combination, the shaft Q, the eccentric K, the L-shaped bar S, and roller *t*, for the purpose of preventing the log from rolling toward the carriage, substantially as described.

3. In log-turning devices, the combination, with the wheel K, of the stationary brake L, substantially as and for the purpose specified.

4. The combination, with the pulled bar R, of the radius-bars P, shafts T U, friction-wheels G K, levers J M, brake L, rod or cable O, pulleys *o o*, constructed and arranged to operate substantially as described, and for the purpose set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 23. TUESDAY, DECEMBER 7, 1875. PRICE { $5.00 per year—single. $5.00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time. R. H. DUELL, *Commissioner.*

COMMISSIONER'S DECISIONS.

O. E. MCMURRAY.—*Interlocutory Appeal.*

[*Appeal from the Principal Examiner in the matter of the application of Oscar E. McMurray for letters patent for* STOP-VALVES.—*Decided November* 3, 1875.]

Parts which, though shown as concerned in an operation, may be rendered unnecessary by a ready substitute, need not be explicitly cited in a combination claim.

SPEAR, *Acting Commissioner:*

I am not sure that the matter appealed is one of form. It seems to pertain to the patentability of the subject-matter, and to be properly appealable to the Board of Examiners-in-Chief; but as the matter has been brought before me, I am inclined to give applicant the benefit of the doubt, especially since looking into the case I am of the opinion that the Examiner's objection is not a valid one. The claim is as follows:

In stop-valves, the movable yoke or support D, with one or more valves, E, supported thereby, in combination with the stem B and nut C, operating, &c.

The Examiner's objection is, that this claim is not for an "operative combination." More specifically, the objection appears to be that levers shown in the central figure, and which, in accordance with the construction there represented, are necessary to the operation of the device, are not included in the claim. Now, the yoke or support D is represented by applicant as the central element of his invention. It carries the valves, lifting them as it rises and lowering them as it descends, at the same time holding them so that the final movement of the descending nut pushes them laterally into firm position upon their seats. This lateral movement is caused by the lower part of the nut pressing, in its descent, either against levers that transmit the lateral motions to the stems that support the valves, or else directly against the beveled ends of the stems themselves.

According to one modification, plainly shown, the levers are not needed at all, and the modification is a very obvious one. Since, therefore, these pivoted levers are not absolutely necessary, I do not think that any ambignity arises by the omission of this element from specific mention in the claim, nor that what would be understood as a statement of the invention from the terms of the claim would be in any respect inoperative. The claim, as it stands now, covers either the modification shown in the central figure or in that upon the right-hand side below, the figures not being numbered as they should be. It is always a very difficult and delicate question to determine how subordinate claims for an improvement in a mechanism of any considerable number of parts, or in any respect complicated, should be limited, and no exact rule can be laid down for such cases. Unquestionably, an applicant having made an improvement upon a previously existing machine may lay claim to the specific part which he has improved, or to any reasonably well-defined group of parts thus improved, even although that part or that group of parts do not alone operate to produce any beneficial result. No one is misled by any such claim, but understands readily, even if it be not specifically stated, that the improvement is upon a specified part of the machine to which it relates. To require the applicant to specify all the parts necessary to the complete operation would be to defeat the very object for which he seeks for patent, and would be plainly against

reason. But to how small a number of elements he shall reduce his claim is not so easy to determine; but each case must be judged in a great measure by itself, care only being taken that the claim do not mislead. I see no such tendency to mislead in the present case, nor any possible harm that could result from the allowance of it.

I must, therefore, reverse the decision of the Examiner.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

LEVI DECKER *vs.* WILLIAM H. GRIFFITH & CO. LEVI DECKER *vs.* CHARLES SILVERBRANDT.

[*In equity.—Before* BLATCHFORD, *J.—Decision rendered November* 5, 1875.]

The claim in this case is for "the catgut" or other cord E, partially or fully embedded, or otherwise attached at the angle *a* of the rubber cushion C, so as to protect said cushion against the impact of the ball, substantially as herein shown and described, and for the purposes set forth.

The manufacture and use by Winant, prior to the alleged date of invention by Decker of his device, of a strip of spring steel, or equivalent material, with holes in its lower edge, through which wires were passed and fastened to the under side of the rail, said strip being placed in a crease or groove cut in the upper face of the rubber near the angle thereof, and the manufacture by Stevens, prior to 1864, of india-rubber cushions for billiard-tables having a French clock-spring placed in a slot in the upper face of the rubber, parallel to and near the inner face of the rubber, bringing the upper edge of the spring near the upper corner of the rubber, are substantially the same arrangements of devices used by Decker.

[*William J. A. Fuller*, for the plaintiff.
Edward N. Dickerson, for defendants.]

BLATCHFORD, *J.*:

The patent sued on in these cases, being a reissue granted to the plaintiff, Levi Decker, March 9, 1869, on the surrender of the original patent granted to him December 18, 1866, for an "Improvement in Cushions for Billiard-Tables," has been heretofore the subject of consideration by this court in the case of *Decker* vs. *Grote*, (10 Blatchf. C. C. R., 331.) The invention set forth in the specification of the patent has reference to a cushion formed of india-rubber.

The specification says:

My invention has for its object the preservation of cushions for billiard-tables against the impact of the ball.

The nature of my invention consists in the employment or use of a catgut or other strong cord, located in or at the upper corner or edge of the cushion, and immediately at the point against which the ball strikes when the game of billiards is played. * * *

C is a body of rubber, which forms a cushion, against which the ball strikes. This said rubber cushion has its inner or face side beveled in such a manner that the ball strikes, at about its center, against the upper corner or point of the cushion, as clearly shown at *a*, Fig. 1. For the purpose of protecting the upper curve or edge of the cushion C against the impact of the ball I make a small concave or bed, immediately, or as near as may be, in the upper corner of the cushion, so that a suitable cord, E, or other support may be fitted longitudinally the whole length of the said cushion around the table, so that the cushion is fully protected on all sides of the table against the impact of the ball. For this cord and support of the cushion I usually employ catgut; or cord may be used for the same purpose, but experience proves that catgut is most suitable for the purpose, as it is best adapted to prevent the cushion from giving way or yielding under the impact of the ball, it being understood that the ball only comes in contact with the cushion at *a*, the bevel or inclination being given the face of the cushion in order that all other parts of it will be kept clear of the ball. This cord E may be more thoroughly secured in its position by molding it or embedding it entirely within the rubber near the corner, so as to perform the functions for which it is designed, or it may be secured by gluing a strip of cloth, *b*, over it when not fully embedded in the rubber, or it may be secured by any other well-known means. D is a strip of elastic cloth, which is cemented to the face side of the rubber strip or cushion C, and attached at its lower edge to the lower part of B, (elsewhere described as a strip or cleat behind C,) so as to support the upper edge *a* of C. It will be understood that the cord E is attached to D before the latter is secured to the cushion C and cleat B. To make the whole more secure I usually cover the whole with the cloth F, and after cover the whole again with the usual green cloth G. This cord E performs two very important functions—viz., it gives stiffness to the angle or corner *a* of the cushion C, so that it cannot yield or give way under the impact of the ball to allow the latter to pass over it, and it also gives prominence to the said angle, so as to present, under the yielding of the cushion, a stiff narrow line to the ball, thus obviating much friction, so as not to impede the motion of the latter, and still not interfering in the least with the elastic effects of the cushion upon the ball.

The claim is—

The catgut or other cord E, partially or fully embedded, or otherwise attached at the angle *a* of the rubber cushion C, so as to protect said cushion against the impact of the ball, substantially as herein shown and described, and for the purposes set forth.

In the case of *Decker* vs. *Grote* it was said in the decision of the court:

It is quite apparent that the invention set forth is the placeguard firmly securing, along the upper edge or corner of the rubber cushion, a strong narrow cord, to receive the impact of the ball and protect the cushion against such impact, by reason of its being placed at the fronts, against which, and against which alone, the ball strikes. When the impact comes, the stiff cord receives it in substantially a horizontal direction, and prevents the cushion from giving way under such impact, and allowing the ball to ride over it and leave the table, while at the same time there is little friction from the impact, and the elastic force of the rubber acts fully, through the cord interposed between it and the ball, to repel the ball in substantially a horizontal direction.

The arrangement used by the defendant in that case was to embed the cord in the rubber cushion at the upper edge of it, by placing it there while the rubber was plastic and before it was vulcanized, and by having a thin portion of the rubber interposed between the cord and the outside of the edge. It was held that such arrangement embodied the invention claimed in the patent, and had the same mode of operation in use.

The novelty of the invention was challenged in that case by the citation of an application for a patent filed by one Carpenter in January, 1858, and rejected in April, 1858, of a patent to one Sycher, granted in November, 1863, and of abandoned experiments made by one Delaney, in California, but the patent was sustained against these objections.

Subsequently, in the case of *Decker* vs. *Griffith* (10 Blatchf. C. C. R., 343) the use of a round metallic wire, in the manner in which it is used by the defendants in the suit secondly above entitled, was held by this court to be an infringement of the Decker patent.

The alleged infringement complained of in the first-above entitled suit consists in the use of a flat strip of metal fixing in a slot marked in the india-rubber cushion, and running from end to end thereof, and strained by a straining-key at its end. The strip is capable of moving in the direction of its length when strained, though it is held firmly endwise at all times. The strip lies parallel with the inner inclined face of the cushion and closely adjacent to it, and its upper edge is closely adjacent to the upper inner corner of the cushion.

The alleged infringement complained of in the second above entitled suit consists in the use of a round metallic wire, arranged in like manner with the flat strip of metal, and arranged in close proximity to the upper inner corner of the cushion.

It is contended, on the part of the defendants, that what they use, in so far as it is like that, is described and claimed in Decker's reissue, existed prior to Decker's invention—in other words, that a narrow cord or wire of metal, or other equivalent material, placed and firmly secured along and within and closely adjacent to the upper edge or corner of the rubber cushion, so as to receive the impact of the ball, existed before Decker's invention. Decker testified that he "got the idea" of his invention in the fall of 1864, he thinks in September. That he thinks he made cushions of tables complete, embodying the invention, in the fall of 1864, and that he is quite certain he did so before March, 1865.

The defendants introduce and refer to a patent granted to William K. Winant, August 10, 1858, for improvement in cushions for billiard-tables. The specification of that patent sets forth that the invention of Winant—

consists in the introduction of a strip of spring steel, or equivalent material, into a crease or groove cut in the upper face of the rubber, near the angle thereof, in such a manner that said steel is protected from injury by the rubber which thus intervenes between the steel and the ball, and the cushion is rendered sufficiently firm to prevent the ball embedding and injuring the correctness of the angle of deflection; and beside this, the strip is so narrow as not to be injured by the concussion, and is retained in place without requiring any attachment by screws, cement, or otherwise. * *

In the upper part of the cushion *d*, and near its edge, I make a long incision parallel to its edge, and at a slightly greater inclination than the face of the cushion, and into said crease or groove thus formed I introduce a narrow thin strip of steel, *i*, or equivalent material, and the covering *e*, of cloth or other material, as usual, completes the cushion.

It will be apparent that said strip *i* is retained in place by the rubber, and acts to prevent the ball embedding, and at the same time is itself protected from injury by the rubber on both sides.

There is one feature in this patent of Winant's which is unlike the arrangement of Decker. Winant describes his strip of steel as merely lying in the crease or groove cut in the rubber, and as being kept in place without being attached by screws, cement, or otherwise, whereas Decker describes his cord as being unbedded or embedded entirely within the rubber. The patent to Winant was considered, and very properly, by the Patent Office, where Decker's patent was reissued, as not having anticipated Decker's claim in his reissue.

It is shown by the evidence of Daniel D. Winant, the brother of William K. Winant, that prior to 1864 he made many billiard-tables constructed in accordance with the Winant patent, but with the added feature of an arrangement for tying down the steel to the cushion by means of holes in the lower edge of the strip, and wires put through them and fastened to the under side of the rail to keep the strip in place in the rubber. In that arrangement the steel strip was incorporated in the structure, so as to be incapable of dislodgment quite as effectually as if molded or embedded entirely within the rubber, as suggested in Decker's specification. It stiffened the angle or corner of the cushion, and prevented its yielding under the impact of the ball, and allowing the ball to pass over it. It presented substantially the same features and mode of operation shown in the defendant's arrangement in the first above entitled suit, where the flat strip of metal is used so far as there is anything in common between the plaintiff's arrangement and that of the defendants. The greater or less inclination of the strip to the face of the cushion, the greater or less proximity of the face of the strip to the inner face of the cushion, the greater or less width of the strip, and the greater or less proximity of its upper edge to the upper corner of the cushion, are questions of degree only so long as the effective feature of the defendant's arrangement is found in the earlier structure in connection with the use of the strip, which is shown to be the fact.

It is also shown that one Stevens, in Boston, prior to 1864 made india-rubber cushions for billiard-tables, which had a French clock-spring placed in a slot cut in the upper face of the rubber parallel to and near the inner face of the rubber, bringing the upper edge of the spring near the upper corner of the rubber. The spring was cemented into the slit, and cloth was glued or cemented over the slit. The spring was thus embedded entirely within the rubber. A portion of a cushion of such construction, made prior to 1864 by Stevens, is produced. It contains the features presented by the defendant's arrangement with the flat strip, so far as the latter is like the plaintiff's arrangement.

As to the defendant's arrangement with the round wire embedded in the rubber, it required no invention to substitute, in the Stevens arrangement, a round wire for the steel strip.

If the plaintiff's reissued patent can, in view of the Winant and Stevens arrangements above described, be upheld at all, because it is made to cover a cord embedded entirely within the rubber, and is not limited, as his original patent was, to a cord applied outside of the upper corner of the cushion, it certainly cannot be extended to cover arrangements which are substantially the same as the Winant and Stevens arrangements.

The bill must be dismissed with costs.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date December 7, 1875.]

8,820.—Toy Money-Box.—JOHN G. BAKER, Philadelphia, Pa., assignor to THE ENTERPRISE MANUFACTURING COMPANY OF PENNSYLVANIA, same place. Application filed November 13, 1875. Term of patent 7 years.

8,821.—Cassimere.—EDWARD C. CLARK, Rockville, Conn. Application filed November 22, 1875. Term of patent 3½ years.

8,822.—Stocking-Legs.—MARTIN LANDENBERGER, Jr., Philadelphia, Pa., assignor to JOHN LANDENBERGER and GEORGE W. LANDENBERGER, same place. Application filed October 14, 1875. Term of patent 7 years.

8,823.—Trimming.—CARL LINDENTHAL, New York, N. Y. Application filed November 19, 1875. Term of patent 7 years.

8,824.—Glassware.—FREDERICK S. SHIRLEY, New Bedford, Mass. Applications filed November 24, 1875. Term of patent 3½ years.

8,825 and 8,826.—Pattern-Sheet for Embroidery.—WILLIAM STEINHAUS, New York, N. Y., assignor of one-half his right to OTTO FRICKENHAUS, Brooklyn, N. Y. Applications filed October 20 and November 13, 1875. Term of patents 3½ years.

8,827.—Glass Dishes.—JAMES S. ATTERBURY and THOMAS B. ATTERBURY, Pittsburg, Pa. Application filed December 1, 1875. Term of patent 7 years.

8,828 and 8,829.—Embroidery-Pattern.—EMIL CREMARD, New Haven, Conn., assignor to HENRY ST. JOHN, same place. L L and K K. Applications filed November 30, 1875. Term of patents 3½ years.

8,830.—Inkstands.—EDWARD FINNEY, Philadelphia, Pa. Application filed September 22, 1875. Term of patent 3½ years.

8,831.—Inkstands.—GEORGE E. HATCH, East Cambridge, Mass. Application filed October 12, 1875. Term of patent 3½ years.

8,832.—Toy Chariot.—EDWARD R. IVES, Bridgeport, Conn. Application filed November 4, 1875. Term of patent 7 years.

8,833.—Inkstands.—HUGH S. KERR, Philadelphia, Pa. Application filed November 22, 1875. Term of patent 3½ years.

8,834.—Corner-Piece for Picture-Frames.—CHARLES P. POHNER, Boston, Mass.—Case 2. Application filed November 1, 1875. Term of patent 3½ years.

8,835.—Shirt-Fronts.—VICTOR H. ROTHSCHILD, New York, N. Y. Application filed November 3, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date December 7, 1875.]

3,190.—Wool-Oil.—AMERICAN LUBRICATING-OIL COMPANY, Cleveland, Ohio. Application filed November 16, 1875.
"words 'ACME WOOL.'"

3,191.—Soap.—R. W. BELL & CO., Buffalo, N. Y. Application filed November 17, 1875.
"word 'CZAR.'"

3,192.—Railway-Journal Bearings.—BOWLES & WILKINS, Chicago, Ill. Application filed November 23, 1875.
"a six-pointed star, having the words 'Trade-Mark, Established 1865' printed across the face of the star."

3,193.—Pumps.—COFFIN & WOODWARD, Boston, Mass. Application filed November 23, 1875.
"words 'OCEAN PUMP.'"

3,194.—Corset-Clasps.—COOLEY, BIGLOW & NICHOLS, New York, N. Y. Application filed November 18, 1875.
"words 'Serpentine Wire Corset Clasps.'"

3,195.—Bitters.—HENRY ERNST, New York, N. Y. Application filed November 19, 1875.
"words 'Modoc Vegetable Bitters.'"

3,196.—Lubricating-Oils.—GLOBE OIL COMPANY, Parkersburg, W. Va. Application filed November 19, 1875.
"large letter A and the lozenge and its inclosed letters J. A. S."

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

THE OFFICIAL GAZETTE.

The OFFICIAL GAZETTE of the United States Patent Office is published weekly by the Patent Office. It is printed by authority of an act of Congress, which provides for its gratuitous distribution to libraries at the rate of eight for each congressional district.

The GAZETTE contains the decisions of the Commissioner of Patents, and such decisions of the courts in patent causes as are believed to possess general interest to inventors and patentees.

The claims of all patents granted are printed in the GAZETTE, bearing the same date as the issue of the patent, accompanied by a brief synopsis of the invention and a portion of the drawing.

The illustrations are photographic reproductions on a reduced scale of the drawings accompanying the original application, and preserve their fidelity. The limited space permitted for each patent prevents, in many cases, an adequate representation, but the prominent feature of invention is usually shown. Disclaimers filed in the Office are nowhere else published.

Changes in the rules of practice of the Office are announced in the GAZETTE, which affords a much readier mode of communication with parties interested than to await a new edition of the Rules of Practice.

Finally, any matter believed to be of interest to inventors in their official intercourse with the Office, will receive in the GAZETTE the attention the subject warrants.

INDEX OF INVENTIONS PATENTED DECEMBER 7, 1875.

	Class No.	No. of Patent.
Adding machine, D. L. R. Butt	42	170,706
Alarm, burglar, A. A. Budd	24	170,705
Alarm, burglar, H. A. Sherman	24	170,905
Animals in giving birth, instrument for aiding, W. Delin	156	170,827
Auger, earth, M. and T. R. Way	51	170,790
Bag for packages of compressed vegetable substances, knitted, J. D. Culp, (reissue)	100	6,779
Baggage seal, J. S. Crary	146	170,823
Barrel, L. E. Sanderland	40	170,914
Barrel polishing machine, H. S. Smith	40	170,908
Barrel shaping machine, H. S. Smith	40	170,909
Basket, Meinkheim and Chase	109	170,755
Bath tub seat, J. W. Nye	8	170,762
Bathe and basins, waste valve and overflow for, W. S. Carr	8	170,709
Battery, galvanic, R. M. Lockwood	50	170,864
Bearings, lining for machine, Lathrop and Weber	87	170,747
Bed bottom, spring, E. Barton	62	170,805
Bed lounge, D. J. Powers	62	170,687
Bedstead, invalid, J. Crosby, (reissue)	62	6,790
Bedstead, sofa, G. J. Henkels	62	170,853
Bedstead, sofa, G. N. Seidler	62	170,777
Bee hive, E. Armstrong	9	170,698
Bird cage, G. Gunther	170	170,847
Bird cage, C. F. Holden	170	170,671
Bird cage, hanging, G. W. Fuller	170	170,845
Boat detaching apparatus, J. Patterson	13	170,892
Boiler injector, steam, W. T. Messinger	148	170,756
Boot and shoe polishing machine, Place and Cunningham	16	170,765
Boot rubber, J. Pienovi	16	170,767
Boxes, machine for making, E. James	174	170,859
Brace, back and shoulder, H. R. Allen	38	170,655
Brace, hip and thigh, H. R. Allen	156	170,656
Brick drier, E. F. Andrews	20	170,998
Brick machine, Mitchell and Kennedy	20	170,879
Brick machine, A. Morand	20	170,761
Buckle, A. Dyke	23	170,831
Bung funnel, J. Buck, (reissue)	1	6,784
Burners, automatic lighter for gas, Stockwell and Weiss	90	170,913
Bustle, A. Carter	60	170,710
Butter carrier, B. F. Roberts	45	170,770
Can, paint, M. Bray	107	170,763
Can seaming machine, W. J. Gordon	136	170,727
Can spout, oil, D. G. Dustin	107	170,718
Cane gun, C. Melaye	165	170,984
Car axle box washer, C. H. Brown	122	170,811
Car axle washer, W. H. Fits Gerald	122	170,838
Car coupling, J. T. A. Lewis	122	170,748
Car for one rail railroads, R. Stone	122	170,692
Car ventilation, G. H. Storey	166	170,783
Car wheels, casting, W. Wilmington	33	170,925
Carding engines, feeding mechanism for, J. G. Freeman	28	170,842
Carding machines, feeding apparatus for, J. J. Dewey	28	170,825
Carriage axles, machine for forming collars on, J. Kritch	60	170,744
Carriage bows, machine for setting, J. H. McClymonds	31	170,875
Carriage wheel, S. W. Ludlow	31	170,866
Cartridge primer, W. S. Smoot	32	170,780
Cartridge shells, tool for heading, Salisbury and Wells	32	170,772
Chandelier, J. Matthews	64	170,672
Churn, reciprocating, W. McKinley	45	170,877
Cigar, M. Rosenthal	160	170,901
Cigarette mouth piece, D. Marquis	160	170,752
Clay pulverising machine, J. N. Kerper	80	170,743
Cleaning compound, McGugin, Lybargar, and Hibbets	35	170,682
Clevis, J. G. Miller	114	170,758
Clothes drier, H. J. Brown	91	170,812
Clothes line prop, C. C. Schwaner	91	170,775
Coal chute, portable, R. R. Hoopes	79	170,856
Coal oil motor, F. Bürger	67	170,813
Cooking utensil, A. Viehmeyer	154	170,921
Coolers, &c., stand for water, W. L. McDowell	58	170,876
Corn drill, J. R., S. B. and G. W. Rude	133	170,902
Corn sheller, feeding belt and partition for, W. P. Quarton	59	170,897
Corn uncovers, H. H. Gilchrist	114	170,736
Cotton gins, power for, L. B. Stith	67	170,782
Cotton openers, beaters for, R. Kitson	28	170,675
Countershaft, W. Frech	87	170,667
Cultivator, E. B. Moore	43	170,882
Cultivator, rotary spade, D. W. Brodnax, Sr	43	170,661
Curry comb, C. A. Hotchkiss	144	170,733
Curry comb, C. A. Hotchkiss	144	170,734
Curry comb, C. A. Hotchkiss	144	170,735
Curry comb, C. A. Hotchkiss	144	170,736
Curry comb, C. A. Hotchkiss	144	170,857
Curry comb, C. W. Saladee, (reissue)	144	6,788
Curtain fastener, T. E. King	31	170,674
Curtain rollers, bracket for, H. L. Judd	62	170,740
Cuspedore, J. B. Connolly	62	170,819
Cuspedore, J. C. Moore	62	170,883
Demijohn for containing malt liquors, D. H. Shourds	1	170,906
Dental plates, attaching disks to, Q. A. Scott	46	170,776
Devaporizing apparatus, L. K. Fuller	48	170,844
Dish washer, M. E. Whiteside	86	170,923
Door spring, W. H. Myers	24	170,887
Drop light, R. M. Shoule	64	170,779
Drying apparatus, A. Wilder	48	170,924
Eggs, compound as a substitute for, J. A. Griffin	35	170,670
Elevator, hydraulic, T. Stebine	79	170,781
Embankments, mattress for forming, Eads and Andrews	82	170,832
Engine, fire, G. E. Barker	118	170,809
Equalizer, draft, L. F. Smith	31	170,690
Equalizer, spring, W. Smith	31	170,691
Fan, automatic, B. Lingane	165	170,863
Faucet, W. L. Brownell	167	170,704
Fence, W. A. Couch	52	170,714
Fence, J. Dwyer	52	170,830
Fence, T. Harding	52	170,850
Fence wire, barbed, J. E. Page	52	170,891
Files, machine for stripping, J. Garland	53	170,725
Finger ring boxes, machine for making cushions for, B. S. Dennison, (reissue)	86	6,780
Fire arm, breech loading, C. Green	18	170,669
Fire extinguishing apparatus, J. H. Connelly	118	170,820

	Class No.	No. of Patent.
Fire place heater, J. M. Atkinson	154	170,801
Flue lining, C. A. Freeman	90	170,841
Fruit and egg packing box, J. A. Miller	63	170,685
Fruit basket, N. L. Tuck	63	170,920
Fruit, preparing preserved, J. F. Bassford	58	170,700
Fuel, press for molding artificial, H. Cottrell	61	170,713
Furnace, puddling, S. Caddick, (reissue)	85	6,778
Furnace slag, disintegrating, C. Diebold	85	170,717
Gage, steam pressure, J. Burden	148	170,706
Game apparatus, M. C. Berr	143	170,707
Gas apparatus, illuminating, P. L. Allaire	66	170,799
Gas generating apparatus, C. L. Vasques	27	170,788
Gas mixing machine, L. Lanasweert	66	170,677
Gate, automatic, R. S. Rinker	52	170,899
Glass mold, H. Frans	68	170,839
Glassware, device for removing the blow over from, W. Adams	68	170,798
Grain conveyer shaft, H. L. P. F., and E. D. Chase	79	170,711
Graining plates, frame for, R. A. Adams	111	170,695
Grate, M. G. Fagan	154	170,835
Grate bar, W. C. Childs	149	170,817
Gun, cane, C. Melaye	165	170,694
Gun carriage, M. M. Franzini	165	170,840
Hammer, drop, C. Lusted	60	170,868
Harness saddle, J. Maclure	72	170,870
Harness saddle, J. Maclure	72	170,871
Harness saddle, J. W. Schwaner	72	170,774
Harness saddle, A. Teas	72	170 916
Harvesters, sway bar guide for, W. R. Baker	74	170,804
Hat trimmings, machine for covering reeds for, G. A. Shepard, (reissue)	76	6,782
Hay loader, C. M. Young	77	170,796
Heater, feed water, N. W. Kirby	148	170,743
Heater, fire place, J. N. Atkinson	154	170,801
Heater, locomotive feed water, W. Halsted	94	170,729
Hide scouring machine, C. Rose	92	170,771
Hides, treating, W. H. Holmes	92	170,855
Hinge, D. W. Long	24	170,750
Hinge attachment, strap, H. Freeman	24	170,843
Hinge, shutter, F. Beckert, Jr	24	170,702
Hinge, strap, J. G. Reynolds	24	170,769
Horseshoe, N. J. Blatherwick	60	170,809
Horseshoe, A. W. Smith	60	170,911
Horseshoe nails, machine for finishing, H. A. Wills	60	170,793
Hose and tubing, T. H. Dunham	81	170,828
Hose, belting, &c., preserving cotton, hemp, and flax, T. H. Dunham	81	170,829
Hose, hydraulic, S. W. Baker	81	170,803
Hose nozzle, I. W. McGaffey	167	170,753
Jack, hydraulic, E. M. Dudgeon, (reissue)	79	6,786
Jelly cup, E. F. Cash	58	170,815
Journal box, lubricating, H. E. Smith	87	170,907
Key book, J. H. Gates	146	170 668
Key hole guard, F. W. Bechmann	93	170,701
Kitchen utensil, J. C. Noble	88	170,888
Kitchen ventilator, J. V. Montgomery	166	170,860
Ladder, fire escape, J. A. Groehon	30	170,846
Lamp, street, H. Wellington, (reissue)	90	6,789
Lathe for turning spools, W. R. Landfear	175	170,861
Lathes, planers, and drilling machines, combination of, J. McLaren	100	170,683
Lighter for gas burners, automatic, Stockwell and Weise	90	170,913
Lithographic presses, damping attachment for, H. Voirin	54	170,693
Lock, indicator, L. R. Norman	93	170,889
Lock, time, S. W. Hollen, (reissue)	93	6,787
Locomotive feed water heater, W. Halsted	94	170,729
Loom for weaving blinds, B. R. Murphy	95	170,885
Loom for weaving pile fabrics, Webster and Wade	95	170,922
Loom, ribbon, P. Schwartz	95	170,904
Loom temple, J. C. Thiekins	95	170,785
Louver, ventilating, G. Hayes	30	170,852
Lunch pail, H. W. Schuessler	88	170,903
Mariner's log, G. E. Elliott	138	170,720
Meat cutter, G. W. Rawson	25	170,896
Mechanical movement, C. B. Withington	67	170,927
Medical composition, I. T. Thrash	98	170,918
Motor, coal oil, F. Barger	67	170,813
Mowing machine, W. C. Douthett	74	170,665
Oatmeal machine, H. Kruse	57	170,745
Oil, mat for pressing, T. H. Murphy	26	170 886
Oil tanks, man hole cover for, W. H. Anderson	58	170,697
Ore concentrator, J. Longmaid	3	170,751
Ore separator, P. Osterspey	3	170 890
Pannier or bustle, R. Biering	80	170,807
Paper box, E. W. Dennison	109	170,664
Paper drying machine, C. S. Clark	108	170,712
Paper perforating machine, P. McAleer	109	170 873
Pavement, stone, J. McBean	110	170,874
Photo-plates for printing in fatty inks, preparing, P. A. Despaquis	111	170,716
Photographic eye rest, S. M. Williams	111	170 794
Pie plate stand, A. Moody	88	170,881
Pitman connection, G. H. Earnest	67	170,666
Plaiting machine, M. M. Macdonald	38	170 869
Planing machines, cutter head for, H. H. Baker	173	170,802
Planter and fertiliser distributer, seed, M. P. Curlee	133	170,823
Planter, check row, W. H. Johnson	133	170,673
Planter, corn, Gmeiner and Schöttler	133	170,728
Planter, hand seed, T. J. Hubbell	133	170,865
Plow, J. Phillips	114	170,764
Plow, gang, T. M. Shaw	114	170,778
Press for molding artificial fuel, H. Cottrell	61	170,713
Plowing and seeding machine, D. McVaw	114	170,754
Printing in fatty inks, preparing photo plates for, P. A. Despaquis	111	170,716
Printing presses, perforating attachment for, J. C. Forman	117	170,724
Propeller, screw, N. A. Patterson	139	170 893
Pump, W. McBarnard	118	170,680
Pump buckets, coupling for chain, N. D. Davis	118	170,824
Pump valve, Hubbard and Hart	118	170,737
Pumps, expansion bucket for chain, D. W. Witmer	118	170,936
Radiators, air vent for steam, G. W. Blake	147	170,808
Rail holder, C. W. Matthews	99	170,679
Ratchet wheel, J. F. Thomas	67	170,917
Refrigerator, E. B. Jewett	58	170,739
Rein holder, G. W. Miller	31	170,750
Rice mortar, N. O. Tilton	57	170,787
Running gear, L. D. Hurd	72	170,856
Sad iron, A. L. Parcelle	91	170,763
Salt or sugar, process and apparatus for manufacturing, Weaver and Colwell	129	170,791
Sand and gravel heater, J. McC. Perkins	126	170,894
Sash fastener, B. Fischer	94	170,723
Sash holder, P. Lugenbell	24	170,867
Saw, crosscut, J. E. Emerson	130	170,833
Saw set, F. C. Barber	131	170,657
Sawing machine, S. W. C. Adams	130	170,797
Sawing machine, band, W. W. Carey	130	170,814
Screw cutting die, V. J. Reece	14	170,768
Seat, school, W. A. Bradford	62	170,810
Separator, grain, D. A. Caswell	159	170 816
Separator, ore, P. Osterspey	3	170,890
Sewer basin, Brady and Ward	51	170,660
Sewing buttons to cloth, &c., machine for, J. C. Taft	38	170,784
Sewing machine, J. Keith	134	170,741
Shaving cup, Schauble and Dohm	161	170,773
Shears for sheet and plate metal, T. Berridge	44	170,658
Sled, child's, H. N. Tucker	31	170,919
Sled propeller, D. W. De Forest	31	170,715
Smoke drum and water heater, N. A. Moore	154	170,884
Sofa, N. M. Mackenzie	62	170,678
Soldering iron, Anderson and Goldy	136	170,800
Speaking tube, R. H. Hooper	158	170,672
Spectacles, F. Yeiser	157	170,795
Speculum, Harding and Higbee	156	170,851
Spinning ring holder, G. Draper	142	170,826
Spoke socket, H. A. Holt	31	170,732
Stereoscope, W. H. Lewis	111	170,749
Stills and drying chambers, condenser for, M. Harris	47	170,734
Stove, S. H. La Rue	154	170,746
Stove, cooking, J. S. Adams	154	170,696
Stove, cooking, E. Bussey, (reissue)	154	6,785
Stove, cooking, F. H. Hamilton	154	170,849
Stove register, White and Lewin	154	170,799
Stoves, ash sifting attachment for, A. C. Corse	154	170,821
Swing, W. P. Rogers	146	170,900
Table, ironing, J. Flafrock	91	170,837
Table, ironing, W. P. Hall	91	170,848
Tables, corner for, R. Ewald	62	170,722
Tack, E. P. Hincks	16	170,854
Tag fastener, J. M. Goodridge, (reissue)	146	6,781
Thill coupling, T. McCaffery	31	170,681
Ticket, B. Morse	146	170,686
Tire, H. Thompson	31	170,786
Tire upsetter, M. Schou	60	170,688
Tongue support, J. D. Meals	31	170,678
Tool holder, J. A. B. Williams	29	170,694
Toy pistol, T. J. Carroll	143	170 662
Toy trundle and bell, W. F. Starr	143	170,912
Tubing, device for finishing metallic, H. R. Bonwell	163	170,806
Twine cutter, letter opener, and stamp moistener, combined, J. Eitel	146	170,719
Valve and overflow for baths and basins, waste, W. S. Carr	8	170,709
Valve, safety and relief, J. W. Melling	148	170,757
Vane, weather, W. H. Pickering	118	170,766
Vegetable substances knitted bag for packages of compressed, J. D. Culp, (reissue)	160	6,779
Ventilating louver, G. Hayes	30	170,852
Ventilator, J. L. Faxon	166	170,836
Ventilator, kitchen, J. V. Montgomery	166	170,880
Vise, bench, G. M. Evans	29	170,721
Vulcanizing apparatus, J. D. Heiges	84	170,731
Wagon, dumping, H. Bailey, (reissue)	31	6,783
Wall paper, machine for trimming, C. Boust	109	170,659
Washing and wringing machine, Cilley, Wright, and Nelson	91	170,818
Washing machine, J. F. Lawson	91	170,862
Water meter, F. Philippi	167	170,895
Weather vane, W. H. Pickering	118	170,766
Whiffletree eye, J. Pierpont	31	170,896
Whiffletree fastening, H. R. Jackson	31	170,738
Windmill, M. D. Cummins	118	170,663
Windmill, D. Lempson	118	170 676
Window sash, W. W. Evans	30	170,834
Window shutter, S. Victor	30	170,789
Wire, machine for threading and inserting, S. E. Shute, Jr	170	170,689

	Class No.	No. of Patent.
Wood bending machine, E. Q. Smith	176	170,910
Wood, press plate for drying and bending, S. Swarts	176	170,915
Wrench, B. F. Joslyn	100	170,860
Zinc from its ores, distilling, G. E. Moore	99	170,780

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED DECEMBER 7, 1875.

	Patent No.
Adams, J. S., Cooking stove	170,696
Adams, R. A., Frame for graining plates	170,695
Adams, S. W. C., Sawing machine	170,797
Adams, W., Device for removing the blow over from glassware	170,798
Adler, B., [illegible]	170,677
Allais[illegible] gas apparatus	170,799
Allen, [illegible] shoulder brace	170,655
Allen, H. R., [illegible] thigh brace	170,656
Anderson, A., and L. W. Goldy, Soldering iron	170,800
Anderson, W. H., Man hole cover for oil tanks	170,697
Andrews and Eads	170,832
Andrews, E. F., Brick drier	170,928
Andrews, E. W., assignee	170,864
Anthony, E. and H. T., & Co., assignees	170,749
Armstrong, E., Bee hive	170,698
Atkinson, J. M., Fire place heater	170,801
Bailey, H., Dumping wagon, (reissue)	6,783
Baker, H. H., Cutter head for planing machines	170,802
Baker, N. T., assignee	170,898
Baker, S. W., Hydraulic hose	170,803
Baker, W. R., Sway bar guide for harvesters	170,804
Baldwin, W. D., assignee	170,834
Barber, F. C., Saw set	170,657
Barker, G. E., Fire engine	170,699
Barton, E., Spring bed bottom	170,805
Bassford, J. F., Preparing preserved fruit	170,700
Bechmann, F. W., Key hole guard	170,701
Beckert, F., Jr., Shutter hinge	170,702
Benwell, H. R., Device for finishing metallic tubing	170,806
Berridge, T., Shears for sheet and plate metal	170,658
Biering, R., Pannier or bustle	170,807
Blake, G. W., Air vent for steam radiators	170,808
Blatherwick, N. J., Horseshoe	170,809
Bliss, C. F., assignee	170,722
Boust, C., Machine for trimming wall paper	170,659
Bradford, W. A., School seat	170,810
Brady, P., and G. M. Ward, Sewer basin	170,660
Bray, M., Paint can	170,703
Briggs, A. T., assignee	170,908, 170,909
Brodnax, D. W., Sr., Rotary spade cultivator	170,661
Brown, C. H., Car axle box washer	170,811
Brown, G., assignee	170,729
Brown, H. J., Clothes drier	170,812
Brownell, W. L., Faucet	170,704
Buck, J., Bung funnel, (reissue)	6,784
Buckhout, J. D., assignee	170,846
Budd, A. A., Burglar alarm	170,705
Burche, S. O. A., assignee	170,885
Burden, J., Steam pressure gage	170,706
Burger, F., Coal oil motor	170,813
Burr, M. C., Game apparatus	170,707
Bussey, E., Cooking stove, (reissue)	6,785
Butt, D. L. R., Adding machine	170,708
Caddick, S., Puddling furnace, (reissue)	6,778
Caboone, E. E., assignee	170,870, 170,871
Campbell, Jones & Co., assignees	170,839
Campbell, N. E., assignee	170,861
Carey, W. W., Band sawing machine	170,814
Carr, W. S., Waste valve and overflow for baths and basins	170,709
Carroll, T. J., Toy pistol	170,662
Carter, A., Bustle	170,710
Cash, E. F., Jelly cup	170,815
Caswell, D. H., Grain separator	170,816
Chase and Meinlkheim	170,755
Chase, H. L. P. F., and E. D., Grain conveyer shaft	170,711
Childs, I. P., assignee	170,742
Childs, W. C., Grate bar	170,817
Cilley, I. J., L. A. Wright, and T. Nelson, Washing and wringing machine	170,818
Clark, C. S., Paper drying machine	170,712
Colwell and Weaver	170,791
Connolly, J. H., Fire extinguishing apparatus	170,820
Connolly, J. B., Cuspadore	170,819
Conley, S. J., assignee	170,928
Consolidated Tobacco Company, assignee, (reissue)	6,779
Cornwell, G. W., assignee	170,665
Corse, A. C., assignee	170,835
Corse, A. C., Ash sifting attachment for stoves	170,821
Cottrell, H., Press for molding artificial fuel	170,713
Couch, W. A., Fence	170,714
Crary, J. S., Baggage seat	170,822
Crosby, J., Invalid bedstead, (reissue)	6,790
Culp, J. D., Knitted bag for packages of compressed vegetable substances, (reissue)	6,779
Cummins, M. D., Windmill	170,663
Cunningham and Place	170,765
Curlee, M. P., Seed planter and fertilizer distributer	170,823
Davis, J. H., assignee, (reissue)	6,782
Davis, N. D., Coupling for chain pump buckets	170,824
De Forest, D. W., Sled propeller	170,715
Dennison, R. L., Machine for making cushions for finger ring boxes, (reissue)	6,780
Dennison, E. W., Paper box	170,664
Despaquis, P. A., Preparing photo plates for printing in fatty inks	170,716
Dewey, J. J., Feeding apparatus for carding machines	170,825
Diebold, C., Disintegrating furnace slag	170,717
Dohm and Schauble	170,773
Douthett, W. C., Mowing machine	170 665
Draper, G., Spinning ring holder	170,826
Dudgeon, E. M., Hydraulic jack, (reissue)	6,786
Dulin, W., Instrument for aiding animals in giving birth	170,827
Dunham, T. H., Hose and tubing	170,828
Dunham, T. H., Preserving cotton, hemp, and flax hose belting, &c	170,829
Dustin, D. G., Oil can spout	170,718
Dwyer, J., Fence	170,830
Dyke, A., Buckle	170,831
Eads, J. B., and J. Andrews, Mattress for forming embankments	170,832
Earnest, G. H., Pitman connection	170,666
Eaton, J., assignee	170,843
Eitel, J., Combined twine cutter, letter opener, and stamp moistener	170,719
Elliott, G. E., Mariner's log	170,720
Emerson, J. E., Cross cut saw	170,833
Evans, G. M., Bench vise	170,721
Evans, W. W., Window sash	170,834
Ewald, R., Corner for tables	170,722
Fagan, M. G., Grate	170,835
Faxon, J. L., Ventilator	170,836
Finfrock, J., Ironing table	170,837
Fischer, B., Sash fastener	170,723
Fitz Gerald, W. H., Washer for car axles	170,838
Fitzpatrick, J. B. and J. B., assignees	170,845
Forman, J. C., Perforating attachment for printing presses	170,724
Frans, H., Glass mold	170,839
Franzini, M. M., Gun carriage	170,840
Frech, W., Countershaft	170,667
Freeman, C. A., Fine lining	170,841
Freeman, H., Strap hinge attachment	170,843
Freeman, J. G., Feeding mechanism for carding engines	170,842
Fuller, G. W., Hanging bird cage	170,845
Fuller, L. K., Devaporizing apparatus	170,844
Garland, J., Machine for stripping files	170,725
Gates, J. H., Key book	170,668
Gilchrist, H. H., Corn uncoverer	170,726
Gmeiner, C., and C. Schottler, Corn planter	170,728
Goldy and Anderson	170,800
Goodridge, J. M., Tag fastener, (reissue)	6,781
Gordon, W. J., Can seaming machine	170,727
Green, C., Breech loading fire arm	170,669
Griffin, J. A., Compound as a substitute for eggs	170,670
Groehon, J. A., Fire escape ladder	170,846
Gunther, G., Bird cage	170 847
Hall, W. P., Ironing table	170 848
Halsted, W., Locomotive feed water heater	170,729
Hamilton, F. H., Cooking stove	170,849
Harding, E. B., and E. W. Higbee, Speculum	170,851
Harding, T., Fence	170,850
Harris, G. W., assignee	170,814
Harris, M., Condenser for stills and drying chambers	170,730
Hart and Hubbard	170,737
Harvey, C., assignee, (reissue)	6,781
Harvey, S. B., assignee	170,672
Harwood, G. S., assignee	170,825, 170,842
Hastings, J. L. and W. H., assignees	170 820
Hayes, G., Ventilating louvers	170,852
Heiges, J. D., Vulcanizing apparatus	170,731
Henkels, G. J., Sofa bedstead	170,853
Hibbets, McGugin, and Lybargar	170,673
Hickey, P., assignee	170,727
Higbee and Harding	170,851
Hincks, E. P., Tack	170,854
Holden, C. F., Bird cage	170 671
Hollen, S. W., Time lock, (reissue)	6,787
Holmes, W. H., Treating hides	170,855
Holt, H. A., Spoke socket	170,732
Hooper, R. H., Speaking tube	170,672
Hoopes, R. R., Portable coal chute	170,856
Hotchkiss, C. A., Curry comb	170,733
Hotchkiss, C. A., Curry comb	170,734
Hotchkiss, C. A., Curry comb	170,735
Hotchkiss, C. A., Curry comb	170,736
Hotchkiss, C. A., Curry comb	170,857
Hotchkiss' Sons, assignees, (reissue)	6,788
Hoyt, S. N., assignee	170,813
Hubbard, L., and W. A. Hart, Pump valve	170,737

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED DECEMBER 7, 1875.

170,655. BACK AND SHOULDER BRACES. H. R. Allen, Indianapolis, Ind. [Filed Sept. 20, 1875.]

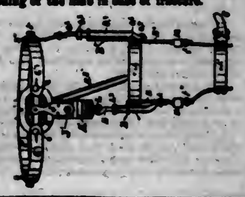
Brief.—An arrangement of bands, levers, pawls, and ratchets is placed around and upon the person, to straighten curvatures of spine, &c. The claims in detail fully set forth the invention.

1. The curved base-spring B, provided with pads K' K' and strap Y, in combination with the upright back and front bars A A' and curved braces C C', substantially as set forth and described.

2. The curved bar or arm R, pivoted as shown, and provided with a pad, K', substantially as set forth and described.

3. The combination of the upright front and back bars A A' with the circular ratchets D D', pawls P P', and upper front and back bars E E', substantially as and for the purpose set forth and described.

4. The upper front and rear bars E E' and the adjustable top spring-bar F and pad K, ratchets *a a*, and pawls H H, constructed and operated substantially as and for the purpose set forth and described.



5. The adjustable curved side bar G, provided with the hooks L', or other means of fastening to the upper ends of the side bars A A' and pad K', substantially as and for the purpose set forth and described.

6. The shoulder-brace M, provided with a pad, K', strap S, and hook V, in combination with the arm R, substantially as and for the purpose set forth and described.

7. The braces, as above described, constructed so as to operate on both sides, as shown in Fig. 1, or separated at the line *a b* of Fig. 2 for one side, substantially as set forth and described.

170,656. HIP AND THIGH BRACES. H. R. Allen, Indianapolis, Ind. [Filed Sept. 20, 1875.]

Brief.—Several bands passing around the waist are connected at their sides by vertical bars, and the lower one furnished in front with a peculiarly-constructed spring-pad. Bands and vertical connections also are arranged to inclose the leg. A strap adjustment draws down the foot, to prevent shortening of the limb in case of fracture.

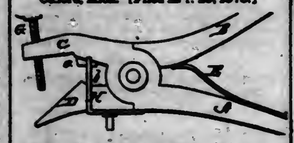
1. The curved padded spring-brace or seat-piece K, provided with an eyebolt, L, in combination with the adjustable screw L', substantially as and for the purpose set forth and described.

2. The combination of the curved padded spring-brace K and one or more curved spring-bars F F', provided with straps G G' G', substantially as described.

3. The adjustable hinged spring-bar J, provided with the adjusting-screw J', in combination with the curved padded spring-brace K and pad H, substantially as set forth and described.

4. The side bar O', in combination with one or more curved spring-bars, F F', and pivoted to the adjustable screw O', substantially as and for the purpose set forth and described.

5. The removable side bar B', constructed with an angle or clip, as described, in combination with the tube O', adjusting-screw O', and side bar O' of the body-brace F F' or thigh-brace T, substantially as and for the purpose set forth and described.



6. In combination with the leg and body parts of the braces, the adjustable screw B', tube B', hinged at the top and bottom to pieces N' N', and secured in sockets E' E', which are pivoted to the curved spring-bars F and E, or other parts, substantially as and for the purpose set forth and described.

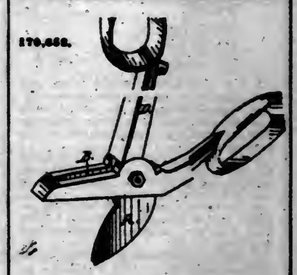
7. The curved spring-bar E, provided with notches *c* and hooks *c'*, or attached in any manner with the curved spring-bar A, substantially as set forth and described.

8. The curved padded spring-brace or seat-piece K', in combination with the rocking springs R R' and adjusting-screw L', constructed and operated substantially as set forth and described.

9. The curved padded seat-piece or band T, in combination with the eyebolt L, adjusting-screw L', and adjusting-screw O', arranged to operate substantially as set forth and described.

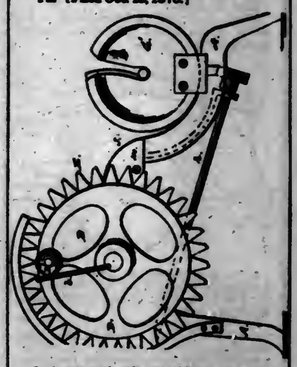
170,657. SAW-SETS. Fernando C. Barber, Oxford, Mich. [Filed Mar. 20, 1875.]

1. The jaw D, having the inner surface, on which the saw is placed, inclined, and provided with the recess *b*, into which the tooth is set, substantially as and for the purposes set forth.



2. The combination of the pivoted handles A B, with spring E between them, the jaw C, with die *a*, and set-screw G, and the jaw D, provided with the recess *b*, and having the inner surface inclined, as shown, substantially as and for the purposes set forth.

170,658. SCRAPE FOR CHEST AND PLATE METAL. Thomas Berridge, Sturgis, Mich. [Filed Oct. 11, 1875.]



Brief.—Shears for cutting sheet or plate metal terminate, one arm or handle, in a blunt solid-point cutter, having a plain or concave upper surface with sharp edges. The other handle has a box-shaped extremity, in which is an elongated slot, with plane surface and rectangular edges, in which slot the cutter operates, playing steadily and freely in and out; the construction giving a double cut without injury to the cut edges or displacement, except the narrow strip cut out, and also permits the simultaneous cutting of two strips of equal or unequal width from a plate of metal.

The double-cutting shears for sheet and plate metal, consisting of cutter A, with plane or concave upper surface, and a rectangular slot, B, in which the cutter operates, thereby making a double cut, substantially in the manner and for the purpose herein shown and described.

170,659.

170,660. MACHINES FOR TRIMMING WALL-PAPER. Charles Bonar, Northumberland, Pa. [Filed Oct. 19, 1875.]

1. A paper-trimming machine, constructed with the rotating cutter and clamp G, or its equivalent, mounted upon, and secured to, the shaft or roller upon which the paper is wound while being trimmed, substantially as set forth.

2. The combination of the roller C, the disk-shaped or flanged wheel D, and the circular-saw cutter E, constructed and operating substantially as and for the purposes set forth.

3. The hinged standard B', in combination with the roller C, carrying cutter E, for the purposes set forth.

4. The hinged clamp G, with rod *a*, having handle *b* formed upon its end, in combination with the roller C, for the purposes set forth.

5. The combination of the movable carriage H, provided with stationary and movable standards G G' and rock-bar F, the plate *e*, shaft A, and hand-wheel I, substantially as and for the purpose set forth.

6. The combination of the frame A, having the raised corner part J, with steel plate *m*, standards B B', roller C, with clamp G, wheel D, with circular-saw cutter E, movable carriage H, with standards G G, and the shaft *d*, all constructed and arranged to operate substantially as and for the purpose set forth.

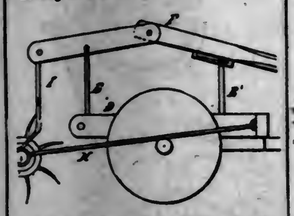
170,661. SEWER-BASINS. Patrick Brady and Geo. M. Ward, Newark, N. J. [Filed Apr. 7, 1875.]

Brief.—The opening of the sewer-basin extends from the wall to the front or curb, exposing the entire interior, and has a recessed front, into which the cover fits, the latter extending over the bed of the depressed throat. The throat has for its bed the recessed front of the head, and for its top the front of the cover. A removable trap is held on a dovetail projection, and is closed on three sides by a tight joint to form a water-trap.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

170,660.

1. In a sewer-basin, the head B over the wall of the basin, and open over the whole interior thereof, and cut to thin front or curb, and having the recessed front between the two sides, substantially as specified, and for the purposes set forth.

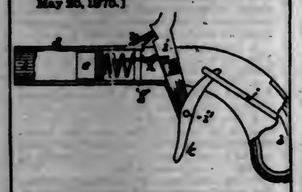


2. The cover B, over the whole interior of the basin, and extending to the curb-front over the bed of the throat, substantially as and for the purposes specified.

3. The throat, having for its bed O the recessed front of the head, and for its top the front of the cover, substantially as shown and described.

4. The adjustable trap K, substantially as shown, and for the purposes specified.

170,661. ROTARY SPADE-CULTIVATORS. D. W. Brabham, Sr., Rockdale, Tex. [Filed Sept. 20, 1875.]



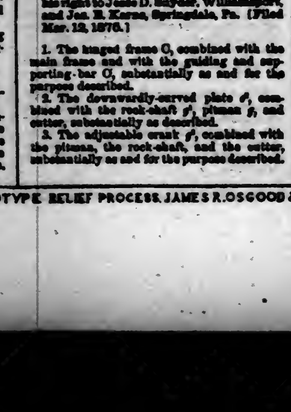
Brief.—Revolving spader attached to the rear of the vehicle, and devices for lifting and holding down the same.

1. The combination, with the frame D, with supporting-arches E E', of the compound lever F and yoke I, for raising the cultivator-wheel, as described.

2. The rotary spade-cultivator compound of frame D, supporting-arches E E', jointed hinged hand-lever F, yoke I, rods H, and wheel G, all constructed, arranged, and adapted to operate as and for the purposes described.

170,662. TOY PISTOLS. Thomas J. Carroll, Bridgeport, Conn., assignor of one-half his right to Chas. Whipple, same place. [Filed May 26, 1875.]

1. The combination of the pistol body *r*, the spring *f*, the wire *h*, hammer *i*, and cap-nipple *m*, all constructed and operating substantially as shown and described.



2. The combination of the hammer *i*, the spring-hook *j*, and the trigger-lever *k*, all arranged to operate substantially as shown and described.

3. The combination of the piston *o*, spring *f*, wire *h*, hammer *i*, spring-hook *j*, and trigger *k*

170,663. WINDMILLS. Mantzwill D. Commaker, Napoleon, Ohio. [Filed Oct. 15, 1875.]

Brief.—The frame of this windmill is composed of two upright posts connected by three horizontal bars, the lower ones forming the support for the mill, and the upper one the bearing. There are two upright parallel bars connected at both ends by castings. In the center of these bars are bearings for the crank-shaft, to which the pump-rod is attached. On one end of the shaft the wheel is secured so close to the crank and pump rod that no power is lost. The tail-vane is hinged to the side of one of the bars in such a manner that it can turn in but one direction. There is a regulating-vane; the shank of it forms at its inner end a cogged segment, which connects or gears with a short rack-bar, which is connected by a slide placed between the two bars. When the regulating-vane is turned, the segment raises the rack-bar and slide, and by these means the lever is raised, which causes the wheel and vane to turn toward each other, thus throwing the wheel out of the wind.

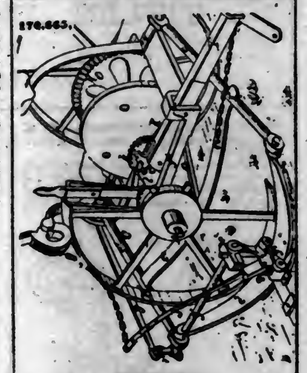
170,663.

1. The combination, with the frame C, wheel D, and vane E, of the pivoted regulating-vane H, with cogged segment *e*, rack-bar *f*, with rod *i* and slide *k*, rod *m*, weighted lever *l*, and rod *n*, substantially as and for the purposes herein set forth.

2. The stop-rod *p* and pivoted finger *t*, in combination with the slide *k* and its connections with the wheel D and vane E, substantially as and for the purposes herein set forth.

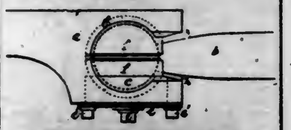
170,664. PAPER BOXES. E. W. Dennison, Boston, Mass. [Filed Aug. 6, 1875.]

A box in which the outer finishing-sheet formed with one or more openings, as described, in combined with an inner sheet, substantially as and for the purposes shown and set forth.



170,665. MOWING-MACHINES. William G. Deatherage, Springdale, assignor of part of his right to James D. Snyder, Williamsport, and Jos. B. Kerns, Springdale, Pa. [Filed Mar. 12, 1875.]

1. The hinged frame G, combined with the main frame and with the guiding and supporting-bar C, substantially as and for the purpose described.



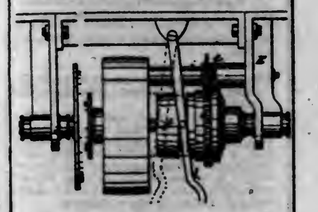
2. The downwardly-curved plate *s*, combined with the rock-shaft *g*, pitman *f*, and cutter, substantially as described.

3. The adjustable crank *g*, combined with the pitman, the rock-shaft, and the cutter, substantially as and for the purpose described.

170,665.

170,666. PITMAN-CONNECTIONS. Geo. H. Barnard, Springfield, Ohio. [Filed Jan. 4, 1875.]

1. In a pitman-connection, a double ball-joint, in which the outer ball consists of the two hemispherical shells *f f*, (divided vertically,) in combination with ball *b'* of pitman-rod *b*, ping-shell *c*, with its key *d* and stickle-head *e*, as shown and specified, as and for the purpose set forth.



2. The combination of stickle-head *e*, hole *g*, with slot *h*, shell-ping *c* with its key *d*, bar *a*, screws *s'*, and set-screws *s''*, as shown and specified, for the purpose herein before set forth.

3. Parts *f'* of shells *f*, in combination with neck of ball *b'*, and slot *h* of stickle-head *e*, as and for the purpose set forth.

4. In combination, pitman-rod *b* with ball-head *b'* and shell-sections *f f*, stickle-head *e* with hole *g*, slot *h*, shell-ping *c*, and the securing and adjusting devices specified, arranged substantially as described.

5. In combination with stickle-head *e*, ball *b'*, shells *f f*, shell-ping *c*, bar *a*, screws *s'*, set-screws *s''*, and rod *i*, with ball *j*, gaps *i* and *i'*, wheel A, bolt *l*, pin *r*, and nuts *b b' b''*, as shown and specified, as and for the purpose herein before set forth.

170,667. COUPLER-SHAFTS. Wm. Frosh, Cincinnati, Ohio. [Filed July 19, 1875.]

1. In a counter-shaft, the gearing herein described, for the purpose of regulating the backward and forward motion by the use of one belt, substantially as described, and for the purposes set forth.

2. The combination, with the hangers and cross-bar, of the cloth, provided with two male cones, one on either end, substantially as described, and for the purposes set forth.

3. The driving-wheel *c*, cloth *f*, gear *e*, hangers B and *r*, pinions *b b*, and cloth A, in combination with the cloth *f*, substantially as described, and for the purposes set forth.

170,668. KEY-BOOKS. Julian H. Gates, Hartford, Conn. [Filed Oct. 2, 1875.]

A key-book, having pocket *b* and removable key-pin *d*, located as herein set forth, all substantially as described.

170,669. BEEHIVES - LOADING FEED - ARMS. Charles Green, Rochester, N. Y. [Filed Nov. 1, 1875.]

1. As an improvement in the construction of this class of fire-arms, the locking-lips *c* upon the shanks S and S', in combination with the head *b* and axial journal J, all constructed and arranged to operate substantially in the manner and for the purpose set forth.

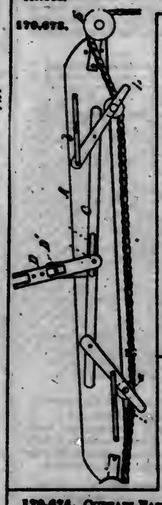
2. In combination with the axial journal J and cross-tie *r*, the adjustable compensating-key *g*, hung in the wing E, so as to be operated, substantially as described, for the purpose of perfecting and securing the bearing at the journal J, cross-tie *r*, and between the end of the barrels and the front vertical face of the breech-block A, as set forth.

170,670. COMPOUNDS AS A SUBSTITUTE FOR SOAP. Joseph A. Griffin, Syracuse, N. Y. [Filed Nov. 9, 1875.]

The compound consisting of cream tartar, tartaric acid, alum, soda bicarbonate, sugar, gumma, gum-arabic, sulphur, and starch, in about the proportions above specified, as and for the purpose described.

170,671. BIRD-CAGES. Charles F. Holden, Boston, Mass. [Filed Oct. 19, 1875.]

In combination with a feed dish or receptacle, B, the guard-plate *f*, projecting from the interior of the cage, and so arranged as to form a cover for the feed-receptacle when in place, substantially as and for the purpose set forth.



170,672. CHECK-ROW PLANTERS. William H. Johnson, Farmer City, Ill. [Filed Sept. 4, 1875.]

Brief.—Pivoted forked arms are connected (to operate together) by a bar having a central slot, for the attachment of a slotted arm, that communicates motion to the seed-slide. The check-row cord is provided with a double series of knots, to correct inaccuracies occurring in planting in opposite directions. The forked arms are provided with small grooved pulleys.

1. In combination with the connecting-arm C, slotted at its center, and pivoted slotted arm D, the trippers B B', pivoted at their center and ends to the arm C and frame A, and constructed with Y-shaped mouth and grooved pulleys *a*, as and for the purpose described.

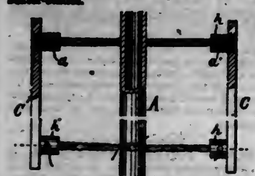
2. In combination with the trippers B, with grooved rollers *a*, and frame A, with rollers B, the line E, with sets or pairs of separate knots *f f'*, for operating the seed-dropping devices in a forward and backward direction, as described.

170,672.

170,673. SPEAKING-TUBES. E. H. Hotzer, Washington, D. C. [Filed June 9, 1875.]

The receiver constructed as described, and consisting of the plates *a a'*, in combination with the curved or angular deflectors *b b* and division-plate B, all constructed to operate substantially as and for the purpose set forth.

170,674. CORNAIN-FASTENERS. T. B. King, Rockville, Conn. [Filed Nov. 4, 1875.]



1. The combination of the pin C, consisting of a metallic cylinder, with a slit cut longitudinally through its outer part, *c*, and the eye D, to form a buttoning device, substantially as herein described.

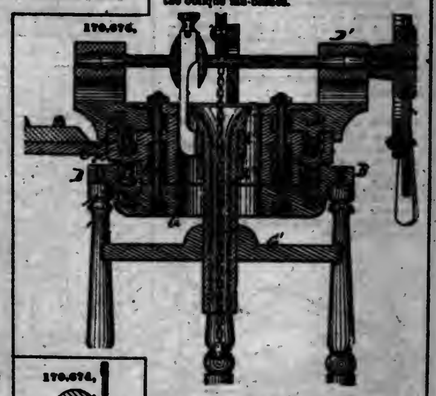
2. The pin C, constructed, as herein described, with the slit *c* and the screw *c*, substantially as herein set forth.

170,675. BEATERS FOR COTTON-OPENERS. Richard Kitson, Lowell, Mass., assignor to Kitson Machine Company. [Filed June 21, 1875.]

Brief.—The beater-arms are formed of two or more strands of tempered steel wire, or other flexible metal, provided at their extremities with loops for securing them to the beater-blades.

1. The yielding beater-arm, constructed of two or more strands of tempered steel wire or other flexible metal, in combination with the shaft and blades of the beater, substantially as described.

2. The double beater-arm, provided with loops *a a'* at the extremities for securing them to the blade, substantially as described.



3. The combination of the beater blade C and the leg *b* with the beater-arm, provided with the loop *a'*, substantially as described.

4. The combination, with the beater-shaft A, of the twisted-wire beater-arm, whose strands are divided and encompass the shaft, substantially as described.

170,676. WINDMILLS. Daniel Lampson, Rockford, Ill., assignor of one-half his right to M. Pottinger, same place. [Filed Apr. 16, 1873.]

Brief.—The turn-tables carrying this wind-wheel and the vane consists of two or more independently-rotating annular plates, provided with annular grooves and friction-rollers, in combination with a grooved annular bed-plate, with rings and clamping-plate, and through-bolts. The angular hook-bolts, in combination with the ring, are for securing the oblique fan-blades.

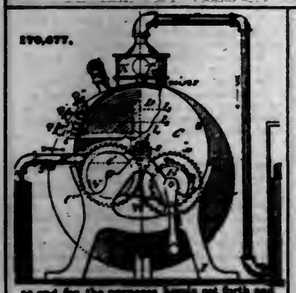
170,676.

1. The turn-table carrying the wind-wheel and the tail or vane, consisting of two or more independently-rotating annular plates provided with the annular grooves and the friction-rollers, arranged and operating as described.

2. The grooved annular bed-plate B, in combination with the annular plates C and D, constructed, arranged, and operating substantially as and for the purpose described.

3. The combination of the annular bed-plate B, rings C, D, and G, clamping-plate F, and through-bolts, all constructed and operating substantially as described.

4. The angular hook-bolts *p*, in combination with the ring C, for securing the oblique fan-blades, substantially as described.



170,677. GAS-MIXING MACHINES. Louis Lesenwort, San Francisco, Cal., assignor of one-third his right to Bar Adler, same place. [Filed June 18, 1874.]

Brief.—Different gases are mixed in varying proportions, as desired. Two meter-wheels in separate chambers of different sizes, each provided with a number of filling-cocks, at different heights, and each filled with water to varying heights, proportioned to the amount of gas to be passed through each chamber. From each chamber the gas passes through a purifying-chamber to the mixing-chamber, provided with a fan-wheel.

1. In a machine for mixing gases, substantially such as herein described, the casings holding the several gases to be mixed, provided respectively with a graduated series of nozzles, through which they may be filled up to determined relative levels with a liquid, to regulate their respective capacities for gas, substantially as and for the purpose specified.

2. The cylinders *d d'*, fitted to the pipes *c c'* between the casings O O' and mixing-chamber X, filled with chloride of calcium and carbon, or their equivalents, for purifying the gases delivered by the drums D D' previous to their combination, substantially

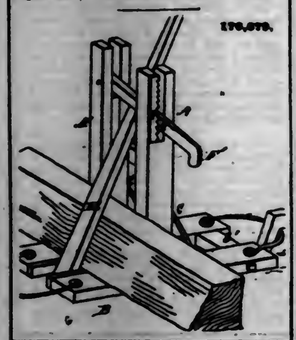
170,677.

as and for the purposes herein set forth and specified.

13. The fan or blower F, provided in the mixing-chamber X, actuated by the clock-work W W' p E c f b V i M, for the more intimately mixing of the gases delivered by the drums D D' through the risers S S', and purifying-compartments d d described, substantially as and for the purposes herein set forth and specified.

170,678. SOFAS. Hall M. Mackenzie, Providence, R. I. (Filed Sept. 27, 1875.)

Brief.—The central portion of the back is adapted to a horizontal position to form a table, while the central portion of the seat is slid back, whereby the ends of the back form seats to the table. The central portions of the seats and backs can also be entirely detached from the ends, which latter can then be used as chairs.



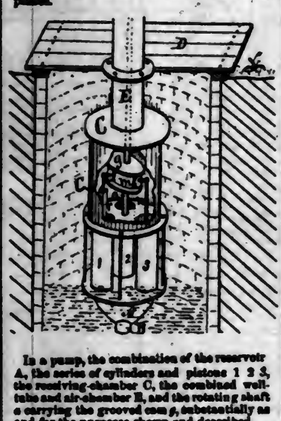
1. A sofa, the back of which is constructed with a central section, B, that can be drawn or slid up, and laid transversely across and above the seat in a horizontal position, substantially as and for the purposes set forth.

2. A sofa, having a seat provided with a central section, S, movable forward or backward, as described, and a back provided with a central movable section, B, substantially as set forth.

3. A sofa, composed of four principal parts, viz: the movable central back-section, the movable central seat-section, and the two end chairs or sofa sections, arranged together as described, and capable of separation, substantially in the manner and for the purposes specified.

170,679.

1. The adjustable shears F, fitted to the projecting neck N of the jack-clip J J by the bolt d, or its equivalent, and retaining-ring m, for steering the shaft-strap L, by the eye e and bolt r, to the axle A, substantially as herein set forth, and for the purposes specified.



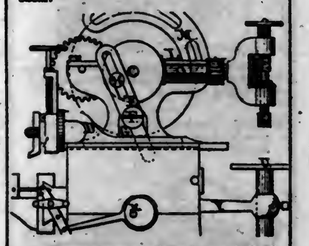
2. The combination of the adjustable shears F, strap L, and connecting-bolt r with the elastic packing O, arranged, as described, on the casting a a and lip l of the projecting neck N, forming part of the jack-clip J J, substantially as and for the purposes herein set forth and specified.

170,680. CLEANING COMPOUNDS. David McGugin, Jasper R. Lybarger, and Francis M. Hibbets, Knox County, Ohio. (Filed Sept. 16, 1875.)

The cleansing compound described, consisting of sal-soda, potash, borax, grease or oil, sulphate of soda, benzine, and ammonia, substantially in the proportions named.

170,681. TELL-COUPLINGS. T. McCaffery, San Francisco, Cal. (Filed Aug. 28, 1875.)

Brief.—Ears made in one piece separate from body of clip, but firmly attachable thereto and adjustable thereupon.

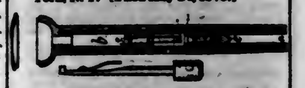


1. The adjustable shears P, fitted to the projecting neck N of the jack-clip J J by the bolt d, or its equivalent, and retaining-ring m, for steering the shaft-strap L, by the eye e and bolt r, to the axle A, substantially as herein set forth, and for the purposes specified.

2. The combination of the adjustable shears P, strap L, and connecting-bolt r with the elastic packing O, arranged, as described, on the casting a a and lip l of the projecting neck N, forming part of the jack-clip J J, substantially as and for the purposes herein set forth and specified.

170,682. COMBINATION OF LATHES, PLANERS, AND DRILLING-MACHINES. Jas. McLaren, Albany, N.Y. (Filed Sept. 3, 1874.)

Brief.—The lathe-arbor carries, on an extension back of the driving-pulley, a bevel-gear, through which motion is communicated to a drill-spindle and a crank-disk, which, through the medium of a slotted rocking lever, reciprocates a planer-tool. A table for supporting the metal to be drilled, and another for supporting the metal to be planed, are connected, respectively, to opposite sides of the lathe-shear.



1. The combination of the lathe-spindle C with the sliding head D of the shaping-machine, when arranged substantially as herein described, so as to permit the simultaneous use of both machines, as herein set forth.

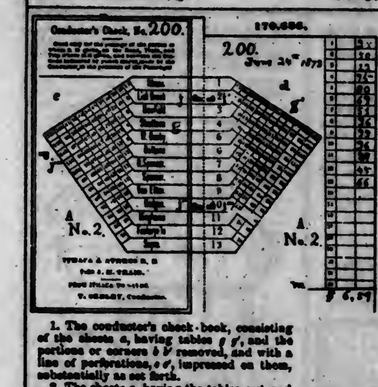
2. The combination of the lathe-spindle C with the drill-spindle S, when arranged to operate substantially as and for the purposes specified.

3. The combination of the lathe-spindle C, sliding head D, and drill-spindle S, when arranged to operate substantially as herein described, and for the purposes set forth.

170,683. CANE-GUNS. Chas. Melegy, New York, N. Y. (Filed May 24, 1875.)

The walking-stick gun made of the tubes a b, connected together and receiving the cartridge, in combination with the mouth-piece r, sliding hammer s, operated by the air expelled from the mouth, and the vent w, substantially as set forth.

170,684. PACKING-BOXES FOR FRUIT AND SEED. Joseph A. Miller, Providence, R. I. (Filed Jan. 14, 1874.)



1. The parers d d, suspended and sustained at both ends by the bands a a, within a packing-case, substantially as and for the purpose described.

2. The combination of the parers d, suspended and sustained at both ends by bands a a, with ring C, substantially as and for the purpose described.

3. The combination of parers d, ring C, and elastic bands a, substantially as and for the purpose described.

170,685. TIRES. Ben Moses, Ithaca, N. Y. (Filed July 14, 1873.)

170,686.

1. The conductor's check-book, consisting of the sheets a, having tables g g', and the portions or corners b b' removed, and with a line of perforations, c c', impressed on them, substantially as set forth.

2. The sheets a, having the tables g g', and the portions or corners b b' removed, and with lines of perforations k c' and c' s impressed on them, thus being adapted to be bound into books for railway conductors' use, as set forth.

170,687. BED-LOUNGES. David J. Powers, Chicago, Ill. (Filed Oct. 20, 1875.)

Brief.—The frame supporting the fabric of the bed-bottom, and the braces connecting the front legs with the back of the lounge, are so arranged that, when the lounge is unfolded to form a bed, the central portion of the fabric does not come in contact with any portion of the frame when sprung down by the weight of the occupant.

1. The frame F and cross-rails B B, supporting the fabric I, constituting the bed-bottom, in combination with braces E E, as described.

2. The cushion M, hinged to frame F, as described, so as to allow it to drop away from the fabric forming the bed-bottom when unfolded, and to rest upon the fabric when folded, as specified.

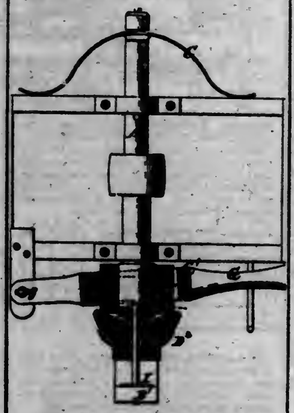
170,688. TIRE-UPSETTERS. Matthias Schoo, Freehold, N. J. (Filed Oct. 20, 1870.)

Brief.—A spring-lever, (operated by a treadle,) with a curved bearing-face, is used to clamp the tire, and prevent it from buckling while being upset. The main lever, for operating the curved clamping-jaws, is fulcrumless, and from near its center a connecting-rod extends to one of the jaws, while the rod connecting it with the other jaw extends from near its end. The end of said lever is formed with a stop, which abuts against the anvil and arrests its movement. The cars of the anvil and movable jaw are formed with dovetailed grooves, which receive dovetailed projections upon the stationary clamping-jaws.

1. The independent fulcrumless lever or bar M, stop g, and levers or bars f f', in combination with the clamping-jaws L L', substantially as and for the purpose described.

2. The clamping-blocks provided with dovetailed projections, in combination with dovetail grooves in their supports, substantially as described.

3. The spring-lever N, constructed as described, in combination with the frame and anvil of a tire-upsetting machine, as specified.

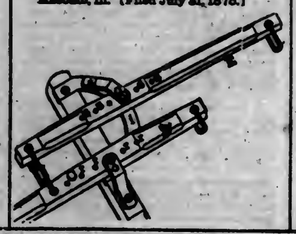


4. The lever H, having the hook-shaped end e, and hung in swinging bars J, in combination with the moving jaw E F, having the rounded projection h, whereby the lever and jaw operate in direct contact, substantially as specified.

5. The clamping-jaws L, secured to their plates or bushings c, having holes diagonally through them, and provided with wedge-shaped bases, substantially as and for the purpose described.

6. The combination of the frame B, anvil C, lever E, jaw F, the operating-lever and hangings, clamping-jaws and levers M f f', blocks I, and plate B, substantially as shown and described.

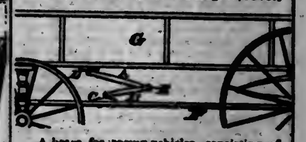
170,689. MACHINES FOR THREADING AND INSERTING WIRE. Samuel B. Shute, Jr., Richmond, Ind. (Filed June 3, 1875.)



Brief.—The wire is inserted through mandrel A into die I, the lever G thrown down to cause the jaws D D' to grasp the wire, and the mandrel-jaws and wire rotated, causing the wire to advance through the die, the length threaded being limited by the throw of lever G. The rotation of the wire, in threading the second length, causes the first to enter the work, where it is cut off.

1. The combination, with a machine for threading and inserting wire, substantially as described, of the mandrel A, die I, lever G, and jaws D D', arranged and operating substantially as and for the purpose specified.

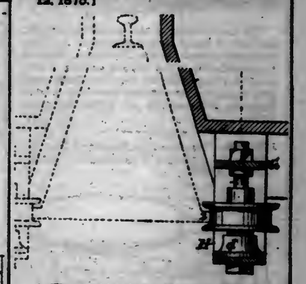
2. The combination, with the mandrel A, die I, lever G, and jaws D D', of the cam-groove d, arranged and operating substantially as and for the purpose specified.



170,690. DRAFT-EQUALIZERS. L. F. Smith, Macomb, Ill. (Filed July 31, 1875.)

1. The combination of the frame B, sliding hollow mandrel A, griping-jaws D D', die I, and spring C, substantially as specified.

2. The herein-described chuck, composed of the griping-jaws D D', spring D', sleeve B, segments F and F', and yoked lever G G', substantially as specified, in combination with the hollow mandrel and die I, as set forth.

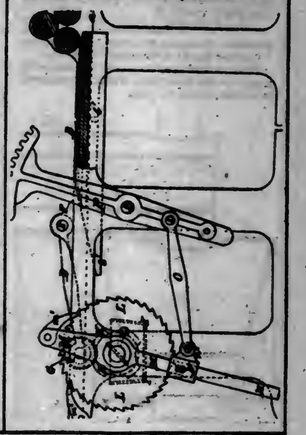


170,691. SPRING-EQUALIZERS. W. Smith, Independence, Ky. (Filed Aug. 17, 1875.)

The combination of the lever C and lever E, each provided with a series of holes, r r r and s s s, with the circling plate i and fulcrum-plate o o, as and for the purpose set forth.

A brace for spring vehicles, consisting of the two links A and B, of unequal length, and united together at E, said links being attached, respectively, to the body G and reach F by bearings D E' and C E, which bearings are located, with reference to each other, substantially as herein described and illustrated.

170,692. CARS FOR CRIB-RAIL RAILROADS. Roy Stone, Vandalia, N. Y. (Filed Nov. 12, 1875.)



1. The combination, with a car adapted to one-rail railroads, of rubber-rimmed guide-wheels, substantially as herein set forth.

2. The combination of the plates G and H, secured to the frame of the car, with a stationary spindle carrying the guide-wheel, and screw, to secure the two plates together, as specified.

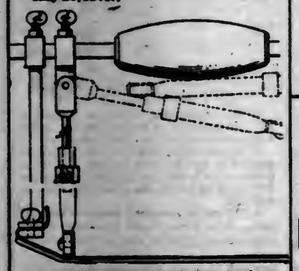
3. The within-described guide-wheel, consisting of the flanged body, removable flange, and intervening rubber ring q, as set forth.

170,693. DAMPING ATTACHMENTS FOR LITHOGRAPHIC PRESSES. Ernest Vidrin, Paris, France. (Filed Oct. 6, 1875.)

Brief.—The damping-roll receives a quantity of water from the trough-roll, and deposits it upon the stone as the latter passes under it.

1. The combination of the vibrating levers P and M, ratchet-wheel L, pawls n^1 n^2, connecting-bar O, and adjustable sleeve N, with the feed-roller H, substantially as and for the purpose specified.

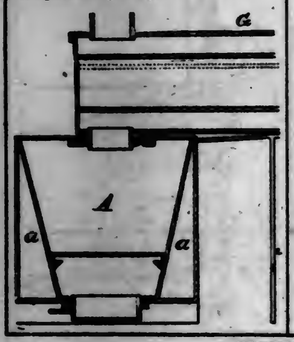
2. The adjustable collar G and cams K K', in combination with the wetting-roller C, water-feed roller H, and wetting-table B, substantially as and for the purpose specified.



3. The combination of mechanism for producing the intermittent feed movement, consisting of the details P M O N L n^1 n^2 and feed-roller H, with the cam K or K', collar G, roller C, and reciprocating wetting-table B, substantially as and for the purpose specified.

170,694. HOLDERS FOR TOOLS. John A. B. Williams, Philadelphia, Pa., assignor to S. S. White, same place. [Filed Dec. 15, 1874.]

The combination of the slotted hand-piece, the slotted chuck revolving therein, the locking-latch pivoted in the chuck, the recessed tool-shank, the collar sliding on the chuck, and the spring acting on the collar, these members being constructed and operating in combination, substantially as hereinbefore set forth.



170,695. FRAMES FOR GRAINING-PLATES. Robert A. Adams, Pittsburg, Pa. [Filed May 20, 1875.]

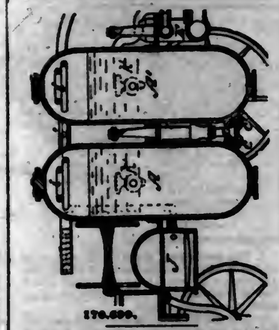
A frame for holding elastic transfer-plates for graining, consisting of the bar, handle, adjustable arms, adjustable stems, joints, lateral projections, hooks, clamps, adjustable stretchers, and screws, the whole combined and arranged substantially as and for the purpose above described.

170,696. COOKING-STOVES. Jas. S. Adams, Olathe, Kans. [Filed Sept. 10, 1875.]

Brief.—The oven is made adjustable by means of the short pipe, which is connected to a plate sliding in ways.

The double-wall oven C mounted on the furnace A, and made adjustable thereon, in combination with the side supporting-rack J, substantially as described.

170,697. MAN-HOLE COVERS FOR OIL-TANKS. William H. Anderson, Brooklyn, E. D., N. Y., assignor of one-half his right to A. J. Pouch, same place. [Filed Nov. 12, 1875.]



Brief.—The cover is seated by gravity. When forced open by sudden pressure within the tank, it comes in contact with an arm connected to a coiled spring, and is quickly closed.

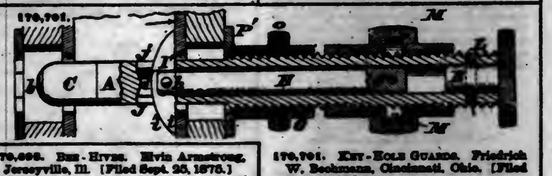
The combination, with the cover B of an oil-tank, A, of the arm D, and coiled or helical spring C, the whole provided for use and operation, substantially as and for the purpose set forth.

---

2. The air-heating pipe f, arranged inside of the air-spaces of the receivers A A', and communicating with a furnace, J, substantially as described.

170,700. PROCESSES OF PREPARING PRESERVED FRUIT. John F. Bamford, New York, N. Y. [Filed Oct. 16, 1875.]

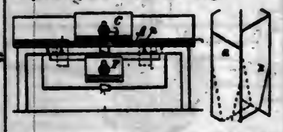
The process of preparing preserved fruit for the use of bakers and others by bringing an equal quantity of fruit and water to a boil, and then adding one ounce of starch to each quart of the diluted fruit, as set forth.



170,701. KEY-HOLE GUARDS. Friedrich W. Beckmann, Cincinnati, Ohio. [Filed Nov. 8, 1875.]

1. A key-hole guard or protector, consisting essentially of a barrel, A, containing a reciprocating shaft, H, to which is pivoted one or more detents, I or I', that are capable of being protruded or closed by the advance or retraction of said shaft H, substantially as herein described.

2. The combination of slotted screw-threaded barrel A e J J' L, shaft H h, detents I I', escape G, and interiorly-grooved propelling-nut K M, as and for the purpose stated.



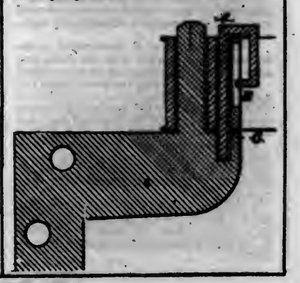
3. In combination with the barrel A L, having one or more opening and closing detents, the nut O, for locking the protector to the door, in the manner described.

4. A shaft provided with a detent or detents, in combination with barrel A, revolving tube O, and closing-nut O, substantially as and for the purpose set forth.

170,698. BEE-HIVES. Elvin Armstrong, Jerseyville, Ill. [Filed Sept. 25, 1875.]

Brief.—A rectangular tube, two sides of which act as springs to contract the passage, has one of the remaining sides shortened, so as to form a trap-passage for the capture of moths and drones. It is held in position and adjusted by means of a small wedge.

In a bee-hive, the combination of the tube h, provided with the short side e, with the fastening-wedge i and opening f, these parts being constructed and adapted for united operation, substantially as herein described.



170,699. FIRE-ENGINES. George H. Barker, Waverly, N. Y., assignor of one-half his right to L. D. Stone, same place. [Filed Apr. 12, 1874.]

Brief.—Water is supplied by a force-pump to tanks by branch pipes provided with cocks. An air-forcing pump communicates with them in a similar manner. Chemicals are introduced into the tanks, and the air-pipes enter at the bottoms of the same, the incoming air thereby keeping the chemicals agitated and suspended in the water. By means of the cocks in the supply and discharge pipes, while one tank is being discharged the other can be recharged. A hot-air pipe leading from a small furnace extends through and is coiled within the upper part of the tanks, by expansion of the air to increase the force of discharge.

1. In a fire-engine, a common water-supply pipe, provided with cocks opening into two water-receivers, in combination with a pump forcing air into either of the receivers at pleasure, and a common discharge-pipe, whereby, while one of the receivers is being exhausted of its contents the other is being filled, and the water therein agitated to form a solution of carbonic-acid gas and the water therein, substantially as described.

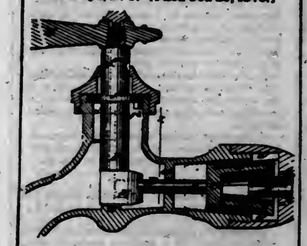
170,702. SHUTTER-HINGES. F. Beckert, Jr., Allegheny, Pa. [Filed Mar. 26, 1874.]

Brief.—A simple form of bent pin, not easily detachable, dropping automatically, when in certain position, into a vertical aperture provided for it, and thence into a socket, thereby securely locking the hinge when the shutter is in open position.

The hereto-described bent pin A, in combination with a hinge provided with vertical aperture B, socket C, and guide E, wherein the said pin is arranged to operate substantially in the manner and for the purpose specified.

170,703. PAINT-CANS. Mallen Bray, Newton, Mass. [Filed Oct. 15, 1875.]

Brief.—A soft-metal packing provided with an annular slit, bent from the opposite side, so as to open the lips of the slit, is soldered to the inner upper side of the cover, to receive and clamp the top of the can when forced into the cover, so as to fasten the groove adjacent to the lips of the slit. The cover has locking-springs made by slits in its vertical side.



1. The flexible packing-ring b, constructed as set forth, and adapted to receive and engage with the top edge of the body of the can, as and for the purpose described.

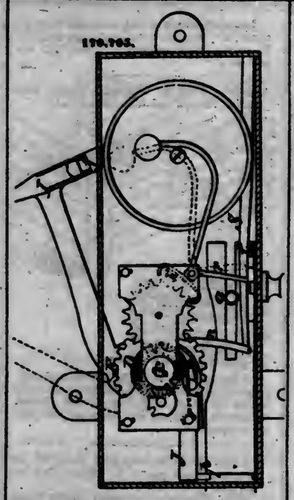
2. A can-cover provided with two or more spring-catches, d', formed by cutting two or more openings through the vertical flange of the cover, and bending the upper edges of the stock below said openings inward, as set forth, in combination with a can having two or more recesses, e e, formed in its vertical sides, and adapted to engage with said spring-catches to lock the cover on, substantially as described.

3. The ring C, struck up from a flat sheet without seam, and provided with the vertical rib or lip C', in combination with the cylinder A, to which it is soldered, and the cover D, provided with the packing-ring b, all arranged and adapted to operate as and for the purpose described.

4. A soft-metal packing-ring, b, formed as set forth, fitted and soldered at its inner edge to the hub a of the cover D, substantially as described.

170,704. FAUCETS. Willis L. Brownell, Brooklyn, N. Y. [Filed Oct. 20, 1875.]

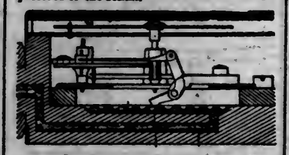
1. The combination, with a valve closing with the pressure of water, of a cam or eccentric stem, the latter restricted in its movement in such a manner that the pressure will always automatically close the valve and return the handle to its proper position for opening the valve, substantially as set forth.



2. The combination of the hollow tapered valve C with the fixed tube B, the latter serving to deliver water within the valve, and also to support the same when opened, substantially as and for the purpose specified.

3. The valve-operating shaft F, provided with the disk f^3, having a projection, f^4, whereby said disk is adapted to act both as a packing and stop for arresting the movement of the shaft, as set forth.

170,705. BURGLAR-ALARMS. A. A. Budd, Indianapolis, Ind. [Filed Sept. 4, 1875.]



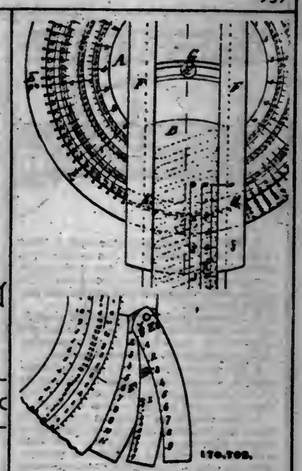
1. In combination with the bolt B, inclined plane p, and pawl J, the hammer I, substantially as described.

2. The combination of the spring D, hammer I, step i, spring S, arm r, and the movable bolt, whereby an alarm on the bell and an explosion can be obtained, substantially as described.

170,706. STEAM-PRESSURE GAGES. James Burden, Birmingham, England. [Filed Aug. 30, 1875.]

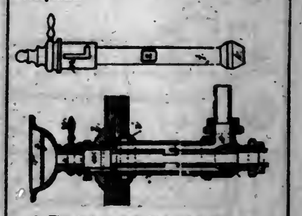
Brief.—Mercury interposed between the steam and diaphragm or tube receiving the pressure of the steam.

The described improvement in diaphragm and Bourdon gages, which consists in interposing between the diaphragm or measuring-tube and the steam or other moving agent, mercury or quicksilver, substantially in the manner and for the purposes set forth.



170,707. GAME APPARATUS. Melbourne C. Burr, Minneapolis, assignor of one-half his right to Frances Lee Williams, same place, and Miss E. Newport, Brainard, Minn. [Filed Nov. 1, 1875.]

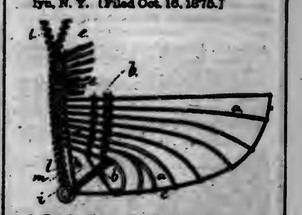
In a game apparatus, the standards A A and cross-bar C, provided with the pivoted support E, ball B', and ball G, all combined and arranged to operate substantially as described and shown.



170,708. ADDING-MACHINES. D. L. R. Batt, Pilot Point, Tex. [Filed Nov. 30, 1874.]

The combination of the pieces B', B'', and B''' with the disk D, wheel A, frame F, and slide E, substantially as specified.

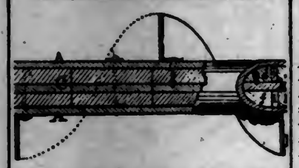
170,709. WASTE-VALVES AND OVERFLOWS FOR BATHS AND BASINS. William S. Catt, New York, N. Y. [Filed Oct. 21, 1875.]



Brief.—The lock-nut and collar clamp the slab and sustain the outer tube, containing the valve mechanism. The inner tube may be lifted and locked in a suspended condition as long as desired. At the top is formed a soap-receptacle.

1. The tube e, provided with the collar f and lock-nut l, for clamping the slab m, in combination with the tubular stem f of the valve c, passing through the lock-nut l, and means for sustaining the tube when elevated, substantially as set forth.

2. The combination, with the overflow and waste-water valve, of a cup for soap at the upper end of the tubular stem, substantially as set forth.



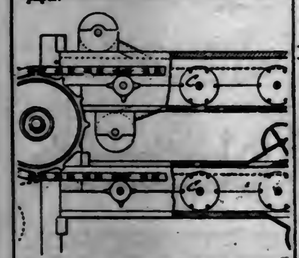
170,710. BUSTLES. Albert Carter, Brooklyn, N. Y. [Filed Oct. 16, 1875.]

1. The bustle made with the spring-wires, extending from the waist-band outward and downward in the form of loops, and connected together by cords, in combination with the bow b, passing diagonally from one end of the band to the other, and united with said spring-loops a, as set forth.

2. The bellows l and m, wound in opposite directions, set together, and combined with the loops a and the interior wire i, as set forth.

170,711. GRAIN-CONVEYER SHAFTS. Henry I. Chase, Philander F. Chase, and Edwin D. Chase, Peoria, Ill. [Filed Nov. 9, 1875.]

1. The hollow iron conveyer-shaft A, filled with a core of wood, C, or like substance, to strengthen the same, and form a solid basis for the nails or screws which secure the flights to the shaft, substantially as and for the purpose described.



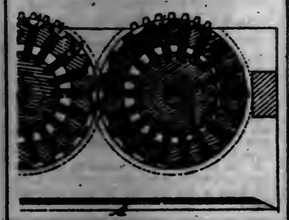
2. The combination, with the filled shaft A, of the iron band or ferrule d at either end of a shaft-section, applied and operating substantially as and for the purpose described.

3. The combination of the hollow conveyer-shaft A, wooden core C, made in sections d e f g, and ferrule d, arranged and operating substantially as and for the purposes described.

4. The wooden core-sections d e f g, split twice longitudinally through the center at or near a right angle to each other, and filled with wooden wedges h i, combined together with the pipe A, substantially and operating as and for the purposes set forth.

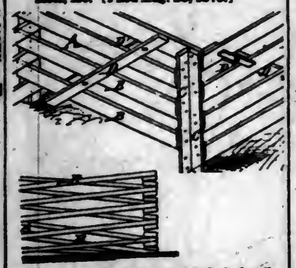
170,712. PAPER-DRYING MACHINES. Culver S. Clark, New York, N. Y. [Filed Nov. 6, 1875.]

Brief.—The surface of the drums and carriage is composed of a series of rods. The force of the blast assists the movement of the paper.



1. In paper-drying machines, the combination of paper-carrying cylinders and feeding-drums, made of lateral rods supported in side disks, with blowers above and below the same, to admit the unobstructed action of the air-blasts on one or both sides of the paper, substantially as set forth.

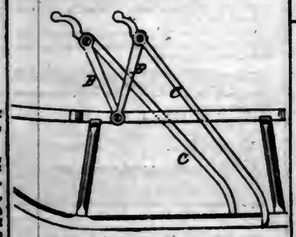
2. The combination of two end-open cases, A A, with drums, intermediate rotary carriers, and hot-air flues, delivering the air on opposite sides of the paper in the direction of the latter's motion, for the purpose specified.



170,713. PRESSES FOR MOLDING ARTIFICIAL FUEL. Herbert Cottrell, Newark, N. J. [Filed May 31, 1875.]

Brief.—The plastic material is poured between the cylinder-molds, and as they come together they press it into blocks, which are ejected by plungers operated by cams.

The combination of the eccentric ring H, eccentric G, and plungers J with the cylinder E, substantially as herein shown and described.

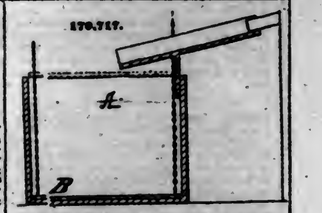


170,714. FENCES. William A. Couch, Hannibal, Mo. [Filed Aug. 26, 1875.]

In combination with the interlocked rail-panels A of the folding fence, the detachable tattes composed of the bar D and pivoted buttons D', as shown and described, to operate as specified.

170,715. SLED-PROPELLERS. David W. De Forest, Brooklyn, N. Y. [Filed Nov. 24, 1875.]

Brief.—The power is applied directly to the propelling-staff without leverage.

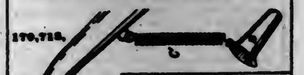


The staff C, constructed to be grasped by the hand of the operator, and the link B, pivoted at its upper extremity to the staff C, and at its lower extremity to the side of the sled, the whole constructed and combined for use and operation substantially as and for the purpose described.

170,716. PROCESSES OF PREPARING PHOTO-PLATES FOR PRINTING IN FATTY INKS. P. A. Desgenais, Paris, France. [Filed July 6, 1875.]

The method, herein described, of preparing gelatinous surfaces for photograph-printing in fatty inks by solarizing the gelatine from both sides until the solarization from the back meets the deeper solarizations of the image, so as to retain the image while being printed from, substantially as set forth.

170,717.



The combination, with the water-tank A, of the vertically-movable slab B, for the purposes herein set forth.

170,718. OIL-CAN SPOUTS. D. G. Dustin, Batavia, Ohio. [Filed May 12, 1875.]

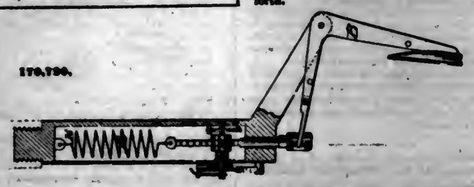
As a substitute for the usual chain and other devices, the spiral spring C, connected and operated, in combination with the cap B and spout B, as shown and described.

170,718.

170,719.

170,719. COMBINED TWINE-CUTTERS, LETTER-OPENERS, AND STAMP-MOISTENERS. John Bital, Sacramento, Cal. [Filed Aug. 14, 1875.]

1. The combination, with a strong operating guard-spring, of a small pair of scissors, a letter-opening knife, and a pivoted sponge-holder, forming a combined twine-cutter, letter-opener, and stamp-moistener, substantially as and for the purposes set forth.



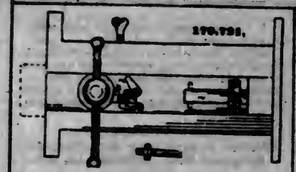
2. The combination of the guard-spring, with a pair of scissors, pivoted to the legs of the same, for operating the scissors by depressing the spring ends, substantially as described.

3. The combination, with scissors, of guard-spring B and pivoted spring C, arranged substantially as and for the purpose specified.

170,720. MARINERS' LOGS. G. B. Elliott, St. Andrews, Canada. [Filed Nov. 6, 1875.]

In mariners' logs, a sliding spring-governed rank, actuated by a concave pressure-disk, and combined, by transmitting-gear and carrier-dog, with a separately-turning and spring-actuated index-hand, provided with retaining-pawl and ratchet mechanism, for registering speed of vessel on dial of casing, substantially in the manner and for the purpose set forth.

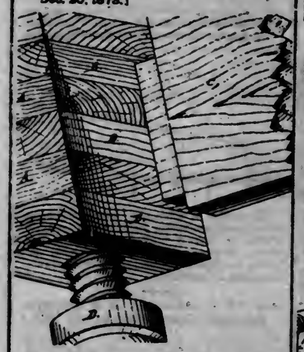
170,720.



170,717. DESTRUCTIVE FURNACE-SLAG. Charles Diebold, Lebanon, Pa. [Filed Feb. 21, 1876.]

Brief.—The slag is run upon the slab, which is then lowered into the water-tank. After the slag is disintegrated, the slab is raised and the slag can be readily removed.

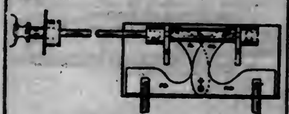
170,721. RENCH-VISES. George M. Brown, Pittsburg, Pa. [Filed Mar. 6, 1875.]



Brief.—To prevent the strain of the pivots upon the jaws from splitting or breaking them, the equalizers of a bench-vise are provided with solid fixed pivots, held in suitable recesses in the outer faces of the jaws by means of pivoted buttons.

170,721.

The equalizers a a, having solid pivots, in combination with the recesses in the outer faces of the jaws, and the buttons l l, substantially as and for the purpose hereinbefore described and set forth.



170,722. COMBING FOR TABLES. Robert Ewald, New York, N. Y., assignor to Geo. Brown and C. F. Sims, same place. [Filed Dec. 20, 1875.]

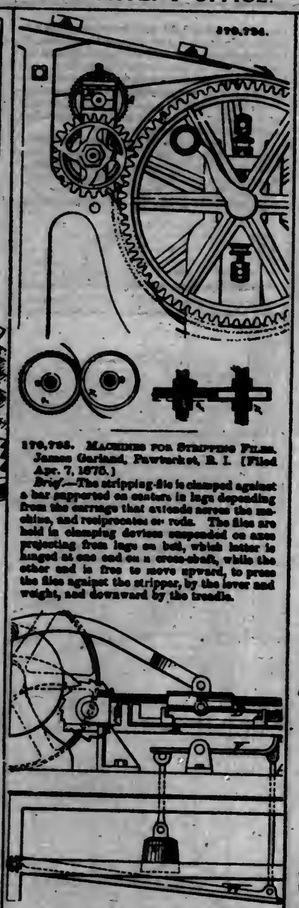
The corner-block A B constructed of two or more pieces of wood, with the grain crossing each other, as described, and adapted to the reception of the side and end pieces C, and the leg D, substantially as and for the purpose hereinbefore set forth and described.

170,723. SASH-FASTENERS. B. Fisher, Columbus, Ohio. [Filed Nov. 27, 1875.]

Brief.—Two inclosed crank-levers carry stops, which project through the metal box or casing, and engage in notches in the meeting-flanges upon a shaft within the case move the inner ends of the crank-levers, and the shaft is operated by a knob. Pushing the knob forward one crank, and pulling it releases the other one.

The combination, in a sash-lock for both sashes, of the two crank-levers m n, with their bolts E F, and a shaft, with flanges c c, overlying both levers, substantially as described.

170,724. PERFORATING ATTACHMENTS FOR PRINTING-PRESSES. Jonathan C. Forman, Cleveland, Ohio. [Filed June 26, 1875.]



Brief.—The sheet is taken from the cylinder by rotary perforators, which are driven by gearing from the press. The drum of each perforator receives and confines the chips punched out of the sheet.

1. In combination with a printing-press, the herein-described perforating apparatus, consisting of the perforating-rollers F N and P P, sheets E L, and wheels G G, operating conjointly with said press, in the manner substantially as described, and for the purpose specified.

2. The combination of the roller F, carrying a series of removable punches, and roller e, constructed with a receiving-cavity, substantially as and for the purpose described.

170,725. MACHINES FOR STRIPPING FILES. James Garland, Pawtucket, R. I. [Filed Apr. 7, 1875.]

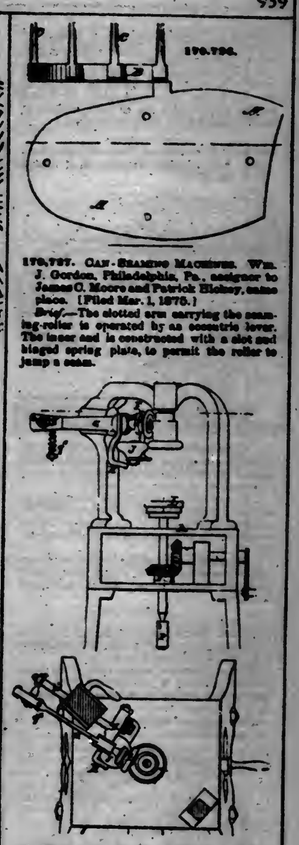
Brief.—The stripping-file is clamped against a bar supported on centers in lugs depending from the carriage that extends across the machine, and reciprocates on rods. The files are held in clamping devices suspended on axes projecting from lugs on bolt, which latter is hinged at one end on a cross-strut, while the other end is free to move upward, to press the files against the stripper, by the lever and weight, and downward by the treadle.

1. The combination of the stripping-instrument m, the leveling-holder H, and the rectangular carriage G, substantially as described.

2. The leveling file-blank holders, as described, in combination with the elevating-bed M, arranged and operating substantially in the manner described.

3. The combination, with the holders or cradles, to which the file-blanks and stripper-file are secured, of the center-points supporting the same, and placed on a line with the surfaces in contact, substantially as and for the purpose set forth.

4. The combination of the lever V, the rest q, the weight U, or spring, and the treadle W, arranged and operating substantially as described.



170,726. COMB-UNCOVERERS. Hugh H. Gilchrist, Swan Creek, assignor of one-half his right to John J. Worden, Youngstown, Ill. [Filed July 24, 1875.]

Brief.—An iron plate, of the form of a half-circle for shape or bend, has connected to one side a bar with lines like a four-tined fork. The device is secured in the bent of the plowman, who uses his foot in throwing clods from the growing plants.

The combination of the plate A, bar B, and prongs C with each other, substantially as herein shown and described, to adapt the device for attachment to the plowman's foot, as and for the purpose set forth.

170,727. CAN-SEAMING MACHINES. Wm. J. Gordon, Philadelphia, Pa., assignor to James C. Moore and Patrick Blaney, same place. [Filed Mar. 1, 1875.]

Brief.—The slotted arm carrying the seaming-roller is operated by an eccentric lever. The inner end is constructed with a slot and hinged spring plate, to permit the roller to jump a seam.

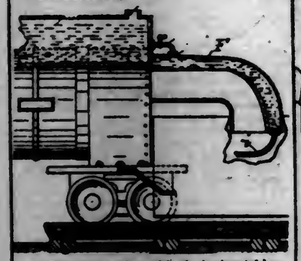
1. The combination of rod or arm G, roller F, and opening spring-section g^2, to permit the roller to jump a seam in the can, substantially as described.

2. The combination of roller F and eccentric H, substantially as and for the purposes described.

3. The combination of arm G, roller F, eccentric H, and the slotted joint on the head of the arm G, substantially as described.

170,728. CORN-PLANTERS. General Gardner (and Christoph Schoster, Dale, Wis. [Filed Aug. 26, 1875.]

Brief.—The axle is made in two parts, and provided with a double clutch at the center, so that seed may be planted from one or both of the seed-boxes. Within the seed-boxes are double slides, worked alternately by cams on disks secured to the bearing-wheels. One of the slides is provided with a scraper for carrying the seed to the discharge-orifice.



1. The combination, with the grain or seed box A, receptacle l, and spout p, of the double cut-off valves b and p, feeder r, and alternat-

ing cams or projections *a* and *a*, all constructed and arranged to operate substantially as and for the purpose specified.

2. The combination, with the grain or seed boxes A A, of the axle, formed in two parts, and the central coupling *i* sliding upon one portion thereof, arranged to operate substantially as and for the purpose specified.

170,720. LOCOMOTIVE FEED-WATER HEATER. Wm. Halsted, Trenton, N. J. [Filed Oct. 28, 1875.]

1. The combination, with the horizontal locomotive smoke-pipe, of a water-compartment located directly above and upon the same, substantially as shown and described.

2. The combination, with the horizontal locomotive smoke-pipe and with the water-compartment F, of a tank, O, connected with said compartment, substantially as shown and described.

3. The combination of the horizontal smoke-pipe, water-compartment F, and tube *i*, leading to the boiler, substantially as shown and described.

170,730. CONDENSERS FOR STILLS AND DISTILLING-CHAMBERS. Milo Morris, Jamestown, N. Y. [Filed Nov. 22, 1875.]

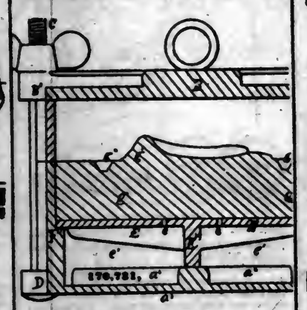
Brief.—Places an upper part of an evaporating-chamber a peculiar water-chamber, and catches and conveys away condensation by a line-shaped trough. Cover of the evaporating-chamber may be made with inlets to the water-chamber.

1. The combination, in an evaporating-chamber, of a spiral or ribbated condenser, having a longer vertical than horizontal diameter in its cross-section, and having its inlet and outlet outside of the chamber, with a correspondingly spiral or ribbated trough, to catch and convey the condensation, as and for the purposes set forth.

2. The combination of the evaporating-chamber A, spiral cup-condenser E, having outlet C, apertured cover D, and trough X, all arranged as and for the purposes set forth.

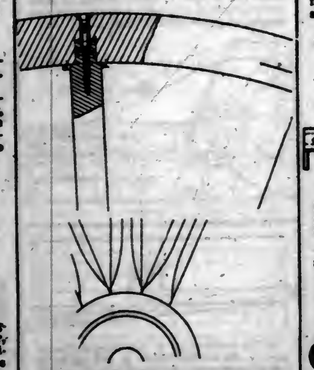
170,731. VULCANIZING APPARATUS. J. D. Haigus, York, Pa. [Filed Sept. 9, 1875.]

Brief.—The steam-chamber is inside of the sectional flask. The mold has an annular channel for waste exhibited.



1. A dental flask constructed with sections *a*' *d*', the section *a*' being divided by a perforated plate or tray, B, and provided with an internal steam-generating chamber, *c*', beneath the plate or tray B, substantially as shown and described.

2. In a dental flask, the combination, with a section, *a*', provided with a steam-generating chamber, *c*', and perforated supporting plate or tray B, of the removable section *d*' and cover D, substantially as shown and described.



3. A dental flask embodying in its construction a section, *a*', provided with a steam-generating chamber, *c*', perforated plate or tray B, removable section *d*', and a top or cover, D, the whole being held and drawn together by external bolts or rods C C, working in grooved projections or guides F, and screw-nuts G G, substantially as shown and described.

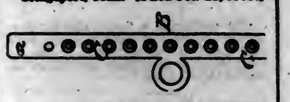
4. The combination with a dental flask, constructed with an internal steam-generating chamber, of a filling, *g*, provided with a groove or channel, *g*', around the die *f*', substantially as and for the purposes described.

5. The combination with a dental flask, constructed with an internal steam-generating chamber, *c*', and perforated supporting-plate E, of a filling or mold, *g*, surrounding a die, *f*', and provided with a groove or channel, *g*', substantially as and for the purposes described.

170,732. SPOKE-SOCKETS. HENRY A. HALL, Wilton, N. H. [Filed Feb. 20, 1874.]

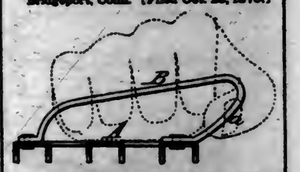
In a carriage-wheel, the combination of a rim, having spoke mortises or sockets bored only partly through the same, spokes having tenons bearing against the bottoms of their mortises, and their shoulders against the inner periphery of the rim, and screws driven through the outer periphery of the rim into the ends of the spokes, all substantially as and for the purposes set forth.

170,733. CURRY-COMBS. C. A. Hotchkiss, Bridgeport, Conn. [Filed Oct. 28, 1875.]



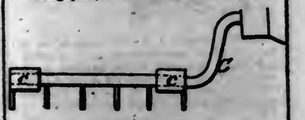
Brief.—The handle on the back of the comb is made in two pieces, one of which forms a brace for the comb, being firmly riveted to the comb. The back of the comb is made solid by means of filling-strip placed between the teeth-bars, and riveted to the end pieces and handle.

1. Filling-pieces D, combined with comb-bars A, substantially as described.



2. The handle to the back of a curry-comb formed of two pieces, C G, of which the piece C extends across the back of the comb to brace and strengthen the same, and is bent upward to form the thumb-rest *g*, substantially as specified.

170,734. CURRY-COMBS. C. A. Hotchkiss, Bridgeport, Conn. [Filed Oct. 28, 1875.]



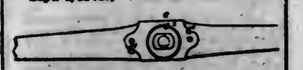
The mane-comb teeth C, the comb bar or back B, and the brackets *a*, formed entire, and adapted for the purposes herein specified.

170,735. CURRY-COMBS. C. A. Hotchkiss, Bridgeport, Conn. [Filed Oct. 28, 1875.]

The handle B, attached at both ends to the curry-comb frame, said handle being bent, as shown, to extend beyond the side of the frame, forming an obtuse angle with the frame, and also an inclined thumb-rest, *a*, substantially as specified.

170,736. CURRY-COMBS. C. A. Hotchkiss, Bridgeport, Conn. [Filed Oct. 28, 1875.]

In a curry-comb having cast-metal end pieces B B, the sub-brokers eyes C, formed on said end pieces in the cast and process of casting, as specified.



170,737. PUMP-VALVES. Lewis Hubbard and William A. Hart, Buffalo, N. Y. [Filed Nov. 19, 1875.]

1. A steel or other hard-metal valve-seat piece, C, provided with a wrench-section, E, valve-cams D D', and screws F F', adapted to screw into the body H on one side, and the cage B on the opposite side, substantially as described.

2. A removable reversible double-seated valve-piece, in combination with the parts B and H, as and for the purposes set forth.

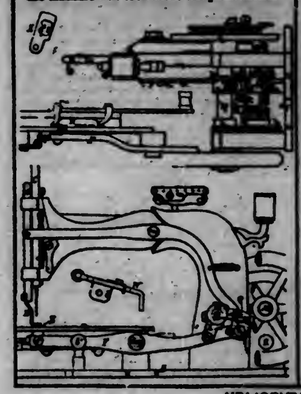
170,738. WHIFFLETREE-FASTENERS. E. R. Jackson, La Fayette, Ind., assignor to himself and T. J. Beede, same place. [Filed Sept. 4, 1875.]

The plate A, having a reversedly-opening T-shaped groove, *a*', with enlarged ends, in combination with the plate C, having a stud or pivot, *c*', provided with a head, as and for the purposes described.

170,739. REFRIGERATORS. Edgar B. Jewett, Buffalo, N. Y. [Filed Nov. 6, 1875.]

Brief.—A cooling chamber, between the food-chamber and the ice-box, is sloped and perforated at its upper end, to retain water upon it, and has communications with the outside and inside of the refrigerator, for inlet of air and water to the food-chamber.

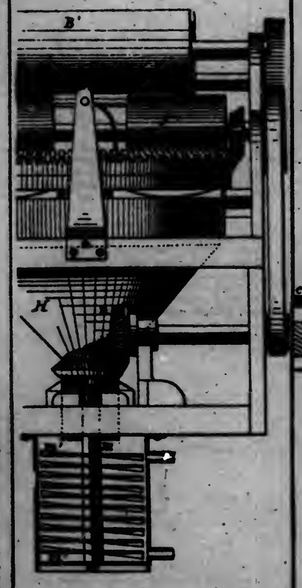
The combination, in a refrigerator and with the ice-chamber A thereof, of the inclined air-cooling chamber C, provided with air inlet and escape openings *c f* and overflow-aperture A, arranged near the highest point of the air-chamber, for retaining the ice-water in a body above the air-chamber, and then discharging the same through the latter, whereby both the upper and lower walls of the air-chamber are thoroughly cooled, substantially as hereinbefore set forth.



170,740. BRACKETS FOR UPSTAIR-ROLLERS. Hubert L. Judd, Brooklyn, N. Y. [Filed Sept. 27, 1875.]

The bracket, made with the wings *c*, point *d*, and narrow bar *e*, notched at its upper end to receive the staple *f*, as and for the purpose set forth.

170,741. SEWING-MACHINE. J. Keith, Providence, R. I. [Filed Sept. 9, 1875.]



Brief.—The machine is capable of producing the plain and contrivering or button-hole stitch. The lever that carries the cloth is pivoted to the bed of the machine that it is capable of six motions. At the rear end of the lever there are attached two auxiliary levers, one of which is called the reverser. In addition to the driving-shaft provided with cams, there is an auxiliary shaft, also provided with a series of cams. When the outer ends of the levers are in contact with the cams on the auxiliary shaft, the embroidery or button-hole stitch is formed. The position of the levers is shifted by slipping the stud down into the lower notch of the bank, whereby the outer ends of the levers will be thrown into action with the cams on the main shaft, and the machine will then make the plain stitch.

In a sewing-machine, the combination of the auxiliary shaft R, its cams T Y Z A', the latch-lever X, stud *g*, reverser W, and lever Q, with the main shaft M, its cams S S', the presser D, and feeder E, and their operative levers P P', all being arranged, connected, and applied in manner and by means substantially as set forth.

170,742. CLAY-PULVERIZING MACHINES. J. N. Kerper, Washington, D. C., assignor of one-half his right to I. P. Childs, same place. [Filed Nov. 22, 1875.]

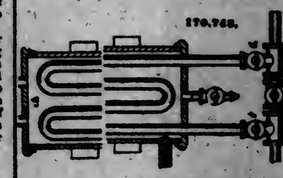
Brief.—The clay deposited in the hopper passes between the first set of rollers, being thereby partially pulverized, and falls upon the revolving grate, where it is further crushed by the heavy rollers, and forced through into the hopper, and conducted thence to the scraper-cylinders. A scraper at the point of feed is used to remove stones too large to pass through the rollers. A serrated scraper loosens up the clay on the grate.

1. The combination of the crushing-rollers B B', and the suspended scraper D, constructed and arranged to operate substantially as described.

2. The combination of the crushing-rollers B B' and the revolving grate, substantially as set forth.

3. The combination of the revolving grate and the rollers F and F', arranged to operate substantially as set forth.

4. The combination of the revolving grate, the rollers F and F', and the rake or agitator R, substantially as described.



5. The combination of the revolving grate, the hopper H, the scraper-cylinder M, and revolving shaft *n*, with its arms *n'*, all combined and arranged to operate substantially as set forth.

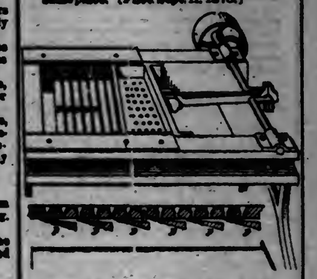
170,743. PUMP-WATER HEATERS. Mahem W. Kirby, Indianapolis, Ind. [Filed Aug. 26, 1875.]

Brief.—The water-connections with the heater are such that water may be forced through or around the heater.

1. The feed-pipe D, leading from the tank, and provided with a cock, F, below the cylinder A, in connection with the exit-pipe D in the cylinder A, and the cock G below the cylinder, all in combination with the cylinder A, and connected with the pump of a locomotive by means of the pipe D', all constructed and operated so as to heat the feed water in its passage through the coil D in the cylinder A before it is drawn into the pump to be injected into the boiler, substantially as specified and set forth.

2. In combination with the cocks F and G, the cock H, arranged to operate, as described, between them, for the purpose specified.

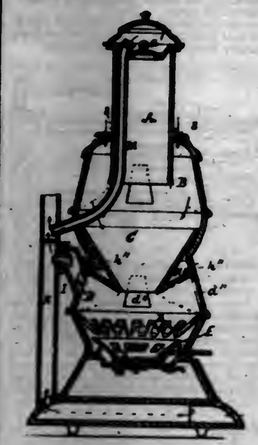
170,744. MACHINES FOR FORMING COLLARS ON CARRIAGE-AXLES. Jacob Krisch, Cleveland, Ohio. [Filed Mar. 4, 1875.]



Brief.—The revolving center point is fixed immovably to the frame of the machine, while the other center point is fixed in a carriage, that is drawn inward to thrust the metal by eccentrics through the medium of a stirrup. The blocks in standard do not clamp, but merely prevent deflection of the bar, and blocks subserve the same purpose in addition to that of dies.

1. In machines for the manufacture of axles, the adjusting center-screws C' D, in combination with the guide-blocks *a a'*, stay I, guide-standards F, dies *e e'*, and carriage B, whereby the axle-blank is held at its extreme ends upon points or centers, and pressure applied thereto, thereby upsetting said blank, as described, and at the same time preventing deflection of the bar, substantially as set forth.

2. The combination of two centers, in line with each other, by and through which to apply the power required to upset the bar, and adjusting-guides or supporting devices intermediate between said centers, to prevent deflection of the bar while being upset, substantially as set forth.



170,745. OATMEAL-MACHINES. H. Kruse, Akron, Ohio, assignor to F. Schumacher, same place. [Filed Sept. 11, 1875.]

In an oatmeal-machine, the beveled knives D D, applied, as set forth, in relation to plate G, serving both to cut the grain and as a gage to regulate the size of the particles of meal, substantially as described.

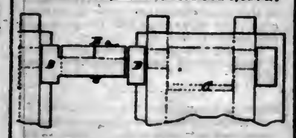
170,746. STOVES. Silas H. La Rue, Franklintown, N. J. [Filed Oct. 12, 1875.]

Brief.—There is a down-draft through a cooking-chamber to an annular illuminated combustion-chamber above the lower body of coal.

1. In a downward-draft magazine-stove for soft coal, the combination, substantially as shown and described, of the adjustable fresh-air openings 3 3, the illuminating-chamber B, cooking-chamber or fire-pot C, and the combustion-chamber D, provided with the mica windows b^5 b^6, the said parts being arranged in relation to each other substantially as and for the purposes described.

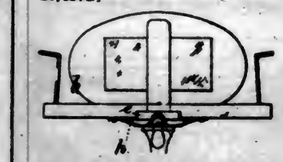
2. The combination, in a downward-draft magazine-stove for soft coal, substantially as described, of the magazine A and the illuminating-chamber B, constructed and arranged so that the walls of that portion of the magazine which projects above the top of the illuminating-chamber shall form the external wall of that part of the stove, while the lower end of said magazine extends down into the said illuminating-chamber, as shown and described, with the adjustable fresh-air openings or holes 3 3 in the upper portion or top of the said illuminating-chamber, the illuminating combustion-chamber D, and the exit-pipe I, leading from the combustion-chamber D into the flue K, constructed and arranged substantially as and for the purposes shown and described.

3. In a downward-draft magazine-stove for soft coal, the combination, substantially as described, of the fresh coal-air chamber H, provided with the entrance and exit openings h^3 h^4, with the cooking or fire chamber C, and the combustion-chamber D, all constructed and arranged substantially as and for the purposes specified.



4. In a downward-draft magazine-stove for soft coal, the combination of the adjustable fresh-air openings 3 3, the cooking or fire chamber C, the combustion-chamber D, the exit-pipe I, and the grate R, substantially as and for the purposes described.

170,747. LUBRICATING MACHINE-BEARINGS. Lebbeus W. Lathrop and Thos. A. Weber, New York, N. Y. [Filed Nov. 2, 1875.]



As a new article of manufacture, anti-friction cloth surfaced with a mixture of graphite and sugar, cemented thereto by heat and pressure, in the manner described.

170,748. CAR-COUPLINGS. J. T. A. Lewis, East Boston, Mass. [Filed Oct. 7, 1874.]

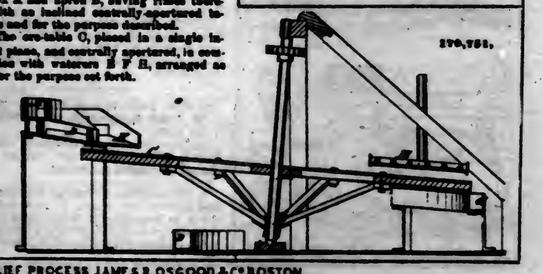
In combination with the grooved and recessed hooks R R, provided with abutments D D for the ends of the said hooks to bring up against in the act of coupling, all being arranged as specified and shown.

170,749. STEREOSCOPES. Wm. H. Lewis, New York, N. Y., assignor to R. and H. T. Anthony & Co., same place. [Filed Oct. 20, 1874.]

The guide and frictional detainer for the picture-slide of a stereoscope-instrument composed of the spring *b*, that is attached to said slide, and bears at its ends in a groove, or upon a rib at the under side of the bar *c*, to form a guide, as set forth.

170,750. HEMMER. David W. Long, Parkersburg, W. Va. [Filed Mar. 27, 1875.]

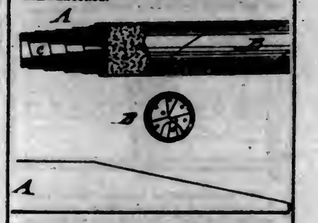
Brief.—An angular four-leaved hinge has supplemental lips formed or returned upon its shorter leaves, so arranged as to overlap the edge of a trunk, allowing the screws to be passed into the wood transversely, instead of directly into the edge; the construction preventing splitting, and at the same time strengthening the hinge.



A hinge for trunks and other purposes, having angular leaves B and supplemental lips *a*, connected to the leaves A, substantially as described.

170,751. ORE-CONCENTRATORS. John Longmaid, Bingham, Utah. [Filed July 13, 1874.]

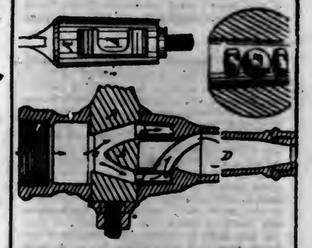
Brief.—The inclined revolving-round table receives the ore from the riffle-box at its upper side, which also spreads the ore over the table by the water with which it feeds the ore. The heavy particles go to the outer edge, and the light to the circular opening at the center. The water-pipe at the lower edge aids this separation. Bubble troughs at the outer and lower edges receive the separated ore.



1. The combination of bottom-perforated ore-box A and apron B, having riffles thereon, with an inclined centrally-apertured table, as and for the purpose described.

2. The ore-table C, placed in a single inclined plane, and centrally apertured, in combination with waters E F H, arranged as and for the purpose set forth.

170,752. CIGARETTE MOUTH-PIECES. D. Marquis, New York, N. Y. [Filed Aug. 6, 1875.]



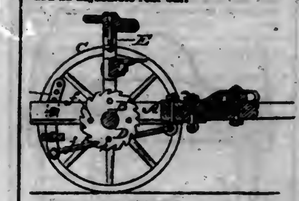
Brief.—The mouth piece is wound from a peculiarly-cut strip of paper, so that the central opening is flaring outward, and the outside of the mouth-piece tell tapering in the same direction.

A mouth-piece, A, for cigarettes, made from a strip or blank of spirally-wound paper, to form a central smoke-passage, C, decreasing in diameter from the tip toward the rear or butt end, as and for the purpose stated.

170,753. NOZZLE FOR HOSE. Ivra W. McGaffey, Chicago, Ill. [Filed Sept. 15, 1875.]

Brief.—The plug is perforated by a divided water-way, the divisions of which are separated by a partition, which, in turn, is furnished with a passage independent of the two branches of the water-way. The nozzle-pipe is made with a central through-bore, which, when the plug is removed, is a straight unobstructed passage-way, and provided with one or more lateral channels entering from the plug-chamber, and turning into the central bore between the plug-chamber and the point of the nozzle, in combination with the plug A, furnished with the V-shaped water-way, substantially as specified.

1. The plug A, perforated by a divided water-way, the divisions of which are separated by a partition, *b*, which in turn is furnished with a passage, *d*, independent of the two branches of the water-way, substantially as specified.

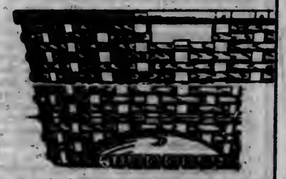


2. The nozzle-pipe, made with a central through-bore, which, when the plug is removed, is a straight unobstructed passage-way, and provided with one or more lateral channels, *d*, entering from the plug-chamber, and turning into the central bore between the plug-chamber and the point of the nozzle, in combination with the plug A, furnished with the V-shaped water-way, substantially as specified.

3. The nozzle-pipe, provided with a lateral diverging channel or channels, *d*, when said channels are constructed at their exit into the bore, for the purpose of accelerating the diverted current, substantially as specified.

4. The combination of the tapering barrel D, the plug A, provided with the V-shaped water-way, and the channels *d*, constructed and arranged substantially as specified.

170,754. PLOWING AND SHELLING MACHINES. Daniel McVey, Gallatin, Tenn. [Filed July 3, 1875.]

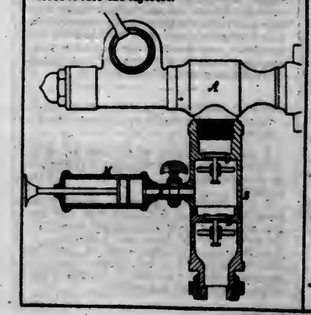


Brief.—A frame for the reception of several interchangeable devices, and provided with an arched bar, axle, bearing-wheels, fixed-wheel, with side pins and saw-like peripheral teeth, and an adjustable rear bar.

1. The frame A, provided with the axle B, wheels C, wheel D, arched bar E, and adjustable transverse bar G, in combination, as shown.

2. The wheel D, provided with the teeth for feeding cotton-seed, and the lateral pins for operating the wheat and corn dropping mechanism.

170,755. BASKETS. Bernard G. Meinikheim, Newtown, and William D. Chase, New York, N. Y.; said Chase assignee to said Meinikheim. [Filed Sept. 16, 1875.]

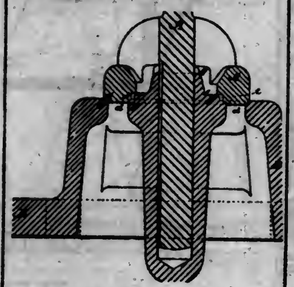


1. A basket constructed entirely of metallic uprights A A and wooden hoops B B, that are placed with reference to said uprights, substantially as shown and described.

2. The metallic bottom D, combined with and fastened to the metallic uprights A A of a basket-frame, substantially as specified.

170,756. STEAM-BOILER INJECTORS. Wm. T. Messenger, Boston, Mass. [Filed Sept. 21, 1875.]

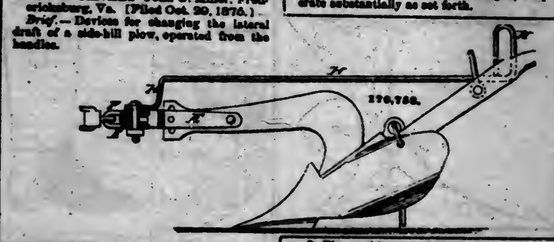
Brief.—Between the injector and induction-pipe the force-pump is applied, as shown; said pump, together with its connections, serving to raise water in the induction-pipe, and force it into the injector.



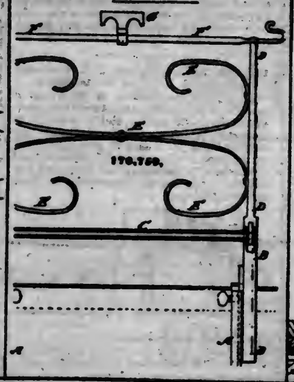
1. The combination of a steam-boiler injector, A, and a force-pump applied thereto and to the water induction pipe of said injector, all being substantially as and for the purpose specified.

2. The combination of a steam-boiler injector, A, and a force-pump applied to it and its induction-pipe O, as described, with a cock, M, arranged between the pump-barrel H and its valve-case B, and in their connecting-conduit K, as specified.

3. The combination of the pump-barrel H and valve-case B, connecting-conduit K and the stop-cock M, all being arranged substantially in manner, and for application to a steam-boiler injector and its induction-pipe, as described.



170,757. SAFETY AND RELIEF VALVES. J. Wm. Molling, Bristol Bank, Wigan, England. [Filed Nov. 3, 1875.]



The valve and seat A B, having faces *a' b'* *a² b²* *d*, spaces *e f*, collar *f'*, and annular hole *g*, as and for the purpose described.

170,758. CULTIVATORS. John G. Miller, Fredericksburg, Va. [Filed Oct. 20, 1875.]

Brief.—Devices for changing the lateral draft of a side-hill plow, operated from the handles.

The combination of the adjustable notched clevis E, the adjustable double-tree clevis F, and the rod H with each other, and with the beam and handles of a plow, substantially as herein shown and described.

170,759. BRICK-HOLDERS. Geo. W. Miller, Constitution, Pa. [Filed Sept. 20, 1875.]

1. The combination of the springs *b'*, with the hinged side bars B D of a rain-rest, substantially as herein shown and described.

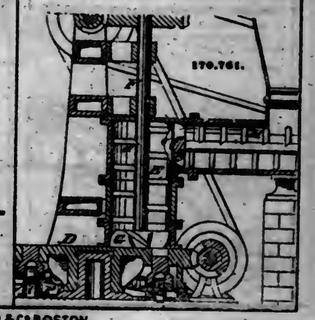
2. The combination of the slotted and grooved bars A, with the hinged bars B D of a rain-rest, substantially as herein shown and described.

3. The combination of the slotted and grooved bars A, the tongued bars B, the cross-rod *a*, the hinged bars D, the springs *b'*, the brace E, the cross-bar F, and the V or double hook G, with each other, substantially as herein shown and described.

170,760. DISTILLING ZINC FROM ITS ORES. C. E. Moore, Jersey City, N. J., assignor to the Passaic Zinc Company. [Filed Oct. 12, 1875.]

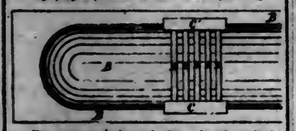
Brief.—Mixes with the manganiferous zinc ore and carbonaceous material, previous to charging the retorts, a quantity of iron scrap, ore, or silica, to prevent destructive corrosion of the retorts.

The improvement in the art of distilling metallic zinc from its manganiferous ores, consisting of the treatment of the manganiferous zinc ore, supplementary mineraling material, and carbonaceous matter simultaneously, in the distilling-vessel, by heat, substantially as before set forth.



170,761. BRICK-MACHINES. A. Morand, Germantown, Pa. [Filed May 24, 1875.]

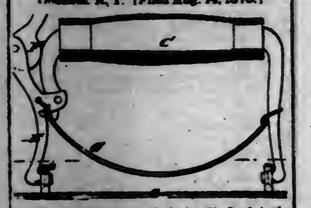
Brief.—The clay passes from the hopper into a horizontal tempering-cylinder, which communicates with the upper portion of a vertical receiving-cylinder (each having mixing and propelling blades) to a mold-table rotating on a hollow track, provided with perforations for the dirt to fall through.



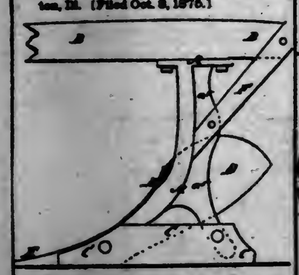
1. In a brick-machine, the combination of the mold-wheel D, vertical receiver E, and horizontal pugging-mill H, arranged substantially as shown, and provided with suitable shafts and pugging-blades, and the propellers G G', constructed as described and arranged, to operate substantially as set forth.

2. The combination of the vertical receiver E and horizontal pugging-mill H, arranged as shown, and provided with suitable shafts and pugging-blades, the mold-wheel D, the propellers G G', constructed as described, and the hollow way P, as and for the purposes specified.

3. The hollow cantway P, provided with openings *k k* in its upper face, and openings *l l* in the side, for the escape of obstructions to the rollers *i i*, in the manner substantially as shown and described.

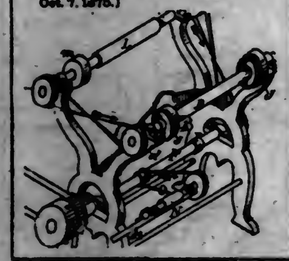


170,702. SHAVE FOR HAIR-TUBE. Jos. W. Nye, Lynn, Mass. [Filed Oct. 6, 1875.]



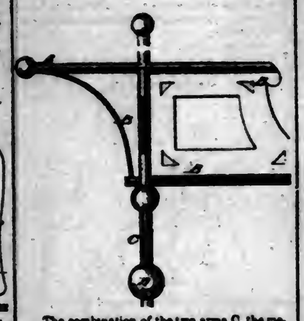
The open rack formed of the slats D, united at their ends to the boards A, having overhanging fingers C C, in combination with a bath-tub, B, arranged below the top edge of the tub, and adjustable longitudinally thereon, in the manner herein described, and for the purpose set forth.

170,703. SAD-IRONS. Albert L. Parcells, Oneonta, N. Y. [Filed Aug. 14, 1875.]



The combination, with the handle C, of rigid hook-standards D, standard E, a cam, F, pivoted to the upper end of the latter, and the spring G between the two standards, as shown and described.

170,704. PLOWS. Joseph Phillips, Smithton, Ill. [Filed Oct. 8, 1875.]



The plow-upright A, having a flange, *a'*, formed upon its upper end, having its lower end *a''* forked or widened, and a horizontal prong or arm, *a'''*, formed upon it, having a longitudinal rabbet, *a''*, formed upon the rear part of its land-side side, and two longitudinal flanges, *a' a'*, formed upon its mold-board side, substantially as herein shown and described, to adapt it to receive the beam B, the land-side C, the mold-board D, the share E, and the handles F G, as set forth.

170,705. POLISHING-MACHINE FOR BOOTS AND SHOES. Wallace Place and Robert Cunningham, Cambridge, Mass. [Filed Oct. 7, 1875.]

In a polishing-machine, substantially such as described, the shaft C, provided with the wheels I, m, the shaft D, provided with the wheels *k k*, having the rabbets J J, in combination with the counter-shaft N, provided with a fibrous covering, all constructed and arranged to operate substantially as set forth and specified.

170,706. WEATHER-VANES. W. H. Pinkerton, Boston, Mass. [Filed Nov. 13, 1875.]

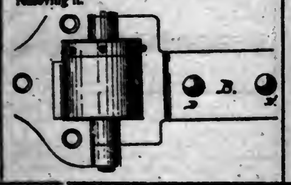
The combination of the two arms C, the metallic ball D, and the frame and glass E F with a vane, B, substantially as herein shown and described.

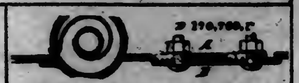
170,707. RUBBER BOOTS. Joseph Pinnovi, Newark, N. J. [Filed Nov. 24, 1875.]

The longitudinal supports *a*, applied to the upper of an elastic boot, substantially as and for the purpose shown and described.

170,708.

170,709.





170,708. SCREW-CUTTING DIES. V. J. Reece, Greenfield, Mass. [Filed Nov. 6, 1875.]

A die made with split spring ends, set by spreading-pin and adjusting-screw passing at right angles to pin through one of the split ends of the die, substantially as and for the purpose set forth

170,709. STRAP-HINGE. J. G. Reynolds, Elizabeth, N. J. [Filed Oct. 20, 1875.]

Brief.—The longer strap or hinge-leaf is made in overlapping parts, which are corrugated saw-tooth fashion, and provided with elongated bolt-holes; the construction permitting the sag of a door or gate to be taken up by sliding the corrugated laps on each other, thereby shortening the strap, and giving the hinge lateral adjustability without removing it.

A strap-hinge the strap-leaf of which is made in two parts, the corrugated or rough-cored ends A and B overlapping each other, and provided with the elongated bolt-holes D and D', substantially as and for the purpose set forth.

170,710. BUTTER-CARRIERS. R. F. Roberts, Bennington, Vt. [Filed July 14, 1875.]

Brief.—The carrier has ice-box above and butter-shelves below, connected by standards, which act as legs, as guides to direct the carrier on and out of the pail. One of the standards has to it the drip-conduit, and between standards are conduits for descending cold air.

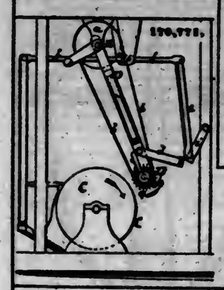
1. A butter-waiter having shelves C, one over another, an ice-chamber, D, over the shelves, and standards E supporting the shelves and ice-chamber, and having legs which sustain the waiter at its lower periphery, substantially as shown and described.

2. The combination, with the pail or vessel A, of a butter-waiter in and removable from the pail or vessel, and having shelves C, one over another, an ice-chamber, D, over the shelves, and standards E, supporting the shelves and ice-chamber, and having legs standing on the outer portion of the bottom of the pail or vessel, substantially as set forth.

3. In combination with the pail or vessel A, the removable butter waiter, having shelves C, an ice-chamber, D, over the shelves, and standards E, supporting and projecting laterally beyond the shelves and ice-chamber, substantially as shown, and as and for the purpose described.

4. In combination with the pail or vessel A, the removable butter-waiter, having shelves C, an ice-chamber, D, over the shelves, legs standing upon the outer portion of the bottom of the pail or vessel, and standards E, which support the ice-chamber and shelves, and of which standards one is tubular, and serves to conduct water from the ice-chamber to the bottom of the pail or vessel, substantially as shown and specified.

5. A butter-carrier, consisting of the pail or vessel A, having a removable cover, E, and a waiter in and removable from the pail or vessel, and having shelves C, ice-chamber D, over the shelves, and standards E, which support and project laterally beyond the shelves and ice-chamber, and of which standards one is tubular, and serves to conduct water from the ice-chamber to the lower part of the pail or vessel, substantially as described.



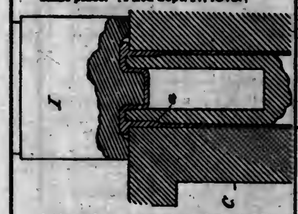
170,711. HUB-SCOOPING MACHINES. Carl Rose, New York, N. Y. [Filed Nov. 10, 1875.]

1. The combination of the rotary bed G, with the pendulum-frame D and scouring-roller G, substantially as herein shown and described.

2. The pendulum-frame D, carrying the scouring-roller, and combined with the system of levers *d e f g*, substantially as and for the purpose herein shown and described.

3. The rotary scouring-brush G, provided with series or tufts of elastic sheet-strips *f f*, set with their faces parallel to the axis of the roller, substantially as specified

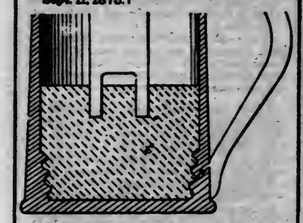
170,712.



170,713.

170,713. CLOTHES-LINE PROPS. Christian C. Schwaner, Winterset, Iowa. [Filed July 24, 1875.]

The combination, with a line, B, of four props, A, open-slotted at their upper ends, and pivoted under said slots in opposite pairs, as and for the purposes specified.



170,714. TOOLS FOR HEADING CARTRIDGE-SHELLS. George P. Salisbury and Charles S. Wells, New Haven, Conn., assignors to Winchester Repeating-Arms Company, same place. [Filed Sept. 17, 1875.]

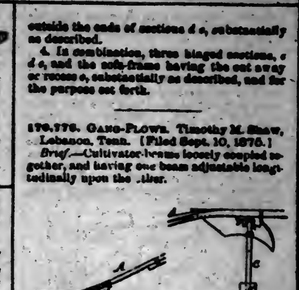
1. As an improvement in tools for heading cartridge-shells re-enforced by a thickened portion at or near their closed ends, a mandrel or anvil, B, provided with a shoulder or equivalent taper to support the shell while being headed by its re-enforced or thick portion only, substantially as described.

2. The combination of a holding or female die, C, a bunter, I, and a mandrel or anvil, B, provided with a shoulder, *c*, or equivalent taper, all being constructed and arranged to operate substantially as and for the purpose set forth.

170,715. SHAVING-CUPS. Philipp Schenkle and Louis Dohm, Elizabeth, N. J. [Filed Sept. 11, 1875.]

A shaving-cup provided with an internal screw-thread, or other equivalent means for securing and retaining the soap when the cup is inverted, substantially as specified.

170,716. HARness-SADDLES. John W. Schwaner, New York, N. Y. [Filed Oct. 23, 1875.]



1. The wrought-iron bed-plate A, cut out into proper shape, struck up into proper form, and provided with the holes, the strengthening corrugations *a'*, and the recesses *a''*, for the bent-strap loops G, substantially as herein shown and described.

2. The wrought-iron seat-plate B, cut out into proper shape, struck up into proper form, and provided with the rib C, the square hole *b'*, and the countersunk hole *b''*, in combination with the bed-plate A, substantially as herein shown and described.

3. The salient angles *b'*, formed upon the side edges of the seat-plate B, to be bent down over the side edges of the wooden seat-block D, as herein shown and described.

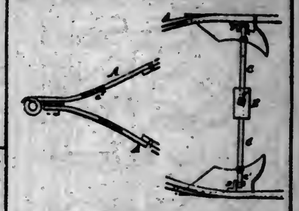
170,717.

170,718.

170,717. SOFA-BEDSTEADS. Geo. N. Seidler, Hartford, Conn., assignor of one-half his right to Charles May, same place. [Filed Mar. 6, 1875.]

Brief.—The pawl-rail and pawls support the head-section of the bed in an inclined position, and the rigid legs support the foot and middle section when unfolded as a bed, and swing inside the sofa-frame when the parts are folded, and give a firm support to the section forming the seat of the sofa. A recess is formed in the rear portion of the sofa-frame, to permit the movement of the head-section when the parts are changed from a sofa to a bed.

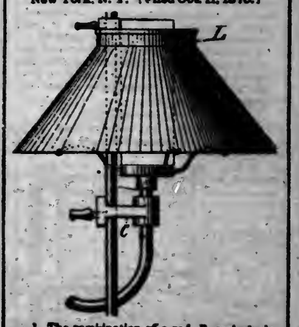
1. The combination of the hinged pawl-rail *b* with the rear rail *b*, substantially as described.



2. In combination, the rear rail *b*, hinged pawl-rail *b*, and hinged pawls *i*, substantially as described.

3. In combination, the sofa-frame, section *a*, section *d*, and section *c*, provided with rigid legs *f*, which fold inside the sofa-frame and outside the ends of sections *d e*, substantially as described.

4. In combination, three hinged sections, *c d e*, and the sofa-frame having the cut away or recess *e*, substantially as described, and for the purpose set forth.

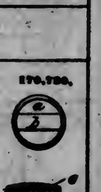


170,718. GANG-PLOWS. Timothy M. Shaw, Lebanon, Tenn. [Filed Sept. 10, 1875.]

Brief.—Cultivator-beams loosely coupled together, and having one beam adjustable longitudinally upon the other.

The combination of the handles B B and bars C, pivoted couplings *c'*, coupling-blocks E, and vertical movable bars D D with the plow-beams A, having the several bolt-holes specified, whereby the beams and handles may be adjusted to place the plows opposite or in advance of one another, in the manner set forth.

170,719. DROP-LIGHTS. Richd. M. Shouse, New York, N. Y. [Filed Oct. 11, 1875.]

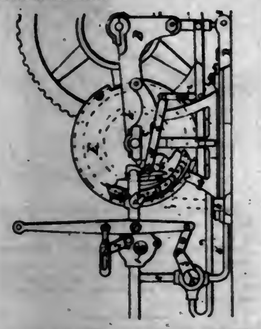


1. The combination of a rod, B, and shade C, the former passing through the latter, and an arm, C, to which the burner and elastic tube are attached, and by which they are supported, substantially as shown and described.

2. The combination of a shade, C, a vertically-adjustable ring, L, and rod B, substantially as shown and described.

3. The combination, with a shade, C, and an adjustable ring, L, of an adjustable arm, C, substantially as shown and described.

170,720.

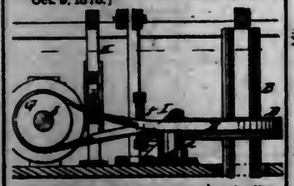


170,720. PRIMERS FOR CARTRIDGES. W. S. Smoot, Ilion, N. Y. [Filed Nov. 24, 1874.]

A primer for cartridges, consisting of the cup A, having the fulminate *a*, disk *a*, and bar-anvil *b* secured thereto, substantially as shown and described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

170,783. HYDRAULIC ELEVATORS. Timothy Graham, Boston, Mass. [Filed July 30, 1875.]



Brief.—The brake is applied by a cylinder and piston, to which the water is admitted when it is cut off from the motor. Communication of the cylinder and motor, the waste pipe, and pressure head with each other is by four-way cock. A slotted link permits said cock to be operated to let water on and off the cylinder without letting it into the motor. The frame in which the bearing drum rests swings on the shaft of the motor, and operates by intermediate mechanism an adjustable chute, which regulates the supply of the water to the motor.

1. The wheel E and pipe G, provided with the valve I, in combination with the pipe K, four-way cock N, exhaust-pipe n, cylinder J, piston M, piston-rod M', and brake P, substantially as and for the purpose specified.

2. The swinging frame E, provided with the yoke *b'* and drum A, in combination with the levers I and *b'* and automatic port G, all constructed to operate substantially as and for the purpose set forth.

170,782. POWERS FOR COTTON-GINS. L. B. Saith, Bennett's Cross-Roads, N. C. [Filed Oct. 9, 1875.]

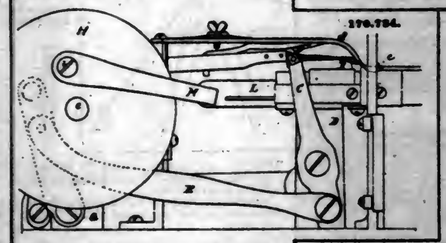
1. The vertically-sliding frame L and roller A, in combination with the guides K P, pulley G, wheel D, and belt B, constructed and arranged substantially as described, whereby the roller and frame hold the belt in proper position by their own weight, substantially as and for the purpose set forth.

2. The combination of the angling-roller *d*, adjustable frame L, vertical rollers *f f'*, and horizontal roller A in the vertically-sliding frame L, all interposed between the drum D and pulley G, to operate upon the endless belt C, for the purposes herein set forth.

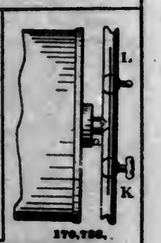
170,783. CAR-VENTILATOR. G. H. Storey, La Porte, Ind. [Filed Nov. 12, 1875.]

Brief.—A system of pipes, in combination with the exhaust of a locomotive, to effect the withdrawal of the impure air from passenger-cars, and a consequent ventilation.

The combination, with the exhaust of a locomotive, of a system of pipes, substantially as specified, leading to the cars, and causing a current from the cars to the engine, as described.

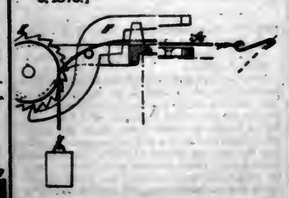


170,784. MACHINES FOR SEWING BUTTONS TO CLOTH, &c. Jerome C Taft, Providence, R. I. [Filed Aug. 10, 1875.]



Brief.—The needle, shuttle, and looper are located beneath the cloth plate, and the button eye and cloth are pressed down through the aperture in the plate. The needle carries its loop through the eye and cloth, the shuttle passes through the loop, and the looper catches the shuttle thread, and carries a loop of it into the path of the needle in its next forward movement.

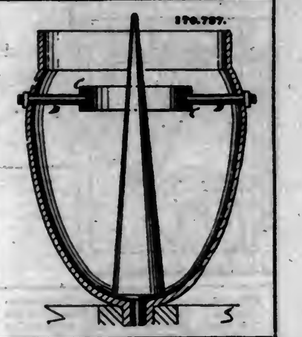
1. The combination of the stationary perforated work supporter A and the needle B, shuttle K, and the looper N, provided with mechanism for operating them, substantially as and for the purpose specified.



2. The combination of the cam wheel H, lever G, the connecting-rods E M, and the needle and shuttle carriers C L, all being applied substantially as specified.

3. The work supporter A, constructed, substantially as described, with the hole *a*, each being to receive the work and the button-eye, as specified.

170,785. LOOM-TEMPLES. John C. Thickins, Washington Mills, N. Y. [Filed Oct. 6, 1875.]

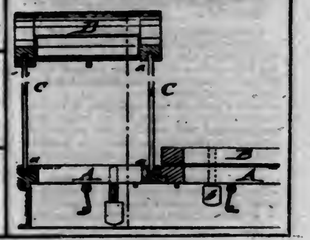


The ratchet E and lever F, combined with the cord and weight of a loom-temple, all arranged to hold the weight in place when the cord A is detached from the cloth, substantially as specified.

170,786. TIRES. Harry Thompson, Decatur, Ind., assignor to himself and G. W. McConnell, same place. [Filed Nov. 13, 1875.]

The combination of the open, concave, and flanged rim B, and the endless convex rim A, with the felly-rim C, substantially as specified.

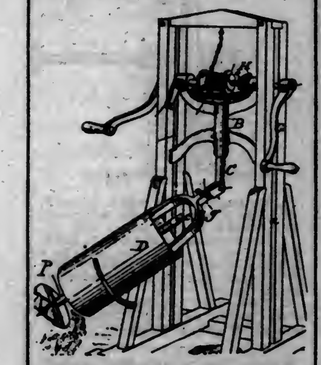
170,787.



170,788. GAS-GENERATING APPARATUS. C. L. Vaquez, Philadelphia, Pa., assignor to Rue & Bickins, same place. [Filed Apr. 19, 1875.]

Brief.—An excessive pressure of air, or a heat pressure of gas in the outer chamber, forces part of the contained water into the inner chamber through its open lower end, and thus unseals the vent-pipe.

1. The combination, with a carburetor or gas apparatus, of a compensator, constructed of the cylinder A and inclosed cylinder C, with the connecting cones D between them, the conveying-tube *i'*, the upwardly-projecting tube B, and the downwardly-projecting tube G, all constructed and operating substantially as and for the purpose set forth.



2. The combination, with the blower, of the warm and cold air pipes K L, continuous of each other, and having an outlet-pipe, e, common to both pipes, as set forth, and for the purpose described.

170,789. WINDOW-SHUTTERS. Sofio Victor, New York, N. Y. [Filed Nov. 6, 1875.]

170,790. MANTE-ADJUSTS. Martin Way and Thomas R. Way, Springfield, Ohio, assignors of one-half their right to G. W. Kelley, same place. [Filed Nov. 8, 1875.]

Brief.—The boring-cylinder is suspended from the shaft by a universal joint instead of a hinge-joint, so that when drawn out from the frame it may be laid upon the boat arm O without detachment. The portion of the shaft which carries the boring-plate is detached when the earth is discharged.

1. The earth-boring machine, consisting of the main frame A, the vertically-sliding frame B, provided with the vertical shaft C, and the gearing and hand-cranks for operating the same, and the boring-cylinder D, suspended from the shaft by means of a universal joint, the parts being combined and arranged to operate as shown and described.

2. In combination with the laterally-swinging boring-cylinder D, the arm O on the frame to support the cylinder while the earth is being discharged.

3. In combination with the boring-cylinder D, connected permanently to the shaft C, the movable bottom plate M, provided with the shaft P and guide-plate *j*, and secured in place by a pin, *g*, as shown, so that when the pin is removed the bottom will be forced outward by the pressure of the earth above it.

170,791. PROCESSES AND APPARATUS FOR MANUFACTURING SALT OR SUGAR. James R. Weaver and William S. Colwell, Pittsburg, Pa.; said Colwell assignor to said Weaver. [Filed July 2, 1875.]

1. The process of manufacturing salt or sugar, herein described—that is, heating the saline or saccharine liquor under pressure in a close chamber, and thence forcing it into an evaporating-boiler, from whence it is distributed in thin sheets and a current of air passed over it, substantially as herein before described and set forth.

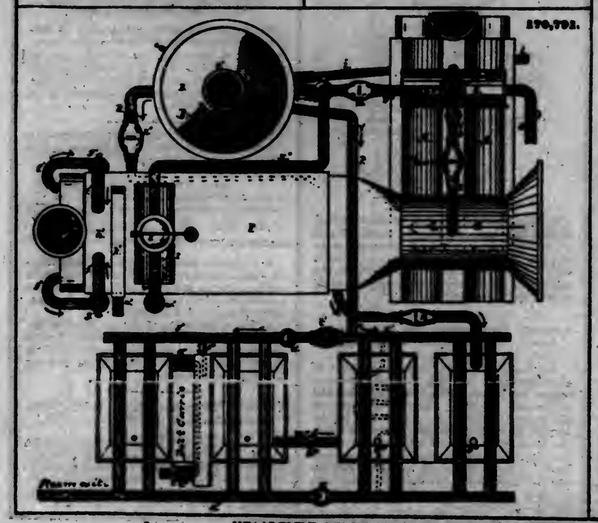
2. The combination of the heater B, steam boiler or boilers A, boiler or boilers C, air-heater G, and evaporating-chamber F, substantially as herein described, and for the purpose set forth.

3. The combination of the boilers C, pipes *f*, distributing-pipe *f'*, evaporating-chamber F, and air-heater G, substantially as herein described, and for the purpose set forth.

4. The combination of the heater B, pipe *h*, and boiler or boilers C, substantially as herein described, and for the purpose set forth.

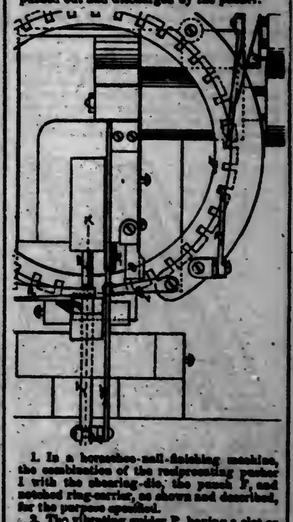
5. The combination of the pipes *a e f g f' l g'* and vats *c*, *w*, *x*, and *y*, substantially as herein described, and for the purpose set forth.

6. The combination of the boiler drums *e'* and steam-chambers *g''* with the vats *c y*, substantially as herein described, and for the purpose set forth.



170,792. REGISTERS FOR STOVES. Leonard A. White and George W. Lewis, Dighton, Mass. [Filed Apr. 3, 1875.]

Brief.—A spiral spring surrounding a rod, and inclosed within the shell of the knob, keeps the register or slide in contact with the door, and yet allows its required movement.



The bellow shank or casing A, the cap D, the rod C, and the spring S, when used together for the purpose and in the manner substantially as herein set forth.

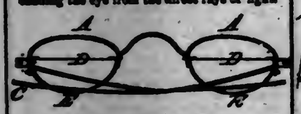
170,793.

170,794. MACHINES FOR FINISHING HORSE-SHOE-NAILS. Henry A. Wills, Chicago, Ill., assignor to Julia A. Wills, same place, and Lucy S. Kingsland, Burlington, Vt. [Filed July 5, 1875.]

Brief.—An intermittingly-rotating wheel, with notches at its edge, in which the nails hang suspended by their heads; a die and punch for shearing the nail; a pivoted holder, between flanges of which the head of the nail is brought, which holds the nail suspended after it has been pushed out of the notch by the punch; and a pusher for pushing the nail back through the die, and into the notch again after it has been trimmed, in readiness to be taken to the bending-dies, where it is again held suspended by another holder until it is beveled, when it is finally pushed out and discharged by the pusher.

1. In a horseshoe-nail-finishing machine, the combination of the reciprocating pusher I, with the shearing-die, the punch F, and notched ring-carrier, as shown and described, for the purpose specified.

2. The vibrating guider P, having a slot or recess in its under side, in combination with the punch F, notched ring-shearing die, and pusher I, as shown and described, to operate as and for the purpose specified.

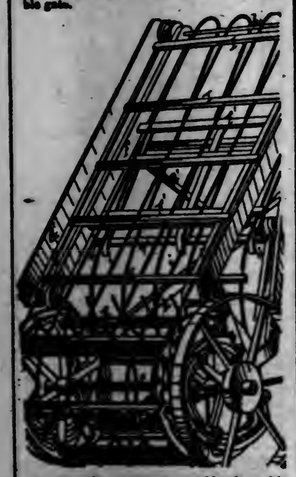


170,795. PHOTOGRAPHIC EYE-REST. S. M. Williams, San Francisco, Cal. [Filed July 13, 1875.]

A photographic eye-rest, as described, consisting of the box A, provided with the laterally-adjustable sliding doors, and containing an automatically-moving continuous picture, in combination with the vertically-adjusting support B, all constructed and arranged to operate substantially as and for the purpose set forth.

170,786. SPECTACLES. Frederick Veiner, Danville, Ky. [Filed Oct. 28, 1875.]

Brief.—The spectacle-glasses have a shade placed above the frames, for the purpose of shading the eye from the direct rays of light.



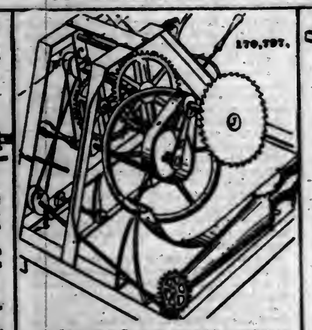
1. The arch-shaped shades A A, connected by a bridge, a, and provided with bows, substantially in the manner and for the purpose specified.

2. In combination with shades A A, lenses D and bows B B, secured to the shades, as described.

170,790. HAY-LOADERS. Chas. M. Young, Meadville, Pa. [Filed Sept. 13, 1875.]

Brief.—Spring gathering-teeth on rock-shafts, controlled by pivoted crank-arms operated by a fixed cam, and working in connection with an endless elevator, the tension of which is regulated by a pendent adjustable gate.

1. In a hay-loader, the combination, with the endless elevator, of the rotating and rocking gathering-heads B, provided with the crank-arms and the stationary frame-plates B B, provided with the cam-grooves b', actuating said rocking-heads, substantially as described.



2. The crank-arms I, pivoted to the rotating and rocking heads B, and operating in combination with the grooved cam-plates B, substantially as described.

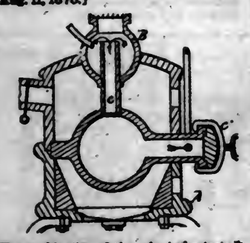
3. In a hay-loader, the combination, with the endless elevator, of the yielding or spring gathering-teeth applied to the rotating and rocking heads B, arranged and operating substantially as described.

4. The combination, with the endless elevator, of the pendent adjustable gate V, for regulating the tension of the elevator belt or apron, and controlling its return path, substantially as described.

170,797. SAWING-MACHINES. S. William C. Adams, North Lansing, Mich. [Filed June 8, 1875.]

Brief.—A circular saw is hung upon an arbor, which is driven in a sleeve-bearing at the end of a revolving arm keyed on the extreme front end of the main driving-shaft, so that in cutting a log of a given diameter the log can be cut by a saw revolving about the same of half the diameter of a stationary saw. The log is fed forward upon a spiked roller operated by worm-gear, in connection with a diagonally-journaled feed-shaft, which can be raised or lowered, to tighten the crank-belts, by means of a rock-shaft provided with a tappet not acted by the lower girt of pendulum-frame.

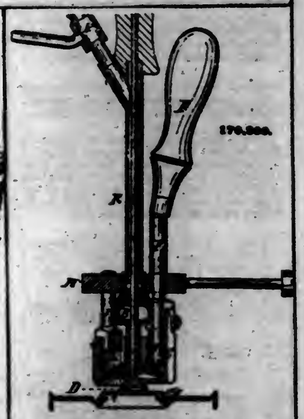
1. In a cut-off sawing-machine, substantially as described, a circular saw, whose arbor is rotated or driven in a bearing or sleeve at the end of a revolving arm, substantially as shown and set forth.



2. The combination, with the bed and pendulum-frame of the rest-carr, a means for raising and lowering it, the worm and the worm-gear for actuating the spiked roller which carries the log, substantially as described.

170,798. DEVICES FOR REMOVING THE BLOW-OVER FROM GLASSWARE. William Adams, Pittsburg, Pa. [Filed Oct. 18, 1875.]

A device for removing the blow-over from glassware, said device having a cone or similar shaped cavity, provided with corrugated or cutting surface, substantially as specified.



170,799. ILLUMINATING-GAS APPARATUS. Pierre Leon Allaire, Paris, France. [Filed Aug. 11, 1875.]

The combination of the spherical retorts B C with the connecting-pipes c, provided with a screw-thread on either end, whereby the position of the upper retort may be regulated in such a manner as to insure that it shall fit the aperture in the upper part or dome of the shell, substantially as specified.

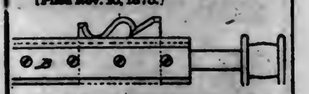
170,800. SOLDERING-IRONS. Abraham Anderson and Leander W. Goldy, Camden, N. J. [Filed Sept. 20, 1875.]

Brief.—The soldering-surface is made of sheet-steel bent into ring form, and having a copper bit between its ends. The steel and copper are adjacently clamped to a disk, in the center of which is perforated the hollow handle, through which the gas and air enter, the flame being deflected to the ring by a convex disk. Through the handle and pipe passes loosely a rod, carrying at its lower end the cap-holding button. The disk which supports the ring is perforated to admit to the flame a separate soldering-iron.

170,800.

1. The combination of pipe K, burner B, rod d', foot D, disk E, bit C, and steel ring A, for the purpose described and set forth.

2. The combination of the burner B, disk E, soldering-ring A, and the plate H, having a perforation to admit the insertion and heating of a separate soldering-iron, substantially as herein described.



3. The steel ring A, in combination with the copper bit C, to form a soldering-iron, substantially as herein described.

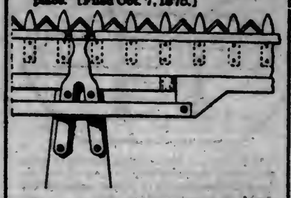
170,801. PIER-PLATE HEATERS. James M. Atkinson, Pittsburg, Pa. [Filed Nov. 1, 1875.]

The herein-described combination of sectional spheroidal-shaped oven A, draft-apertures a' a', located at the top and sides, as specified, draft-passage B, extending entirely around said oven, and fire-place, having sloping and vertical walls b' b', substantially as shown and specified.

170,802. OUTSIDE-HEADS FOR PLANING-MACHINES. Halsey H. Baker, Fieldsfield, N. J. [Filed Nov. 10, 1875.]

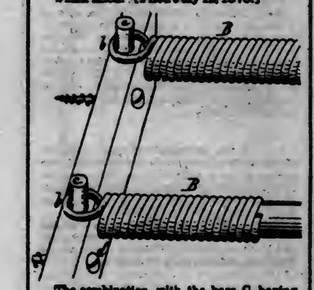
1. A planing-machine cutter-head constructed with a recess or recesses under the main cutters, for the insertion or reception of the molding or short surfacing cutters, substantially as shown and described.

2. The combination of the molding or miter straight cutters C with the surfacing-cutters B, carrying an cape thereto, and the recessed cutter-head, substantially as and for the purpose specified.



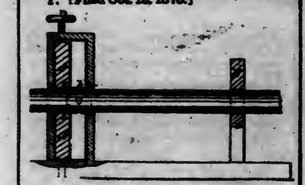
170,803. HYDRAULIC HOSE. S. W. Baker, Providence, R. I. [Filed Feb. 10, 1875.]

In hydraulic hose, the elastic cellular fabric, as described, combined with a water-proof lining, and the seam having scarfed edges D D, having a packing of india-rubber or other suitable cement united in tubular form, as described, as a new article of manufacture.



170,805.

170,804. SWAT-BAR GUIDES FOR HARVESTERS. William R. Baker, Chicago, Ill., assignor to C. H. & L. J. McCormick, same place. [Filed Oct. 7, 1875.]



The combination, substantially as hereinbefore set forth, of the finger-beam, the recessed longitudinal guide-piece thereof, the supports projecting rearwardly from the finger-beam, and the strap or guide-bar secured to these supports in rear of the finger-beam and recess in the guide-piece, whereby an unobstructed space for the escape of clogging matter is provided in rear of the finger-beam in the sweep-bar guide.

170,805. SPRING BED-BOTTOMS. H. Barton, Flint, Mich. [Filed July 12, 1875.]

The combination, with the bars C, having vertical studs c on their tops, of the round wooden rods A, having their ends threaded, and the spiral springs B, adapted to screw onto the ends of the said rods, and provided with loops b, when the several parts are constructed and arranged substantially as described and shown.

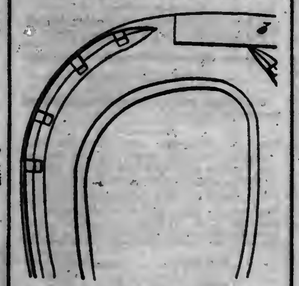
170,806. DEVICES FOR FEEDING METALLIC TUBING. Henry R. Bennell, New York, N. Y. [Filed Oct. 18, 1875.]

A device for finishing the surface of tubes, consisting of a series of adjustable scraping-dies, combined with an annular burnisher, substantially as and for the purposes described.

170,807. FASTENERS ON BUSTLES. Robert Sterling, New York, N. Y. [Filed Oct. 1, 1875.]

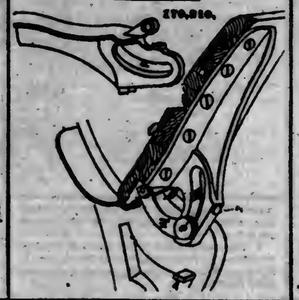
1. A bustle each half of which is composed of suitable material, cut in substantially the form shown in Fig. 2, and provided with gores a a sewed thereon, as and for the purposes specified.

2. In a bustle, the combination and arrangement of the horizontal springs c c, side springs f f, oblique curved springs g g, and bent spring h, all substantially as shown and specified.



170,808. AIR-VENTS FOR STEAM-RADIATORS. George W. Blake, New York, N. Y. [Filed Nov. 16, 1875.]

Brief.—The pin is operated to clear the passage of any obstructions.

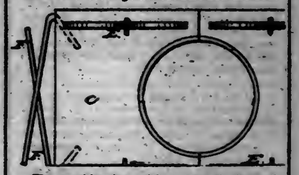


The combination of the longitudinally-movable clearing-pin B and its attached spindle b' with the socket A, provided with a stuffing-box, U, an outlet, g, and an escape-orifice or vent-opening, E, within which the clearing-pin works, substantially as and for the purposes herein set forth.

170,809. HORSESHOES. Nelson J. Blatherwick, Chicago, Ill. [Filed Oct. 20, 1875.]

A horseshoe enlarged upon the lower side at and near the point b, and formed substantially as specified, for the purposes set forth.

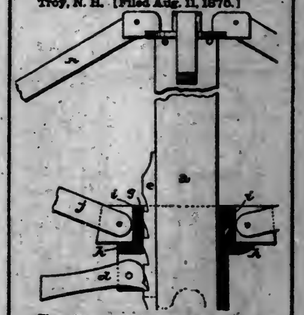
170,810.



170,811. SCHOOL-SEATS. W. A. Bradford, Goshen, Ind. [Filed May 13, 1875.]

Brief.—The curved slotted seat-arms work between the frictional plates and the standards, whereby the movement of the seat-arms is controlled, and the cushioned stops hold the seat firmly in position when thrown down, and relieve the hinge-pivots of strain.

The curved slotted arms B, in combination with the bolts c, nuts c', and frictional plates F, substantially as shown and described.



170,812. CAR-AXLE-BOX WASHERS. Chas. H. Brown, Richmond, Va. [Filed Oct. 6, 1875.]

Brief.—Double cut of springs for forcing the washer both against the axle and the box.

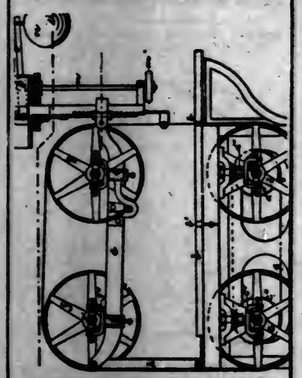
The combination, with a car-axle box, of the bisected backliner or washer C C, having upon one face the flat springs E E, and provided with the end springs F F, all substantially as and for the purposes herein set forth.

170,813. CLOTHES-DRIERS. H. J. Brown, Troy, N. H. [Filed Aug. 11, 1875.]

The collar c, made in one solid piece, having the shoulder h and vertical flange g, around which flange the collar f snugly fits, so as to hold the collar in position, in combination with the catch d, rack e, arms j, rods n, and cap o, substantially as shown and described.

170,814. COAL-OIL MOTORS. Frans Ruppe, Washington, D. C., assignee of one-half his right to Saml. N. Hoyt, same place. [Filed Nov. 16, 1875.]

1. The combination, with the cylinder of a hydrocarbon motor, of an oil-spraying apparatus and an independent air-inlet, whereby oil and air are commingled within the cylinder, substantially as set forth.



2. The combination of the open-end cylinder, the piston working in the same, the oscillating valve in the bottom thereof, and provided with a series-opening, and openings for the admission of air for the flame and exhaust, and the oil and air inlet pipes, all substantially as set forth.

3. The upward-opening valve *e* in the opening C in the bottom of the cylinder, in combination with the air-inlet pipe, the piston, the oscillating valve, and the lamp, all substantially as set forth.

4. The open-end cylinder, the water-jacket surrounding the same, the piston, the oscillating valve, with its openings *e f g*, the valve *d*, air and oil inlet pipes I J, lamp H, in combination with the shaft E, arm D, piston-rod C, cam O, crank-arm lever E, and rocker-arm M, having slot *m*, all constructed and arranged substantially as set forth.

170,816. BAND-SAWING-MACHINES. Wilson W. Carey, Lowell, Mass., assignor of one-half his right to G. W. Harris, same place. [Filed Oct. 9, 1875.]

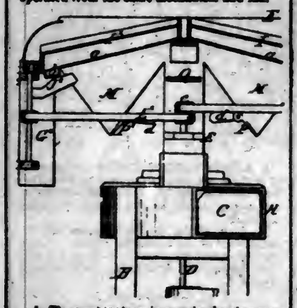
Brief.—The saw is made to pass over a system of four pulleys, two of which are carried by a swinging frame, which may be adjusted vertically by the operator, through the medium of a screw and hand-wheel.

1. The combination, with the pulleys *c d*, below the work-plate A, of the adjustable pulleys *f g*, swinging arm *e*, its link h, and the stationary guide k, as and for the purpose set forth.

2. The combination, with the swinging arm *e* and its pulleys, of the stationary guide k, shaft *l*, the lever *o*, and the adjustable weight *n*, as and for the purpose set forth.

3. The combination, with the swinging arm *e* and its pulleys, of the screw-shaft *l*, gears *l m'*, shaft *m*, and hand-wheel *m'*, as and for the purpose set forth.

170,815. JELLY-CUPS. Evan F. Cash, Baltimore, Ohio. [Filed May 1, 1875.]



1. A jelly-cup having its top formed in the shape of an elongated circle, with a rim having rectangular recesses, substantially as described and shown.

2. In combination, a jelly-cup with an oval top, and a rim having recesses, and a strainer cover having flanges and cams, substantially as described.

170,816. GRAIN-SEPARATORS. Daniel H. Caswell, Nashville, Tenn. [Filed Sept. 20, 1875.]

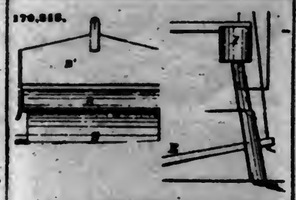
Brief.—Double gravity-separator having two independent feeders and regulators, and operated from the same mechanism and fan.

1. The combination, in a grain-cleaning machine, of a grain-cleaning trunk of two opposite open drop-trunks, G G^1, and a central section, E, with a suction-fan, C, and two oppositely-inclined separators, I I^1, from which the grain passes into the drop-trunks G G^1, whereby different kinds of grain may be cleaned at the same time and by the same blast within and through the opposite trunks.

2. The combination, in a grain-cleaning machine, having the opposite open drop-trunks G G^1, central suction-trunk E, suction-fan C, and oppositely-inclined separators I I^1 of the intermediate closed drop-chambers M, provided with pendent deflectors H and valves P P^1, substantially as and for the purposes set forth.

3. The combination, with the oppositely-inclined separators I I^1, outer and central trunk-sections G G^1 and E, and suction-fan C, of the slides Q Q Q, whereby the suction-currents in the outer trunk-sections may be regulated either together or independently of each other, substantially as herein set forth.

170,817. GRATE-BARS. Walter C. Childs, Pittsburg, Pa. [Filed Aug. 28, 1875.]



A Bessemer steel grate-bar, substantially as described.

170,818. WASHING AND WRINGING MACHINES. Ithiel J. Gilley, Lamont, and L. A. Wright and Theodore Nelson, Grand Rapids, Mich. [Filed Sept. 24, 1875.]

1. A washing-machine, above described, having frame K, with slots L for roller-slide A', and slot N for lower bearing, hinge C, and movable standard G, in combination with adjustable rollers A and D, roller-slide A', lever B, treadle B, and bench F I, for the purpose set forth.

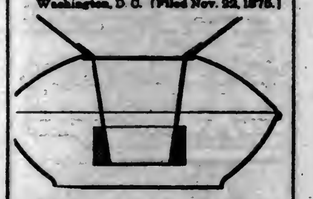
2. The combination of the frame K, having the open slot or bearing N, with the rollers A B, adjusted by the slide A', as and for the purpose described.

170,819.

1. A self-righting suspendore, having a weight suspended within by rods or other devices depending from the top or throat, substantially as and for the purpose set forth.

2. A suspendore made self-righting by a weight suspended within the vessel and above its base, substantially as and for the purpose described.

3. A suspendore or other similar vessel provided with a suspended removable weight to self-right the same.



170,820. FIRE-EXTINGUISHING APPARATUS. Jos. H. Connelly, New Brighton, assignor to Jos. L. Hastings and Wm. H. Hastings, Pittsburg, Pa. [Filed Sept. 20, 1875.]

Brief.—From the generator the gas goes to a receiver, where it is held under pressure. In combination is shown an ejector. The gas passing through draws water from a suitable reservoir, and thus the gas and water, passing to discharge, commingle. When a portable apparatus is desired a series of holders are placed on a truck, and the suitable pipe-connections made.

1. In a fire-extinguishing apparatus, the combination of a carbonic-acid-gas generator, connected by a suitable pipe, with an independent holder or holders, an ejector arranged to be operated by such gas in drawing and forcing water, substantially as set forth.

2. The combination of a carbonic-acid-gas holder, an ejector-nozzle, a water-supply pipe, and a mixing-chamber arranged in the line of discharge, substantially as described.

170,821. CUSPADORES. Jos. B. Connolly, Washington, D. C. [Filed Nov. 22, 1875.]

1. A self-righting suspadore, having a weight suspended within by rods or other devices depending from the top or throat, substantially as and for the purpose set forth.

2. A suspadore made self-righting by a weight suspended within the vessel and above its base, substantially as and for the purpose described.

3. A suspadore or other similar vessel provided with a suspended removable weight to self-right the same.

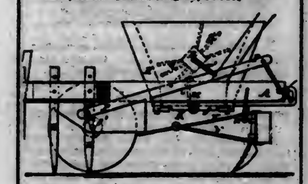
170,822. FIRE-EXTINGUISHING APPARATUS. Jos. H. Connelly, New Brighton, assignor to Jos. L. Hastings and Wm. H. Hastings, Pittsburg, Pa. [Filed Sept. 20, 1875.]

Brief.—From the generator the gas goes to a receiver, where it is held under pressure. In combination is shown an ejector. The gas passing through draws water from a suitable reservoir, and thus the gas and water, passing to discharge, commingle. When a portable apparatus is desired a series of holders are placed on a truck, and the suitable pipe-connections made.

1. In a fire-extinguishing apparatus, the combination of a carbonic-acid-gas generator, connected by a suitable pipe, with an independent holder or holders, an ejector arranged to be operated by such gas in drawing and forcing water, substantially as set forth.

2. The combination of a carbonic-acid-gas holder, an ejector-nozzle, a water-supply pipe, and a mixing-chamber arranged in the line of discharge, substantially as described.

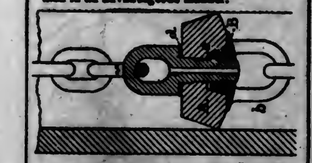
170,823. ASH-SIFTING ATTACHMENTS FOR STOVES. A. G. Cone, Troy, N. Y. [Filed Oct. 16, 1875.]



In combination with the vessel grate of a stove, an ash-lifting grate, pivoted at or near its transverse center within an inclosing frame, which parts are capable of a longitudinally-reciprocating motion in a horizontal plane, while said lifting-grate is capable of a partial revolution in a vertical plane within said frame, substantially as and for the purpose specified.

170,825. BAGGAGE-SEALS. John S. Carey, Washington, D. C. [Filed Oct. 28, 1875.]

In combination with the soft-metal disks A B, provided with seats and holes *a b*, the wire C, having its ends formed into loops, adapted to lie around the seats *a*, and secured in position, substantially as and for the purpose set forth.

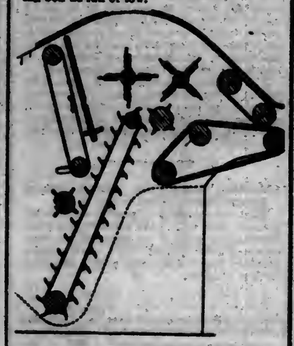


170,826. SEED-PLANTERS AND FERTILIZER-DISTRIBUTERS. Merideth P. Curlee, Corinth, Miss. [Filed July 17, 1875.]

The combination of the laterally-operating and detachable slides J K, having handles L, the hooked bolts M M, bars I I, and slide N, with the hopper and the operating devices, all substantially as and for the purpose set forth.

170,827. COUPLINGS FOR CHAIN-PUMP BUCKETS. Nelson D. Davis, Orion, N. Y. [Filed Oct. 12, 1875.]

Brief.—The rubber disk closely envelops a portion of the hollow bolt. The nut fits into a tapering recess, as shown, and expands the disk in an advantageous manner.

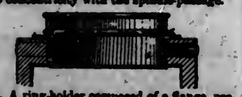


1. The elastic bucket A, having the tapering cavity *a* and solid intermediate portion perforated by the link-cavity, as shown, combined with the said link-cavity C, washer *d*, and tapering nut B, of less depth than said cavity, whereby elasticity is obtained between the bucket and its metal connections, and the bucket rendered capable of expansion, substantially as herein specified.

2. The tubular link-cavity C, combined with the elastic bucket A and lower link-nut B, whereby a central elastic connection and means for admitting air to, and draining water from, the tubing are obtained, as and for the purposes herein specified.

170,828. FEEDING APPARATUS FOR CARDING-MACHINES. John J. Dewey, Hartford, Vt., assignor to George S. Harwood and George H. Quincy, Boston, Mass. [Filed Oct. 16, 1876.]

Brief.—Improvement on Letters Patent No. 159,925, February 16, 1875. A regulating apron and shield to prevent the overfeeding of the lower feed apron, and serving to render the feed uniform, whether the stock in receiving-box be full or low.



1. In feeding mechanism for carding-engines, the combination, with the spiked lifting-apron, of a regulating-apron, substantially as and for the purposes set forth.

2. The combination, with the lifting-apron, of a regulating-apron adjustable to and from the lifting-apron, substantially as set forth.

3. The regulating-apron and the shield, in combination with the lifting-apron and feed mechanism, substantially as set forth.

170,829. SPINNING-RING HOLDERS. George Draper, Hopedale, Mass. [Filed Aug. 5, 1875.]

Brief.—A tapering ring-holder of sheet metal provided with flange and ring-holding projections, in combination with a ring-rail and adjusting-screws, to bring and hold the ring into concentricity with the spindle-passage.

1. A ring-holder composed of a flange, provided with ring-holding ears or projections, and a shank, tapered and gradually enlarged from the flange to the lower end of the shank, substantially as described.

2. A ring-holder, composed of a flange provided with ring-holding projections, and of a shank tapered or enlarged from the flange toward the end of the shank, in combination with a ring-rail and adjusting-screws adapted to place the rings in concentricity with the spindle, all substantially as described.

170,830. INSTRUMENTS FOR AIDING ANIMALS IN GIVING BIRTH. William Dulin, Big Grove, Iowa. [Filed Oct. 21, 1875.]

Brief.—A spoon-shaped wire frame is passed over the head of the pig, and a wire slide is slipped up under the jaw, and traction applied by the handles, with which the frame and slide are furnished.

The combination of the spoon-shaped wire frame A, and the wire slide C placed thereon, each provided with a suitable handle, substantially as and for the purposes herein set forth.

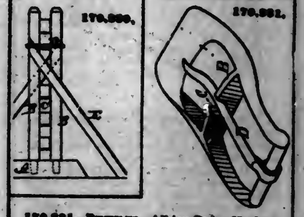
170,831. HOSE AND TUBING. T. H. Dunham, Boston, Mass. [Filed May 21, 1875.]

1. Cloth hose or tubing made of metal and fiber threads, treated with tallow, tar, ochre, sulphate of ammonia, or its equivalent, and woven into a solid, compact tube, as stated.

2. Hose or tubing composed of threads of fiber and metal, permeated with tallow, tar, ochre, sulphate of ammonia, or its equivalent, and woven up into a compact tube, which is coated inside and out with cements, substantially as described.

3. The improvement in the process of forming hose, consisting in permeating the threads, prior to weaving, with tallow, tar, ochre, sulphate of ammonia, or other soluble salts of an alkali or infusorial earth, weaving them into a close, compactly beat-up tubing or fabric, and coating with clay, whiting, or chalk, or other cement, or its equivalent, the proportions being substantially as described.

170,832. PROCESSES FOR PRESERVING COTTON, HEMP, AND FLAX HOSE, BELTING, &c. T. H. Dunham, Boston, Mass. [Filed Dec. 7, 1874.]



The hereinbefore-described process of treating cotton, hemp, and flax packing, hose, and belting, either before or after they are manufactured into proper shape for consumption, substantially as and for the purpose above specified.

170,833. FENCES. John Dwyer, Marion, Ohio. [Filed Oct. 21, 1875.]

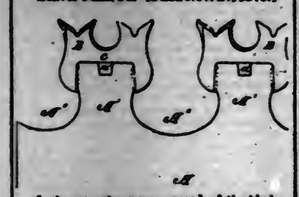
Brief.—Single wires are wrapped around the upper ends of the vertical posts, which are notched at their base in sill-pieces; said wires also encircle the upper ends of the inclined braces, which pass on opposite sides of the vertical posts, and then bind the vertical posts, the inclined braces, and the rails firmly together.

The combination of the base A, upright posts B B, rails C, braces B E, and the wire D, all constructed and arranged substantially as and for the purposes herein set forth.

170,834. 170,835.

170,834. BUCKLES. Albion Dyke, Nashua, N. H., assignor of one-half his right to I. O. Woodward, same place. [Filed Oct. 20, 1875.]

In a buckle, substantially such as described, the cross-bar B, crowning near its center, and provided with the notch C, substantially as set forth and specified.

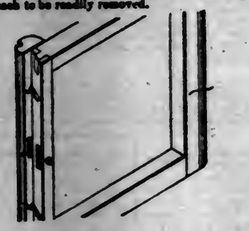


170,835. MATTRESSES FOR FORMING EMBANKMENTS. Jas. B. Eads, St. Louis, Mo., and Jas. Andrews, Allegheny, Pa. [Filed Aug. 19, 1875.]

1. A mattress for the formation of jetties or embankments formed of an upper and an under layer of poles or saplings E G, compressed so as to compound body, F, of brush by means of rails A C and pins B, as herein shown and described.

2. The combination, with the compressible body F G, rails A C, and pins B, of the wedges D, driven into the ends of the said pins in positions transverse to rails A C, as shown.

170,830. CROSSCUT-SAWS. J. B. Emerson, Beaver Falls, Pa. [Filed Nov. 27, 1875.]



1. A crescent-saw composed of the blade A, having jag-projecting bases A' and spaces A² between them, and the removable plate B, having a series of cutting-points or teeth, b, substantially as described.

2. A crescent-saw constructed to have the teeth thereof attachable and removable, in the manner substantially as described.

3. The attachable and removable plate B, having two or more cutting-points or teeth, b, thereon, and forming a part of a crescent-saw, substantially as described.

170,831. WINDOW-SASHES. William W. Evans, Georgetown, assignor to himself and Wm. D. Baldwin, Washington, D. C. [Filed Nov. 6, 1875.]

Brief.—The side of the frame is beveled, and a beveled strip is attached thereto by staple-hinges and a lock, which enables the sash to be readily removed.

1. The sectional sash-frame composed of sections having their adjoining faces beveled, and provided with a locking device to unite them, as and for the purpose set forth.

2. The combination, substantially as hereinbefore set forth, of the sash-sections and hinges uniting the sections, for the purpose specified.

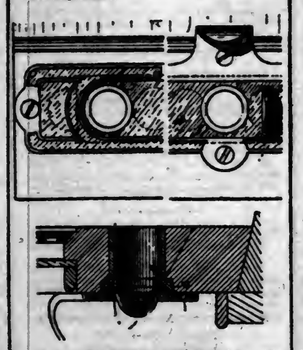
3. The combination of the window-casing, the sectional sash, and the locking device uniting the sections, these members being constructed and operating substantially as set forth, whereby the sash may be slid up and down and swung out horizontally.

170,832. GRATES. Michel G. Fagan, Troy, N. Y., assignor to himself and A. C. Cowe, same place. [Filed Sept. 6, 1875.]

Brief.—The grate-bars are loosely supported on the side bars, to allow expansion and admit of ready removal. A horizontal vibratory motion is imparted to the grate by means of the centrally-pivoted cross-bar.

1. The cross-bar A, constructed as shown, and provided with the transverse openings *d* and *c'*, substantially as and for the purpose specified.

2. In combination with the cross-bars A and A, provided with the transverse openings *c'* and *d'*, the side bars B and B, having the lugs *b b* separated by spaces or notches *b'* and *b'*, substantially as and for the purposes shown.

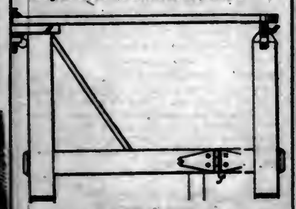


3. In combination with the side bar B, provided with mortises *b² b²*, the end bar C, having the tenons *c*, which fits into and is contained within said mortise, substantially as and for the purpose set forth.

4. In a stove-grate having separate bars, a cross-bar pivoted transversely to or upon a central supporting-bar by means of a vertical plate, which is secured to and projects downward from the lower side, near the longitudinal center of said cross-bar, substantially as and for the purpose shown and described.

5. The hereinbefore described grate, consisting of the cross-bars A and A, side bars B and B, and bars C and C, and center bar D, all constructed and combined in the manner and for the purpose substantially as specified.

170,833. VENTILATORS. John L. Frazo, Quincy, Mass. [Filed Nov. 4, 1875.]

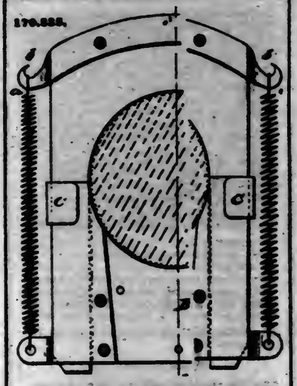


Brief.—A ventilator arranged in a sash, with a metal plate with tubes attached, the plate being on the inside of the sash, and the tubes on the outside. There is also a covering-plate provided with holes, which moves back and forth at pleasure.

1. A ventilator composed of a plate with projecting tubes, and with a sliding covering-plate, substantially as described.

2. The metal plate and projecting tubes, in combination with a holding-plate and lifting-hook, and with a perforated sliding covering-plate adapted to slide between the metal plate and holding-plate, all substantially as described.

170,834. IRONING-TABLES. John Finfrock, Piqua, Ohio. [Filed Oct. 26, 1875.]



1. An ironing-stand consisting of two posts, provided with cross-bars *g* at top, and connected by a rail jointed at *f*, as shown and described.

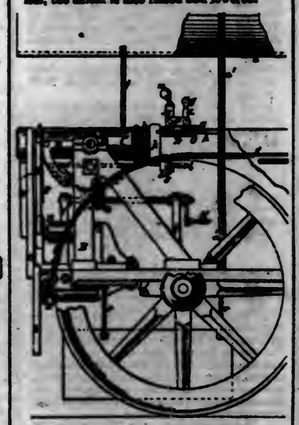
2. The combination of a stand having cross-bars *g*, a clamp-screw, *h*, and an ironing-board having open-end slot, as and for the purpose specified.

170,835. WASHERS FOR CAR-AXLES. W. H. Fitz Gerald, Brooklyn, N. Y. [Filed June 1, 1875.]

Brief.—For preventing escape of lubricant from car-axle box.

170,836.

The two parts A and B, in combination with the metal straps C C, springs G G, eyelets *a*, and hooks *b*, all constructed and arranged as and for the purpose herein specified.



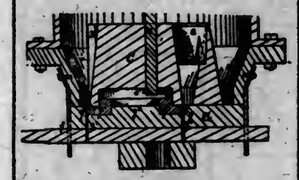
170,839. GLASS-MOLDS. H. Franz, Pittsburg, Pa., assignor to Campbell, Jones & Co., same place. [Filed Oct. 29, 1875.]

In molds for glassware, pockets or cavities formed between the mold and the ring, substantially as and for the purpose specified.

170,840. GUN-CARRIAGES. M. M. Frezzini, Naples, Italy. [Filed Oct. 6, 1875.]

Brief.—The segment, which moves in contact with the rest on the protecting-shield, is rigidly attached to the cannon and bed-piece, so that when the muzzle of the cannon is raised and lowered by the training mechanism, the shield is also raised and lowered.

1. In a gun-carriage, an adjustable shield covering a part of the front of the gun, and adapted to be raised and lowered by the raising and lowering of the cannon attached to the said carriage, for the purposes described.



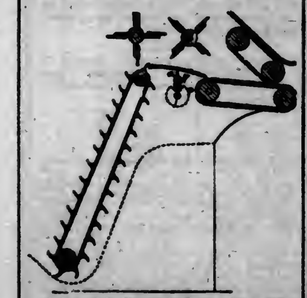
2. The combination of the shield U, rack P, and segment-gear Q, when the several parts are adapted to operate the said shield, in the manner substantially as described and shown.

3. The combination, with the carriage A, of the shields U X S and spring-buffers E E', all substantially as described and shown.

4. The combination, with carriage A and wheels B, of the metallic bands S, bearing upon the periphery or tires of the said wheels, and saw-rods t, substantially as described and shown.

5. The combination, with the carriage A, of the rods *a' b d f* and eyelets *f'*, forming a removable support for the covering *q*, substantially as described and shown.

170,841. FLUE-LININGS. Charles A. Freeman, New Cumberland, W. Va. [Filed Sept. 20, 1875.]

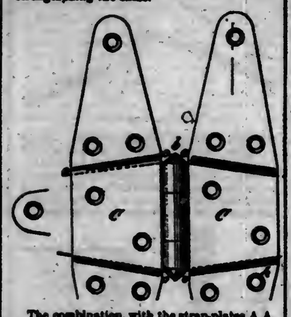


1. The die for forming flue-pipe, provided with two or more cores, arranged within said die in such a manner that the spaces intervening between the several cores and the die shall correspond to the web or walls of the article to be produced, substantially as described.

2. In a die for forming pipe, the combination of the cylinder-head A, central core, and one or more side or wing cores, substantially as set forth.

170,842. FEEDING MECHANISMS FOR CARDING-ENGINES. Josiah G. Freeman, Worcester, assignor to G. S. Harwood and G. H. Gaskey, Boston, Mass. [Filed Oct. 16, 1875.]

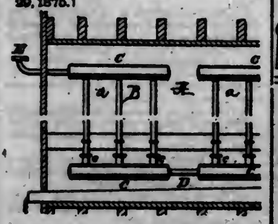
Brief.—Improvement on Letters Patent No. 43,925, August 23, 1864, and No. 159,822, February 16, 1875. A picker-bar provided with spikes or teeth, having a rising and falling motion through perforations in a metal shield or plate, by means of revolving cams, prevents the clogging of the material on its way from the lifting-apron and the lower feed-apron.



1. In card-feeding mechanism, substantially such as described, the combination of a series of opening teeth or spikes, and a shield or plate, through apertures or perforations in which the teeth or spikes are at intervals protruded and withdrawn, substantially as and for the purposes set forth.

2. The picker-bar and shield through which teeth or spikes of said bar work, as described, in combination with the lifting-apron, the feed-apron, and the spiked fan, substantially as set forth.

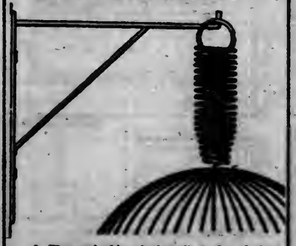
3. The combination, with the picker-bar shield and the picker-bar, of the revolving cams, arranged and operating substantially as described, to offset the rise and fall of the picker-bar at stated intervals, in the manner set forth.



170,843. STRAP-HINGE ATTACHMENTS. H. Freeman, Parker's Landing, Pa., assignor of one-half his right to John Baton, Brooklyn, N. Y. [Filed Nov. 10, 1875.]

Brief.—The chain very fully points out the invention. A brace-plate or separate supplemental leaf readily attached to the ordinary strap-hinge, for relieving the strain, and strengthening the same.

The combination, with the strap-plates A A of the hinge, of the brace-plates C C, offset on the edges of the strap-plates, and serving as attachments and braces to the hinge, substantially as herein described.

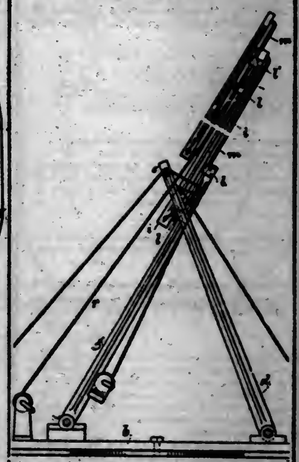


170,844. DEVAPORIZING APPARATUS. Levi K. Fuller, Brattleborough, Vt. [Filed Oct. 29, 1875.]

1. The combination of the vertical pipes a c, grouped as shown, with the elbows *a e* and cross-pipes O O, in the manner specified.

2. The combination of the pipes a c arranged in groups of two or more, with the pipes O O, D D, E, and F, substantially in the manner and for the purposes specified.

170,845. HARDING BIRD-CAGES. George W. Fuller, Boston, Mass., assignor of one-half his right to John B. Fitzpatrick, same place; said George W. Fuller and John B. Fitzpatrick assignors of one-half each of their rights to John McC. Perkins, Washington, D. C. [Filed Apr. 7, 1875.]



1. The method herein described of rendering a bird-cage elastic, or of giving it an oscillating or undulating motion, consisting in suspending the same from an elastic medium, substantially as described, and for the purposes set forth.

2. A helical suspension-spring, in combination with a bird-cage, substantially as shown and described, and for the purposes set forth.

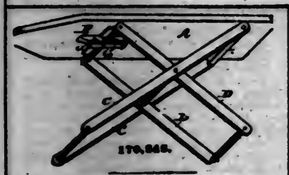
170,846. PIER-SCAFFOLD LADDERS. John A. Groshon, New York, N. Y., assignor to himself and J. D. Bentbouse, same place. [Filed Oct. 16, 1875.]

Brief.—A derrick for raising the ladders is hinged to the platform, said derrick being raised and sustained in an elevated position by a drum and rope. The sides of the ladder are T-shaped in cross-section. On the front of each ladder-section are secured loops, which receive metallic rods, said rods being secured to the rear of the adjoining section.

1. The derrick-frame *d*, hinged at 3 to the platform, and the winch-barrel *f* and chain, to raise and sustain such derrick, in combination with the extension-ladders *g g*, connected to the platform and the winch-head *h*, and chains or ropes to the ladders to raise the same, as set forth.

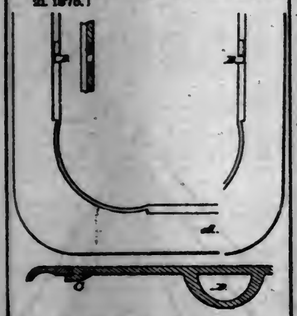
2. The guide-rods *n n'* at the backs of the extension-ladders, in combination with the loops *l l* upon the respective ladders behind such guide-rods, and the winch and hoisting mechanism, substantially as set forth.

3. The extension-ladders formed of T-shaped side bars that taper toward the ends, with the cross-bars or rungs between the said side bars, substantially as set forth.



170,847. BIRD-CAGES. Gottlob Gunther, New York, N. Y. [Filed Oct. 4, 1875.]

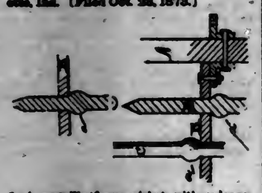
The removable screen F, connected to the body of the cage, in combination with the mat B, supported by the bars or stand D, said parts being so arranged that the bird can reach the mat through the wire screen, all as described.



170,848. IRONING-TABLES. Wm. P. Hall, Greenville, Mich. [Filed Oct. 28, 1875.]

An ironing-table, A, provided with folding legs O D and rest R, said rest resting one leg of the table when in use by means of a button, G, clamping one round of the leg in the teeth of the rack, and releasing said round therefrom when it is desired to fold up the legs of the table, all as specified, for the purpose set forth.

170,848.



170,849. COOKING-STOVE. Farwell H. Hamilton, Bloomington, Ill. (Filed May 21, 1875.)

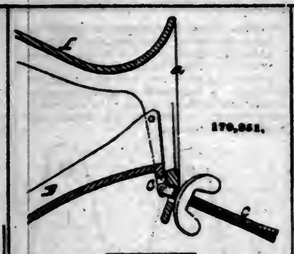
1. In combination with the stove-top, having the sides B placed out of the center line of said top, and tapering bearing for the pins C of the long section, as described, in combination with said section, having the said pins or projections C, substantially as and for the purpose specified.

2. In combination with the long section, having the pins or projections C, adapted to be slid under the stove-top, as specified, the curved support D, having a common longitudinal center with said pins C, and acting as a support by resting on the cross-plate of the stove, as described.

170,850. FENCE. Thos. Harding, La Fayette, Ind. (Filed Oct. 28, 1875.)

1. A metallic fence-picket, with enlargements or bosses a a, formed by "upsetting" the metal of the picket, as and for the purpose set forth.

2. In combination with metal pickets C, provided with bosses or enlargements a a, as described, the perforated rails B B upon the upper and lower sides of said bosses, respectively, and the posts A, to which the ends of said rails are secured to form a metallic fence, as set forth.

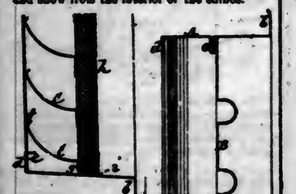


170,851. SPROUTLUMB. E. B. Harding, Northampton, and E. W. Higbee, Springfield, Mass. (Filed Nov. 2, 1875.)

Brief.—The flange of the short blade is extended to complete a circle, and in the lower side of it is a slot to receive the lug of the long blade when opened to its fullest extent. The extreme ends of the blades are wider than any other parts of the same.

1. A bivalve sprouter, having its blade A widened from its flange outwardly, substantially as shown and described, and for the purpose set forth.

2. The blade A having a broad circular flange or guard, a a, concentrically as shown and described, and for the purpose set forth.



3. The elongated flanged blade A, having the slot or recess d, in combination with the blade B and screw C, substantially as and for the purpose set forth.

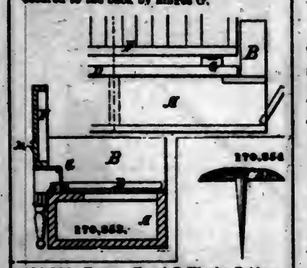
170,851.

170,852. VENTILATING-LOUVERS. George Hayes, New York, N. Y. (Filed June 29, 1875.)

Brief.—The exposed surface is of corrugated metal, with suitable perforations. Back of the perforated plate are gutters, to keep out rain and snow from the interior of the edifice.

1. The combination, in a ventilating-louver, of a reticulated covering and gutters at the back or across the interior surface of said covering, substantially as specified.

2. The perforated plate or reticulated covering E, formed with corrugations A, in combination with the gutters C and the frame or case A, essentially as described.



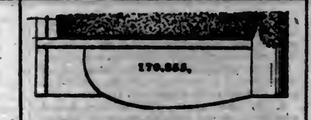
3. The case or frame A, constructed with double metal flanges c c on its sides, and intermediate of the width of the latter, substantially as specified.

4. The combination of the outer flange b with the inner flanges d of the louver frame or case A, essentially as described.

5. The gutters C, constructed with flanges f g, substantially as described, and for the purposes herein set forth.

170,853. SOFA-BEDSTEAD. G. J. Hambsch, Philadelphia, Pa. (Filed Sept. 28, 1875.)

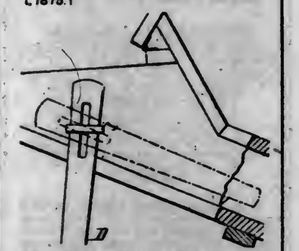
A sofa-bedstead, consisting of the main frame-work or body A, having separate compartments therein, provided with end pieces hinged at their lower edge to the frame to form doors to said compartments, the back-frame F having bolts H, the end pieces E, sliding head and foot boards C, and seat D, secured to the back by hinges G.



170,854.

170,854. TACKS. Enoch P. Hincks, Bridgeport, Conn. (Filed Oct. 4, 1875.)

As an article of manufacture a soft-rubber head, combined with a pointed shank, the rubber head being molded around the shank and took head, as set forth.

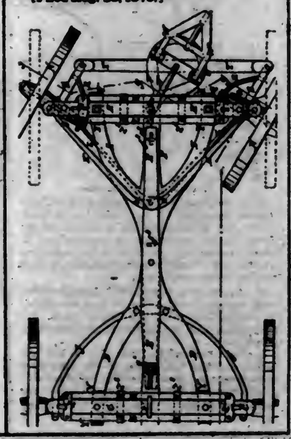


170,855. PROCESSES OF TREATING HIDES. Wm. H. Holman, Philadelphia, Pa. (Filed July 10, 1875.)

170,855.

The within-described process of treating hides or skins before they are subjected to the tanning operation—that is to say, subjecting them to the action of a rapidly-moving roughened surface, which will remove the adhering flesh, and break up the gristle of the hide or skin, as and for the purpose herein set forth.

170,856. PORTABLE COAL-CHUTES. Ralston S. Hoopes, West Chester, Pa. (Filed Nov. 1, 1875.)

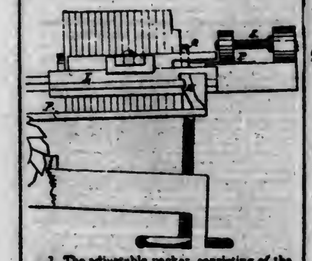


The within-described portable coal-chute, consisting of a box, A, having a shield or door, B, adjustable legs D, and otherwise constructed, substantially as and for the purpose set forth.

170,857. CURRY-COMBS. C. A. Hotchkiss, Bridgeport, Conn. (Filed Oct. 28, 1875.)

A curry-comb having frame A, handle B, thumb-rest a, and tang C formed of one piece, said thumb-rest being nearly on a vertical line with the wall of the frame, and said handle B being on the same line with tang C, substantially as specified.

170,858. RUNNING-GEARS. Lorenzo D. Hurd, Wellsville, N. Y., assignor of one-half his right to Thos. Fuller, same place. (Filed Aug. 28, 1875.)

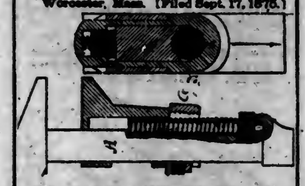


1. The combination of the rods Q and the brace-arms E and their nuts with the pivoted hollow axles O and the arms S, substantially as herein shown and described.

2. The combination of the plate or frame U and the pivoting-bolt V with the cross-bar T, the pivoted axles O, and the king-bolt passing through the bolster H, the head-blocks G, and the bar M, substantially as herein shown and described.

3. The combination of the reach made in two parts, E F, and provided with the eyebolt and lugs e' f' and the hook and eye e' f', with the rear bolster, axle, and bounds, and the forward bolster, head-block, and bounds, substantially as herein shown and described.

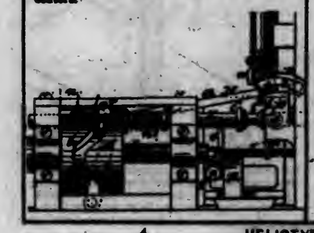
170,859. MACHINES FOR MAKING BOXES. Elias James, Tyngsborough, assignor to Benj. F. Stevens, Lowell, Mass. (Filed Oct. 6, 1875.)



Brief.—The material is secured in a sliding clamp, which carries it over a series of revolving cutters, that form the tongues and grooves by which the pieces of the box are united.

1. The adjustable packer, consisting of the frame X, the guides M M', the piece P, and screw S, as and for the purpose specified.

2. The packer, in combination with the adjustable table F, as and for the purpose specified.



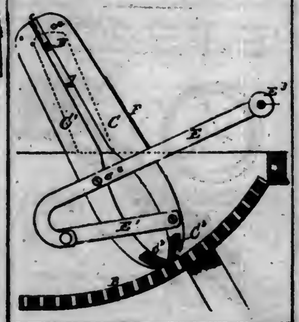
170,860. WRENCHES. Benjamin F. Joslyn, Worcester, Mass. (Filed Sept. 17, 1875.)

The combination of the stem A of the wrench, the movable jaw a, and the spring-yoke C, a portion of which is adapted to the screw, another portion projecting through and arranged to slide in the said movable jaw and embracing the stem A, all being constructed as set forth.

170,861. LASTING FOR TURNING SHOES. William R. Landfear, Brooklyn, N. Y., assignor to himself and Nathan R. Campbell, Hartford, Conn. (Filed July 1, 1875.)

Brief.—The upper-blanks are placed in a hopper, from which they are conveyed automatically by a set of spring-fingers, which seize the blank as it emerges from the lower end of the hopper, and convey it to the lathe-centers.

1. The combination, with the supply-tube A, of the spool-blank conveyor B, provided with jaws e and f, for holding and releasing the spool, and having its upper surface constructed to form a cut-off to the spool-supply tube, as and for the object specified.

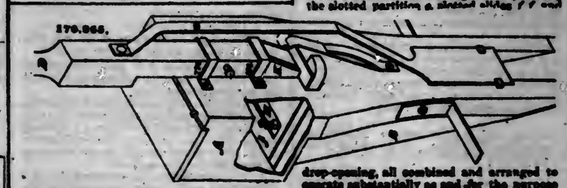


2. The sleeve n', in combination with the sliding spindle i, the stops or collars n n', the nut n', adjustable on said sleeve, and the grooved cam G, essentially as specified.

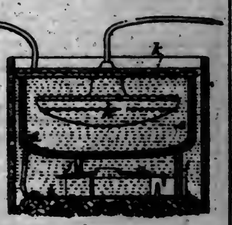
3. The combination of the eccentric pin s on the shaft I, with the sliding rod t, the spring u, the stop or nut v, and the knife carriage M, essentially as described.

4. The combination of the grooved cam G with the vibrating arm K, by which the spool-blank cut-off and conveyor B is operated, and the nut n', by which the sliding spindle i is actuated, substantially as specified.

170,862. WASHING-MACHINES. J. F. Lawson, Butler, Mo. (Filed July 26, 1875.)



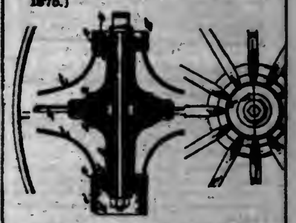
Brief.—The suds-box has a corrugated bottom. A swinging rubber is provided with jaws for grasping the clothes, which are opened and closed by the operating-lever.



170,863. HAND SEED-PLANTERS. Thomas J. Hubbell, Napa City, Cal., assignor of one-half his right to George W. Cornwell, same place. (Filed Apr. 27, 1875.)

Brief.—The seed-slide is moved forward by a handle, the lower end of which is made wedge-shaped, for working through a slot, and is retracted by a spring-arm. To the handle is attached one end of a rod, the other end of which is made into a sliding plate, that moves vertically in ways, for retaining a charge of dropped seed until the plate is retracted by the upward movement of the handle.

The plunger D, with its wedge-shaped end K, and having the handle O of the sliding plate attached to it, in combination with the seed-box A and conducting-tube B, having the slotted partitions a, slanted ends f f, and drop-opening, all combined and arranged to operate substantially as and for the purpose described.



170,864. GALVANIC BATTERIES. Robert M. Lockwood, New York, N. Y., assignor to himself and E. W. Andrews, same place. (Filed Sept. 1, 1874.)

1. The porous cup, resting upon or sustained by a connection to the copper pole, and the zinc pole supported within the porous cup, so that the relative position of the poles is maintained, and they rest upon the sulphate-of-copper crystals in the cell, as set forth.

2. The copper pole, made of the funnel-shaped plate c and ring b, connected together and receiving the supports f, that sustain the porous cup a, as and for the purposes set forth.

170,865. GARDEN-WHEELS. Samuel W. Ludlow, Cincinnati, Ohio. (Filed Oct. 19, 1875.)

1. A carriage-wheel having its hub secured to it by flexible braces C, and its spokes to an annular plate, H, adapted to play laterally between the flanges of the hub, substantially as and for the purposes specified.

2. The combination of the hub A c, heads or rings E, and spring-braces C, the latter having bent ends e, fitting the pockets d', substantially as and for the purposes specified.

3. The rim G, composed of plates g g', formed and fitted together substantially as and for the purposes specified.

170,967. SASH-HOLDERS. Peter Lugenbell, Greensburg, Ind. [Filed Apr. 23, 1875.]

Brief.—The sides of the sash are tapering, and at each withdrawn corner, at top and bottom, a rubber roller is inserted. The sash rests against a rubber roller on each side, and upon its sharp projecting corner above and below each roller. A lateral pressure compresses the rubber roller, and frees the sharp corner of the sash from the frame, and allows the window to be readily moved.

The combination, with an ordinary straight window-frame, A, of the sash B, having its side rails tapering in opposite directions, and the flexible rollers C C inserted in the smaller or narrower ends of the side rails, substantially as and for the purposes herein set forth.

170,968. DROP-HAMMERS. Charles Lasted, New Orleans, La. [Filed Oct. 11, 1875.]

Brief.—Levers are pivoted to the frame, and, with links and levers, form lazy-tongs, which increase the distance which the hammer can be raised by an upright movement of the rod.

1. The levers *e f d d' m m' e e'* and hammer C, in combination with the frame A, provided with pin *b* and guide D, and the anvil-block E, as described, and for the purpose set forth.

2. The hammer C and levers *e f d d' m m' e e'*, in combination with the links *e e'*, lifting-rod *f*, nut G, and springs *i i'* the whole being arranged to operate, by means of the levers *g* H and connecting-rod F, as described, and for the purposes specified.

170,969. PLAITING-MACHINES. Manvill M. Macdonald, Syracuse, N. Y. [Filed Nov. 27, 1875.]

The combination, with the bed-plate A, of the spring-loops C, for supporting the wires or rods B, substantially as set forth.

170,970. HARNESS-SADDLES. John Mashure, Newark, N. J., assignor to E. R. Osborne, same place. [Filed Oct. 30, 1875.]

1. The metal plates *f f*, smaller than the jockey, and combined with each half of the jockey, substantially as and for the purposes set forth, making a jockey, as shown in Figs. 6 and 7.

2. The detachable skirting, having linings which form pockets for the reception of the tree, substantially as described.

3. The detachable housing V, provided with thin metal plates *u*, in combination with shoes *r s*, for the reception of the turret-nuts, substantially as set forth.

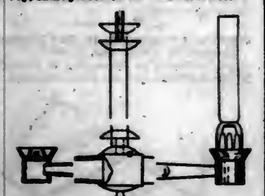
4. The combination and arrangement of the jockey, detachable flaps, and adjustable housing, all readily removable, and capable of being fastened out for packing, substantially as and for the purposes set forth.

170,970.

170,971. HARNESS-SADDLES. John Mashure, Newark, N. J., assignor to E. R. Osborne, same place. [Filed Oct. 19, 1875.]

1. The ridges *e e* on crown of the tree, substantially as and for the purposes set forth.

2. The long seats *d d*, with indentations, near ridges of the tree, substantially as and for the purposes set forth.

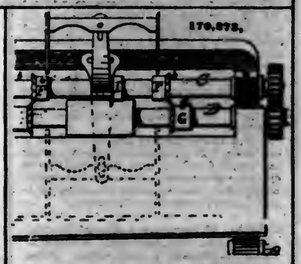


3. The holes *c c* in the tree below the turret, in combination with a metal backband-hook.

4. In a jockey-saddle, the jogs *g g*, forming square shoulders, extending across the entire width of the end of the tree, for the reception of the stiffener *h*, as described.

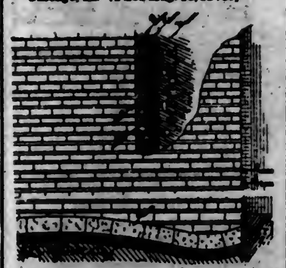
5. The metallic backband-straps *f f*, provided with loop and hook, substantially as and for the purposes set forth.

6. The adjustable socket-plates *j j*, in combination with a metal tree, having socket-hole *i*, a turret and turret-nut, constructed and operating substantially as and for the purposes shown in Figs. 1 and 2.



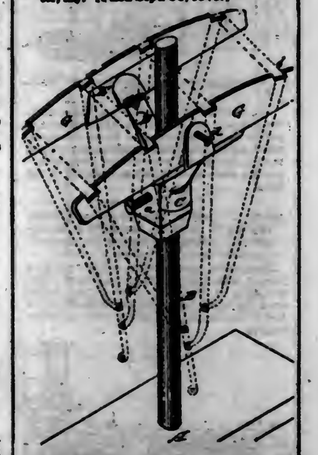
170,972. CHANDELIERS. John Mathews, Lawrence, Mass., assignor to S. B. Harvey, same place. [Filed Jan. 2, 1875.]

In a chandelier constructed as herein described, the combination of the supporting-rod A, with its covering for covering the screw-cap in the tank, in a manner substantially as herein described.



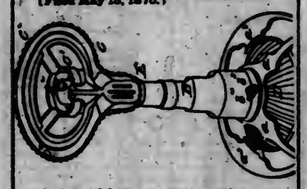
170,973. PAPER-PERFORATORS MACHINES. Philip McAleer, Washington, D. C. [Filed Sept. 14, 1875.]

170,973.



In a perforating-machine, the combination, with two parallel shafts, of one or more disk-knives adjustably secured to each shaft, and having their peripheries broken by radial slots and adapted to overlap, substantially as and for the purposes described.

170,974. STONE PAVEMENTS. John McBean, Chicago, Ill. [Filed Aug. 16, 1875.]



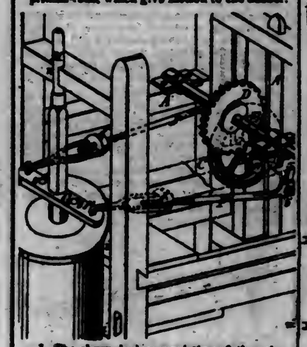
In combination with pavement-blocks of stone, cut purposely to a uniform size and made smooth on both sides and edges, a bed of sand and a filling composed of dry gravel and a compound of coal-tar and pitch, of about the proportions specified.

170,975. MACHINES FOR SETTING GARMENT-BOWS. James H. McClymont, Winchester, Ky. [Filed Sept. 20, 1875.]

The combination, with the base A, of a single vertical post, B, the adjustable collar C surrounding said post, and having the arms D D and holders E E at their outer ends, and the notched longitudinally-adjustable bow-in G G resting upon the holders, all constructed substantially as and for the purposes set forth.

170,976. STANDS FOR WATER-COOLERS, &c. William L. McDowell, Philadelphia, Pa. [Filed May 12, 1875.]

1. A stand for a water-cooler or flower-pots composed of the three parts A B C, each part being a single casting, and the part A being formed with the legs *a*, and having a connecting-ring at top and bottom, substantially as set forth.



2. The pedestal A, having the legs *a a a*, ring *a'*, and disk *a''*, all cast in one piece, substantially as set forth and shown.

3. In combination with the hollow column B, having the internally-projecting ears *b'*, the casting C constituting a removable top to a water-cooler or flower-stand, and provided with the ring C' having the openings *c* and interlocking lugs *d'*, substantially as shown and described.

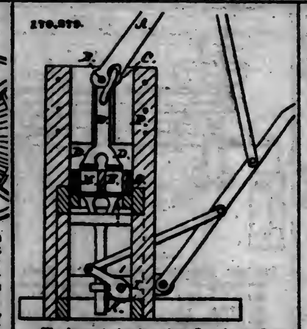
4. The rest C, composed of the ring C, ring C', and channeled arms *d' d' d'*, substantially as shown and described, to catch the overflow or drip from the water-cooler or flower-pots, substantially as set forth.

170,977. REciPROCATING CHURNS. William McKinley, Bellaire, Ohio. [Filed Apr. 30, 1875.]

Brief.—The churn is held in position by the pitman-rods, which give motion to the dasher.

1. The churn-dasher consisting of the spindle H, the horizontal arms I I' and strips n, and the gathering-arms n, substantially as described and shown.

2. The combination of the spindle H, with its cross-head, and the pitmen F F', journaled upon the shaft E, for the purpose of permitting the location of the churn outside of, and disconnected from, the gear-frame, substantially as described and shown.



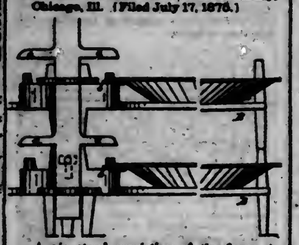
170,978. TONGUE-SUPPORTS. Jos. D. Meals, North Washington, Pa., assignor to himself, Andw. J. Jack, and Thomas G. Jack, same place. [Filed Oct. 23, 1875.]

In combination with the running-gear and pivoted tongue of a wagon, a spring for supporting the tongue, said spring having one fixed end and one free end, a yoke for confining the spring, and a set-screw bearing on the free end of the spring, for adjusting the tension of the spring, substantially as specified.

170,979. RAKE-MACHINES. J. M. Mitchell, Dunlap, and L. B. Kennedy, Keokuk, Iowa. [Filed Oct. 23, 1875.]

170,979.

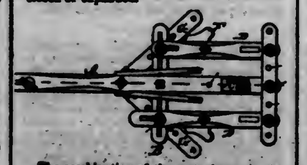
The lever A, having pivot B and cam C, in combination with brick-press plunger D, having guideways, and the connections by which the lever A raises the plunger after driving it down, substantially as set forth.



170,980. KITCHEN-VENTILATORS. Joseph V. Montgomery, Toledo, Ohio. [Filed Aug. 27, 1875.]

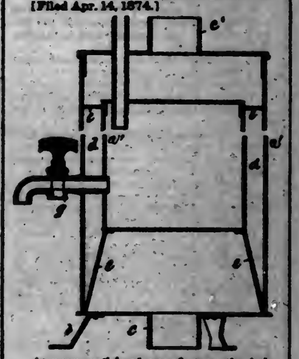
Brief.—The sleeve operates as a damper and as a support for the cone.

The slotted sleeve B and cone C, in combination with the slotted pipe A, substantially as and for the purpose set forth.



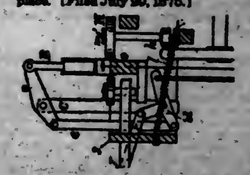
170,981. PIE-PLATE STANDS. Alex. Moody, Chicago, Ill. [Filed July 17, 1875.]

A pie-stand consisting of the frame A, shelves B, and a locking device, substantially as described, whereby the pie-plates can be securely locked in position, while the pies can be removed, substantially as and for the purpose set forth.



170,982. CULTIVATORS. Enos B. Moore, Bell's Mills, Ala. [Filed Aug. 20, 1875.]

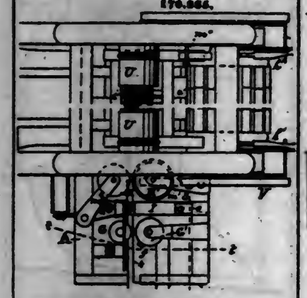
Brief.—Harrow-frame in front of plows, with slotted bars to allow the whole to be closed or expanded.



The combination of the main beam A, stationary slotted cross-beam B, adjustable cross-beam C, the slotted beams D D, carrying the plow feet and shares, and the adjustable harrow-bars, all substantially as and for the purpose herein set forth.

170,983. SMOKE-DRUMS AND WATER-HEATERS. Nelson A. Moore, Kensington, Conn. [Filed Apr. 14, 1874.]

As a new article of manufacture, the independent smoke-drum and water-heater herein described, capable of attachment and use in connection with any ordinary stove or heater, and consisting of the upright stove-like body *a*, having pipe-thimbles *c* and *c'*, respectively, at bottom and top, and the internal water-heating chamber *a'* centrally fixed therein by stays or supports *a a*, the entire body of said chamber directly in the line of the escaping products of combustion, so as to be wholly surrounded thereby, and having an induct-pipe, *f*, at top, and an educt-pipe, *g*, with suitable cut-off, at bottom, all substantially as and for the purposes set forth.



170,984. LOCKS FOR WRAPPED BANDS. R. R. Murphy, Parkersburg, W. Va., assignor to C. A. Wade and S. G. A. Burche, same place. [Filed July 20, 1875.]

1. The combination of a feed-pusher, B, and its actuating mechanism, sliding feed-block I, auxiliary feed-wheels G G', main feed-wheels H H', and center-beam K, substantially as and for the purposes set forth.

2. The combination of feed-pusher B and

170,866.

sliding feed-block I and mechanism for operating the same, substantially as set forth.

3. The combination of slot-adjuster J, constructed and operating as described, with the center-beam K, substantially as set forth.

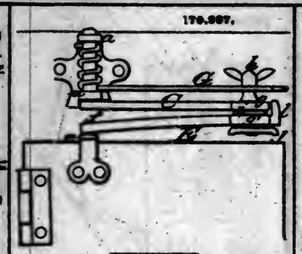
4. The combination of an automatic slot-adjuster, J, and auxiliary feed-wheel G', connected and operating together substantially as set forth.

5. The auxiliary feed-wheel G', provided on its periphery with a rubber block, *f*, in combination with wheel G and slot-adjuster J, substantially as set forth.

6. Wheel H', provided on its periphery with a rubber band, in combination with the balance-wheel F and friction-wheel A, substantially as set forth.

7. An automatic feed mechanism consisting of a feed-pusher, B, sliding feed-block I, auxiliary feed-wheels G G', and main feed-wheels H H', constructed and combined to feed the shute into the warp-shed, substantially as set forth.

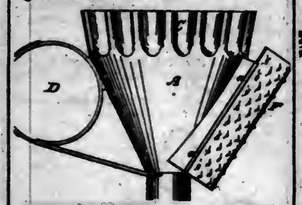
8. The combination of pusher-holder *a*, feed-pusher B, standard C, levers *b c*, double crank-lever *d*, rod D, treadle-bar E, crank-arm *e*, and balance-wheel F, substantially as set forth.



9. An adjustable bobbin-holder having apartments or recesses *f* to receive the thread, in combination with the warp-thread carriers *d* and center-beam K, substantially as set forth.

10. The rack Y, in combination with the bobbin-holder U and the center-beam K, provided with transverse slots, substantially as set forth.

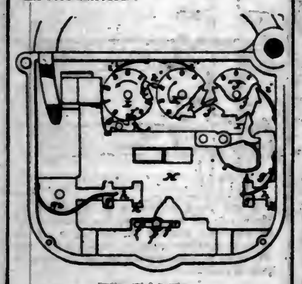
11. The bobbin-holder U, having its bearings in sliding frames *b' b'*, and balanced by means of weighted levers V V, in combination with levers X X, connected with the toggle-jointed levers R R, substantially as set forth.



12. The combination of a wedge, l, lever W, and pin *m'* upon the sliding plate *b'* with the bobbin-holder, substantially as set forth.

170,867.

170,868. KITCHEN UTENSILS. J. C. Noble, Brooklyn, N. Y., assignor to himself and Mary Loveland, same place. [Filed Nov. 2, 1876.]

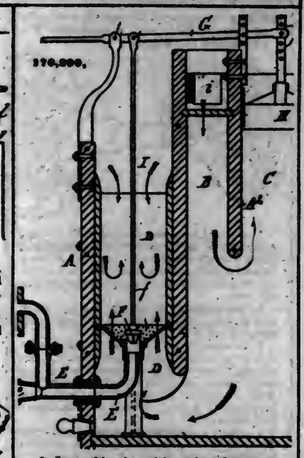


Brief.—Kitchen utensil consisting of a funnel with a removable grater, and inclined guides affixed to the funnel.

The combination of the funnel A and handle D with a removable grater, F, and the inclined guides *a a* affixed to the funnel in the manner shown and specified, and for the purpose set forth.

170,869. INDICATOR-LOCKS. L. R. Norman, St. Louis, Mo. [Filed Oct. 6, 1875.]

Brief.—A pawl attached to the lock-bolt is arranged to engage with a ratchet-wheel attached to a dial, so as to move the dial one figure every time the bolt is withdrawn, thereby indicating the number of times the lock has been unlocked.



1. The lock-bolt H, having spring-pawl I, in combination with the dials J K L, and ratchet *j k l*, as and for the purpose set forth.

2. The spring-pawl or lever O, in combination with the dial L, and lock-bolt H, substantially as and for the purpose set forth.

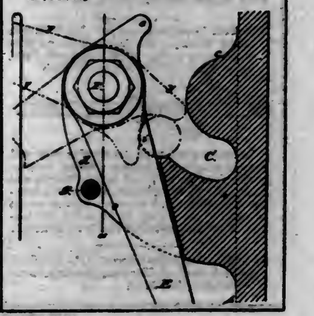
170,870. ORE-SEPARATORS. Peter Ostergay, Mechernich, Prussia, assignor to Adolphus Meier & Co., St. Louis, Mo. [Filed Sept. 27, 1876.]

Brief.—Water is fed into a compartment connected with a sieve-separator, upon which the ore to be washed is placed. A conical plug, which closes an orifice in the center of the separator, is connected by a rod to a lever, which latter is raised or lowered by a float in the water-compartment. When a back pressure of water is created by the accumulation of heavy mineral in the meshes of the sieve, the float rises, carrying with it the lever and conical plug, and the heavy mineral is automatically discharged from the sieve.

170,889.

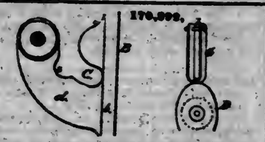
1. In combination with a mineral separator or washer, D, the water-compartments B C, the float H, connected to a lever, G, carrying the valve F, by means whereof the weight of the minerals suspended in the separator is utilized to produce a back pressure of the water-column in C, to automatically open the said valve, as and for the purposes set forth.

2. An operating automatic mechanism, consisting of the water-compartments B C, the latter having a float, H, connected to a lever, G, carrying a valve, F, the pipes E, trough F', all said parts being combined with a separator of the character herein shown and described, and by means whereof the alternate opening and closing of said valve F is accomplished, in the manner set forth.



170,891. RAISED FRENCH-WIRES. Justin R. Page, Sycamore, Ill. [Filed June 26, 1875.]

Brief.—The horizontal wire, at each point for the barbs, returns back upon itself, and forms a loop. Through this loop passes a piece of wire, pointed at each end, which is then bent to clasp the horizontal wire, and point inwardly and outwardly



In combination with the wire B, having the eye or turn *a*, the double-pointed barb C, having a corresponding eye or turn therein, said wire and barb being thereby attached, as herein described, and for the purposes specified.

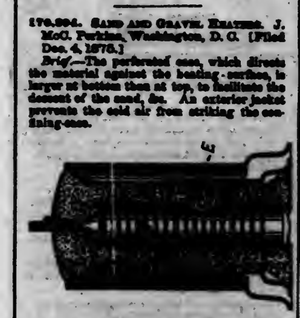
170,892. BOAT-DAVITS AND APPARATUS. J. Patterson, Washington, D. C. [Filed Oct. 20, 1875.]

170,893.

1. The bracket B, consisting of the base-plate *b*, the lugs *d d' a*, the recess *i*, and curved or inclined slot or recess C, in combination with the lever E, journaled at F, and provided with the cam-shaped nose *e*, all combined and operating substantially as and for the purpose described.

2. In combination with bracket B and lever E, constructed substantially as shown, the pin *f*, as and for the purpose described.

In testimony that I claim the foregoing as



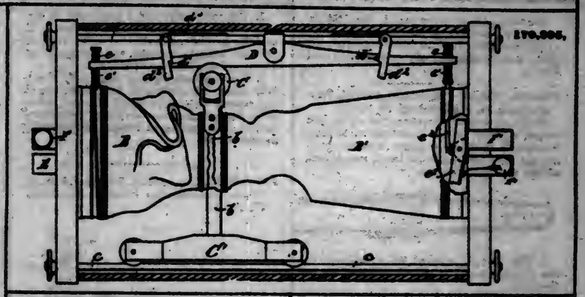
170,894. SCREW-PROPELLERS. Newton A. Patterson, Johnson, Tenn. [Filed Apr. 22, 1876.]

The concave-faced propelling-blade, formed with increased thickness toward one or more of its edges, to produce a flat or concave rear surface, substantially as and for the purposes set forth.

170,895. SAND AND GRAVEL SEATERS. J. McC. Perkins, Washington, D. C. [Filed Dec. 4, 1876.]

Brief.—The perforated case, which directs the material against the bearing-surface, is larger at bottom than at top, to facilitate the descent of the sand, &c. An exterior jacket prevents the cold air from striking the seating-case.

1. In a sand and gravel seater, the laterally-perforated cylinder, having a solid central top or cover, in combination with a tapering perforated exterior cylinder, elevated from the ground to allow the removal of the falling sand, and provided with a flaring collar, substantially as described, and for the purposes set forth.



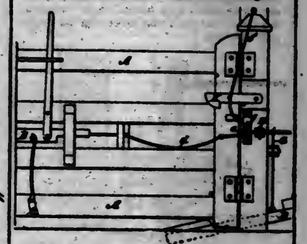
2. The combination of the hot-air jacket, elevated from the ground, as shown, and provided with perforations or slots near its top, and fitting closely to the top perimeter of the flange G, with the tapering perforated cylinder C, perforated cylinder B, cover H, and smoke-pipe J, substantially as described, and for the purposes set forth.

170,896. WATER-MOTORS. Frank. Philput, St. Louis, Mo. [Filed May 1, 1876.]

Brief.—Two flexible bags alternately fill and empty; the moving partition between them carrying a trunk, which traverses the lower side of a stationary one, which operates the inlet and discharge valves.

The combination of the bags B B', movable partition A, carrying-roller C, trunk C', the lifting-lever D, having stops *b'*, arms *d'*, and valve-actuating arms *b'*, with inlet and discharge pipes E F F', all arranged to operate in the manner and for the purposes set forth.

170,898.

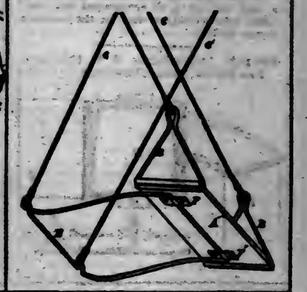


1. The combination, with a corn-sheller feeder, of the partitions A', of greater height than the intervening partitions, and alternating in position with the same, so as to divide the channels into sets of two each, substantially as and for the purposes described.

2. The combination, in a feeder, with the series of divisions, forming channels, of a single hinged equipoised bolt, B, as and for the purposes set forth.

170,899. AUTOMATIC GATES. R. S. Bledsoe, Mount Jackson, Va. [Filed Sept. 17, 1876.]

Brief.—The gate is opened by a weight, which is freed from a catch and allowed to work by a slight pull upon a cord by the person approaching. The gate swings back and is held in place by a catch. The vehicle, in passing, runs over the end of a lever, and raises the weight, which is caught by its proper catch and held in place. After passing through the gate a slight pull upon the cord on the road-side raises the catch, which holds the gate, and the gate swings shut by its own weight.



1. The combination, with the gate and suitable intervening mechanism, of a lever arranged transversely to the road-way, and pivoted, so that a vehicle passing upon the same raises a weight or bends a spring at the other end, to keep in store an available power for opening the gate for the next succeeding vehicle, substantially as described.

2. The combination of the weighted lever D, the elbow-levers G H, with connecting-rods, and the cord *d*, attached to the latch of the gate, as and for the purpose described.

3. The combination, with the arm *a* of the elbow-lever H, of the hooks J K, connected by a wire or cord, and operated by tripping-cords attached to posts on both sides the gate, substantially as described.

4. The combination of the weighted lever D, the elbow-levers G H, with connecting-rods, the hooks J K, with their tripping-cords, and the cord *d*, attached to the latch of the gate, substantially as described.

170,900. SWINGS. Wm. P. Rogers, Akron, Ohio. [Filed Oct. 26, 1876.]

170,902.

1. The bracket B, consisting of the base-plate *b*, the lugs *d d' a*, the recess *i*, and curved or inclined slot or recess C, in combination with the lever E, journaled at F, and provided with the cam-shaped nose *e*, all combined and operating substantially as and for the purpose described.

2. In combination with bracket B and lever E, constructed substantially as shown, the pin *f*, as and for the purpose described.

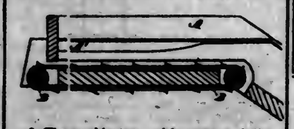
In testimony that I claim the foregoing as

170,904. SAND AND GRAVEL SEATERS. J. McC. Perkins, Washington, D. C. [Filed Dec. 4, 1876.]

Brief.—The perforated case, which directs the material against the bearing-surface, is larger at bottom than at top, to facilitate the descent of the sand, &c. An exterior jacket prevents the cold air from striking the seating-case.

1. In a sand and gravel seater, the laterally-perforated cylinder, having a solid central top or cover, in combination with a tapering perforated exterior cylinder, elevated from the ground to allow the removal of the falling sand, and provided with a flaring collar, substantially as described, and for the purposes set forth.

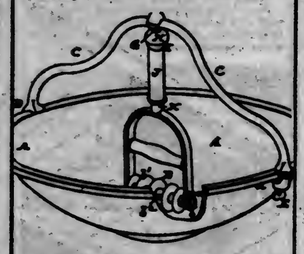
2. The combination of the hot-air jacket, elevated from the ground, as shown, and provided with perforations or slots near its top, and fitting closely to the top perimeter of the flange G, with the tapering perforated cylinder C, perforated cylinder B, cover H, and smoke-pipe J, substantially as described, and for the purposes set forth.



170,905. WHIFFLETREE-HOOK. Joshua Pierpont, Bushnell, Ill., assignor to Pierpont & Tuttle, same place. [Filed Nov. 8, 1876.]

The single-tree eye C, having the bent end *c'*, and straight end *c''*, and arranged to operate with the single-tree A and hook B, substantially as and for the purpose specified.

170,907. FENCING-BELTS AND PARTITIONS FOR CORN-SHELLERS. Wm. B. Quarton, Fremont, Iowa. [Filed June 26, 1876.]



Brief.—A single belt provided with cleats, operating in connection with dividers, forming distinct channels, for use in connection.

1. The combination, with a corn-sheller feeder, of the partitions A', of greater height than the intervening partitions, and alternating in position with the same, so as to divide the channels into sets of two each, substantially as and for the purpose described.

2. The combination, in a feeder, with the series of divisions, forming channels, of a single hinged equipoised bolt, B, as and for the purpose set forth.

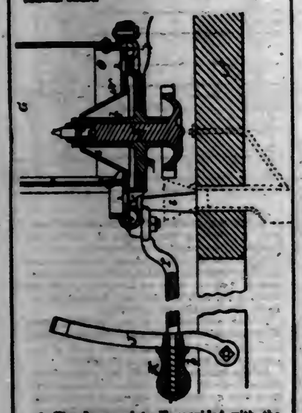
170,908. MEAT-CUTTERS. Geo. W. Bowers, Belleville, Ill., assignee of two-thirds his right to J. J. Piggott, St. Louis, Mo., and M. T. Baker, Belleville, Ill. [Filed June 21, 1876.]

1. The bowl A, having marginal rib *a*, and ball C, having clamping-jaws D and cut-covers E, in combination with the knuckle-joint H I, slotted arm J K, and roller B, all substantially as set forth.

2. The bowl A, roller B, and ball C, in combination with the ball-and-socket joint H I, hollow stem J, forming a bearing for the spring L, and spindle K, as and for the purpose set forth.

The combination of the seat A, the rigid upright B B', and hinged foot-rest K, supported by the rapes O O' G G', arranged to cross each other, and all substantially as described and shown.

170,901. CIGAR. Morris Rosenthal, Philadelphia, Pa. (Filed Aug. 10, 1875.)



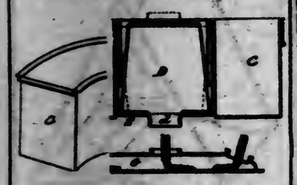
Brief.—A wooden stem inserted in the end carries a paper button that holds to the end, the outside of which is coated with the igniting-mixture; and a central band, roughened, affords the igniting agent.

1. The stem C, adapted for attachment to the lighting end of a cigar, substantially as described.

2. In combination with a cigar, the stem C and roughened band B, substantially as described.

170,902. GRAIN-DRILLS. John R. Buda, Squire R. Buda, and Geo. W. Buda, Liberty, Ind. (Filed Aug. 14, 1875.)

Brief.—The frame-plate is provided with a circular groove, having outlets for the dirt and chaff to escape. The hopper is mounted upon a pivoted frame, adjustable vertically by the handle or a lock-bar, and held by a spring working in the end of the handle. The dropping-plate is made conical in form, and is operated by a central shaft having a cog-wheel that gears with a worm on the longitudinal shaft.

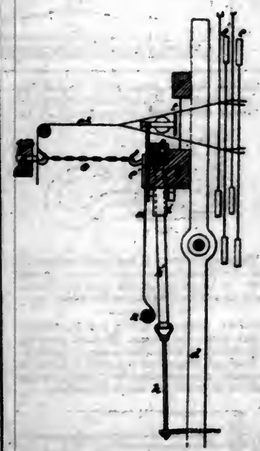


1. The frame-plate E, provided with the circular groove a, with outlets *y y*, substantially as and for the purposes herein set forth.

2. The combination of the conical drop-plate H with frame-head E, having the hollow central box I formed therewith, the shaft K extended through and above the drop-plate, covered by the lug *i*, and provided with the oil-chamber *n*, stopper *p*, and hole *o*, all substantially as and for the purposes set forth.

3. The hopper G, lever I, handle K, spring *h*, and lock-bar J, all constructed and combined substantially as and for the purposes herein set forth.

170,903. LOCOMPASS. E. W. Schmeider, New Haven, Conn. (Filed Sept. 10, 1875.)

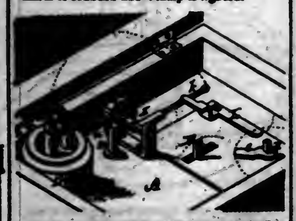


---

1. The combination, in a lunch-pail, of several removable segmental compartments, C, and the central removable vessel D, with one or more burners beneath, and a supporting-frame, substantially as described.

2. The combination, in a lunch pail, of several removable segmental compartments, C, the central removable vessel D, with one or more burners beneath, and the pan-shaped cover I, all supported in a frame, substantially as described.

170,904. RIBBON-LOOMS. Philipp Schwartz, Gross Ammensleben, Prussia. (Filed Mar. 17, 1875.)



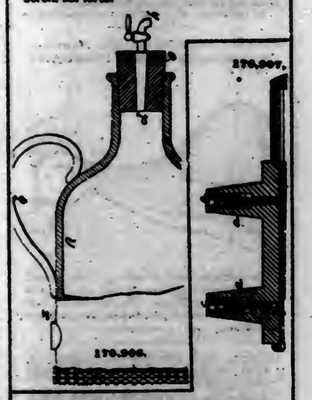
1. The combination of a shuttle, constructed substantially as herein described, and a shuttle-race, arranged to support or carry the shuttle wholly in front of its bobbin, whereby the shuttle is enabled to operate in the narrowest portion of the shed, with the bobbin occupying the rear of the shuttle and widest portion of the shed, substantially as and for the purpose set forth.

2. The combination of the shafts *a* and *b*, double cam *c' c''*, shoe *f*, flat spring attached to the shoe, the vertical rod *h*, attached to the flat spring, and provided with strap *h'*, attached to the ends of the picker-bar, the spring *m*, having a head, *l*, for engaging with the picker-bar to hold it stationary, and a chain, *c*, connected with the front beam *g'*, for releasing the head from the picker-bar, all substantially as shown and described.

170,905. BURGLAR-ALARMS. H. A. Sherman, Fremont, Ohio. (Filed Nov. 5, 1875.)

Brief.—The device is connected by a line or cord with a door or window, and any attempt to enter sets off the mechanism, by which an alarm is sounded and a lamp is lighted.

1. The combination, with a clock-work, B, and alarm-bell D, of the shaft *k*, rocker *d*, and arm *e* for operating a lever, L, a spring detent-holder, I, and hasp H, with cord *h*, substantially as and for the purposes herein set forth.



2. The combination of the journaled detent-holder I, spring *i*, and cams *J*, for the purposes herein set forth.

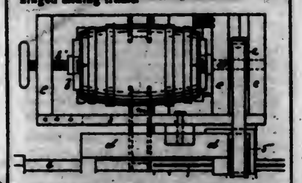
3. The post *m*, with adjusting-screw *n* in its upper end, in combination with the detent-holder I and spring *i*, substantially as and for the purposes herein set forth.

170,906. DRILLING FOR CONTAINING MALT LIQUORS. David H. Shourds, Philadelphia, Pa. (Filed Nov. 16, 1875.)

Brief.—By the device shown malt liquors can be supplied in families in quantities less than contained in ordinary barrels or half-barrels. Moreover, the freshness is retained, and the expense of numerous small bottles obviated. By placing the demijohn on its side it answers the purpose of a small cask.

The within-described demijohn, consisting of the vessel A, its handle A, cork *a* with faucet *b*, and vent-hole *n*, all being combined substantially in the manner and for the purpose herein set forth.

170,906.



170,907.

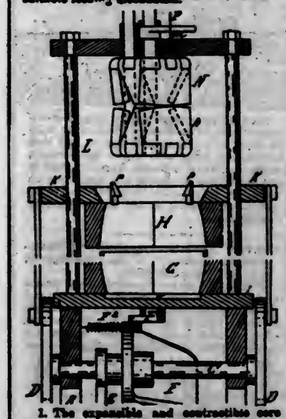
170,907. LUBRICATING JOURNAL-BOXES. H. B. Smith, New York, N. Y. (Filed Nov. 4, 1875.)

The cover of the journal-box formed with the projection *c*, having the enlarged reservoir *b*, and the contracted channel *c*, with the wick and stopper arranged in position, substantially as shown and described.

170,908. BARREL-POLISHING MACHINES. Hezen S. Smith, Brooklyn, N. Y., assignor of one-half his right to A. T. Briggs and Wm. H. Thrall, New York city. (Filed Sept. 28, 1875.)

Brief.—The barrel is held and revolved in a pivoted frame, which is connected to a hinged sliding frame.

1. In a machine for dressing barrels, the combination of the endless belt or emery-surfaces with a pivoted frame for holding the barrel, that can be turned horizontally around, substantially as shown.



2. In combination with the frame *A*, pivoted so as to be turned around, the chocks for holding the barrel, and beam *d*, adapted to be moved back and forth on the chocks, as described.

3. The beam *d*, having both an endwise and swinging motion on the shaft *c*, and having the pulley *f* fastened to its end, the pulley being fastened on the shaft, so as to revolve with it, substantially as specified.

4. The combination of the shaft *c*, beam *d*, pulley *f*, frame *e*, pivoted on the said beam, chocks, pulley *l*, and belt, with the endless belt *k* and pulleys *i m*, substantially as set forth.

170,909. RAISING-SHAFTING MACHINES. Hezen S. Smith, Brooklyn, N. Y., assignor of one-half his right to A. T. Briggs and Wm. H. Thrall, New York city. (Filed Oct. 6, 1875.)

Brief.—Straight cylindrical shells for barrels, formed of a single sheet of wood or of a number of staves, are compressed and treated at the same time by means of an expansible and contractible core, made in two parts, each of which is formed of wide and narrow hinged plates. A shaping-die consisting of two compressing-jaws—an upper and a lower one—the lower one being stationary, and the upper having a vertically-reciprocating motion, and suitable feeding mechanism.

1. The expansible and contractible core herein described, that is made in two halves, each of which halves is expanded and contracted at the same time, substantially as shown.

2. A core for barrels made in two parts, each part being formed of wide and narrow hinged plates *a b*, in combination with the cam *d* and spring *e*, substantially as described.

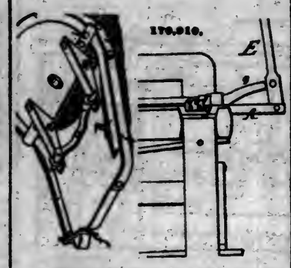
3. In a barrel-shaping machine, a shaping-die, G H, made in two parts, one of which is stationary, and the other movable, in combination with an expansible and contractible core, and devices for operating the same, substantially as set forth.

4. The combination of the hinged or pivoted parts of each half of the die and the expansible core, herein described, with the mechanism for closing the dies and expanding the core simultaneously, substantially as and for the purpose set forth.

5. In a machine for shaping barrels, the expansible shaping-die, the expansible core, and the mechanism for operating them, all as herein described, in combination with a mechanism for moving the upper part of the die up and down, substantially as shown.

6. In combination with the core N, the cords or chains P P', pulleys Q R, lever S, and cam R, as described.

7. The combination of the cam F, crank F', spring F', shaft *f*, arms *g*, connecting-rods *h*, and dies G H, as specified.



8. The combination of the shaft *f*, and its operating mechanism, with the crank *h*, connecting-rod *i*, crank *m*, and shaft *o*, substantially as shown and described.

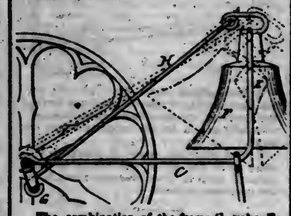
9. The combination of the springs *p*, or their equivalents, with the die H for holding the truss up above the die, substantially as specified.

10. In combination with the dies G H, adapted to be opened and closed upon the barrel, the shaft *f*, arms *g*, and connecting-rods *h*, substantially as shown.

170,910. MACHINES FOR BENDING WOOD. Edward Q. Smith, Evansville, Ind. (Filed May 8, 1875.)

Brief.—Strips of wood for chair-backs can be bent in any desired direction by means of a steady and pressure applied to the strip during the operation of bending it on a rotating, sectional, and hinged former of any desired irregular shape.

1. The combination, in a wood-bending machine, of a rotating former with a traveling head, A, which has at one end a pivoted lever, B, connected, by means of a cord or wire, *c*, to a spring-arm, E', at the opposite end of the bed A, and provided with a shoe, *e*, as and for the purpose described.



2. The combination, with the sections of a divided former for wood-bending machines, of levers *m*, attached to one section, and staples adapted to said levers on another section, all substantially as described.

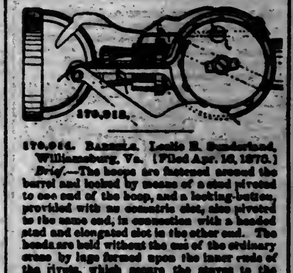
170,911. HORSESHOES. Aaron W. Smith, Manchester, N. H. (Filed Feb. 1, 1875.)

The horseshoe constructed, as herein described, with a horizontal grooved base and parallel upper and lower surfaces, giving to its main body an equal thickness from the heel nearly to the toe, and with an abrupt upward projection or thickening, *f*, at the toe, as and for the purpose set forth.

170,912. TOY THUNDER AND BELLS. W. F. Story, East Hampton, Conn. (Filed Sept. 9, 1875.)

The combination of the frame C, yoke E, wheels B, rod H, and ball F, substantially as and for the purpose set forth.

170,913. AUTOMATIC LIGHTERS FOR GAS-BURNERS. Henry B. Stockwell and Albert R. Wolcott, Brooklyn, N. Y. (Filed Oct. 20, 1875.)



1. In automatic lighters for gas-burners, a slide-piece, operated by the gas-cock, and constructed to feed the fulminate-ribbon to the anvil, simultaneously with the raising and dropping of the spring-hammer, substantially as described.

2. The slide-piece, provided with boot and recessed shoulder, in combination with the correspondingly-bent spring-hammer for raising and dropping the same by the forward motion of the slide-piece, substantially as specified.

3. The combination of the recessed bottom slot of magazine, turned by the gas-cock, with the projecting lug of the slide-piece for moving the same in forward and backward direction, substantially as set forth.

4. The combination of the guide-piece, having guard-flange at the side adjoining the anvil, with the arm of the pivoted cover for guiding ribbon and slide-piece, substantially as described.

5. In automatic gas-lighters, the burner-socket, magazine, and guide, cast in one piece, substantially as set forth.

170,914. RAZORS. Leslie H. Sunderland, Williamsburg, Va. (Filed Apr. 16, 1875.)

Brief.—The heaps are fastened around the barrel and locked by means of a stud pivoted to one end of the heap, and a locking-button, provided with an eccentric slot, also pivoted to the same end, in connection with a headed stud and elongated slot in the other end. The heads are held without the cut of the ordinary straps by lugs formed upon the inner ends of the rivets, which secure the staves to the heaps, and which alternate upon opposite sides of the heads when the barrel is set up and the heads inserted.

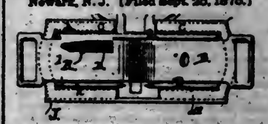
1. The button D, pivoted to one end of the heap, and having an eccentric slot, *f*, in combination with the headed stud, *e*, attached to the other end of the heap, substantially as and for the purpose described.

2. The heap E, having at one end the slot *d* and headed stud *e*, in combination with the pivoted key *g* at the other end, and the pivoted button D, having an eccentric slot, *f*, substantially as and for the purpose described.

3. The device for holding the head of the barrel, consisting of the lugs *l*, attached to the inner sides of the staves, and when the barrel is set up alternating upon opposite sides of the inserted head, substantially as and for the purpose described.

170,915. PRESS-PLATES FOR DRYING AND BENDING WOOD. Samuel Swarts, Buffalo, N. Y., assignor to himself and Gilbert E. Swarts, same place. (Filed Dec. 2, 1875.)

Brief.—The boiler plates are heated by steam. The moisture of the wood escapes through the grooves and perforations.

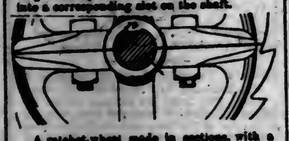


1. An apparatus for drying and bending wood, constructed with curved pressure-plates, heated by steam or other suitable means, and grooved or perforated to carry off the vapor from the wood, substantially as set forth.

2. The combination, in a pressure-plate, of grooves on the working face of said plate, communicating with the external air, to permit the escape of vapor, substantially as set forth.

3. The combination of the drying press-plates A B, constructed with chambers for the reception of steam, and with free-grooves H and perforations G, G', and F, to permit the escape of vapor, as explained.

170,916. HARNESS-SADDLES. Andw. Tee, Newark, N. J. (Filed Sept. 25, 1875.)



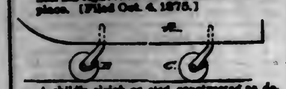
1. The tree A, transversely arched, with ribs B, substantially as and for the purposes set forth.

2. The continuous metal backband B in one piece, in combination with a harness-saddle, substantially as and for the purposes set forth.

3. The jockey J, provided with strips C, substantially as described, for the purpose of forming pockets for the tree to slip in.

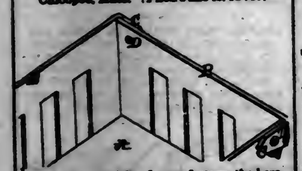
170,917. RATCHET-WHEEL. J. P. Thomas, Elm, N. Y. [Filed Nov. 1, 1875.]

Brief.—Cast in two equal sections, united together when on the shaft. A key cast longitudinally on the inside of the hub drops into a corresponding slot on the shaft.



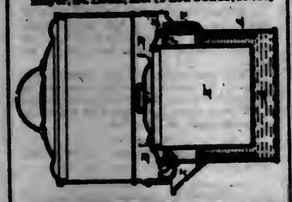
A ratchet-wheel made in sections, with a lug or key, *a*, cast thereon, substantially as shown and described.

170,918. MEDICAL COMPOSITIONS. Isaac T. Thresh, Griffin, Ga., assignor of two-thirds his right to John M. Williams and Dan'l S. Mann, same place. [Filed Sept. 12, 1874.]



A composition of matter, consisting of pulverized or ranged bark's horn, water, bark of the root of button-willow, honey, and Jamaica rum mixed together, substantially in the manner and for the purposes set forth.

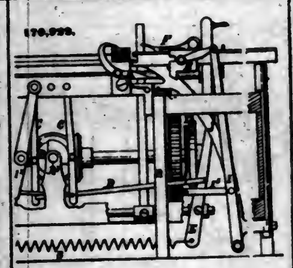
170,919. CHILDREN'S SLEDS. Horace N. Tucker, Stoughton, Mass., assignor of one-half his right to Francis Packard, 2d, same place. [Filed Oct. 4, 1875.]



A child's sleigh or sled constructed as described, and provided with castors B, C, D, and E, in the manner and for the purpose set forth.

170,920. FRUIT-BASKETS. Nelson L. Tusk, Chicopee, Mass. [Filed June 11, 1875.]

As a new article of manufacture, the herein-before-described fruit-basket, consisting of the bottom A, sides B and B, and tongues C and C, formed of one piece, secured in position by means of the eyelets D and D, and coated exteriorly and interiorly with shellac, substantially as specified.



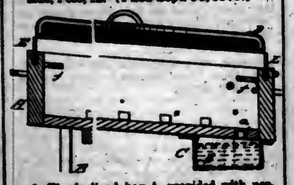
170,921. OCCUPIED DYNAMO. August Vishmeyer, St. Louis, Mo. [Filed Oct. 15, 1875.]

1. The water-vessel A, having top steam-chamber B, and orifices *b*, regulated by valve-ring C, in combination with the cooling-vessel K, having lid K', substantially as set forth.

2. The combination, with the cooling-vessel K K', of the water-vessel A, having drip-pipes H, for conveying the condensed steam, and the supply I, for conveying the cold water to a point near the bottom or heated part of the vessel A, substantially as shown and described.

170,922. LOOMS FOR WEAVING FILED FABRICS. William Webster, Norristown, and James Wade, New York, N. Y., assignors to Webster Loom Company. [Filed Oct. 6, 1875.]

1. The combination of the picker-lever C, cam B, picker-staff E, and spring S, all arranged in the same plane and operating together, as and for the purpose set forth.



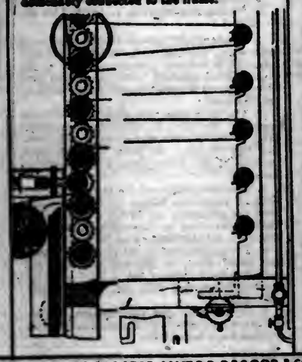
2. In combination, the spring S, picker-staff E, picker-lever C, and cam B of the pliable metallic picker-strap D, as and for the purpose set forth.

3. In combination with the wire box, constructed to hold the wire heads in position side by side, and the latch F, the rulcaser G, constructed and operating substantially as shown.

4. In combination with the wire bar M, the lever I, pivoted shaft K, and frame J, all arranged as and for the purpose set forth.

5. In combination with the picker-staff E, the actuating slide-lever I, levers O F, links P D, the cams B P, arranged upon the shaft A^1, as and for the purpose shown.

170,923. DISH-WASHERS. Maria E. Whiteside, Polo, Ill. [Filed Sept. 30, 1875.]



1. The inclined box A, provided with perforations *a*, cleats *d c*, and rings *f*, and having the receiver C attached to its under side, substantially as and for the purposes herein set forth.

2. The wire-cloth cover D, provided with sheet-metal rim E, in combination with the grooved sides of the dish-drainer box A, for the purposes set forth.

170,924. DRYING APPARATUS. A. Wilder, Augusta, Me. [Filed Dec. 1, 1875.]

Brief.—The frame carrying the lower rollers can be depressed by rack and pinion, to keep the fabric extended. The lower rollers are detachably connected to the frame.

1. The combination of the picker-lever C, cam B, picker-staff E, and spring S, all arranged in the same plane and operating together, as and for the purpose set forth.

2. In combination, the spring S, picker-staff E, picker-lever C, and cam B of the pliable metallic picker-strap D, as and for the purpose set forth.

3. In combination with the wire box, constructed to hold the wire heads in position side by side, and the latch F, the rulcaser G, constructed and operating substantially as shown.

4. In combination with the wire bar M, the lever I, pivoted shaft K, and frame J, all arranged as and for the purpose set forth.

5. In combination with the picker-staff E, the actuating slide-lever I, levers O F, links P D, the cams B P, arranged upon the shaft A^1, as and for the purpose shown.

170,925. DIET-WASHERS. Maria E. Whiteside, Polo, Ill. [Filed Sept. 30, 1875.]

1. The inclined box A, provided with perforations *a*, cleats *d c*, and rings *f*, and having the receiver C attached to its under side, substantially as and for the purposes herein set forth.

2. The wire-cloth cover D, provided with sheet-metal rim E, in combination with the grooved sides of the dish-drainer box A, for the purposes set forth.

170,926. DRYING APPARATUS. A. Wilder, Augusta, Me. [Filed Dec. 1, 1875.]

Brief.—The frame carrying the lower rollers can be depressed by rack and pinion, to keep the fabric extended. The lower rollers are detachably connected to the frame.

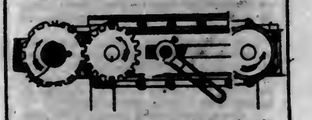
1. The combination, in an apparatus for drying sized or coated fabrics in continuous lengths, of an upper series of geared rolls with a car for carrying the roll of material, a lower series of rolls, and an adjustable stretching-frame, substantially as described.

2. In combination with the car for carrying the roll of cloth, the brake or depressing bar for confining the said cloth in position after it is delivered to the rolls, substantially as described.

170,926. METHODS OF CASTING CAR-WHEELS. William Wilmington, Toledo, Ohio. [Filed Oct. 22, 1875.]

The herein-described method of casting car-wheels by first introducing into the mold molten metal of a proper temperature, and then introducing metal of a higher temperature, which is allowed to escape from the mold in streams across the flange and tread portion while the intermediate sections are being cooled, substantially as and for the purpose described.

170,928. ELEVATOR-BUCKETS FOR CHAIN-PUMPS. Daniel W. Witmer, Springfield, Ill. [Filed June 9, 1875.]

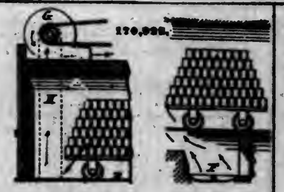


Brief.—A screw-threaded bolt passes through the center of one of the plates and the rubber packing, and engages in a screw-threaded hole in the opposite. This admits of the bucket being expanded without detaching it from the chain or twisting the latter.

1. The bucket for chain-pumps described, consisting of the plate A, having the screw-threaded hole *a'* and eye *a*, the plate B having the hole *b* and eye *b'*, the packing C and bolt D having a head, *c*, resting on the plate B, so that the said bolt can be turned independently of either of the said plates, substantially as described and shown.

2. The combination, with the plates A B and packing C, of the bolt D, having the shoulders *d'*, *c*, and the plate F, the several parts covering substantially as described.

170,927. MECHANICAL MOVEMENTS. C. B. Withington, Janesville, Wis. [Filed Nov. 22, 1875.]



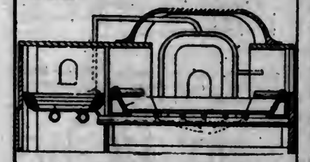
1. The combination, substantially as herein-before set forth, of a chain traversing over suitable pulleys, a shaft connected with said chain by a slotted link and a traversing carriage in which said shaft turns, whereby an intermittent reciprocation is imparted to the sliding carriage, and an intermittent semi-rotative movement imparted to the shaft carried by it.

2. The combination, substantially as herein-before set forth, of a chain traversing continuously in one direction over suitable pulleys, a shaft connected with said chain by a slotted link, a traversing carriage in which said shaft turns, a cam-way or cam-circular grooved plate on the shaft, and stop-pins on the frame, whereby the carriage is positively held while the shaft is turning.

170,929. BRICK-DRYER. R. P. Andrews, St. Louis, assignor of three-fourths his right to A. W. Esper, St. Louis, J. D. Kesbaugh, Glasgow, and S. J. Conley, Columbia, Mo. [Filed Feb. 1, 1875.]

Brief.—The draft-flue extends below the level of the floor, to receive the moist and heavy air.

170,930.



The combination, in a horizontal drier, of a furnace, F, arranged at one end of the drier, and which discharges its heat directly into the body of the drier, and fan H and exhaust-fan G, arranged at the other end of the drier, as and for the purpose set forth.

REISSUES.

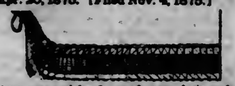
3,779. PUDDLING-FURNACES. S. Caddick, Pembroke, Me. Patent No. 70,222, dated Oct. 29, 1867. [Filed Oct. 2, 1874.]

Brief.—Furnace-chill is made hollow, and is surrounded by a removable pipe. The furnace-doors are lined with fire-brick, the last brick keying the others into place. Fire-box is also furnished with a water-casing. Bed-plate rests upon hollow water-bearers. The stock is braced with L-shaped skeleton corner-irons.

1. In combination in a puddling-furnace, an air-blast box provided with a flange to support the bottom of the furnace, the furnace-bottom supported thereon, and hollow bearers upon which said bottom rests, all substantially as and for the purposes described.

2. In a puddling-furnace, the chill thereof provided with a water-pipe on its upper surface for cooling and protecting the same, separate from and independent of said chill, so that said pipe may be removed for repair without disturbing the chill, substantially as and for the purpose described.

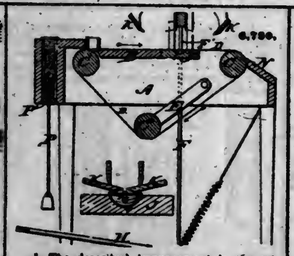
3. The combination of the bed-plate water-pipes, suitably secured to or to the under side of the same, and water-pipes around the fire-box, substantially as described.



4. In combination, the tubular water-casing *b* of the fire-box and the hollow bearers *c*, substantially as described.

5. In combination with a furnace-chimney, the skeleton metallic corner-supports of the same, constructed substantially as described.

6. In combination, the bed-plate, and the hollow water-bearers *c* upon which it rests, substantially as described.



7. In a puddling-furnace, the doors thereof constructed with concave inner surfaces, and fitted with fire-brick having corresponding convex surfaces, in combination with angular flanges on the edges of the doors, substantially as and for the purposes described.

3,778. KNITTED BAGS FOR PACKAGES OF COMPRESSED VEGETABLE SUBSTANCES. J. D. Culp, Gilroy, assignor to the Consolidated Tobacco Company, San Francisco and Gilroy, Cal. Patent No. 162,363, dated Apr. 20, 1875. [Filed Nov. 4, 1875.]

As a new article of manufacture, knit sacks for packing purposes, substantially as described.

3,780. MACHINES FOR MAKING CUSHIONS FOR FINGER-RING BOXES. R. L. Dempiece, Brunswick, Me. Patent No. 161,466, dated Mar. 30, 1875. [Filed Oct. 12, 1875.]

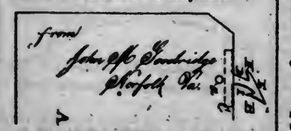
1. The described improvement in the art of making cushions for finger-ring boxes, which consists in the process of piling the component parts of the cushion upon a bed or support, with the covering-strip at the bottom, and the backing-strip at the top, of the pile, coating the exposed surface of the backing with glue or other adhesive material, applying pressure to the backing in such manner as to compress the filling between the covering and backing, and folding both edges of the covering-strip simultaneously over upon the adhesive surface of the backing while the filling is compressed, substantially as and for the purpose specified.

2. In a machine for making cushions for finger-ring boxes, the combination of a supporting bed or table, a substantially horizontal pressure-bar, adapted to press upon a pile composed of layers of material supported on said bed or table, and suitable folding devices, whereby the projecting edges of the lower strip or layer of material are folded over upon the upper surface of the upper strip or layer of material while said pile is compressed, all constructed and arranged substantially as and for the purpose specified.

3. The combination of a supporting bed or table, a substantially horizontal pressure-bar, a removable bottomless holder, and a pair of swinging jaws, all substantially as and for the purpose specified.

4. An endless apron or carrier, in combination with a supporting bed or table, a removable bottomless holder, and suitable compressing and folding devices, substantially as described, for the purpose specified.

5. A supporting bed or table having a groove, *f*, combined with a removable bottomless holder, a pressure-bar, and a pair of swinging jaws, substantially as described.



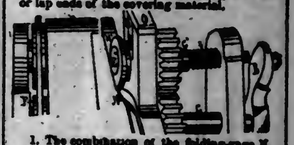
6. A supporting bed or table having a groove, *f*, combined with an endless apron or carrier, a removable bottomless holder, a pressure-bar, and a pair of swinging jaws, as set forth.

7. The jaws K, having the intersecting pivoted arms, in combination with the grooved bed and the removable bottomless holder.

8. In a machine for making cushions for finger-ring boxes, the receptacle O, having the sliding weighted bottom P and stops S S, combined with the table A, having suitable compressing and folding devices, substantially as described.

3,781. TAG-FASTENERS. John M. Goodridge, Norfolk, Va., assignor, by mesne assignments, to Wm. D. Reynolds, (trustee for Mary E. Humphreys,) same place, and Charles Harvey, Baltimore, Md. Patent No. 143,621, dated Oct. 14, 1873. [Filed Oct. 6, 1875.]

Brief.—A double-barbed hook, having a cross-bar at right angles to its shank, is passed through a tag near one end, the short end thereof being pasted to the body portion to hold the hook in position. Below the cross-bar of the hook, and through both body and cemented fold or lap of the tag, an aperture is formed, to admit of an attaching-string when the hook cannot be readily used.



1. A tag combined with the double barbed hook B, having its points placed at angles with the shank D, substantially as and for the purpose specified.

2. The combination of a hook having the cross-bar C, with a tag, A, the two being connected, as shown and described.

3. The combination of a tag perforated at *a* with a fastening-hook, having the cross-bar C, substantially as specified.

6,782. MACHINERY FOR COVERING RIMS FOR HAT-TRIMMINGS. Geo. A. Shepard, Bethel, Conn., assignor to Jos. H. Davis, Boston, Mass. Patent No. 102,722, dated May 3, 1870. [Filed Feb. 6, 1875.]

Brief.—A sheet of sized covering material is fed by an endless apron to and between combined cutting and pressing rolls, which gage the width of the strip to be severed from the sheet. By means of a folding-gage located in front of the rolls, the strip, while being severed, is folded around an interposed reed or wire, and pressed about the same by the rolls, the latter also compressing the free or lap ends of the covering material.

1. The combination of the folding-gage N, placed in front of the pressing-surfaces *a b*, with the pressing-surface *b* of the receiving disk B', constructed upon the projecting end of the shaft C', and the pressing-surface *a* of the roller E, substantially as described.

2. The combination of the pressing-surface *b* of the disk B', constructed upon the projecting end of the shaft C', with the pressing-surface *a* of the roller E, the gage O holding the pressing-surfaces, and the folding-gage N, placed in front of the pressing-surfaces *a b*, to fold the material before it passes through between them, substantially as described.

3. The endless apron I, in combination with the folding-gage N, and the disk B' and roller E, having the flange *e* and the cutting-edges *a'* and *c'*, substantially as described.

4. The combination of the pressing-surface *b*, with the disk B', and the pressing-surface *a* of the roller E, with the groove C, and the folding-gage M, substantially as described.

5. The spring *f*, in combination with the cutting-edges *a'* and *c'* of the disk B' and roller E, and the folding-gage N, substantially as described.

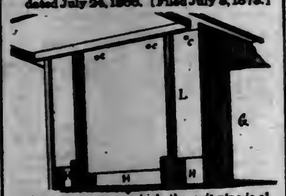
6,783. DUMPING-WAGONS. Hamlin Bailey, Harrisburg, Pa. Patent No. 147,403, dated Feb. 17, 1874. [Filed Sept. 10, 1875.]

1. The coal-vehicle bed A B S, in combination with one or more extensible chute-sections, *a a'*, to supplement the discharge-spout *s*, when said sections are connectedly applied thereto as a suitable adjunct of the vehicle, and so arranged that the act of extending the sections *a a'* to the rear will secure the correct application of section *a* beneath the spout *s*, substantially as and for the purpose set forth.

2. In a coal-vehicle, having bed A, with rearward-inclined bottom B, a stirrup or hanger arranged beneath the bed, as a support and carrier for the extensible chute device, substantially as set forth.

3. In a coal-vehicle, the parallel guides *c c' c c'* arranged beneath the bed A, in combination with the extensible chute *a a'*, when the latter is provided with the compression-points *m m*, substantially as set forth.

6,784. BUNG-FUNNEL. [illegible] Bank, Baltimore, Md. Patent [illegible]27, dated Aug. 22, 1871. [Filed [illegible] 7, 1871.]



Brief.—As the liquid escapes air enters the air-tube, and preserves an equilibrium of pressure within and without the barrel; thus the contents flow freely. The device may also be used for filling purposes. When the barrel is tilted the bent tube extends above the level of the liquid.

6,784.

A tapering tube, A, adapted to be used either as a discharge or filling conduit, in combination with an air-pipe passing through the same, and bent to one side at a point beyond the smaller end of the said tapering tube, as and for the purpose specified.

6,785. COOKING-STOVES. E. Bussey, Troy, N. Y., assignor of one-half interest to C. A. McLeod, same place. Patent No. 86,686, dated July 24, 1868. [Filed July 8, 1875.]

1. In a stove, in which the exit-pipe is allowed to remain in the usual position over the ascending flue, the combination of the following elements: first, the exit-pipe; second, the intermediate plate in front of the vertical heating-chamber; third, the reservoir, substantially as described.

2. The combination of the following elements: first, the exit-pipe placed over the ascending flue; second, the vertical reservoir heating-chamber in the rear of the exit-pipe; third, the reservoir, as and for the purpose described.

3. The combination of the following elements: first, the reservoir heating-chamber located in the rear of the exit-pipe; second, the apertures communicating between the lower part of the chamber and the rear flues; third, the rear flues, as described.

4. The combination of the following elements: first, the reservoir heating-chamber in the rear of the exit-pipe; second, the apertures communicating between the upper part of the heating-chamber and the flue-space behind the oven; third, the flue-space behind the oven.

5. The combination of the reservoir heating-chamber, located to the rear of the exit-pipe, and the downward flues of the stove, as described.

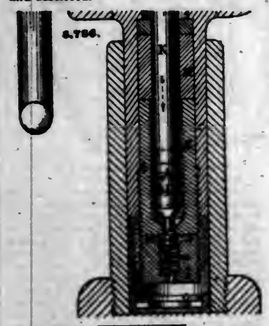
6. The partition-strips in the hot-air chamber, behind the pipe-collar.

7. A hot-air chamber between the intermediate plate and the front side of the reservoir, in combination with the flue-strips in said chamber.

8. The combination of the following elements: first, the hot-air chamber in the rear of the exit-pipe; second, the water-reservoir; third, the partition-strips between the intermediate plate and the reservoir; fourth, the openings communicating between the hot-air chamber and the rear space.

6,786. HYDRAULIC JACKS. E. M. Dodgeon, San Francisco, Cal. Patent No. 162,044, dated Apr. 13, 1875. [Filed June 22, 1875.]

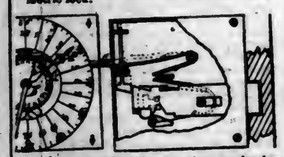
Brief.—Within a hollow ram is the pump-barrel. The plunger is hollow, and passes the water through itself to and from the reservoir. The lower end of it is contracted to extend through the lower valve-seat and open the valve, to return the water to the reservoir, and is bored out that the water-pressure in forcing may close the plunger-valve.



1. The combination, with the reciprocating ram, tube, or shell, C, working in cylinder A, of a tubular pump-plunger contained therein, whereby the operating fluid is passed through said plunger, in the manner described, for the purpose specified.

2. The combination, with the hollow pump-plunger K and pump-barrel B within the ram, packed as shown, of the valves L M, and the apertures or passages *f i a*, substantially as specified.

3. The hollow pump-plunger K, made to extend through the bottom of the pump-barrel, in combination with the lower valve M, essentially as and for the purpose herein set forth.



4. The valve-box J, having a central cavity with parallel sides to hold and guide the spring-valve *m*, and cut out or chambered at its upper end to form the water-space between said cavity and the pump-barrel, as shown and described.

6,786.

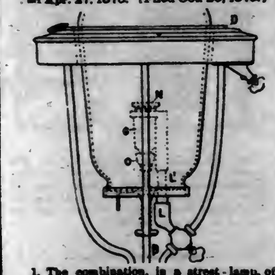
6,787. TIME-LOCKS. Stephen W. Hollen, Cincinnati, Ohio, assignor to Jas. Sargent, Rochester, N. Y. Patent No. 121,782, dated Dec. 12, 1871. [Filed July 9, 1875.]

Brief.—A lever-connection extends from the case of a time-lock over into the case of a non-chronometric lock, and governs the action of a dog, which dogs the bolt of the non-chronometric lock.

1. The combination of a time mechanism and a non-chronometer lock with a lever-connection operated by the time movement, said lever being constructed and located to hold a bar or dog for dogging the bolt of said lock and render it incapable of being unlocked, when locked, until the arrival of the appointed time, when the time mechanism causes its dogging action and admits of the bolt being operated.

2. The combination of a time mechanism and a non-chronometer lock, each arranged in its own casing, with a lever-connection operated by and extending from the time movement and from or through its casing into the casing of the non-chronometer lock, for operating means for preventing the bolt of said lock being unlocked, when locked, until a certain predeterminate time.

3. In combination with a non-chronometer lock, a time mechanism having a lever-connection operated by the time mechanism for dogging the bolt of the non-chronometer lock, with a mechanism for operating the lever to release the bolt for unlocking, and with a mechanism for automatically stopping the running action of the time mechanism when the bolt is so released.

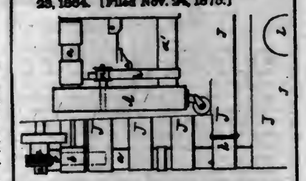


6,788. COMB-COMBS. Cyrus W. Saladee, Putnam, Ohio, assignor to Hotchkiss Sons, Bridgeport, Conn. Patent No. 45,640, dated Dec. 27, 1864; reissue No. 1,664, dated Jan. 24, 1865. [Filed Nov. 6, 1875.]

Brief.—Rigid bars are attached to the back of the comb, which serve as a handle, and also as a brace for the comb.

A carry-comb having an inflexible raised bar or bars rigidly secured to its back, serving the twofold purpose of a grasping-handle and a brace for strengthening the frame-back of the comb, substantially as specified.

6,789. STREET-LAMPS. Henry Wellington, New York, N. Y. Patent No. 162,728, dated Apr. 27, 1875. [Filed Oct. 20, 1875.]



1. The combination, in a street-lamp, of the reservoir D, for holding the burning fluid, the glass globe C resting against the reservoir, a support, E, against which the base of the globe rests, and a hollow supply-tube leading downwardly from the reservoir, and forming part of the frame, substantially as described.

2. The vaporizing-chamber, consisting of a tube *l*, the socket *l'*, and the channel *f* communicating with the said socket and the burner, substantially as described.

3. The hinged perforated base, constructed and arranged substantially as and for the purpose specified.

4. The spring E for supporting in a yielding manner the disk E and globe C, as and for the purpose set forth.

6,790. INVALID-BEDSTEADS. Whittier Machine Company, Boston, Mass., assignee, by mesne assignments, of Josiah Crosby, deceased. Patent No. 43,900, dated Aug. 23, 1864. [Filed Nov. 24, 1875.]

1. A stationary frame, two rollers or drums provided with worm-toothed wheels, and contained therein, and a support adapted to sustain and elevate a person, and bands or suspensories connected with the rollers or drums and support, in combination with a shaft provided with worms to engage and rotate the rollers or drums, to wind or unwind the bands or suspensories, and elevate or lower the support, substantially as described.

2. A frame, two oppositely-arranged drums supported thereon, suspensories connected with the drums, and pulleys over which the suspensories pass to a movable support, in combination with worm-gears on the drums and a shaft mounted in the drum-frame, and provided with reverse worms to wind and unwind the suspensories, and raise and lower the support, the combination being and operating substantially as described, to avoid confusion, as set forth.

3. A frame adapted to support two rollers or winding-drums, each provided with two or more bands or suspensories and a worm-gear, and a second shaft supported on each frame, and provided with a right and a left worm-gear, to rotate the rollers and wind and unwind the suspensories, in combination with a movable support, to which the bands or suspensories are connected, substantially as described.

4. The combination of the frame A, rollers *e*, and devices adapted to operate them, as described, with the adjustable transverse straps J J and trundle-bed, all substantially as described, and for purposes described.

5. In combination, the bedstead and revolving rollers *e* and *e'*, adjustable bands J J, and the trundle-bed, adapted to be raised in contact with the bands J J, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 24. TUESDAY, DECEMBER 14, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time.

R. H. DUELL, *Commissioner.*

COMMISSIONER'S DECISIONS.

ROBERT BRAGG.—*Interlocutory appeal.*

[*Appeal from the Principal Examiner in the matter of the application of Robert Bragg for reissue of Patent No.* 165,438, *for* "GONG-ATTACHMENT FOR ENGINE-HOUSES."—*Decided December* 21, 1875.]

The rule in regard to new matter construed more strictly as to reissue applications than as to original ones. In the former case new matter is expressly forbidden by law to be introduced into a specification, while in the latter case the question is left to the discretion of the Commissioner.

Where an inventor in his patent had stated the object of his invention to be "to provide a novel attachment, principally valuable and applicable to fire-engine houses," and had restricted his specification, drawing, and model to that one object: *Held*, that it was new matter to describe in the reissue application various other uses to which the attachment could be put, especially as those uses suggested something more than an equivalent arrangement and operation.

DUELL, *Commissioner:*

The Examiner rejects the application on the ground that new matter has been introduced into the specification.

Applicant in his patent states the object of his patent to be "to provide a novel attachment for gongs; and it is principally valuable and applicable to fire-engine houses, where the horses which draw the engines ought to be released at the very instant of the first stroke of an alarm, so that they can take their places at the engine and hose-carriage ready to be attached thereto by the first man who may arrive."

The rest of his specification and the claims relate to the means of accomplishing this one object.

The new matter objected to consists in mentioning other objects to be accomplished, as "for opening the doors or gates of the engine-house, for striking an alarm to awaken the engineer or fireman, for turning on the gas automatically at the moment the alarm strikes, and for various other purposes."

This certainly is a departure from a "novel arrangement for gongs."

The Examiner is right in saying that the practice in regard to new matter is notably more strict in the case of reissues than of original applications.

While an original application is pending, and open to amendments, such changes can be made therein which do not amount to a material or substantial variation of the invention, as held in the Carlock case, (8 OFFICIAL GAZETTE, 191,) cited by applicant. There is no regulation of law in such a case, and the question of new matter is left entirely to the discretion of the Office.

But the statute is explicit in regard to reissues. "No new matter shall be introduced into the specification" is the requirement, and the United States Supreme Court have held that under this restriction only that which "was suggested or substantially indicated in the specification or drawings which properly belonged to the invention as actually made and perfected" can be embraced by a reissue. "Interpolations," they add, "of new features, ingredients, or devices, which were neither described, suggested, nor indicated in the original patent or Patent Office model, are not allowed." *Seymour* vs. *Osborne*, (11 Wall., 516.) The same court had before, and has since, pointedly condemned the

practice of enlarging the specification, or inserting expanded or equivocal claims for the purpose of embracing new features not hinted at in the original patent. *Burr* vs. *Duryee*, (1 Wall., 531); *Carlton* vs. *Bokee*, (17 Wall., 463.)

Now, in the present case there is nothing in the patent to suggest or indicate that, besides loosening the horses from the stalls, the apparatus might be operated to simultaneously light the gas, and to open all the doors and gates. Something more, too, than equivalent features or modes of operation are here suggested. The applicant also adds that the apparatus may be used for "various other purposes," and we might expect that if this application is granted it will be followed by others setting forth those "various other purposes" as fast as the applicant may discover them.

The decisions of my predecessors are in harmony as to this practice, and while it is not the intention of the Office to abridge the right that inventors have to amend their original patents so as to fully protect their entire invention, yet it is also its duty to see that such amendments are restricted within the precise limits of the law.

The decision of the Examiner is affirmed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, DISTRICT OF NEW JERSEY.

GEORGE B. TURRELL *vs.* EDWARD SPAETH AND CHARLES GUELICKER.

[*In equity—Before* NIXON, *J.*]

Upon bill filed, charging defendants with infringement of reissued letters patent, and praying for an injunction, and account of gains and profits made by defendants: *Held*, that a subpœna *duces tecum* might be issued, requiring defendants to produce before the Examiner all books, papers, and documents whatsoever, that will show the number of "skates" made or delivered by the defendants, or their employés, since the date of the reissue of letters patent, and until the commencement of the suit.

[*Chas. F. Blake*, for complainant.
J. Van Santvoord, for defendants.]

NIXON, *J.*:

This suit is for the infringement of reissued letters patent, dated April 6, 1875, for "Improvement in Skates," of which the complainant became the owner by assignment on the 13th of April, 1875. The bill was filed July 6, 1875, charging the defendants with infringement, and praying for an injunction, and for an account of the gains and profits made by the defendants, and of all the damages sustained by the complainant from the said infringement.

The complainant is taking testimony to prove his *prima-facie* case, and has issued a subpœna *duces tecum* to one of the defendants, Edward Spaeth, requiring him to produce before the Examiner "all books, papers, and documents, whatsoever, that will show the number of skates made or delivered by the defendants, or their employés, since the 6th day of April, 1875."

The defendants complain that this is not an honest inquiry into their acts to sustain the charge of infringement, but an attempt, by an abuse of the process of the court, to ascertain the nature, extent, and direction of their business affairs. While they express themselves willing to make a full exhibit of all their manufacture and sale of skates from the date of the last reissue of the patent to the commencement of this suit, they protest that the complainant is not entitled at this stage of the proceedings, and before a decree against them for infringement, to compel an exposure of their business matters since the last-named date. They have accordingly applied for, and obtained, a rule upon the complainant to show cause before the court (1) "Why the subpœna *duces tecum* should not be modified by inserting the clause 'and until the commencement of this suit' after the words and figures '6th day of April, 1875;'" and (2) "Why the defendants should not be excused from disclosing to the complainant, in the complainant's *prima-facie* case, what defendants have or have not done since the commencement of this action."

The counsel for the complainant justifies the questions propounded, and the call for the books, exhibiting the amount and character of the business of the defendants since the filing of the bill, on the ground that the complainant's patent is for a combination; that it already appears in evidence that the defendants have a contract to manufacture the skates, which are sworn to be an infringement of the complainant's patent, and to deliver them to persons who are not licensees of the patentee; that a number of such skates are yet to be made and delivered under said contract; that it further appears that the defendants are accustomed to make large quantities of the parts of skates interchangeable, and to put them together afterward; that it is admitted in their testimony that some of these parts were manufactured before the commencement of the suit, and the object of the present inquiry is to ascertain whether the other parts of the skates have not been manufactured since, and whether the parts made before filing the bill have not since been united to form skates, so that what was done after the reissue and before the suit has been contributory to the infringement.

The reissued patent owned by the complainant, and for the infringement of which the suit is brought, is undoubtedly for a combination in the specifications. The inventor states that the nature of his invention consists in the combination, with a skate and the lateral-acting clamps, of mechanism that operates to move the clamps toward each other with sufficient force to cause them to grasp the sole, and hold the skate to the boot or shoe.

The first claim of the reissue is for—

The combination, in a skate, of clamps for grasping the sole, a plate or rest for the foot, and mechanism for moving and holding the clamps.

The second is for—

The clamps for grasping the heel and the clamps for grasping the sole combined with mechanism operating and holding both sets of clamps, substantially as specified.

And the law is well settled that such a patent is not infringed by the use of some of the parts which make up the combination, the other parts being omitted, unless the place of the discarded constituents is supplied by something substantially equivalent.

As was remarked by Mr. Justice Nelson in delivering the opinion of the Supreme Court in *Vance* vs. *Campbell*, (1 Black, 429:)

Unless the combination is maintained, the whole of the invention fails. The combination is an entirety; if one of the elements is given up the thing claimed disappears.

Hence, also, it was held in *Gould* vs. *Rees*, (15 Wall, 194,) that "where the defendant, in constructing a machine, omits entirely one of the ingredients of the plaintiff's combination, without substituting any other, he does not infringe; and if he substitutes another in the place of the one omitted, which is new or which performs a substantially different function, or if it is old, but was not known at the date of the plaintiff's invention as a proper substitute for the omitted ingredient, then he does not infringe."

The complainant seeks to establish his *prima-facie* case of infringement by putting one of the defendants on the stand as a witness, and proving by him what the defendants have done. He calls his attention to Exhibit No. 1, and asks whether he has made skates substantially like that. The witness admits that he has, and that the defendants have a contract to furnish such skates to the firm of Peck & Snyder. He is then requested to produce the contract, which he properly declines to do, alleging as a reason that he does not wish to disclose to rivals the price which they were to receive, nor the number to be manufactured; but he again admits that it was a contract to deliver skates very nearly like Exhibit No. 1 of complainant. The sole pertinent inquiry now is the fact of the infringement, and that fact will not be made any more evident by producing the contract than it has been by the admissions of the defendants. The extent of the infringement is a different question, and will only arise, if at all, upon a reference for an account after a decree for the complainant.

He then continues the defendants' examination as follows:

Q. 23. Do you keep books of account which show how many skates like Exhibit 1 you make; the deliveries of such skates, and the dates of such delivery?
A. Yes.
Q. 24. Will you produce those books of account at the next adjournment?
(Objected to, because complainant has no right to compel the witness to produce his books at this stage of the suit, and because he has not served any subpœna *duces tecum* upon him, and he has no right to such subpœna.)
A. I decline throwing our books open to the complainant.
Q. 25. In manufacturing skates under your contract has it been your practice to make considerable numbers of each of the different parts of the skates and keep them until such time as you may desire to put them together?
A. We always have made those parts at the commencement of the year, as that is work we keep boys on to fill up time when we are doing nothing else.
Q. 26. During the period of time between the reissue of the patent and the filing of the bill did you have on hand a considerable number of each of the parts constituting the clamping mechanism like that in Exhibit No. 1?
A. Yes; we always do have such parts in the factory.
Q. 27. Since that time have you used any of the parts that you then had in store in the construction of skates substantially like complainant's Exhibit No. 1?
(Objected to as immaterial and irrelevant to any issue in this suit; and because the question ought to be limited to the time of the commencement of this suit; and counsel instructs witness not to state what he has done since that time.)

The design of these questions is apparent. They are put on the theory that in a patent for a combination, he is an infringer who makes or sells only one or two of the parts of which the combination is composed, if done with the intent that the purchaser shall unite them with the other parts, procured either from the same or other sources, and at the same or at different times.

That seems to be the principle decided in *Wallace* vs. *Holmes*, (9 Blatch., 65,) on which the counsel for the complainant relies in support of his right to ask the question, and to call for the books of the defendants, exhibiting their business since the commencement of this suit.

In that case, where there was a patent for a new and useful improvement in lamps, which consisted of an improved burner in combination with a chimney, and the proof was that the defendants had manufactured and sold the burner alone, leaving the purchaser to supply the chimney—without which the burner was useless—the late Judge Woodruff held that the manufacture and sale of the burner by the defendants without the chimney was an infringement of the patent.

It cannot be [he says] that where a useful machine is patented as a combination of parts, two or more can engage in its construction and sale, and protect themselves by showing that, though united in an effort to produce the same machine and sell it, and bring it into extensive use, each makes and sells one part only, which is useless without the other, and still another person, in precise conformity with the purpose in view, puts them together for use. If it were so, such patents would indeed be of little value. In such case all are tort-feasors, engaged in a common purpose to infringe the patent, and actually by their concerted action producing that result. * * * * * Each is liable for all the damages.

Without thereby intending to intimate an ultimate opinion in regard to that case, or in regard to its relevancy to the pending one, I propose to adopt its spirit in the order which I shall make on the present motion.

Let the subpœna *duces tecum* be modified as the defendant requests, by inserting the clause "and until the commencement of this suit" after the words and figures "6th day of April, 1875;" but at the same time let the defendant, and any other witnesses, answer question 27, and all other questions tending to show the subsequent use of any of the parts of skates like Exhibit No. 1, which defendants had on hand when the suit was commenced.

This order is made upon the supposition that the answer to question 27 will serve the purpose of complainant as to present proof. If the evidence as to the fact of what the defendants have done since the commencement of the suit in the matter of uniting the constituents of the combination should not be satisfactory to the complainant, and it is supposed that the book of the defendants will shed more light on the subject, the court will hear an application hereafter, on notice to defendants, in regard to exhibition of the books of account.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date December 14, 1875.]

8,836.—Cooking-Stove.—NICHOLAS S. VEDDER, Troy, N. Y. No. 1. Application filed December 3, 1875. Term of patent 3½ years.

8,837.—Base-Burning Stoves.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, N. Y., assignors to said VEDDER. No. 6. Application filed December 3, 1875. Term of patent 3½ years.

8,838.—Cooking-Ranges.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, N. Y., assignors to said VEDDER. No. 3. Application filed December 3, 1875. Term of patent 3½ years.

8,839.—Illuminating Base-Burning Stoves.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, N. Y., assignors to said VEDDER. No. 7. Application filed December 3, 1875. Term of patent 7 years.

8,840 and 8,841.—Heating-Stoves.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, N. Y., assignors to said VEDDER. Nos. 9 and 5. Applications filed December 3, 1875. Term of patents 3½ years.

8,842.—Cooking-Stove.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, N. Y., assignors to said VEDDER. No. 2. Application filed December 3, 1875. Term of patent 3½ years.

8,843.—Parlor-Stoves.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, N. Y., assignors to said VEDDER. No. 4. Application filed December 3, 1875. Term of patent 3½ years.

8,844.—Cooking-Stoves.—NICHOLAS S. VEDDER and FRANCIS RITCHIE, Troy, N. Y., assignors to said VEDDER. No. 10. Application filed December 3, 1875. Term of patent 3½ years.

8,845.—Paper Box.—ISIDORE BIRGÉ, Philadelphia, Pa. Application filed March 13, 1875. Term of patent 3½ years.

8,846.—Handles of Table Cutlery.—EDWIN L. BRITTIN, Derby, Conn. Application filed November 27, 1875. Term of patent 7 years.

8,847.—Toy Balloon.—HUGH S. KERR, Philadelphia, Pa. Application filed November 24, 1875. Term of patent 7 years.

8,848.—Lamp-Chimneys.—FREDERICK S. SHIRLEY, New Bedford, Mass. Application filed September 17, 1875. Term of patent 7 years.

8,849.—Bottles.—BERNARD SIMON, Scranton, Pa. Application filed December 7, 1875. Term of patent 3½ years.

8,850.—Range.—NICHOLAS S. VEDDER, Troy, assignor to JOHN A. GOEWEY, Albany, N. Y. Application filed December 8, 1875. Term of patent 3½ years.

8,851.—Base-Burning Stoves.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, N. Y., assignors to said VEDDER. No. 8. Application filed December 3, 1875. Term of patents 3½ years.

[Each certificate bearing date December 14, 1875.]

427.—Title: **"Silver Shine—for Silver, Plated Ware," &c.**—JAMES A. BABCOCK, New York, N. Y. Application filed November 29, 1875.

428.—Title: **"White Rubber Cement."**—WILLIAM C. BYERS, Pittsburg, Pa. Application filed December 6, 1875.

429.—Title: **"H. G. Farrel's Celebrated Arabian Liniment."**—HIRAM G. FARRELL, Peoria, Ill. Application filed December 7, 1875.

430.—Title: **"Old Hermitage Bourbon Whiskey."**—W. A. GAINES & Co., Frankfort, Ky. Application filed December 4, 1875.

431.—Title: **"Old Hermitage Rye Whiskey."**—W. A. GAINES & Co., Frankfort, Ky. Application filed December 4, 1875.

432.—Title: **"Hamm's Pure German Mustard."**—HERBERT H. HAM, Boston, Mass. Application filed December 6, 1875.

433.—Title: **"Beware of Counterfeit Notes."**—HETSCH BROS., Newport, Ky. Application filed November 24, 1875.

434.—Title: **"Golden Medal."**—JULIUS JACOBSON, Boston, Mass. Application filed December 4, 1875.

435.—Title: **"Amusement, Novelty, and Variety.—The Seasons and Cassino."**—WILLIAM MCCONNELL, Philadelphia, Pa. Application filed November 27, 1875.

436.—Title: **"R. J. Owens, chemist, Carbolic Acid Family Salve."**—R. J. OWENS, Brooklyn, N. Y. Application filed December 9, 1875.

437.—Title: **"Russian Water-Proof Leather Preservative."**—CHARLES S. PIPER, Boston, Mass. Application filed December 7, 1875.

438.—Title: **"Tibbetts' Pile Ointment."**—LEWIS TIBBETTS, Augusta, Me. Application filed November 22, 1875.

439.—Title: **"Thomas' Specific Preparation, Nos. 1, 2, and 3, For the Hair."**—JOHN W. THOMAS, New Orleans, La. Application filed December 9, 1875.

440.—Title: **"Kriss Kringle."**—JOHN J. WILTSE, Ames, Iowa. Application filed November 13, 1875.

441.—Title: **"Dice Croquet."**—F. A. WRIGHT, Cincinnati, Ohio. Application filed October 25, 1875.

INDEX OF INVENTIONS PATENTED DECEMBER 14, 1875.

	Class No.	No. of Patent.
Acid, retort for concentrating sulphuric, J. Saunders	35	171,049
Alarm and indicator, combined burglar, J. Thorman	24	171,065
Animal power, W. P. Emmert	159	170,944
Antiseptic fluids, device for impregnating timber with, J. Huntington	35	171,135
Antiseptic fluids, device for impregnating timber with, J. Huntington	35	171,136
Auger, core, O. W. Townsend	29	171,194
Baker and roaster, W. Wachs	154	171,200
Bale tie and hoop lacer, L. I. Bodenhamer	7	170 932
Barrel, D. Wright	40	171,077
Base ball base, J. C. O'Neill	143	171,038
Bed bottom frame, G. C. Perkins	62	171,042
Bed bottom, spring, A. D. Seaman	62	171,180
Bell, call, E. C. Barton	24	171,084
Blackboard and other rubbers, B. Y. Conklin, (reissue)	146	6,797
Blind slat adjuster, W. W. Byam	24	171,096
Boiler feeder, automatic, S. Cook	148	171,100
Boiler, upright tubular, N. C. Heaton	148	171,017
Boilers, water feeder for steam, P. N. J. Macabies	148	171,149
Bonnet fastener, E. K. Hall	76	171,015
Boot and shoe heel attachment, R. S. Van Zandt	16	171,199
Boots and shoes, machine for cutting and blacking the welts in, T. K. Keith	16	170,955
Boring machine, G. W. Badger	173	170,980
Bow and arrow, C. F. Teed	143	171,192
Bread cutter, Walsh and Abearn	98	171,072
Brick machine, T. H. Burridge	20	171,095
Brick machine, W. A. Graham	20	171,118
Bridge gate, draw, O. Esche	21	171,003
Brush holder, I. Heller	22	171,128
Burners, globe for, E. Evans	90	171,112
Can nozzle, oil, G. H. Perkins	107	171,164
Can top, lamp filling, O. N. Perkins	90	171,165
Candle holder, C. Kirchhof, (reissue)	90	6,805
Canister, J. S. Field	88	171,006
Car axle box lubricator, J. Sidebotham	122	171,182
Car coupling, W. Robinson	122	171,172
Car, sleeping, J. Bolt	121	170,985
Cars, device for cooling and ventilating railroad, J. F. Babcock	166	171,079
Cars, hand motor for street, Steel and Austin	122	170,969
Card grinding machine, J. F. Wicks	98	171,075
Carpet lining, J. M. Perkins, (reissue)	95	6,795
Carpet stretcher, Calhoon and Kimerer	62	170,987
Carriage handle socket, child's, A. McLaughlin	31	171,153
Carriage shaft eyes, die for forging, W. B. McElney	31	171,151
Carriage wheel, G. H. Crosby	31	170,994
Casks or barrels, fastening for bungs in, Ott and Weller	40	171,161
Chair, A. B. Stevens	62	171,186
Chair, folding, F. A. Patch	62	171,040
Chuck, G. W. Moulton	100	171,160
Chuck and centerer, G. F. Ballou	100	171,082
Churn dasher, R. M. Case	45	171,097
Churn dasher, J. R. Underwood	45	171,069
Cigar molds, machinery for making, T. D. McGuire	160	171,152
Clock, electric, E. Clark	36	171,098
Cloth, flocking, H. N. Slater	37	171,057
Clutch, A. Swingle	67	171,063
Clutch, machine, A. B. Bean, (reissue)	67	6,791
Coach pad, S. A. Marker	31	171,150
Coal breaking roll, R. Jones	3	171,140
Coffin, J. M. Currier	39	171,101
Composition for covering metallic surfaces, J. Ferguson	35	171,004
Condenser, J. B. Root	148	171,175
Cooler and heater, milk, M. L. Bush	45	170,986
Cordage machine, J. A. Peckham	127	171,041
Corn husking implement, H. W. Hill	59	171,019
Corn popper, F. J. Meyers	154	171,032
Corn popper, C. F. Wickwire	154	170,976
Corset, abdominal, C. A. Griswold	80	171,012
Curtain fixture, C. H. Miller	62	171,034
Cutter stocks, manufacture of, L. Hardy	44	171,127
Cutters, adjustable draft bar for, J. P. Thompson	31	171,064
Dental drills, hand piece for, J. W. Gilbert	46	171,009
Dental plugger, E. S. Rider	46	171,170
Dental plugger, electro magnetic, G. F. Green	46	171,119
Dental plugger, electro magnetic, G. F. Green	46	171,120
Dental plugger, electro magnetic, G. F. Green	46	171,121
Dental plugger, electro magnetic, G. F. Green	46	171,123
Dental tools, &c., vulcanized rubber handle for, B. Donaldson	84	171,106
Door spring, J. A. Robbins	24	171,171
Drawer, tilting, W. S. Moses	62	171,036
Dulcimer, &c., J. A. McKenzie	102	171,031
Ear muffler, B. Edgar	38	170,942
Elevator adjustable lock and dog, hay, J. R. Fitzhons	79	170,945
Elevator dog, hay, J. R. Fitzhons	79	171,114
Elevator for dwellings, G. R. Potter	79	171,167
Engine and driving appliance, steam, S. E. Stokes, Jr.	150	171,187
Engine, electro magnetic, J. Bishop	50	171,087
Engine for twin screw propellers, G. B. Whiting	150	171,074
Engine, steam, J. B. Root	150	171,174
Engine, steam pumping, Cope and Maxwell	150	170,938
Engines, &c., harness for fire, E. O. Sullivan	72	171,190
Evaporator, G. F. J. Colburn	154	170,990
Fan, automatic, A. F. Cloudman	165	170,989
Fan, electro magnetic, G. F. Green	50	171,122
Fare register, W. H. Hornum	42	171,133
Fence barb, wire, H. N. Frentress	52	171,008
Fence, barbed wire, Dobbs and Booth	52	171,104
Fence post, I. L. Sherman	52	171,181
Fence wire, barbed, Dobbs and Booth	52	171,105
Fences, nail for wire, H. S. Smythe	103	171,184
Filter for liquids holding solid impurities, E. S. Hutchinson	153	170,952
Filter, reversible, E. C. Houghton	167	171,020
Filtering liquids, apparatus for, T. R. Sinclaire	167	171,055
Filtering liquids, apparatus for, T. R. Sinclaire	167	171,056
Fire arm, revolving, D. Smith	123	171,059
Fire arms, safety lock for, F. Chillingworth	55	170,928
Fire escape, J. R. Lefferts	30	170,958
Fire escape, W. McAllister	30	171,030
Fire place, R. Thompson	154	171,067

	Class No.	No. of Patent.
Flock washing machine, A. C. Russell	37	171,048
Fruit drier, L. and F. Whittlesey	48	171,202
Fruit preserving jar, T. J. Price	58	171,044
Furnace for steam boilers, R. H. Gordon, Jr	149	170,948
Gage and bracket, siding, W. S. Payn	29	170,964
Gas by electricity, lighting, Hinds and Smith	64	171,131
Gas furnace, A. Parkes	99	171,162
Gas holder, L. Marks	64	171,028
Gas lighting apparatus, electric, Hinds and Smith	64	171,130
Gas, manufacture of, J. P. Gill	66	171,117
Gate, swinging, J. A. Moore	52	171,158
Grain cradle fingers, manufacture of, C. P. Kelsey	49	171,025
Grain meter, B. M. Fulliam	132	170,965
Grain tally, H. L. Townsend	150	171,195
Hair heading machine, E. Hough	161	170,951
Harness collar pad, M. Klein	72	171,144
Harness for fire engines, &c., E. O. Sullivan	72	171,190
Harrow, wheel, F. Bramer	73	171,092
Harrows, hook for, Tracy and Platt	73	171,197
Harvester, C. Crook, (reissue)	74	6,798
Harvester reel and rake, combined, A. Stoler	74	171,189
Harvester reel rake, R. C. Taylor	74	170,971
Harvesting machine, W. M. and G. H. Howe	74	171,091
Hat holder and check, combined, J. E. Smith, (reissue)	146	6,796
Hat ventilator, J. B. Dillaway	76	171,103
Hatchet, J. A. Thayer	29	170,972
Heater and feeder, R. Garstang, (reissue)	148	6,802
Hemp hackling machine, F. D. Frost	78	170,947
Hides, preserving, F. H. L. C. Sacc	92	171,177
Hoes, manufacture of grubbing, J. C. Klein	141	171,141
Horse power, W. H. Butterworth	159	171,094
Horse power, P. K. Dederick	159	171,000
Horse power, P. K. Dederick	159	171,001
Horseshoe machine, U. Billings	60	170,931
Hydrant valve, H. James	167	171,138
Hydrants, street connection for, Folliard and Travis	167	171,116
Ice machine, T. L. Rankin	63	171,168
Implement, combined, P. Broadbooks	29	170,934
Index tabs, gage for cutting, M. N. Lovell	15	170,959
Iron and steel, manufacture of, E. A. and J. A. Jones	85	171,024
Jack, lifting, A. Duncan	79	171,107
Jack, lifting, H. D. Haraden	79	171,126
Jug and sancer, combined, A. French	88	170,946
Key for locks, W. H. Guthrie	93	171,014
Knobs and handles, swing joint for, E. M. Lockwood	24	171 027
Knobs, screw for, W. F. Arnold	93	171,078
Ladder, step, M. N. Lovell	30	170,960
Lamp, C. E. Ball	90	171,081
Lamp, J. A. Evarts	90	171,111
Lamp wick, A. M. Daniels	90	170,995
Lard in casks for transportation, fining and cooling, R. Bellymore	26	170,935
Lathe for turning irregular forms, G. N. Westcott	172	171,201
Leather dressing machine, B. M. J. Blank	92	170,983
Leather, prepared, O. Nichols	92	170,962
Leather to make it water repellent, treating, E. F. Dietericha	92	170,940
Lemon squeezer, C. H. Miller	88	171,154
Life preserver, B. Hempstead	138	171,018
Loom shedding mechanism, R. Elliott, (reissue)	95	6,793
Lounge, folding, O. Stechhan	62	171,060
Lubricator, J. A. Osenbrick, (reissue)	87	6,794
Mechanical movement, W. H. Hernum	67	171,132
Mechanical movement, J. L. Scott	67	171,053
Mill, cider, E. Curtiss, (reissue)	19	6,799
Millstone, H. J. Fogh	57	171,115
Molding machine, L. Houston	173	171,134
Mortise cutter, rectangular, J. Doyle	173	171,109
Motion, apparatus for transmitting, J. L. Scott	67	171,052
Nail plate feeder, W. H. Field	103	171,005
Nail for wire fences, H. S. Smythe	103	171,184
Nut lock washers, punch for making, K. H. Loomis	14	171,148
Nuts, manufacture of hexagonal, G. Johnson	14	171,023
Ore jigger, A. Stroh	3	171,189
Ore washer, Allain and Dejean	3	170,978
Packages with wire strapping, N. O. Hynson	170	170,953
Paper box, S. B. Conover	109	170,991
Paper box, J. L. Reber, (reissue)	109	6,806
Paper folding machine, rotary, S. D. Tucker	108	171,196
Paper, machine for dampening, W. Hillock	108	171 093
Paper, ornamenting dry, La Monte and Hall	109	171,026
Paper pulp, compounding, G. Clarkson	108	171,099
Pegging machine, L. Goddu, (reissue)	16	6,803
Pen, fountain, J. Johnston	146	170,954
Pencil sharpener, I. T. Dyer	146	171,110
Photographs, printing, B. Swasey	111	171,062
Piano action, upright, C. E. Rogers	112	171,046
Piano fortes, stringing and tension device for, C. E. Rogers	112	171,047
Picks, &c., manufacture of, J. C. Klein	49	171,143
Piles, extension cap for, J. C. Davis	82	171,102
Piston springs, manufacturing, J. Mitchell	31	171,157
Plow, W. K. Harrell, (reissue)	114	6,804
Plow, H. H. Hubley	114	171,022
Plow, N. G. Pinney	114	171,166
Plow, J. Worrell	114	171,205
Plow point, T. S. Urie	114	171,068
Potato bug destroyer, I. W. Griscom	63	171,011
Press, baling, P. K. Dederick	7	170,997
Press, baling, P. K. Dederick	7	170,998
Press, baling, P. K. Dederick	7	170,999
Prize, screw, A. Hathaway	7	170,950
Press, screw die, H. Blundell	119	170,984
Printer's case, A. T. De Puy, (reissue)	117	6,801
Printing presses, sheet delivery apparatus for, A. E. Sardo	117	171,178
Privy, G. Schumacher	51	170,967
Propeller, screw, Cook and Barker	139	170,937
Propeller, vibrating, J. D. Cornell	139	170,903
Pump, double acting, L. Bouvier	118	171,090
Pump, steam and vacuum, L. D. B. Shaw	118	170,968
Railroad frog, F. C. Wier	120	171,073
Railroad rail, G. H. Mayer, Jr	120	171,029
Railroad rail chair, street, J. M. Atkinson	120	170,979
Railroad signal, J. H. Bargar	120	171,063
Rake for reapers, self, S. B. Gilliland	74	171,010
Refrigerating apparatus, L. B. Woolfolk	58	171,204
Rein hold, safety, L. Bailey	31	170 930
Rheumatism, remedy for, A. Severin	98	171,054
Rubber article, Dunbar and Lothrop	84	170,941
Sail bending hook, E. D. Rankin	138	170,966
Saw gummer, J. W. and T. Parker	131	171,039
Saw handle, crosscut, W. Millspaugh	131	170,961
Saw handle, crosscut, C. M. Tanner	131	170,970
Saw mill, A. Rodgers	130	171,173
Saw mill head block, F. J. Staley, (reissue)	130	6,808
Sawing fellies, machine for, Kenney and Willard	130	170,956
Scales, spring, Harper and Cross	132	171,016
Screw cutting die holder, J. J. Grant	14	170,949
Screw threading machine, E. Nugent	14	171,037
Separator, grain, C. F. Butterfield	159	170,936
Separator, grain, L. Theobald	159	171,066
Sewing machine, S. W. Francis	134	171,007
Sewing machine, E. H. Smith, (reissue)	134	6,807
Sewing machine, C. F. Toll	134	171,193
Sewing machine shuttle, A. Peeler	134	171,163
Sewing machine, wax thread, A. Leavitt	134	171,147
Sewing machines, device for transmitting power to, J. Bourdin	134	170,933
Shears for cutting hogs' noses, Grow and Sloan	44	171,013
Sheet metal ware, making, J. Trageser	136	171,198
Shirt and drawers, H. H. H. Grosskopf	38	171,124
Shoe nail, D. D. C. Pillsbury	16	171,043
Shoe tongue, W. J. Windram	16	171,203
Shovels, manufacture of lape for, J. C. Klein	141	171,142
Sink, W. Donovan	8	171,002
Skate, O. Edwards	143	170,943
Sled propeller, C. Schwager	141	171,179
Spinning machines, spindle for, J. C. Arnold	142	170,929
Spring, E. H. Tyler	62	170,973
Springs, machine for making spiral, S. L. Bower	170	171,089
Steel, manufacture of, F. J. Slade	85	171,183
Stereoscope, J. F. Steward	157	171,061
Stove, cooking, I. Van Buschoten	154	171,070
Stove grate, N. A. Boynton	154	171,091
Stove pipe shelf, G. W. Langdon	88	171,146
Stove pipe shelf, A. J. Mills	88	171,153
Street connection for hydrants, Folliard and Travis	167	171,116
Suppository mold, A. S. Wetmore	156	170,975
Surveying instrument, J. L. Bogy, (reissue)	157	6,792
Swimmers, glove paddle for, E. G. Kinsley	138	170,957
Table, folding, Lambie and Sargent	62	171,145
Tack extractor, M. Hermance	29	171,199
Tampico, machine for dressing, J. D. Baker	78	171,080
Telegraph, autographic, W. E. Sawyer	158	171,051
Telegraph, copying, W. E. Sawyer	158	171,050
Telegraph, quadruplex, J. Olmsted	50	170,963
Timber with antiseptic fluids, device for impregnating, J. Huntington	35	171,135
Timber with antiseptic fluids, device for impregnating, J. Huntington	35	171,136
Tool, mechanical, R. H. Russell	29	171,176
Toy trundle, J. F. Robertson	143	171,045
Trap, fly, W. J. Bennett	143	171,085
Treadle, W. J. Demorest, (reissue)	67	6,800
Type writing machines, frisket for, W. C. Johnson	117	171,139
Umbrella tip cup, H. Winter	165	171,076
Valve for cylinders, relief, W. Westwater	152	170,974
Valve indicator, J. S. Wallace	148	171,071
Valve, steam, Cope and Maxwell	152	170,939
Valve, throttle, R. Biester	152	171,086
Valve and cut off, balanced, G. W. Hall	152	171,125
Vehicle, N. Haret	31	171,137
Vehicles, shaft coupling for, J. D. Morey	31	171,159
Vent, E. R. Behlers	40	170,982
Ventilating prisons, &c., P. Mihan	166	171,033
Wagon, dumping, J. Mills	31	171,156
Washing machine, E. S. Richmond	91	171,169
Washing machines and wringers, clamp for, W. A. Duncan	91	171,108
Watch cleaning fluid, A. Monnier	36	171,035
Watches, reversible center pinion for, F. E. Smith	36	171,058
Water wheel, J. J. Bourgeois	168	171,088
Water wheel, T. Tait	168	171,191
Wheel hub, R. W. Davis	31	170,996
Whiffletree, J. R. Finley	31	171,113
Windmill, W. F. Corneline	118	170,992
Wire, insulating metal, H. Spitdorf	50	171,185
Wire, strapping packages with, N. O. Hynson	170	170,953
Wood bending machinery, S. R. Bailey	176	170,981
Wringer, J. A. Wilson	91	170,977

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED DECEMBER 14, 1875.

	Patent No.
Ahearn and Walsh	171,072
Allain, A., and A. R. Dejean, Ore washer	170,978
American Cable Screw Wire Company, assignee, (reissue)	6,803
Arnold, J. C., Spinning machine spindle	170,929
Arnold, W. F., Screw for knobs	171,078
Atkinson, J. M., Street railroad rail chair	170,979
Atlantic Refining Company, assignee	171,164
Austin and Steel	170,969
Automatic Boiler Feeder Manufacturing Company, assignee	171,100
Babcock, J. F., Device for cooling and ventilating railroad cars	171,079
Badger, G. W., Boring machine	170,980
Bailey, L., Safety rein hold	170,930
Bailey, S. R., Wood bending machinery	170,981
Baker, J. D., Machine for pressing tampico	171,080
Ball, C. E., Lamp	171,081
Ballou, G. F., Chuck and centerer	171,082
Bargar, J. H., Railroad signal	171,083
Barker and Cook	170,937
Bartlett, E. L., assignee	171,102
Barton, E. C., Call bell	171,084
Beal, F. O., assignee	171,079

TITLES, DRAWINGS, AND CLAIMS

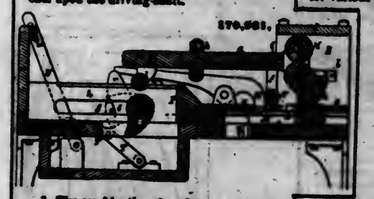
OF

PATENTS GRANTED DECEMBER 14, 1875.

170,929. SPINDLES FOR SPINNING-MACHINES, John C. Arnold, Whitinsville, Mass. [Filed Aug. 30, 1875.]

Brief.—The spindle is provided with projections on opposite sides, which mesh with the interior screw-thread of the bolster and step combined, until the annular groove is reached, within which they move in an unvarying horizontal plane, when the spindle is revolved in one direction; but a reverse motion of the spindle will cause them to again traverse the screw-thread, raising the spindle out of the bolster.

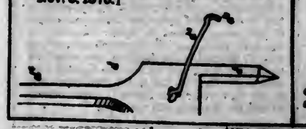
In combination with the spindle *b*, provided with projections *d d*, the step and bolster combined, *f*, having screw-thread *e e*, and annular groove *g*, as and for the purpose set forth and described.



170,930. SAFETY REIN-HOLDS, L. Bailey, New Britain, Conn. [Filed Jan. 6, 1875.]

The combination of the ball *c*, weight *e*, and plate *d*, all substantially as shown and described.

170,931. HORSESHOE-MACHINES, Uriah Billings, Cambridgeport, Mass. [Filed Nov. 16, 1875.]

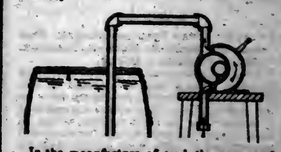


Brief.—The carrier of the former is partially retracted by means of the springs on the reciprocating jaws. The blank having been bent, the carrier carrying the creasers is brought forward and made to traverse it by a cam upon the driving-shaft.

1. The combination, for advancing the carrier F, of the former E, and partially retracting it, each consisting of the duplex cams *r r*, the projections *r' r'*, the two pairs of toggles T, and the slotted levers U U, all arranged and applied to the driving-shaft Q, and to the said carrier, substantially in manner as specified.

2. The combination for operating the creasers, each consisting in the vibratory center F, its shaft E, gears D D, and racks O O, the carrier G, and its retaining-cam *n*, all arranged and applied to the bending E and the driving-shaft Q, substantially in manner as set forth.

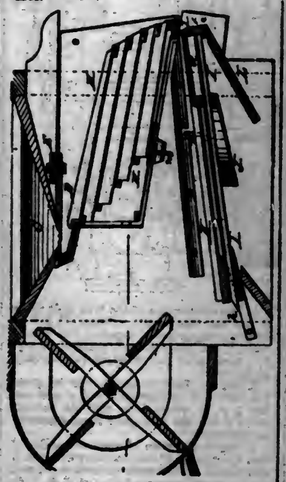
170,932. BALE-TIES AND HOOP-LACERS, I. I. Bodenheimer, Kernersville, N. C. [Filed Nov. 6, 1875.]



170,933. CORRUGATED IMPLEMENTS, Peter Broadbrooks, Batavia, N. Y. [Filed Dec. 18, 1874.]

Brief.—A number of different tools are united with a pocket-knife, in such manner that they not only perform their functions independently, but they can act in combination for various purposes.

As a new article of manufacture, the herein-described implement, composed of the parts substantially as shown and specified.



170,934. FIRING AND COOLING LARD IN CASES FOR TRANSPORTATION, Richard Bullymore, Buffalo, N. Y. [Filed July 24, 1875.]

In the manufacture of lard, the process of forcing a current of cold air through the liquid lard after it is filled into the barrel or cask for shipping or storing, whereby the lard is thoroughly agitated while cooling and congealing, thereby producing lard of fine and even grain, substantially as hereinbefore set forth.

170,935. GRAIN-SEPARATORS, Charles P. Butterfield, Garden City, Minn. [Filed Oct. 6, 1875.]

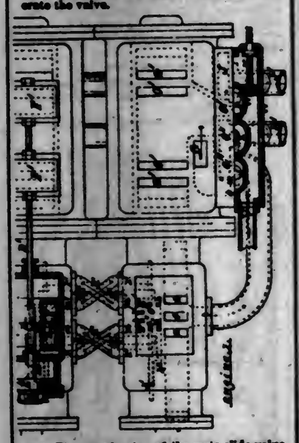
Brief.—Improved movement for a shaking-shoe.

1. The combination, with the frame I and its extension J K, of the support L, having its edges inclined as described, and the corrugated plates *e f*, substantially as and for the purposes herein set forth.

2. The frame I, and its extension J K and supports L, in combination with the conductor b, elevator B, spout p, and hopper C, all as and for the purposes herein specified.

170,936. SCREW-PROPELLERS, Horatio G. Cook and Reuben W. Barker, Portland, Me. [Filed Aug. 19, 1875.]

HELIOTYPE RELIEF PROCESS, JAMES R. OSGOOD & CO. BOSTON



170,937.

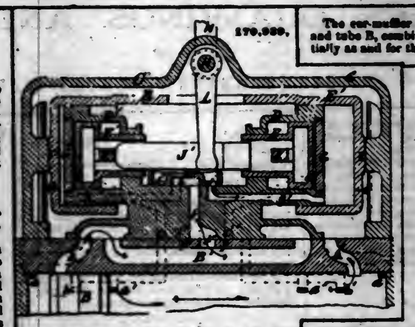
In the propeller-wheel herein described, the combination of blades A A, attached to the shaft one after the other, each upon its individual socket, and each having at its outer end flanges $a' a'$, of uniform or nearly uniform width from end to end, projecting front and rear, substantially as and for the purposes set forth.

170,938. STEAM PUMPING-ENGINES. Hiro Cope and James R. Maxwell, Hamilton, Ohio. [Filed Oct. 2, 1874.]

Brief.—Both engines are compound, or both cylinders of each may be operated by live steam, by moving with a set-screw a valve on the large cylinder. The valves are operated by steam from the main cylinder acting on small pistons. The engines may act singly and independent of each other, or they may be made duplex by taking steam from each main cylinder, through crossed pipes, to the auxiliary cylinder of the opposite engine, to operate the valve.

1. The combination of the main slide-valve D and the master-valve cylinder F', cast or otherwise firmly united together, the master-valve F, and the ports and passages $c' g f f'$, constructed and arranged substantially as described.

2. The auxiliary piston F', with its stem, the ports and passages f, i, and i', and cylinder $f f'$, in combination with the master-valve F and the passages b b', substantially as described.



3. The combination of the master-valve f and its cylinder F', the auxiliary cylinder E and piston E', the main slide-valve D, and the ports and passages b, b', c, c', d, d', f, f', g, g', and h, substantially as described.

4. The combination of two cylinders of unequal areas with the steam-chest W, the valve W', cover X, ports and passages i, m, o'', o', o'', G, and f, and the pipes O, H', and g', whereby high or low pressure steam may be admitted to the larger cylinder, and its exhaust carried to the atmosphere, or to a condenser, substantially as described.

5. The combination of two steam-engines and their valves with the tubes T, three-way cocks B B', and passages a, c, c', c'', i, f, m, m', r, r', v, v', and o'', whereby the engines are convertible from independent acting to duplex, and vice versa, substantially as described.

170,939. STEAM-VALVES. Hiro Cope and Jas. R. Maxwell, Hamilton, Ohio. [Filed Sept. 17, 1875.]

Brief.—Steam from the main cylinder alternately enters back of the differential pistons. Said pistons operate the small valve which opens the exhaust from the main valve-pistons, allowing said valve and pistons to be moved by live steam, to admit steam to the main cylinder.

170,940.

The ear-muffler A, having the frames C C and tube B, combined and arranged substantially as and for the purpose set forth.

1. The tappet-pistons F F', constructed of two unequal areas, with a constant pressure of steam upon the smaller area, operated independently of each other, in combination with the cylinders D D' and the ports and passages a' a'' b b' c c' m m' n n' and the cavity o, arranged to operate together in the manner described.

2. The auxiliary cylinders E E', with their outer ends closed, and inner ends united by an overlapping joint, t, supported by the main slide-valve and cylinders D D', and held in place at the points l l' by lugs cast within the steam-chest, substantially as described.

3. The combination of the main slide-valve and cylinders D D', the auxiliary cylinders E E', the auxiliary slide-valve D'', the tappet-pistons F F', and the ports and passages a' a'', c c', g g', j j', f f' f'', and h h', arranged and operated substantially as described.

170,941. PROCESSES OF TREATING LEATHER TO MAKE IT WATER-REPELLENT. Emil F. Dieterichs, Philadelphia, Pa. [Filed May 11, 1875.]

Brief.—The leather is first treated to a compound of any fatty oil containing oleic, margaric, or other fatty acid, and what is termed alumina oil, then partially dried, when it is immersed in an alumina solution.

As an improvement in the art of waterproofing leather, the application of the compounds described, substantially as set forth.

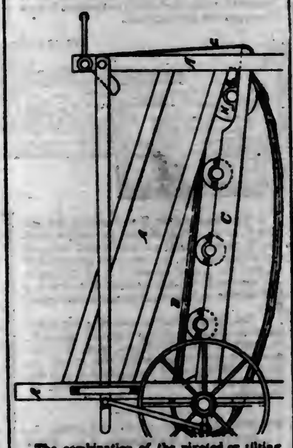
170,942. RUBBER ARTICLES. Hiram P. Dunbar and Thos. G. Lothrop, Boston, Mass. [Filed Nov. 9, 1875.]

1. The improved process for the manufacture of rubber products, substantially as herein described—that is, the cutting, with a base or foundation of cheap material, a facing or series of strips or designs of finer material, susceptible of receiving colors and incorporated with the foundation, substantially as and for purposes stated.

2. The improved rubber product herein shown and explained, being a floor-cloth composed of a body of cheap material, with a series of parallel strips in colors or neutral tints composed of a finer quality of rubber compound, substantially as and for the purposes stated.

170,943. EAR-MUFFLERS. Butler Edgar, Bury, Pa. [Filed Oct. 26, 1875.]

Brief.—The frames are adjustable in the tube.

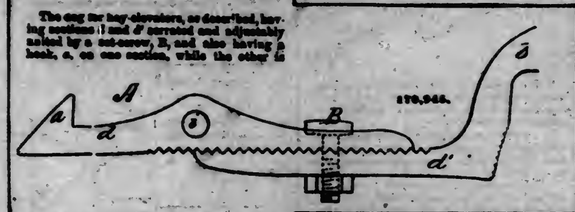


170,944. SEATER. Oliver Edwards, Florence, Mass. [Filed Sept. 4, 1875.]

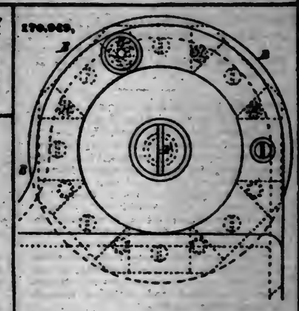
1. In a spring-skate, formed at its front with an inclined riser, A', and spring-support B, constructed and arranged to transmit the weight of the skater in executing toe movements from the spring B in a direct line through the riser A', the runner A, made with a projecting point, A', and of a greater width or thickness between the points A' A' at the junction of the riser with the runner, as and for the purposes described.

2. The heel-plate E, constructed at its extreme rear edge or portion with slotted strock-up ears F, placed at an angle to the direction of the runner, and inclined downward and forward, as shown in Fig. 2, with a slight curve outward at their top edges, substantially as described, whereby the heel is relieved from pressure of the spur slotted ends of the ears, and the slots thereof are brought into a position parallel with the instep, in such a manner that the strap will, when in position, draw equally across its width upon the instep, and in an almost direct or straight line downward, yet rigidly from the back or heel of the skate, as described, and for the purposes specified.

170,945. ANIMAL-POWERS. W. P. Emmert, Freeport, Ill. [Filed June 14, 1875.]



The combination of the pivoted or tilting web-frame C, the crank-shaft D, mounted in the frame A, and arranged above the frame C, the ratchet-wheel E, rigidly mounted on the said shaft, the counterweighted pawl or stop F, pivoted to the frame A, and arranged to engage the wheel E, and the flexible connections G G, attached to the said shaft and to the rear end of the frame C, substantially as and for the purposes specified.

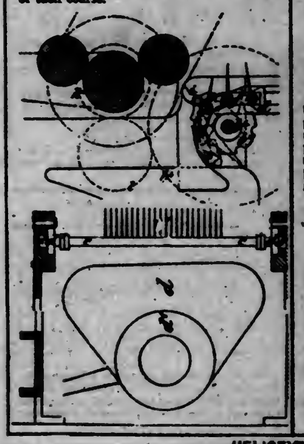


170,946. ADJUSTABLE LOCKS AND DOGS FOR HAT-BLOCKERS. Joseph B. Pitcheon, Centre Hall, Pa. [Filed May 6, 1875.]

Brief.—The catch-lever is formed of two pieces, adjustable as to length by interlocking serrated surfaces, a slot, and a clamp-screw.

The cog for hat-elevators, as described, having sections d and d' serrated and adjustably united by a set-screw, E, and also having a hook, a, on one section, while the other is

1. The combination of the endless sheets of fallers, their triangular tappets, the hollow beams on the tappets, in which the fallers are fixed, and the frame-guides, into which both the beams and tappets project, these members being constructed and operating substantially as set forth.



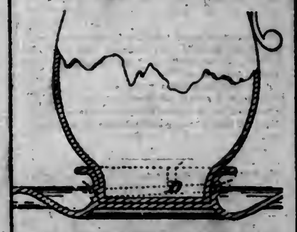
2. The combination of the two endless sheets of fallers, moving at different speeds, as set forth, and the rotating guides to control the inclination of the teeth of the first sheet at the moment of delivering the fiber to the second sheet, substantially as set forth.

3. The combination, with the frame, of the adjustable guides for the tappets and their beams, as set forth.

4. The triangular tappet d, constructed, as set forth, with rounded angles and a boss, d', for the purpose specified.

170,947. HEMP-HACKLING MACHINES. F. D. Frost, London, England. [Filed Mar. 4, 1875.]

Brief.—A hemp-heckling machine of that class in which the fiber, carried on an endless series of spurred fallers, is thence delivered to another endless series of spurred fallers moved faster than the first, revolving guides at the end of the first series facilitating the transfer, triangular tappets at the ends of the fallers, outside of their connecting-links, being controlled in their movement by guide-flanges above their bearings. Said flanges are inclined at their ends and horizontal the rest of their course.



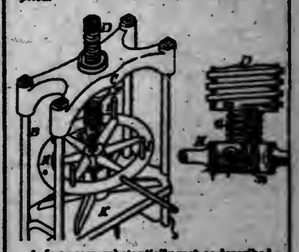
1. In a furnace for steam-boilers, the combination of a hollow arch-front and a hollow horizontal perforated air-flue, through which a portion of the air for the support of the combustion of the fuel passes, the air-spaces in the arch-front communicating with the ash-pit at their lower ends, and with the hollow horizontal flue at their upper ends, substantially in the manner and for the purpose set forth.

2. The combination of the hollow perforated arch-front A, the hollow perforated door, and the arch F, the parts being constructed and arranged with reference to each other, substantially as set forth.

3. The combination of the hollow perforated bridge-wall G, and the perforated flue F, the perforations in the wall being so arranged as to supply air to the gases after they have passed that point and those in the arch-flue, so as to supply air to the same while they are passing over the incandescent fuel upon the grates, substantially as shown and described.

170,948. COUPLING JOINT AND HANGING. Alcuin French, Philadelphia, Pa. [Filed Mar. 13, 1874.]

As a new article of manufacture, a combined jag or pitcher and metal cancer, secured together detachably, substantially as above described.



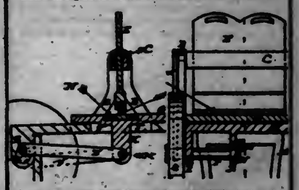
170,949. SCREW-CUTTING DIE HOLDERS. John J. Green, Hartford, Conn., assignor to the Pratt & Whitney Company, same place. [Filed Nov. 15, 1875.]

Brief.—The revolving and hollow cylinder is supported on trunnions, and the die-sockets are so placed that each shall be directly opposite another, in order that the rod that is being cut may pass unobstructed through the cylinder and out at the opposite side.

The revolving die-holder B, when provided with trunnions B B', which leave the center unobstructed, and an even number of openings, C, for holding the dies placed diametrically opposite each other on the barrel, substantially as and for the purpose herein described.

170,950. SCREW-PRESSES. A. Hathaway, Frostburg, Md. [Filed Sept. 28, 1875.]

Brief.—In rotating the hand-wheel to relieve the follower from pressure contact, the screws are caused to interlock, whereby the follower travels on the outer screw, having threads of course or "quick pitch." On removal of pressure contact, the screw-bolts unlock, and the pressure is administered by the screw-bolt having threads of fine or "slow pitch."



1. In a press, substantially such as described, the screw-bolts D G, combined to operate with the follower K, substantially as set forth and specified.

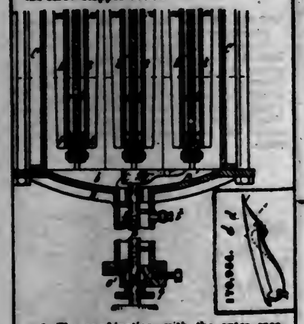
2. In a press, substantially such as described, the clutch a, arranged to operate in coupling the screw-bolts D G, substantially as specified.

3. In a press, substantially such as described, the follower K, provided with the socket E, in combination with the head S, wheel H, clutch a, and bolts D G, substantially as set forth and specified.

170,951. HAIR-HEARING MACHINES. Reuben Keogh, Brooklyn, E. D., N. Y. [Filed June 3, 1875.]

Brief.—A machine for arranging the root ends of hair. The hair is placed between the vibrating plate and bed, and as they rub against the heated surfaces of the latter, the hairs are pushed out head first on either side.

1. The combination of the elastic hair-bending rubber F described with the lower edge of the vibrating plate B, as and for the purposes set forth.



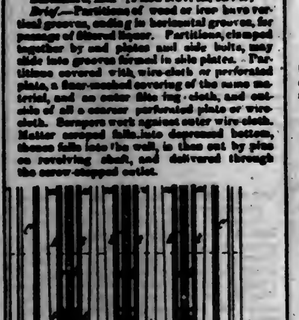
2. The combination of the vibrating bed G, having an elastic face, H, with the table-board of the frame A, shank K, connecting-rod I, crank H, and shaft F, substantially as described.

3. The combination of the vibratory plate B with the vibrating rubber bed G, said bed having a simultaneous and opposite vibratory mo-

tion to that of the lower end of the vibratory plate C by means of the crank H and T on the shaft F, arranged to operate in the manner and for the purposes substantially as described.

170,865. FRAMES FOR LOOMS HOLDING SOLID IMPLEMENTS. Elias S. Ruebhausen, Baltimore, Md. (Filed Nov. 12, 1874.)

Brief.—Partitions of wood or iron have vertical grooves, ending in horizontal grooves, for passage of filtered liquor. Partitions, clamped together by end plates and side bolts, may slide into grooves formed in side plates. Partitions covered with wire-cloth or perforated plate, a finer-meshed covering of the same material, and an outer filter-cloth, and outside of all a coarser perforated plate or wire-cloth. Scrapers work against outer wire-cloth. Matter scraped falls into depressed bottom, thence falls into the well, is then cast by pins on revolving shaft, and delivered through the center-stopped outlet.



1. The combination, with the outer case, filtering-partitions, and scrapers *m*, of the bottom plate B, constructed with a depression, A, forming a receptacle for the solid matter detached from the filtering-partitions by the scrapers, substantially as hereinbefore set forth.

2. The combination, with the outer case and filtering-partitions, of a head provided with depressions *i* and scraper *j*, substantially as and for the purpose hereinbefore set forth.

3. The combination, with the bottom plate B and reservoir *a*, of the shaft *p*, scraper *p'*, and agitating-arms *p''*, substantially as and for the purpose hereinbefore set forth.

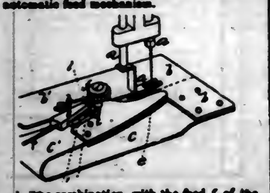
170,866. MEANS OF STRAPPING PACKAGES WITH WIRE. Rhinehart O. Hymes, New Orleans, La. (Filed Apr. 20, 1875.)

Brief.—For the purpose of preventing the breaking open of boxes and packages in transportation, a strap of metal wire of suitable size is coiled to surround the box or package in such manner that the ends lap, and each end terminates in a loop, which is secured to the box or package by any suitable fastening. The strap can be tightened by forming bends, curves, or loops in the same by means of an iron bar provided with a short bifurcated arm bent at a right angle at one end.

1. The metal wire strapping or bonging for boxes, barrels, cases, caddies, and other merchandise-packages, formed and applied substantially as described.

2. The means of tightening the strap after it is applied by means of loops, bends, or curves formed in the wire, in the manner substantially as set forth.

3. The wrench A, constructed in the manner and for the purpose described.



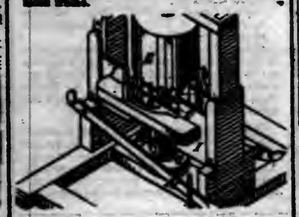
4. Wire strap F on the ends of the package, in combination with the straps surrounding the package, in the manner and form described, for the purpose of preventing the top and bottom of the package from separating.

170,864. FOUNTAIN-PENS. John Johnston, Boston, Mass. (Filed July 14, 1875.)

The improved fountain-pen described, consisting of the spring B, integral with the body A, in combination with the fountain C, provided with the integral journals *d d*, substantially as for the purpose set forth.

170,868. MACHINES FOR OUTTING AND BLACKING THE WELTS IN BOOTS AND SHOES. Thos. K. Keith, Haverhill, Mass. (Filed June 4, 1875.)

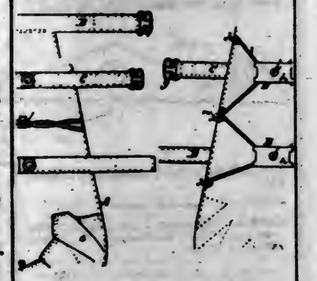
Brief.—A leather-sewing machine is provided with seam-welt trimming and blacking devices, which are made available by an automatic feed mechanism.



1. The combination, with the feed *f*, of the lever *g* and spring-pinch *d d*, substantially as and for the purpose described.

2. The combination of the blacking apparatus *a*, having the opening *a* open its under side, with the bar I, provided with openings *n* and *m*, substantially as and for the purpose herein specified.

3. The combination of the device *l*, *n*, *o*, with the spring *k*, substantially as and for the purpose hereinbefore set forth.



170,869. MACHINES FOR SAWING PELLETS. Thos. M. Kennedy and Eugene L. Willard, Keene, N. H. (Filed Sept. 20, 1875.)

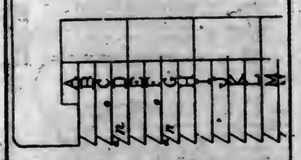
Brief.—Two billets or staves can be cut at the same time by means of a drum-saw, vertically journaled, with the teeth downward in a suitable frame, and secured by the head which carries the main pulley on a shaft standing in a water-way in the lower part of the frame-work, in connection with two independently and vertically adjustable carriages, operated by hand-levers, the inner ends of which are pivoted to the standards of the main frame.

The saw E, mounted on the vertical shaft C, and the vertically-adjustable carriage I, provided with the bed K, guards *o n* and lever N, combined and arranged to operate substantially as set forth and specified.

170,867. GLOVE-PADDLES FOR SWEEPING. Edward G. Kinsley, Stoughton, Mass., assignor to himself and Luther Belcher, Jr., same place. (Filed June 18, 1875.)

1. A flexible glove-paddle, A, provided with the finger-pockets *a b c d e*, and one or more spiders, E, substantially as described, arranged as specified.

2. A flexible paddle provided with finger-pockets *a b c d e*, confining-straps B C D, arm-band *a*, and one or more spiders, E, all being as and arranged substantially as specified.



170,870. FIRE-ESCAPES. John R. Lefferts, New York, N. Y. (Filed July 2, 1875.)

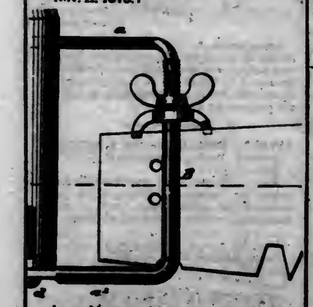
1. The combination of two metallic flexible fire-link ladder G with revolving apron or band D and the winding-crank H, substantially as and for the purposes described.

2. The combination of a fire-ladder and hand with the rail and snap-hook, substantially as for the purposes described.

170,871. GAGES FOR CUTTING INDEX-TABS. Melvin H. Lovell, Erie, Pa. (Filed June 12, 1875.)

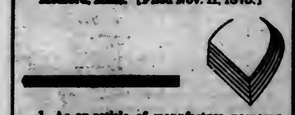
The device for cutting index-tabs, consisting of a sheet of thin metal notched at the edge, and having a slit extending inward from each notch, substantially as shown and described.

170,860. STEP-LADDERS. Melvin H. Lovell, Erie, Pa. (Filed Jan. 23, 1875.)



Brief.—The steps are notched, so as to fit over the two-part stile, and are secured in position by bolts, which pass through the ends of the steps and through the stiles. Cross-pieces are secured to the top portion of the ladder, and extend beyond the sides, between which the props are stowed, and by which the props are braced when the ladder is in use.

1. The steps D, in combination with the rivets R and stiles B B, substantially as shown, and for the purposes mentioned.



2. The combination of the cross-pieces M and P, having extensions *e* and *f*, with the brace C, for the purposes mentioned.

170,861. CROSSCUT-SAW HANDLES. Wm. Millspaugh, Middletown, N. Y. (Filed Nov. 11, 1875.)

In combination with a saw-handle, the slotted ball S, said ball being constructed with portions *a* and *a'*, connecting with the handle, and with suitable fastening device, whereby an open space is left between the end of the saw and handle, substantially as shown and described.

170,862. PREPARED LEATHER. O. Nichols, Medford, Mass. (Filed Nov. 11, 1875.)

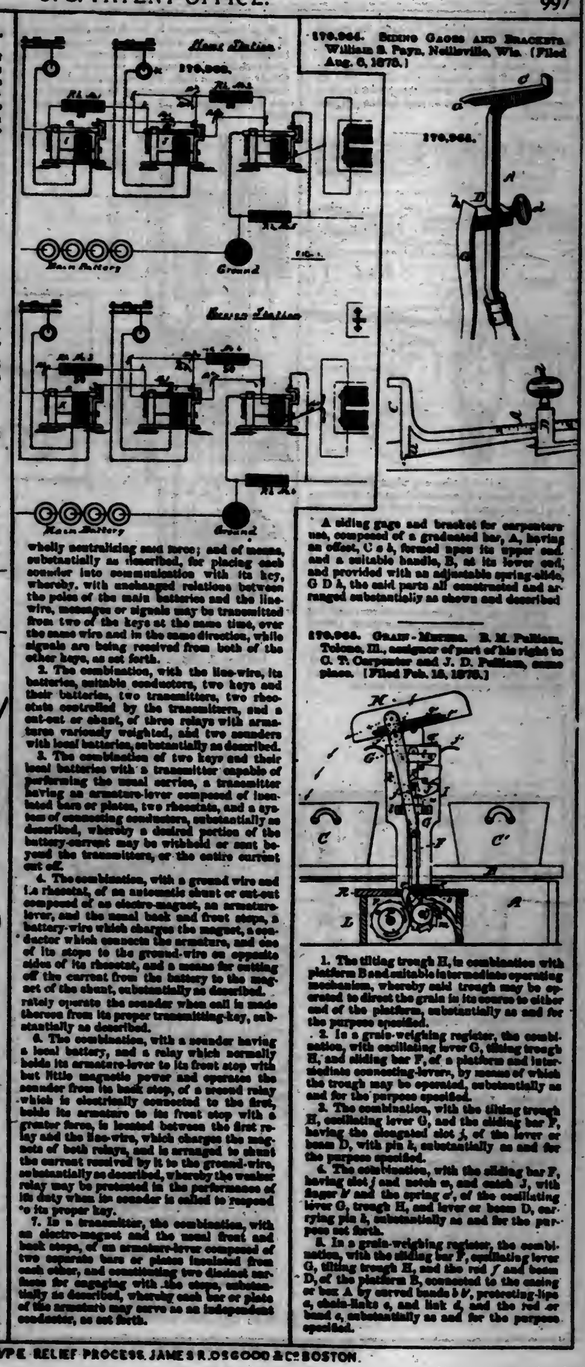
1. As an article of manufacture, prepared leather composed of pieces or splits of real leather or fibrous material, with an intermediate filling of torn or shredded leather, and an alkaline-resin paste, substantially as described.

2. The process of manufacturing prepared leather, consisting in mixing, with torn or shredded leather or shavings, an alkaline-resin paste, then the application of such mixed leather and paste between layers of leather or cloth, and rubbing, drying, and compressing the same into a uniform layer, substantially as described.

170,863. QUADRUPLEX TELEGRAPH. Jos. Olmsted, Providence, R. I. (Filed Nov. 2, 1875.)

1. The combination, substantially as described, with four keys, four sounders, a line-wire, suitable main and local batteries, and suitable intermediate conductors, of means for separately directing the battery-forces to the line-wire in three separate and unequal powers; means, substantially as described, for

2. The combination, with a sounder and its local battery, of two relay-magnets, with armatures variously weighted and arranged to operate wholly neutralizing and none; and of means, substantially as described, for placing each sounder into communication with its key, whereby, with unchanged relations between the poles of the main batteries and the line-wire, messages or signals may be transmitted from two of the keys at the same time, over the same wire and in the same direction, while signals are being received from both of the other keys, as set forth.



2. The combination, with the line-wire, its batteries, suitable conductors, two keys and their batteries, two transmitters, two rheostats controlled by the transmitters, and a cut-out or shunt, of three relays with armatures variously weighted, and two sounders with local batteries, substantially as described.

3. The combination of two keys and their local batteries with a transmitter capable of performing the usual service, a transmitter having an armature-lever composed of insulated bars or pieces, two rheostats, and a system of connecting conductors, substantially as described, whereby a desired portion of the battery-current may be withheld or sent beyond the transmitters, or the entire current cut off.

4. The combination, with a ground-wire and 1/4 rheostat, of an automatic shunt or cut-out composed of an electro-magnet, an armature-lever, and the usual back and front stops, a battery-wire which charges the magnet, a conductor which connects the armature, and one of its stops to the ground-wire on opposite sides of its rheostat, and a means for cutting off the current from the battery to the magnet of the shunt, substantially as described.

5. The combination, with a sounder having a local battery, and a relay which normally holds its armature-lever to its front stop with but little magnetic power and operates the sounder from its back stop, of a second relay which is electrically connected to the first, holds its armature to its front stop with a greater force, is located between the first relay and the line-wire, which charges the magnets of both relays, and is arranged to shunt the current received by it to the ground-wire, substantially as described, whereby the vanishing relay may be presented in the performance of its duty when its sounder is called to respond to its proper key.

7. In a transmitter, the combination, with an electro-magnet and the usual front and back stops, of an armature-lever composed of two separate bars or plates insulated from each other, and constituting two distinct surfaces for engaging with the stops, substantially as described, whereby each bar or plate of the armature may serve as an independent conductor, as set forth.

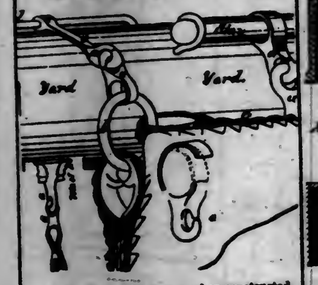
170,864. SEWING GAGES AND BRACKETS. William S. Payn, Neillsville, Wis. (Filed Aug. 6, 1875.)

A sliding gage and bracket for carpenters' use, composed of a graduated bar, A, having an offset, C a b, formed upon its upper end, and a suitable handle, B, at its lower end, and provided with an adjustable spring-slide, G D h, the said parts all constructed and arranged substantially as shown and described.

170,866. GRAIN-METERS. B. M. Pullman, Toledo, Ill., assignor of part of his right to G. T. Carpenter and J. D. Pullman, same place. (Filed Feb. 16, 1876.)

1. The tilting trough H, in combination with platform B and suitable intermediate operating mechanism, whereby said trough may be operated to direct the grain in its course to either end of the platform, substantially as and for the purpose specified.

2. In a grain-weighing register, the combination, with oscillating lever G, tilting trough H, and sliding bar F, of a platform and intermediate connecting-levers, by means of which the trough may be operated, substantially as and for the purpose specified.



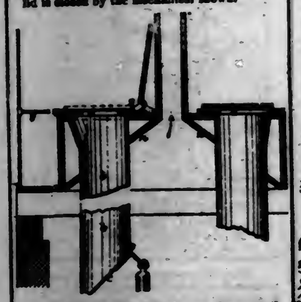
3. The combination, with the tilting trough H, oscillating lever G, and the sliding bar F, having the elongated slot *f*, of the lever or beam D, with pin *k*, substantially as and for the purpose specified.

4. The combination, with the sliding bar F, having slot *f* and notch *n*, and catch J, with finger *b'* and the spring *c'*, of the oscillating lever G, trough H, and lever or beam D, carrying pin *k*, substantially as and for the purpose set forth.

5. In a grain-weighing register, the combination, with the sliding bar F, oscillating lever G, tilting trough H, and the rod *f* and beam D, of the platform B, connected to the same at box A by curved hands *b b'*, protecting-lips *a*, chain-links *c*, and bar *d*, and the rod or band *e*, substantially as and for the purpose specified.

5. In a grain-weighing register, the combination, with a platform, intermediate operating-levers, and the sliding bar F and latchet r, of the registering mechanism, consisting substantially of the notched cylinders M N O, pin s, and drum P, with cross-bars p and finger q, constructed to operate as and for the purpose set forth.

170,966. SAIL-STRINGING HOOKS. Edwin D. Rankin, Cambridge, Mass., assignor to himself and John J. Hillman, same place. [Filed Oct. 7, 1875.]



1. The pair of hooks a c, when constructed with the reversed points and means of attaching them to the rails, stays, and other parts requiring to be connected or hooked together by them, substantially as described.

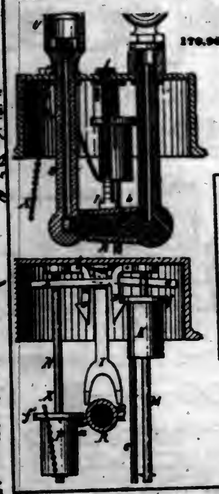
2. The combined hook and grommet, constructed substantially as shown in Figs. 2 and 3.

170,967. PIPE-VISE. Gustav Schumacher, New York, N. Y., assignor of one-half his right to R. D'Hervenne, same place. [Filed June 26, 1875.]

Brief.—The course of the ventilation is upward from the vault and out of the air-chimney. When the closet-door is opened the seat-lid is closed by the mechanism shown.

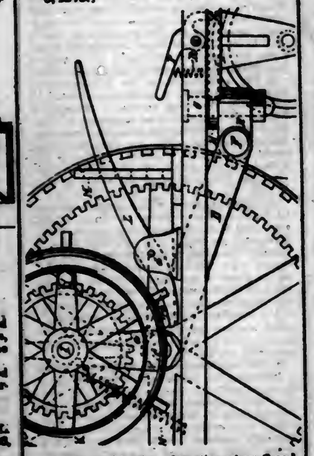
1. The combination of the tube h, provided at bottom with valve c, the sink A, spout n, and air-chimney f, substantially as and for the purpose set forth.

2. The combination of the hinged lid i, rod g, and door k, substantially as and for the purpose set forth.



170,968. STEAM AND VACUUM PUMPS. L. D. B. Shaw, Boston, Mass. [Filed May 26, 1876.]

Brief.—When the cone is filled with water, a float trips a catch and releases a weight, which, in falling, strikes an arm attached to a rotary valve, and allows steam to enter and expel the water from the cone.



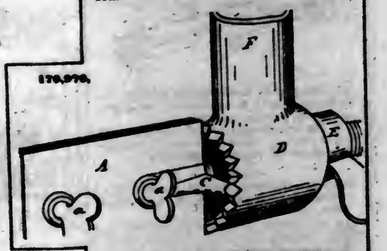
1. The combination of the steam-inlet pipe T, pressure-cylinder pipe S, cone C, and jacket R, provided with the openings b c, all constructed and operating substantially as specified.

2. The jacket R, provided with the lugs d d, in combination with the float W, chain X, pulley J, weights P K, hooks L O, and step I, all constructed and operating substantially as described.

3. A vacuum-pump in which the admission of steam and the relief of pressure are controlled by valve-mechanism operated by the alternate fall of two weights, which are alternately raised to their highest position by the rise and fall of a float resting on the water in the pump-cylinder, all substantially as set forth.

170,969. HAND-MOTIONS FOR STREET-CARS. Robert Steel and Samuel Austin, Philadelphia, Pa., assignors of one-third their right to Chas. J. Miller, same place. [Filed Nov. 6, 1875.]

1. The combination of traction-wheel S and pinions J J with the swinging frame D, substantially in the manner and for the purpose set forth.

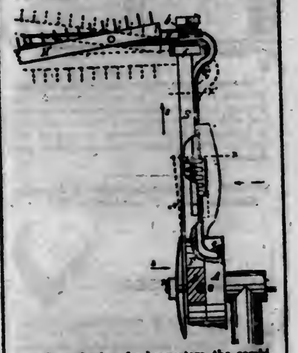


2. The combination of the levers L L with the swinging frame D and racks M M, for raising the wheel S above the road-bed and holding it in its elevated position, substantially as set forth.

3. The combination of the swinging frame D, swivel H, lever P, and spring R, whereby to give an oblique position to the traction-wheel S, substantially as set forth.

4. The combination of the steel bars S with the traction-wheel S, to prevent its slipping on lay road-beds, substantially as set forth.

170,970. CROSS-CUT-SAW HANDLES. Chas. M. Tanner, Defiance, Ohio. [Filed Nov. 1, 1875.]



Brief.—The saw is attached to the handle by means of two metal plates, one of which is extended to form the shank, and recessed to receive the portion on the other plate, and teeth of which are provided with lugs, in connection with a sleeve-socket having its inner edge serrated. The handle is secured in position by turning a nut upon the outer end of the shank, which causes the lugs to engage with the serrations on the sleeve-socket, and can be adjusted to any desired angle by loosening the nut. The plates are attached to the saw-plate by thumb-screws passing through both.

The plates A A, one having a full-length shank, B, partly cut away to receive the portion on the other plate, and each plate having the ears C C, the sleeve D, having the socket F, and the nut E, all constructed as and for the purpose set forth.

170,971. RAKE-HEADS FOR HARVESTERS. Royal G. Taylor, Brockport, N. Y. [Filed Mar. 22, 1876.]

Brief.—Overhung rod provided with mechanism for causing its finger, which carry swivelled and pivoted rake-heads, to act as rakes, and serves a continental platform.

1. In rod-rakes for harvesters, the combination of the sweep-rake head H and sliding rod c, formed with arm e, with the fixed contract L, constructed and arranged to operate substantially as and for the purposes set forth.

2. In combination with the rotatably-adjustable rod c the revolving or reversible head H, rack r, and pinion b, substantially as and for the purposes set forth.

3. The pivoted head H', carried upon the primary reversible head H, which has its axis upon the horizontal arm of the rod c, as shown and described, for the purpose of permitting the former to adjust itself to the position of the platform when required to act as a rake, and to be inverted when only required to rod.

4. In combination with the sweep-rake head H and pinion b the fixed locking-teeth e upon the shank d, which is attached to the arc B for the purpose of preventing the rake-head from revolving upon its axial shaft when the pinion is carried out of gear with the governing-rack r, as when in the act of discharging a gavel.

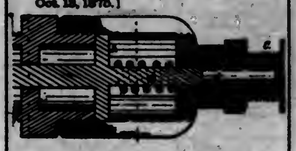
6. In combination with the sweep-rake head H, rod c, and cam-track L, the retaining spring F, arranged to operate substantially in the manner and for the purposes set forth.

7. The spring-tension-regulating cap E, in combination with the springs F and rods c, as and for the purposes set forth.

8. The segmental head-lever M, in combination with the semi-cylindrical rack J upon the radially adjustable and rocking rod c, for the purposes set forth.

170,972. HATCHETS. John A. Thayer, Cambridgeport, Mass. [Filed May 11, 1876.]

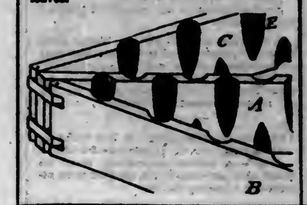
Brief.—The improvement consists of a hatchet-blade, hammer-head, curved claw for extracting nails, and box-scraper formed in one solid piece of metal, and provided with a tubular socket to receive a suitable handle.



As my invention the implement, as described and represented.

170,973. SPRINGS. Erastus H. Tyler, Medway, Mass. [Filed Aug. 26, 1876.]

As a new article of manufacture, the cruciate spring A, having the body B, provided with the fibrous covering D, secured to the same by means of the cement coating C, the fibrous covering being outwardly varnished with a water-proof varnish, all substantially as set forth and specified.



170,974. RELIEF-VALVES FOR CYLINDERS. William Westwater, Pittsburg, Pa. [Filed Oct. 19, 1875.]

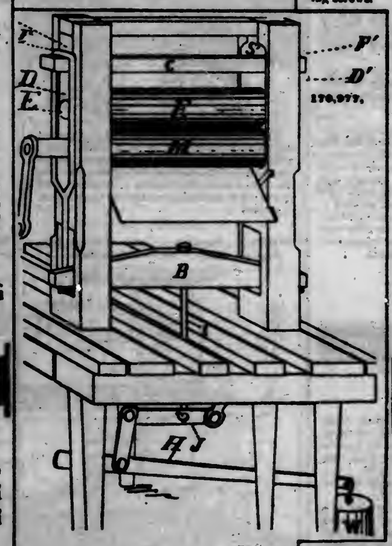
In a safety-valve for steam-cylinders, the combination, with the spring-pressed valve D, having stems c e, of the valve-seat provided with guides, the longitudinally-slotted cap E, hollow screw C, and jam-nut f, all arranged to operate substantially as set forth.

170,975. SUPPORTS-MOLDS. Albert S. Wetmore, Cleveland, Ohio, assignor to J. B. Lowy, same place. [Filed Nov. 24, 1875.]

Brief.—The mold is conveniently arranged, with a central third hinged part. The central part has half-conical openings on each of its sides, to register with the same in the outer leaves.

The suppository-mold herein described, consisting of the leaves A B C, each having the half-cavities E E cut in their faces, and hinged together as shown, and for the purpose set forth.

170,976. CORE-POPPERS. C. F. Wiskirpe, Cortland, N. Y. [Filed Nov. 6, 1876.]



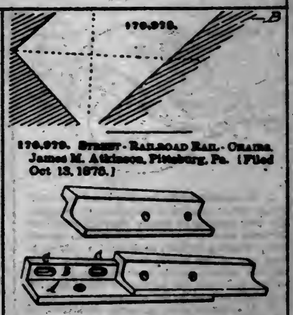
1. A core-popper having a body, A, of wire-cloth molded and bent to form at the lower edge a continuous fold or rim, c, as and for the purpose set forth.

2. The combination, with the body A and its rim c, of sheet-metal strips b, folded and clamped upon the rim c, as set forth.

3. The strap C, bent at the lower end, provided with a tongue or tongues, d, and combined with and applied to the body A, substantially as specified.

4. The combination of the plate C, bent to form a loop, e, a wooden handle slotted to receive the tang, and enlarged at its inner end, and a ferrule, g, as and for the purpose set forth.

170,977. WHEELBARROWS. Joseph A. Wilson, Chester, Vt. [Filed Feb. 26, 1876.]

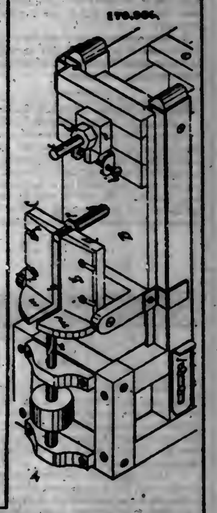


The combination of the rollers E H with the blocks D D', the cross-bar C, the rods F F', the cross-piece B, the rod I, the levers H J, and the weight W, all constructed and operating substantially as and for the purpose described.

170,978. OIL-WARMERS. Alphonse Allain, Paris, and Alfred R. Dejean, Alais, France. [Filed Feb. 26, 1876.]

Brief.—The cavity consists of a parallelogram, having at its base a triangle, whose sides have an angle of forty to fifty degrees with its base—*i. e.*, a mean of forty-five degrees.

The segmental and stationary table B, having in each segment one or more grooves, C, of angles, as specified, and reversed toward the fore part of the table, as and for the purpose described.



170,979. STREET-RAILROAD RAIL-CHAIRS. James M. Atkinson, Pittsburg, Pa. [Filed Oct 13, 1876.]

The shoe S, consisting of base-plate A and flange or side plate B, raised from the edge of said base, and provided with oblong longitudinal slots O, substantially as and for the purpose specified.

170,980. BORING-MACHINES. George W. Badger, Malden, Mass., assignor to Geo. P. Coe, same place. [Filed Oct. 20, 1876.]

Brief.—The machine is intended for boring the holes in boot-trees to receive the spreading screws.

1. The sliding carriage B, with its pivoted holder C, adjustable stop p, adjustable plates f f, and stop m, in combination with a cord-lug-bit and a stop or gage for regulating the forward movement of the carriage, operating substantially in the manner and for the purpose set forth.

2. The adjustable plates f f and stop m, in combination with the holder C, substantially as and for the purpose described.

3. In combination with the sliding carriage B, an adjustable stop or gage, and a projection for regulating its forward movement, and a boring-bit, two laterally-movable post or holders r', arranged in a plane at right angles to that of the boring-bit, substantially as and for the purpose set forth.

170,981. WOOD-BENDING MACHINERY. G. B. Bailey, Boston, assignor to E. A. Gillett, Boston, Mass., and O. S. Gillett, Buffalo, N. Y. [Filed Aug. 24, 1876.]

Brief.—Double or open curves are made in timber by means of two formers. The piece is then leached and taken out to dry or "set."

170,881.

1. In machinery for bending wood into double or reverse curves, or other irregular shapes, the two moving or rotary shaping-blocks or formers, arranged as herein described, so that their shaping-surfaces shall form a continuation one of the other, in combination with flexible straps, one for each former, between which the wood to be bent is confined, substantially as and for the purposes set forth.

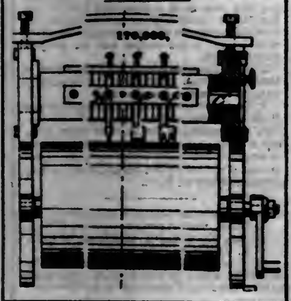
2. The combination, as herein described, of the following elements, namely: two moving or rotary curved shaping-blocks, abutting end to end, and arranged so that their shaping-surfaces shall form a continuation one of the other; flexible binding-straps, one for each former, and clamping devices, which confine the straps and the fastened wood about the formers when the wood is bent, and combination being for operation as set forth.

3. In combination with the abutments I, the forming-blocks attached thereto by a dovetailed connection, substantially as and for the purposes set forth.

4. In combination with the former d, provided with the forward nose l, the hook f and key n, whereby the outer end of the wood and the flexible strap are confined to said former.

5. The combination of the forming or shaping blocks d, carried by the carriage B, with the abutments I and stops s, substantially as and for purposes stated.

170,882. VENTS. Edward B. Bohlers, St. Louis, Mo. [Filed Nov. 6, 1875.]



Brief.—The device consists of a rubber tube operated by an interior spiral spring; and said tube is fitted by a perforated knob into a receiving-tube, the latter having communication with the barrel by a downward-extending channel. The cliff in the rubber tube supplies air on the opening of the thumb, but closes tight when the thumb is closed.

1. The combination of a receiving-tube, being open at one end, and having a bottom vent-tube, with a rubber tube fitted by a spiral supporting-spring, and a perforated knob into the receiving-tube, and provided with a bottom slit, substantially in the manner and for the purposes set forth.

2. The detachable rubber tube or plug of a barrel-vent, being supported by a spiral spring attached to a perforated closing knob, and provided with a short longitudinal slit, substantially as specified.

170,883.

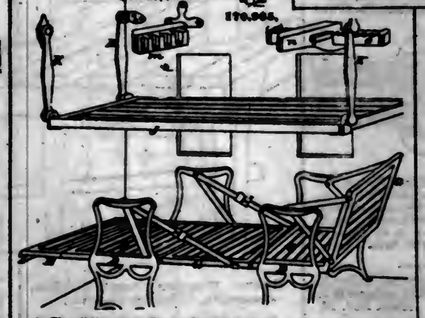
170,884. LEATHER-DRESSING MACHINE. Bert M. T. Blank, Jersey City Heights, N. J., assignor to Morris Rubens, New York city. [Filed Nov. 6, 1875.]

1. In a machine for creasing and polishing leather, the combination of a receiving feed-roller with a series of adjustable creasing and polishing dies, secured to a hollow heating tube or case, substantially in the manner and for the purposes set forth.

2. The combination of the heating tube or case, provided with front grooves, with suitable dies secured and adjusted by set and gage screws, substantially in the manner as set forth.

3. The combination of the heating tube or case, terminal-in sliding and spring-cushioned bearings, with a locking device, for holding the tube or case in fixed position while in operation, and adapted to swing in an inclined position for removing or inserting the dies, all substantially as and for the purpose set forth.

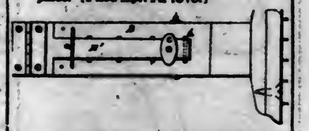
170,885. SCREW DIE-PRESSES. H. Blundell, Providence, R. I. [Filed Nov. 6, 1875.]



Brief.—A fine left-hand thread, to carry an adjustable stop, is cut on the ordinary large or coarse right-hand thread on the spindle of the ordinary fly-press or screw die-press.

The combination of the spindle *a*, provided with a right-handed screw of the usual pitch, and a left-handed screw of less pitch cut on the thread of the same at its upper part, with the stop *b* and clamp-screw *c*, arranged and operating substantially as and for the purpose described

---



170,886. SLEEPING CARS. Joseph Bolt, Benicia, Cal. [Filed Oct. 4, 1875.]

1. The sliding seats B and C with their extensions B, in combination with the backs G, as supported as to lie between the seats and form a continuous bed-bottom, substantially as and for the purposes described.

2. The attachments, consisting of the stationary rest n and the adjustable rest n, for the purpose of supporting guns, substantially as described.

170,887. CARPET-STRETCHERS. Samuel S. Calhoon and John Kinnear, Millersburg, Ohio, assignors to Saml. S. Calhoon, same place. [Filed Apr. 14, 1875.]

The combination of the cross-pieces J J and their extension-slides H H', supporting bars b b, and buttons c c, with the frames A B, substantially as and for the purpose set forth.

170,888. SAFETY-LOCKS FOR FIRE-ARMS. F. Chillingworth, Providence, R. I. [Filed Nov. 24, 1875.]

1. In connection with a gun-trigger, a safety-bolt, E, substantially as and for the purposes described.

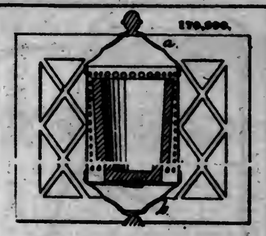
2. In a trigger-guard, the notch G, substantially as and for the purposes described.

170,889.

1. In combination with the ice-box S and steam chest F, the blower H and conduit J, substantially as and for the purpose set forth.

2. The receiver A, shelf B, and chute C, in combination with the conduit J, box S, and blower H, substantially as and for the purpose described.

170,890. AUTOMATIC FANS. Augustus F. Goodman, Brooklyn, N. Y., assignor of one-half his right to Jose Fernandez, same place. [Filed June 1, 1875.]

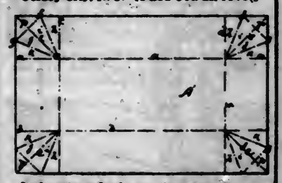


Brief.—Relates to the method of securing the fan-blades.

A fan-wheel consisting of the blades B, B, B', and B'', each curved so that its two edges are in different planes, and the under blade B' having the slot b to receive the edge of the upper blade B'', substantially in the manner and for the purposes described.

170,891. EVAPORATORS. G. F. J. Colburn, Washington, D. C. [Filed Nov. 24, 1875.]

Brief.—A pumice evaporating vessel inclosed by a perforated case, adapted to be attached to a heating device.

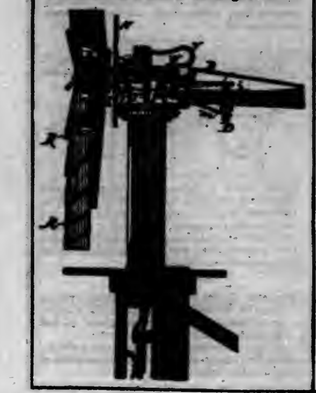


170,892.

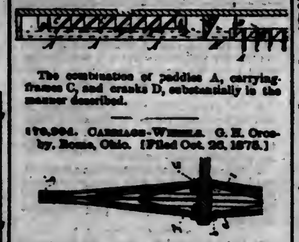
1. The combination of a porous evaporator with a perforated exterior holding case or receptacle, substantially as and for the purpose set forth.

2. The perforated cylindrical case having inclosed ornamental ends *a b* and longitudinal opening or slot *c*, attached to the face of a hot-air register, for holding a porous vessel, substantially as set forth.

170,893. PAPER BOXES. S. B. Conover, Jersey City, N. J. [Filed Oct. 21, 1875.]



1. A rectangular box made with quadruple folds *h i j k* in the corner, substantially as herein shown and described.



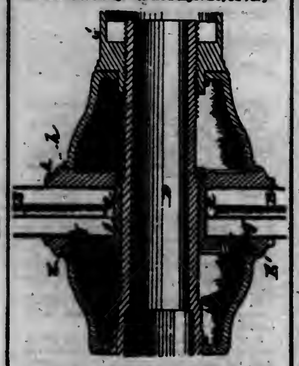
2. A rectangular box made with quadruple folds *h i j k* in the corner, and with the triangular look *p* folded over each corner, substantially as specified.

170,894. WHEELBARROW. Wilbur F. Corvallius, Muncie, Ind., assignor of one-half his right to P. F. Davis, same place. [Filed Sept. 20, 1875.]

Brief.—The main vase is fastened in a frame made of a single piece of timber, curved lengthwise each way nearly to the end, so that it makes four prongs. Two of the prongs are spread apart for the outside rim, and the other two are spread out to make the center-brace for the vase. The vase is pivoted on the cap, and held in position by means of a spring. Immediately back of the wheel is a sternvase, held forward by means of a spring. When the wind blows hard the vane is thrown back, turning the shaft, so that the wheel will mesh with a corresponding wheel on the back of the wind-wheel, causing the rotation of the shaft. When the two vanes are brought together a catch pivoted on the main vane will engage with a ratchet and hold the vane there, thus also holding the mill out of gear.

170,895. WIND-MILLS. Robert W. Davis, Flushing, N. Y., assignor to the Davis Metallic-Wheel-Manufacturing Company, New York city. [Filed Apr. 20, 1875.]

The combination of peddles A, carrying-frames C, and cranks D, substantially in the manner described.



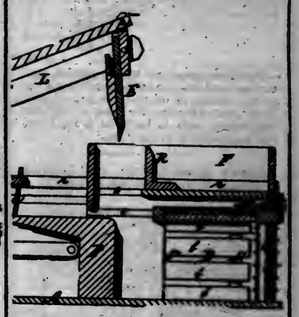
170,896. CARRIAGE-WHEELS. G. H. Crosby, Bonne, Ohio. [Filed Oct. 26, 1875.]

The herein-described wheel, consisting of the felly A, made of T-iron spokes D, having an eye in each end, whereby they are secured to the hub and felly by means of rivets, hub F, having flanges a, collars G, and bolts or rivets b', with or without the straps H'', substantially as described, and for the purpose set forth.

170,897. LAMP-WICKS. Aaron M. Daniels, Hartford, Conn. [Filed Oct. 20, 1875.]

A lamp-wick composed of a central part, consisting chiefly of cotton or vegetable fiber, with a covering of wool or animal hair felted onto it, substantially as herein specified.

170,898. WIND-MILLS. Robert W. Davis, Flushing, N. Y., assignor to the Davis Metallic-Wheel-Manufacturing Company, New York city. [Filed Apr. 20, 1875.]

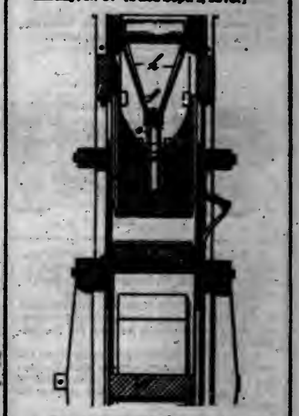


1. The combination of an axle-box, D, the bushing C applied thereto, the snake-receiving or center-piece portion *a*, carrying an enlarged opening, 4, in one of its sides, and a ring, H, adapted to said opening, for holding the spokes in place, substantially as described.

2. The combination of the metallic shells F, the center-piece A, having an enlarged opening, 4, the ring H, spokes E, having notches *g*, and the screw-cap G, all substantially as and for the purpose described.

170,899. BALING-PRESSES. P. K. Dederick, Albany, N. Y. [Filed Apr. 6, 1875.]

Brief.—Devices for feeding and heating the material into the press-box are used to increase the rapidity of feed and double up the material. The size of the opposite end of the press-box is regulated by adjustable plate and a roller.



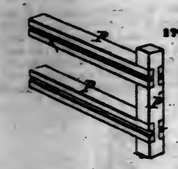
1. In a baling-press, the combination of the heater or feeder E with the lever L and rod *d*, for the purposes herein set forth.

2. The combination of the feed-box F and rake E with the counterweak rod *r*, extending throughout the entire length of the box, and projecting beyond both ends thereof, substantially as described, for the purposes specified.

3. In a press having its front end open, the side plate *b b*, secured in adjustable standards *p p*, substantially as and for the purpose described.

4. In a press having its front end open, the roller C, combined with an adjusting-brake, substantially as and for the purpose described.

170,900. BALING-PRESSES. P. K. Dederick, Albany, N. Y. [Filed Sept. 1, 1875.]

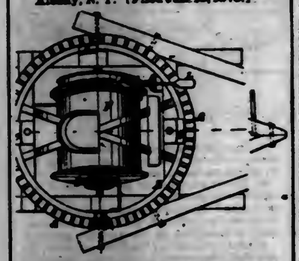


1. In a press having the bale-chamber smaller than the press-box, beveling the mouth of the bale-chamber, substantially as described.

2. The toggle-joint *e f*, in combination with the crank *l* and piston E, substantially as and for the purpose set forth.

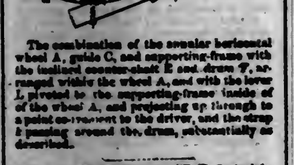
3. The crank *l*, constructed to strike upon the piston E, when the latter is at a point where it cannot be driven toward the press-box by the action of the toggle-joint alone, in combination with the toggle-joint and the piston, substantially as and for the purpose set forth.

4. Hinged spring-seated retaining-pistes, in combination with the press-box of a baling-press for the purpose described.



170,901. BALING-PRESSES. P. K. Dederick, Albany, N. Y. [Filed Sept. 1, 1875.]

170,999.



Partition-strips for baling-presses, constructed with one or more longitudinal grooves for the passage of the tie-wires, and adapted to be inserted between the bales through the longitudinal slots in the sides of the press-box, substantially as described.

171,000. HORSE-POWERS. P. K. Dederick, Albany, N. Y. [Filed Jan. 18, 1875.]

The combination of the annular horizontal wheel A, guide C, and supporting-frame with the inclined counter-shaft E and drum F, arranged within the wheel A, and with the lever L, pivoted to the supporting-frame inside of the wheel A, and projecting up through to a point convenient to the driver, and the strap k passing around the drum, substantially as described.

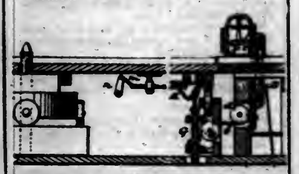
171,001. HORSE-POWERS. (P. K. Dederick, Albany, N. Y. [Filed May 28, 1875.]

1. The armless drive-wheel B, having two inside faces provided with cogs or teeth, in combination with the pinions *c c* and shaft C, substantially as shown and described.

2. The fixed ring A, combined with the shaft C, the outer rotating ring B, and the horizontal sweep, substantially as and for the purpose set forth.

3. The pulley D, mounted loosely upon the shaft C, in combination with the shaft E, gearing *d b b g*, double cog-rims *b b'*, and pinions *c c'*, substantially as and for the purpose described.

171,002. STOVE. William Donovan, New York, N. Y. [Filed Sept. 13, 1875.]



Brief.—A means for preventing escape of foul gases from stoke-hole when not in use.

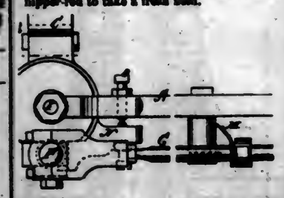
In combination with a strainer-plate, *a*, provided with a threaded depression, *b*, the stopper *d*, provided with threads *e* and handle *f*, as and for the purpose described and set forth.

171,003. DRAW-BRIDGE GATES. Otto Roehe, Milwaukee, Wis. [Filed Dec. 6, 1875.]

Brief.—The vertically-sliding gate is connected by a rope and pulleys with a grooved sliding bar, provided with a friction-roller and guide-rollers, operated by an inclined sliding frame attached to the bridge. The frame is drawn off the friction-roller of the sliding bar by a hand-lever and connections, so as to permit the gate to rise before the bridge starts, if desired.

1. The combination of the vertically-sliding gate D, rope or chain *b*, pulleys *d d*, grooved sliding bar G, guide-rollers *c c*, and friction-roller *l*, for the inclined frame H to operate upon, substantially as and for the purposes herein set forth.

2. The combination, with a bridge-gate, D, and vertically-sliding bar G, connected therewith, of a sliding inclined frame, H, arranged to be moved off and on the sliding bar, for the purposes herein set forth.



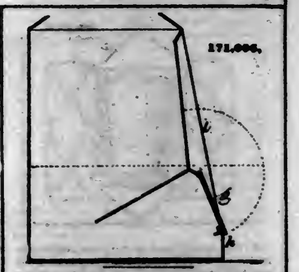
3. The combination of the sliding frame H, rod A, link *k*, shaft I, with arms or cranks *a a'*, connecting-rod L, lever J, and catch *p*, all substantially as and for the purposes herein set forth.

171,004. COMPOSITIONS FOR COVERING METALLIC SURFACES. James Ferguson, Bridgewater, Mass., assignor to Bridgewater Iron Company, same place. [Filed Nov. 16, 1875.]

For preventing the adhering of heated metallic surfaces, the composition consisting of graphite, chloride of sodium, and water, substantially as above described.

171,005. NAIL-PLATE FEEDERS. William H. Field, Taunton, Mass. [Filed Nov. 27, 1875.]

Brief.—The grapers are attached to an oscillating disk. The push-rod is connected to a cam-lever, which is caused, when the rod strikes the machine, to bear against a roller on the movable griper-jaw, and force said jaw against the nipper-rod. A spring retracts the push-rod and cam-lever, to release the jaw and allow the gripers to move back on the nipper-rod to take a fresh hold.

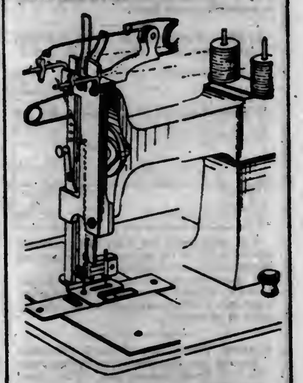


1. The combination of rod G and cam-lever F with jaws C and D, when said rod is arranged to be moved forward by the machine and backward by a spring, and jaw C is pivoted suitably for swinging forward and backward to feed the rod, substantially as specified.

2. The combination of bracket N and adjusting-screws O P with lever F and jaw C, substantially as specified.

3. The combination of supporting-bar A, actuating-rod G, cam-lever F, and the feeding-jaws, the latter being pivoted to the supporting-bar, substantially in the manner described.

171,006. CARRIERS. Jos. S. Field, Brooklyn, N. Y. [Filed July 12, 1875.]

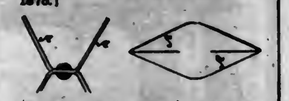


The canister made with the buttresses *f f* at each side of the front portion, and with the swinging flap *g* between and protected by such buttresses, and hinged at the top and closing at the bottom against the ledge *h*, as set forth.

171,006.

171,007. SEWING-MACHINES. S. W. Francis, Newport, R. I. [Filed Oct. 7, 1875.]

Brief.—The machine can be used as an ordinary single-seam shuttle-machine, or to make a number of seams.



1. The combination, with the main shuttle-carrier, of the slotted arm, forming adjustable connection with the auxiliary shuttles, as described, so that the movement of the primary or main shuttle shall be directly transmitted to and partaken of by the auxiliary shuttles, as shown and described.

2. The combination, with the needle-bar, of the primary or main needle, of a slotted arm and adjustable auxiliary needle-clamps, as described, so that the auxiliary needle or needles shall be adjustable on said slotted arm, and the movement of the main needles shall be directly transmitted to and partaken of by the auxiliary needles, substantially as herein shown and described.

3. In combination with the adjustable auxiliary shuttles and needles, arranged and operated as described, the elongated feed and presser feet, substantially as herein shown and described.

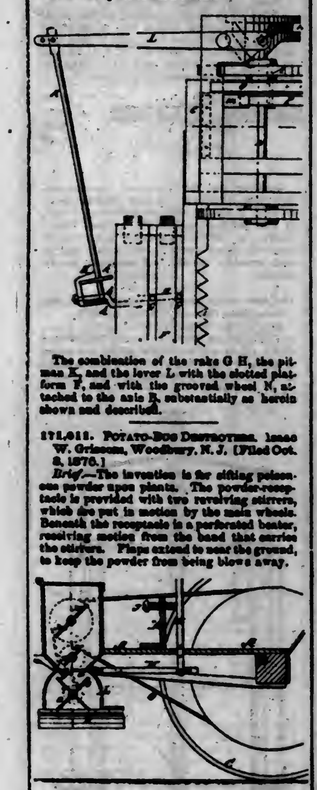
171,008. WIRE-PIERCE RAZOR. Henry N. Frantzen, Dunleith, Ill. [Filed Sept. 25, 1875.]

The barbs A, formed by cutting thin sheet metal into diamond form, slitting them from the acute angles nearly to the centers, and bending the prongs at each end at an angle with each other to adapt them to be twisted into a two-strand wire-cord, substantially as herein shown and described.

171,009. HAND-PIERCER FOR DENTAL DRILLS. John W. Gilbert, Philadelphia, Pa., assignor to Samuel S. White, same place. [Filed Nov. 10, 1875.]

Brief.—A locking-slide closes the path by which the lug on the tool enters a shouldered recess in the socket.

171,009.



1. The combination of the slotted tool-socket, the interlocking slide movable endwise and externally on the tool-holder, and the locking-spring encircling the tool-holder.

2. The combination of the casing, the power-driven shaft rotating in bearings therein, and perforated and slotted to form a tool-holder, a tool provided with a radial lug on its shank, the spring encircling the shaft, and the locking-slide actuated by said spring, to lock the lug on the tool-shank in the slot in the tool-holder, substantially as herein before set forth.

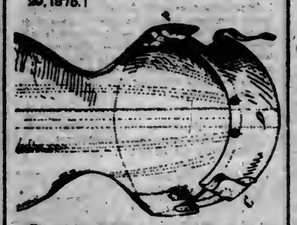
3. The combination of a dental-tool socket, formed substantially as described, and a locking-slide operating to close the path by which the lug on the tool enters a shouldered recess of said socket, substantially as herein before set forth.

171,010. SELF-RAKES FOR REAPERS. Saml. B. Gilliland, Salisbury, Mo. [Filed Aug. 30, 1875.]

Brief.—The rake, whose head operates below the slotted platform, sweeps the grain therefrom by its inward stroke.

The combination of the rake G H, the pitman K, and the lever L with the slotted platform F, and with the grooved wheel N, attached to the axle B, substantially as herein shown and described.

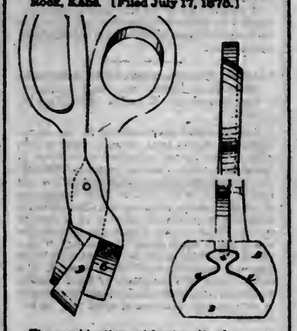
171,011. POTATO-BUG DESTROYERS. Isaac W. Grissom, Woodbury, N. J. [Filed Oct. 8, 1875.]



Brief.—The invention is for sifting poisonous powder upon plants. The powder-receptacle is provided with two revolving stirrers, which are put in motion by the main wheels. Beneath the receptacle is a perforated beater, receiving motion from the band that carries the stirrers. Flaps extend to near the ground, to keep the powder from being blown away.

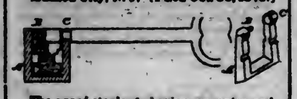
1. The combination of the slide G, the bar H, the pivoted lever I, the adjusting-screw J, and the right upright K with the hopper E F and the platform or frame A, substantially as herein shown and described.

2. The combination, with discharge-chamber I, of a distributer, O, consisting of perforated blades or beaters, as shown and described, in order that the powder may be struck as it falls and atomize before it reaches the plants.



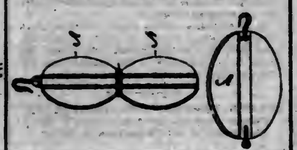
3. The combination, in a hopper having lower discharge-chamber, of stirrer M, feeder N, and distributer O, arranged substantially as and for the purpose specified.

171,012. ABDOMINAL CORSETS. Cathrine A. Griswold, New York, N. Y. [Filed Oct. 20, 1875.]



The abdominal supporter C, formed of a central band, D, and curved side bands D', the former attached to front of corset, and the latter to side stays or hip-bands, as shown and described, for the purpose of throwing the usual strain upon the hips and shoulders.

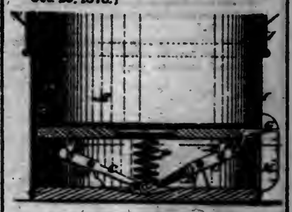
171,013. SHEARS FOR CUTTING HOGS' NOSES. William H. Grow and Crawford M. Sloan, Rock, Kans. [Filed July 17, 1875.]



The combination, with plate B, of an oval-curved blade, C, having the middle offset *c'* wider on the upper than lower part, as and for the purpose specified.

171,014. KNIVES FOR LOCKS. W. H. Guthrie, Hudson City, N. J. [Filed Oct. 30, 1875.]

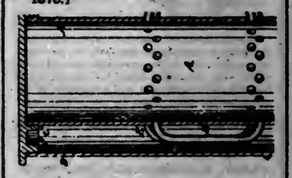
The guard-staple A, having an outer and inner key-hole-closing arm, provided, respectively, with a beveled outer surface, and inwardly-projecting lug B, and with a divided or split eye, C, in combination with a key having a socket and groove for journaling the guard, all constructed and arranged substantially as herein set forth and shown.



171,015. BONNET-FASTENERS. E. K. Hall, Boston, Mass. [Filed Oct. 20, 1875.]

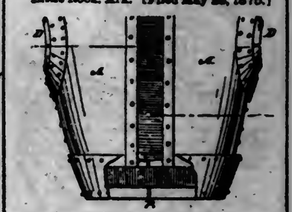
1. As a new article of manufacture, a bonnet-fastener, consisting of the body A, provided with the hook *a* or its equivalent, for securing the fastener to the bonnet, and the eye or loop *c*, adapted to receive a hair-pin for securing it to the hair, as shown and described.

2. A bonnet-fastener, substantially such as described, with a hinged plate, A', arranged to fold against the body A, and clasp a ribbon or ornament, substantially as shown and described.



171,016. SPRING-SCALES. Abram Harper and L. W. Cross, Edgerton, Ohio. [Filed Oct. 20, 1875.]

1. The combination, with the measure A, of the knife-edge pivots B, levers C, spring F, pointer G, and scale H, substantially as specified.



2. The combination of case I, measure A, and the weighing-levers and spring, substantially as specified.

171,017. UPRIGHT TUBULAR BOILERS. N. C. Heaton, New York, N. Y., assignor to W. B. Snyder, same place. [Filed Aug. 21, 1875.]

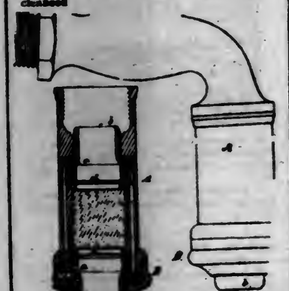
The combination of boiler A and case D, with cap C, having flanges *c' c''*, of which the former is threaded on the inside and works on the outside threaded edge of boiler while the latter rests against the inside edge of case, as shown and described, for the purpose specified.

171,018. LIFE-PRESERVERS. B. Hempstead, Little Rock, Ark. [Filed May 26, 1875.]

A life-preserver, made of wood, in sections, A, connected and hinged to each other by rubber strips B, and provided with a rubber band, C, around the waist, and with rubber D around the seat, waist, and arm-holes, substantially as herein shown and described.

171,019. CORN-HUSKING IMPLEMENTS. E. W. Hill, Decatur, Ill. [Filed Sept. 13, 1875.]

1. In a corn-husker, the bowl E, arranged to be adjusted on the bar A by means of the screw-thread, substantially as shown and described.



2. The bar A, when arranged with the button D on the inside of the bar, and with the said bar provided with holes *e e e e* for the adjustment of the strap C, substantially as shown and described.

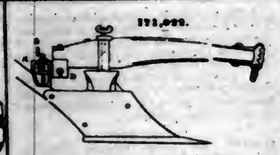
171,019.

171,020. REVERSIBLE FILTERS. Edward C. Houghton, Cambridgeport, assignor to U. C. Walworth, Boston, Mass. [Filed June 10, 1875.]

Brief.—When the filter becomes clogged the shell or case may be removed and inserted in a reversed position: thus the filter will be cleansed

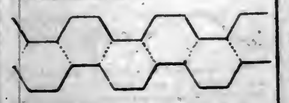
The improved reversible filter, as described, the same consisting of the body A, having a removable cap, B, the reversible case C, provided with removable bands a a, having sockets b b, the diaphragms d d, and a chamber to receive the filtering material, the whole being constructed, combined, and arranged in manner and so as to operate substantially as set forth.

171,021. HARVESTING-MACHINES. Wm. M. Howe, Austin, and Geo. H. Howe, Winnebago City, Minn. [Filed July 17, 1875.]



1. A revolving pasteboard, H, provided with a series of teeth or projections, h, and provided at its base with a circular serrated knife or series of blades, h', substantially as described.

2. The combination, with a revolving platform, H, having a series of teeth or projections, h, and a series of grooves or channels, h', and provided at its base with a circular serrated knife or series of blades, h', of the finger or arm I and plate M, substantially as and for the purpose set forth.



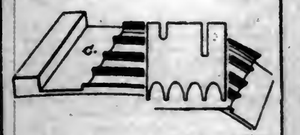
171,022. PLOWS. Henry H. Hahley, Central Manor, Pa. [Filed Oct. 30, 1875.]

Brief.—Two metallic bases with connected traversing screws for the vertical and lateral adjustment of the rear end of the plow-beam.

In combination with the plow handles and beam, the case A and its traveling screw R, for vertical adjustment, and the case D and traveling screw W, for lateral adjustment of the plow beam, the intervening nuts of each screw being connected by a rigid stem, the whole arranged and operated as and for the purpose specified

171,023. MANUFACTURE OF HEXAGONAL NUTS. Geo. Johnson, Haverstraw N. Y. [Filed Nov. 13, 1875.]

1. The method herein described of manufacturing hexagon nuts by forcing or shaping the bar by dies or rolls to form alternating semi-hexagonal projections and recesses, and admit the cutting-off of the nuts at one cutting plane only, substantially as and for the purpose set forth.

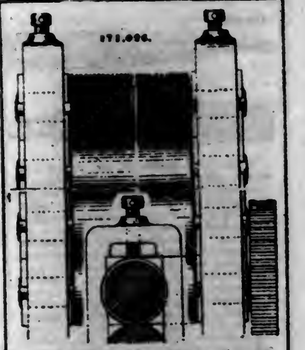


2. A blank or bar for making hexagon nuts, made with alternating semi-hexagonal projections and recesses at both sides, substantially as specified.

171,024. MANUFACTURE OF IRON AND STEEL. Ephraim A. Jones and Josh A. Jones, Middleborough, England. [Filed July 14, 1875.]

The described improvements in the manufacture of iron or steel, which consist in first effecting the partial reduction or removal of the carbon, silicon, and phosphorus, or a portion of any one of them, contained in the pig iron or metal in a cupola or other furnace by the means herein set forth, and then effecting a further reduction or removal of a further portion of the carbon, silicon, and phosphorus contained in such metal in a rotary or un chemical furnace, the iron or metal from such cupola or other furnace being charged, in a molten state, into the rotary or other furnace where puddling is effected by mechanical means in such manner that iron or steel may be obtained.

171,025. MANUFACTURE OF GRAIN-CRADLE FINGERS. Christopher P. Kelsey, Richmondville, N. Y. [Filed June 17, 1875.]



Brief.—The grain-cradle fingers are formed of a straight piece of timber, connected at the ends, and then bent to the desired shape upon a mold or crimping-iron provided with longitudinal flanges, which project up between the fingers, and hold them securely while being bent, whereby a whole set of fingers is formed at one operation, and from a single piece of timber.

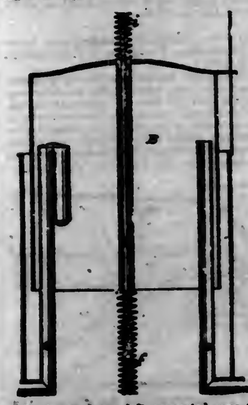
1. The iron crimp or mold C, cast with longitudinal flanges, substantially as shown, and for the purpose specified.

2. The grain-cradle finger, formed of a straight piece of timber, attached at the ends, and then bent to the desired shape upon the mold C, substantially in the manner and for the purposes set forth.

171,026. PROCESSES OF ORNAMENTING DRY PAPER. Geo. La Monte and John H. Hall, New York, N. Y. [Filed Dec. 6, 1875.]

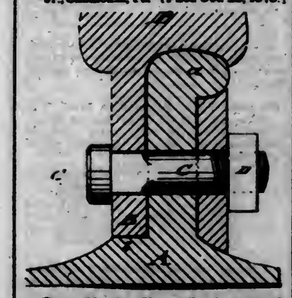
The process of ornamenting paper by passing it while dry between a pair of metallic rolls, one of which is figured, and afterward finishing its general surface between calender-rolls, substantially as shown and described.

171,027. SWING-JOINTS FOR ESCORE AND HANDLES. Edward M. Lockwood, Meriden, Conn., assignor to himself and Chas. Page. [Filed Sept. 20, 1875.]



Brief.—The claim sufficiently points out the invention; the ball shaped end of the shank moving as a universal joint, and the cylinder-shaped only in vertical line, but both forming an inexpensive swing-joint by casting the socket in a single piece around them.

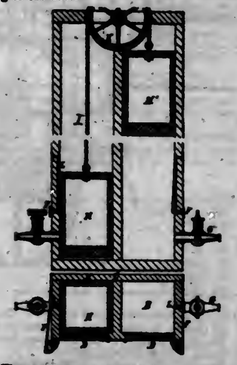
A swing-joint for hoobs and handles, consisting of the shank c, having a protuberance, c', upon or around which protuberance is cast, in one piece, the socket b, provided with a stem, a, so that the said shank and protuberance will swing freely in said socket and be held securely therein, substantially as described.



171,028. GAS-HOLDERS. Louis Marks, San Francisco, Cal. [Filed Oct. 9, 1875.]

Brief.—The holder is provided with a central tube, which slides on a guide-rod, around which, above and below the holder, are coiled spiral springs, for regulating the action of the holder, and thus preventing flickering or jumping of the lights.

The inverted vessel B, supported upon the central upright guide-post G between the spiral springs J J, substantially as and for the purpose described.

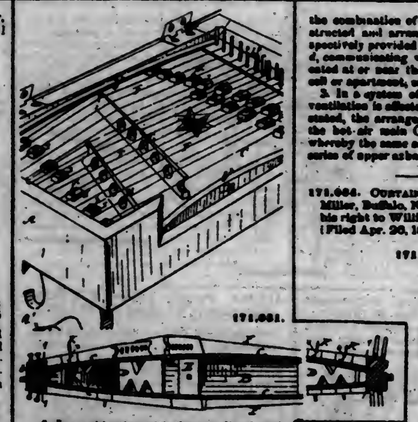


171,029. RAILROAD-RAILS. Geo. H. Mayer, Jr., Shamokin, Pa. [Filed Oct. 23, 1875.]

The combination of base-rail A, having head a and seat b, the correspondingly-constructed cap rail B, and the plate E, fitting closely under head a, and on feet of base-rail, all fastened together by bolts and nuts C D, as shown and described.

171,030. PIPE-ESCAPES. Wm. McAllister, Lawrence, Mass. [Filed Nov. 9, 1875.]

Brief.—Two counterbalanced chambers, connected by a winding rope, alternately rise and fall in an oblong vertical casing, divided longitudinally. A vertical series of doors extends along the front of each compartment, and a stop-cock at the bottom gives the compressed air the function of a cushion to the descending chambers, which finally strike and release an inner and outer catch, to permit the opening of the door.



The air-escape, substantially as specified, composed of the two cars H H', connected by a rope, I, going over a wheel, K, as described, and of the two vertical chambers A B, their stop-cocks, doors D D, springs E E, latches F F, and latch-actuators L L, all arranged essentially in manner and to operate as set forth.

171,031. DULCIMERS AND SIMILAR MUSICAL INSTRUMENTS. James A. McKenzie, Minneapolis, Minn. [Filed Aug. 31, 1875.]

Brief.—Of the dulcimer kind; in this the strings are mounted above and below a sounding-board, and are arranged to be struck by a hammer in the hand of the player. The sounding-board and its frame can be turned upon end pivots, and the strings of both sides utilized.

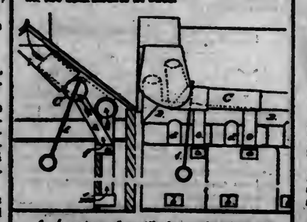
1. A musical instrument constructed with a frame supporting two sounding-boards and two sets of strings or wires, and arranged to be reversed within a case or frame, substantially as described.

2. A musical instrument constructed with a grooved frame, B, supporting two sets of strings or wires, F F, on opposite sides, the sets of strings or wires being arranged to be played upon alternately, substantially as shown and described.

3. In combination with the sounding-board and strings of a musical instrument, the bridges C and H, all constructed and arranged to operate substantially as described.

4. An adjustable fret-block, f, having inclined upper surface I, in combination with the strings, and with an adjustable fret, K, substantially as set forth.

5. In a stringed musical instrument, the combination of the grooved frame B, sounding-board C, and stretchers D D and E, substantially as shown and described.



171,032. COMB-FOUNDS. Fredk. J. Meyers, Covington, Ky. [Filed Oct. 21, 1875.]

The helical wires M and F, of which one is adapted to receive the other, on the principle of a nut and screw, which constitutes parts of the popper and handle, respectively, and enable their nearer and easy attachment and separation, as explained.

171,033. VENTILATING PASSAGES AND OTHER BUILDINGS. Patrick Milan, Cambridgeport, Mass. [Filed Nov. 9, 1875.]

Brief.—The air passes from flues at the upper and lower part of the room through separate ducts, said ducts opening into independent mains, which have a common axis. The mains are made of an increasingly greater diameter from the outer to the inner extention end, as shown. The damper and rod enable the janitor to control the hot-air exhaust of all the apartments at once.

1. A system of ventilation, embracing a duplex (or upper and lower) exhaust, in which each exhaust is provided with separate independent pipes or ducts leading from the apartment to be ventilated, and connected with separate and independent main exhaust flues located above the apartments to be ventilated.

2. In a system of ventilation combining the principle of a duplex exhaust, as described, the combination of the mains C and D, constructed and arranged as set forth, and respectively provided with ducts or pipes c and d, communicating with register openings located at or near the top and bottom of each suit or apartment, substantially as shown.

3. In a system of ventilation to which the ventilation is effected by a fuel-or exhaust, as stated, the arrangement of a damper within the hot-air main C, substantially as shown, whereby the same serves to control the whole series of upper exhaust-openings, as set forth.

171,034. CURTAIN-FIXTURES. Charles H. Miller, Buffalo, N. Y., assignor of one-half his right to William Manning, same place. [Filed Apr. 20, 1875.]

The combination, with the curtain-roller and pulley B, provided with steps d, of the automatic safety-catch F, constructed with overhanging part f, and operating substantially as hereinbefore set forth.

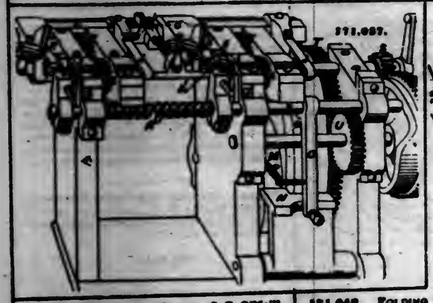
171,035. WATCH-CLEANING FLUIDS. A. Monnier, Sacramento, Cal. [Filed Aug. 27, 1875.]

The compound herein described for cleaning watches, jewelry, and other articles, consisting of distilled water, pure castile-soap, and epsomite of potassium, the proportions being substantially as herein described.

171,036. TRIPOD DRAWERS. W. H. Moore, San Francisco, Cal. [Filed Feb. 10, 1875.]

The sliding drawer B, having the recesses O in its sides, in combination with the extended sides or legs d, and the strips f f and combination A, substantially as and for the purpose described.

171,037. SCREW-THREADING MACHINES. Edward Nugent, Brooklyn, N. Y. [Filed Nov. 22, 1875.]

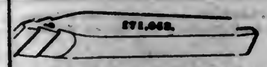


Brief.—Two mains on a rock-shaft movable longitudinally by a spring and a cam, and rotated by a cam through the medium of the former and arm. A reciprocating slide has arms that actuate screw-drivers, and with each cutter is arranged a movable die, which, co-operating with a stop, gripes the blank during the threading operation.

1. The shaft A, carrying two or more cutters, A', in combination with the arm O, spring F, and cams Q and M, substantially as and for the purpose set forth.

2. The feeding device B, having the spring H, in combination with the bar C, cam D, and slotted Y, substantially as and for the purpose set forth.

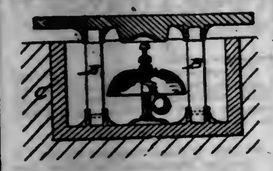
3. The feeding device B, thumb V, and bar C, in combination with the arm J and screw-driver I, substantially as and for the purpose set forth.



4. Two or more cutters, A', arranged up a straight line on a single shaft, in combination with two or more feeding devices, B, and two or more screw-drivers, I, all arranged and operating substantially as and for the purpose set forth.

171,037.

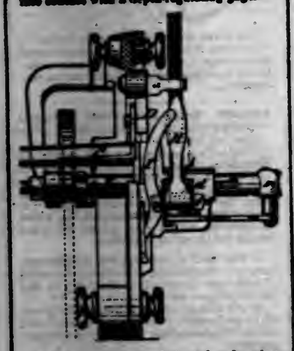
171,040.



171,042.

A nail, having a toothed or indented head tapered or reduced to a point or edge at its out er end, as and for the purposes shown and set forth.

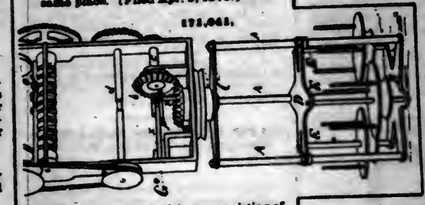
171,038. BASE-BALL BASES. J. C. O'Neill, St. Louis, Mo. [Filed June 10, 1875.]



Brief.—To the base is attached a hidden ball, with mechanism to sound the same upon sudden and forcible pressure of its top.

An improved base for the game of base-ball, constructed with a case or box, elastic supporting-column, cap-plate, and a ball or other sounding device, arranged to be operated substantially in the manner and for the purpose set forth.

171,039. SAW-GUMMERS. John W. Parker and Thomas Parker, Chicago, Ill. [Filed June 10, 1875.]



Brief.—The cutter-arbor and feed mechanism are supported in a sliding carriage upon an auxiliary frame, pivoted at its apex to the main frame, and adjustable, in virtue of a curved slot in its free end, to present the cutter to the saw-teeth at any desired angle. The lower end of the feed-screw is journaled in a sliding box, with a combining-spring attachment, and is provided with a worm-wheel and crank-disk. The worm-wheel is thrown into gear with the worm upon the cutter-shaft by a cam-lever, held down by a curved guard-arm, which is automatically tripped, to release the lever and stop the feed, by coming into contact with a depth-regulating gage.

1. The combination of pivoted and spring-acted cam-lever with fulcrumed guard-lever and depth-regulating gage for interrupting feed of cutter-shaft, in the manner described.

2. The combination of crank-disk of feed-screw, by pivoted connecting-link, with pivot-pin, socket-sleeve, and groove of cutter-shaft to produce reciprocating motion of shaft simultaneously with the revolutions of the same, substantially as set forth.

171,041. CORDAGE-MACHINES. John A. Peckham, New Haven, Conn., assignor of one-half his right to Charles A. Stoken, same place. [Filed Apr. 9, 1875.]

171,041.

1. The herein-described frame, consisting of the three posts indicated by the letter A, the two like plates B and D, constructed and arranged to hold the spindles denoted by the letter E, in the manner described, and the top plate C, all the said parts constructed and arranged substantially as described.

2. The piece c and frame C, in combination with the piece p and pin r, substantially as and for the purpose set forth.

171,042. FOLDING CHAIRS. F. A. Paine, New York, N. Y. [Filed Apr. 17, 1875.]

An improved folding chair, formed by the combination of the side bars A D, the arms E, the brace bars F, and the rounds $a' a^2 a^3 f$, that receive the back B and seat C, with each other, substantially as herein shown and described.

171,043. CORDAGE-MACHINES. John A. Peckham, New Haven, Conn., assignor of one-half his right to Charles A. Stoken, same place. [Filed Apr. 9, 1875.]

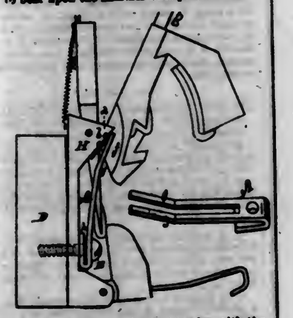
171,043.

1. The herein-described frame, consisting of the three posts indicated by the letter A, the two like plates B and D, constructed and arranged to hold the spindles denoted by the letter E, in the manner described, and the top plate C, all the said parts constructed and arranged substantially as described.

2. The piece c and frame C, in combination with the piece p and pin r, substantially as and for the purpose set forth.

171,044. FRUIT-PRESERVING JARS. T. J. Price, Macomb, Ill. [Filed Mar. 24, 1874.]

Brief.—Unglazed earthenware saturated with salt-brine, dried, and interiorly coated with lime.



A porous fruit-jar, saturated with a solution of salt, and lined on the inside with lime, substantially as and for the purpose set forth.

171,045. TOY TRUNDLER. J. F. Robertson, Chester, N. Y. [Filed Sept. 22, 1875.]

The toy trundle herein described, consisting essentially of the handle A, velocipede-frame B, wheel C, with its crank-axle c, and the jointed toy figure D, all constructed and arranged to operate substantially as and for the purposes set forth.

171,046. UPRIGHT-PIANO ACTIONS. Chas. R. Rogers, Boston, Mass., assignor to the Rogers Upright-Piano Company, same place. [Filed Oct. 28, 1875.]

Brief.—Relates to the peculiar spring used to bear upon the hammer-butt pivot.

1. The springs f f, in combination with the hammer pivot-pin b and pivot-supporter H, provided with the oval bearings k, all constructed and arranged as set forth.

171,047. STRINGING AND TUNING DEVICES FOR PIANO-FORTES. Charles R. Rogers, Boston, Mass., assignor to the Rogers Upright-Piano Company, same place. [Filed Oct. 28, 1875.]

Brief.—The slack of the strings being first taken up on the pins, the strings are then brought to pitch by screws arranged to move the pins and the frames in which they are set.

1. The combination of the slotted slide E, its straining-pin F and operative screw G, all arranged as set forth.

2. The combination of the slotted slides E E, their straining-pins F F and screws G G, with the string-frame B and the lugs f f to extend from it, or a separate bar applied to it, as described.

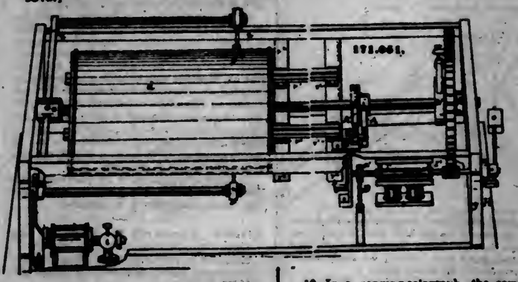
3. The separate bar D, provided with the hook c, and the series of lugs f, all arranged as and for application to the string-frame B and the slides E, as specified.

171,048. FLOCK-WASHING MACHINES. Asa U. Russell, Great Barrington, Mass., assignor to F. A. Russell, same place, and C. E. Blake, New York city. [Filed Sept. 20, 1875.]

Brief.—The flock and water pass, through a spout in the "washer," into a screen situated below the latter, where the fibers are trapped, while the liquid flows off.

The flock washing or treating apparatus formed of the outer box C, made with an open top, and provided with a discharge-opening at its bottom, and the inner box D, made smaller than the box C, with open bottom and top, supported with its lower edge a little above the bottom, and its upper edge a little above the top of the said box C, having the space between it and the box C at one end separated from the spaces between the sides of said boxes, and provided with a screen, F, at said end, in combination with the discharge-spout B of the washer A, substantially as herein shown and described.

171,049. METORETS FOR CONCENTRATING SULPHUROUS ACID. Jos. Saunders, Brooklyn, N. Y. [Filed Nov. 10, 1875.]



1. A glass retort for concentrating sulphuric acid, having a spout or nozzle, B, of the same thickness of the point of its attachment as the side of the retort to which it is attached, and an aperture, E, with inwardly-turned edges and smooth finish, as and for the purposes set forth.

2. In combination with the retorts A and funnels D, the adjustable tubes C, for connecting a series of retorts in the process of concentrating sulphuric acid, as set forth.

171,050. COPYING-TELEGRAPH. Wm. B. Sawyer, New York, N. Y. [Filed Nov. 6, 1875.]

In a copying-telegraph, the method of preparing a message for transmission, consisting in transferring the message to a metallic plate or metallic surface, sprinkling the transfer with an insulating material, subjecting the same to the action of moisture, and hardening the resultant raised surface by heat, light, or chemical action, as set forth.

171,051. AUTOGRAPHIC TELEGRAPHS. W. B. Sawyer, New York, N. Y. [Filed Nov. 6, 1875.]

171,051.

1. In a copying-telegraph, the combination, with transmitting or recording mechanism, having a less speed of motion than the actuating mechanism, of an electro-magnetic regulator, operated by a line-current, as set forth.

2. In a copying-telegraph, the combination, with transmitting or recording mechanism operated by friction, of driving mechanism having a greater speed of motion than the transmitting or recording mechanism, as set forth.

3. The method of operating a copying-telegraph, consisting in carrying the contact style or stylus transversely over or around a cylindrical surface, each style moving in one continuous direction, instead of moving back and forth, substantially as shown and described.

4. In a copying-telegraph, the combination, with a thread-shaft, of a transmitting or recording style or stylus and a semi-cylindrical surface, so arranged that the revolutions of the shaft shall both advance the semi-cylindrical surface longitudinally, and give the style or stylus a transverse circular motion in respect of the cylindrical surface, as set forth.

5. In a copying-telegraph, a semi-cylindrical car, moving upon a railway, substantially as shown and described.

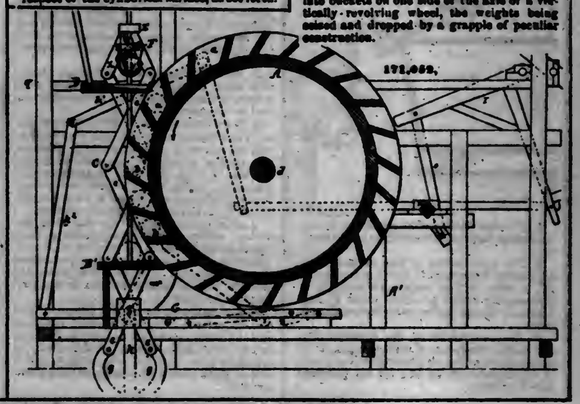
6. In a copying-telegraph, a semi-cylindrical transmitting or receiving car, as set forth.

7. In a copying-telegraph, the method of keeping the instruments at different stations in synchronism, and maintaining the steadiness of their motion, consisting in the employment of friction to actuate the transmitting or recording mechanism, in combination with an electro-magnetic regulator, so that the motion of the transmitting or recording mechanism may be arrested without arresting the motion of the motive or driving mechanism, as set forth.

8. In a copying-telegraph, the combination, with transmitting or recording mechanism, of a friction-connection, situated between the same and the motive power, as set forth.

9. In a copying-telegraph, the combination, with transmitting mechanism operating in one direction, of recording mechanism operating in the opposite direction, or vice versa, substantially as set forth.

10. In a copying-telegraph, the combination, with a semi-cylindrical car, of a curved frame for holding the message-blank in place, as set forth.



11. The combination, with the car d, of the point f', to engage in the thread of a shaft, as set forth.

12. In mechanism for maintaining synchronous motion of different instruments, a detent which yields to the force of advancing mechanism through neutralization by a line-current of the force which held the detent in the path of the mechanism, as set forth.

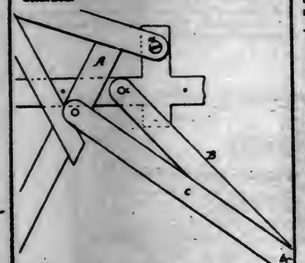
13. In a copying-telegraph, the combination, with transmitting or recording mechanism, of a magnet operated periodically by a local battery to change the circuit of the line, as set forth.

171,052. APPARATUS FOR TRANSMITTING MOTION. James L. Scott, Brooklyn, N. Y. [Filed Dec. 3, 1875.]

Brief.—Motion by hand, transmitted through a series of levers, operates a pair of lazy-tongs, which alternately raise and deposit weights into buckets on one side of the axis of a vertically-revolving wheel, the weights being raised and dropped by a grapple of peculiar construction.

171,052.

1. The extension-frame C carrying a grapple, F, combined with the platforms B B', and with the wheel A, as set forth.



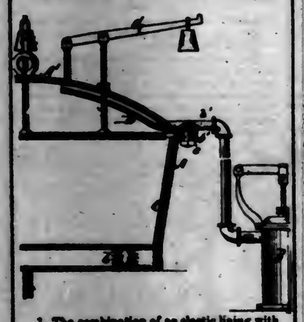
2. The combination of the extension-frame C, lever J, rock-frame I, and their connecting arms and rods, as specified.

3. The combination of the extension-frame C and the grapple, consisting of the bar N, arms f f, elastic arm f', and trigger w, substantially as set forth.

4. The combination of the extension-frame C, lever O, and curved arms g, and link h, as described.

171,645. MECHANICAL MOVEMENTS. James L. Scott, Brooklyn, N. Y. (Filed Nov. 6, 1875.)

Brief.—The operation of the pivotal levers produces a gradually increasing and then decreasing power as the frame to which they are attached.



The combination of the pivoted arm A, the lever B, having its fulcrum near the pivot of the arm A, and the bar C, connected to both arm and lever and forming an acute angle with the latter, all as set forth.

171,646. REMEDIES FOR RHEUMATISM. Aug. Severin, New York, N. Y., assignor to himself and Frederick Ernshäuser, same place. (Filed Oct. 6, 1875.)

The composition of iodide of potassium, solid extract of conium, vine of colchicum, morphine, and compound syrup of sarsaparilla, substantially in the proportions herein described.

171,647. APPARATUS FOR FILTERING LIQUIDS. Thomas R. Sinclaire, New York, N. Y., assignor to Sinclaire Rectifying-Machine Company, same place. (Filed July 6, 1874.)

1. The combination of an elastic lining with a filtering-vessel, substantially as herein specified.

2. The combination of the automatically-adjustable diaphragm E with a filtering-vessel, A, either with or without the air-tight or hermetically sealed or closed cover A', substantially as and for the purposes herein specified.

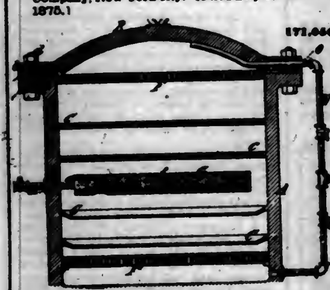
3. The combination of the automatically-adjustable diaphragm F with an air-tight or hermetically sealed or closed filtering-vessel, A A', substantially as and for the purposes herein specified.

4. The combination of the adjustable diaphragms F and K with a tapering or conical filtering-vessel, A, substantially as and for the purposes herein specified.

5. The combination of the adjustable diaphragms F and K, either or both, with an air-tight or hermetically sealed or closed tapering or conical filtering-vessel, A A', substantially as herein specified.

6. The combination of lever mechanism with a diaphragm and a filtering-vessel, substantially as herein specified.

7. The combination of the following elements: the air-tight or hermetically sealed or closed tapering or conical filtering-vessel A A', the pipes or orifices D and M, (one or more of each,) and the adjustable diaphragms F and K, either or both, substantially as herein specified.



8. The combination of the following elements: a forcing apparatus, B, a filtering-vessel, A, with or without the air-tight or hermetically sealing or closing cover A', and the adjustable diaphragms F and K, either or both, substantially as herein specified.

9. The combination of springs with a diaphragm and a filtering-vessel, substantially as and for the purposes herein set forth.

10. An apparatus for filtering, clarifying, or rectifying liquids, consisting of the following parts: an air-tight or hermetically sealed or closed tapering or conical filtering vessel, with or without the lining C, an induction and an eduction pipe or orifice, a forcing apparatus, an adjustable diaphragm or follower, F, and an adjustable diaphragm or piston, K, whereby, when filtering under pressure, any channels formed between either the vessel or lining and the filtering material, or in the filtering material itself, may be closed up, substantially as herein set forth.

11. The combination of an adjustable diaphragm, K, with a conical or tapering filtering-vessel, substantially as specified.

171,648. APPARATUS FOR FILTERING LIQUIDS. Thos. R. Sinclaire, Brooklyn, N. Y., assignor to Sinclaire Rectifying-Machine Company, New York city. (Filed May 6, 1875.)

1. The combination of the following elements: a filtering-vessel, A, with or without the cover B, and with or without the forcing apparatus M, the receiver or distributer G, and the obstructing ledges, deflectors, or shelves C D E, any or all, substantially as herein specified.

2. The combination, with a filtering-vessel, of a cover or top diaphragm provided with ledges, shelves, or deflectors, substantially as and for the purpose specified.

3. The combination of a filtering-vessel, A, with or without the cover B, and with or without the bottom R, either or both, the obstructing shelves or ledges C, the receiver or distributer G, when the latter is arranged substantially parallel with the said obstructing-ledges C, all with or without a forcing apparatus, M, substantially as herein specified.

4. The combination of the following elements: a filtering-vessel constructed to filter liquid under pressure, the receiver G, the obstructing shelves or ledges C, the diaphragms F and F', all with or without the forcing apparatus M, substantially as and for the purpose herein specified.

5. The combination of the following elements: an air-tight or hermetically sealed or closed filtering-vessel, a receiver or distributer, bottom ledges, shelves, or deflectors, an induction pipe or orifice, a diaphragm, and a forcing apparatus, substantially as shown and specified.

171,649. FLOCKING CLOTH. H. N. Slater, Webster, Mass. (Filed Oct. 5, 1875.)

The improvement in the art of flocking cloth, such consisting in employing the flock within a bag or tube composed of the cloth in whole or in part, substantially as set forth, while the said bag or tube is being subjected to the action of the felting-mill, as specified.

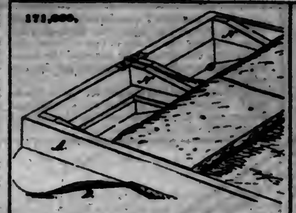
171,650. REVERSIBLE CENTER-PIECES FOR WATCHES. Frank E Smith, San Jose, Cal. (Filed July 7, 1876.)

The U shaped spring e fitted in a mortise, c, in the arbor d, and having the projecting ends or points e i, in combination with the notches a a in the axial bore of the pinion B, substantially as and for the purpose described.

171,650. REVOLVING FIRE-ARMS. D. Smith, Springfield, Mass. (Filed Oct. 9, 1875.)

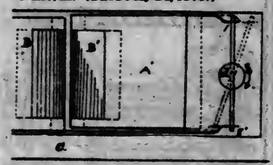
The extractor-plate a, provided with a projection, A, extending rearward of the front face of the recoil-shield a, and having a peripheral shoulder, c, in combination with a catch, t, upon the hammer, operating through the recoil-shield to draw the extractor-plate from its recess in the rear face of the cylinder, and extract two or more shells from the chambers of the cylinder simultaneously, substantially as described.

171,650.



171,656.

171,652. FOLDING LOUNGES. C. Stockhan, Indianapolis, Ind. (Filed Jan. 24, 1874.)



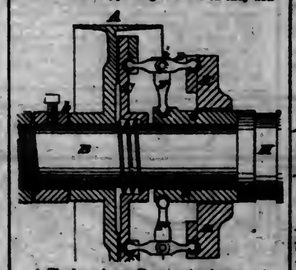
171,653.

1. A seat-post D of a lounge proper, supported by the springs E, and adjusted vertically by means of the knotted cord I, substantially as and for the purposes set forth.

2. The frame A, provided with the inclined blocks N, as described, whereby, when the hinged frame is opened or unfolded, the head sections of the mattress are supported by the inclined blocks, substantially as set forth.

171,654. STEREOSCOPES. John F. Steward, Plano, Ill. (Filed July 24, 1875.)

1. Stereoscopic glasses, made transversely adjustable, for the purpose specified, substantially as described.

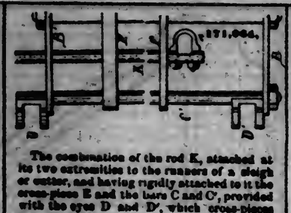


2. The intercepters B B', in combination with the glasses A A', for the purpose specified.

171,655. PROCESSES OF PRINTING PHOTOGRAPHS. Benjamin Sweezy, San Francisco, Cal. (Filed Dec. 20, 1874.)

The described process of printing photographic pictures with ornamental backgrounds by placing a background negative or film entirely over the picture or original negative and next to the collodion side thereof, substantially as and for the purpose set forth.

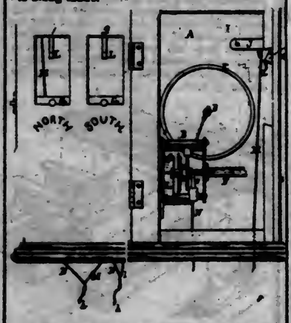
171,656. CLOTHES-DRIER. Alfred Burtonin, San Francisco, Cal. (Filed Oct. 20, 1875.)



Brief.—The clutching-disk is moved by a double knee-lever or toggle closely against the side of the pulley, to cause the two to move together by friction. The knee-levers are made to stand at a small angle between the disk and the support against which they act.

1. The knee-levers D, operating between the cam U and the support E, in combination with the operating-arm F and the sliding clutching-ring H, substantially as and for the purpose herein described.

2. In combination with the loose pulleys A, disk C, and the support E, the levers D D, when placed in a line at an angle with the shaft, so as to force the disk against the pulleys as they are moved more nearly parallel with it, substantially as herein described.

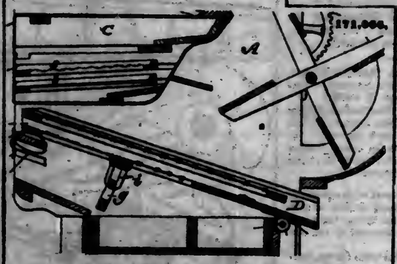


171,656. ADJUSTABLE DRAFT-BARS FOR CUTTERS. Jas. P. Thompson, Milwaukee, Wis. (Filed Apr. 27, 1875.)

The combination of the rod K, attached at its two extremities to the runners of a sleigh or cutter, and having rigidly attached to it the cross-pieces E and the bars C and C', provided with the eyes D and D', which cross-pieces are connected at their extremities by cross-pieces B and B' sliding at their centers upon cross-bar K.

171,658. COMBINED BURGLAR ALARMS AND INDICATORS. J. Thorman, Terre Haute, Ind. (Filed Oct. 10, 1875.)

Brief.—An attempt to open the door or window with which the apparatus is connected causes an alarm to be sounded, and also indicates the point at which the attempt is being made.

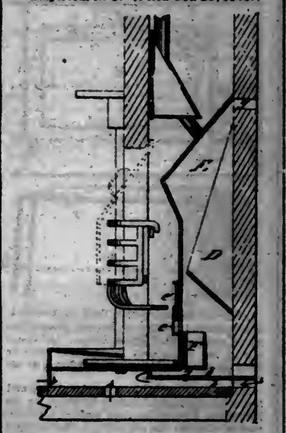


1. In combination with the case A, blinds G and catch c, the spring-hooks I, arms or wires K, and springs d, substantially in the manner as described, and for the purpose specified.

2. In combination with the spring-hooks L and catches a of the blinds G, the right-angled lever a e of the alarm mechanism B, put in connection with each other by the wires M N, whereby they are conjointly operated in the manner substantially as described, and for the purpose specified.

3. The spring-hooks L, blinds G, catches a, wires M N, and alarm mechanism B, arranged to operate in relation to, and in combination with, the nosh or lock thereof, of the windows of a building, substantially in the manner as described, and for the purpose set forth.

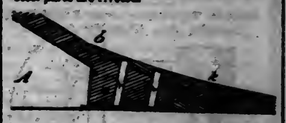
171,659. GRAIN-SEPARATORS. L. Theobald, Fishwell, Mich. (Filed June 5, 1875.)



Brief.—Means of securing the screens of the upper shoe; adjustment for lower screens.

1. In combination with the grooved shoe C and its removable screens, the notched plates or bars c, secured to the rear end of the shoe, as shown and described.

2. The shaft or screen D, provided with the depending slotted arm f, in combination with the body A, provided with the notches n and adjustable bar k, and the rock-shaft g, engaging in the arm e, as shown, whereby a vertical adjustment of the upper end of the shoe is permitted without affecting its operation.

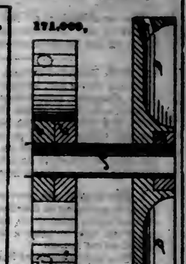


171,667. FIRE-PLACES. Robert Thompson, Stapleton, N. Y. (Filed Oct. 29, 1875.)

The combination of the angular shelf D and air-chamber E, the two respectively arranged in relation to each other, in a fire-place, as and for the purposes set forth.

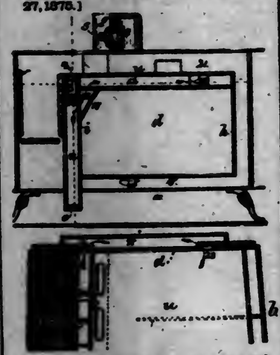
171,668. PLOW-POINTS. Thomas S. Uria, Carson City, Mich. (Filed Apr. 24, 1875.)

Brief.—The steel point is split to receive the wedge-shaped point of an iron plow, and recessed for the end of the share-edge. The steel parts are riveted.



The casting A, having point a, rabbets b b, and the strengthening portion c, in combination with the angular steel point C, having upper branch k, and lower branch l, and rivets h h, constructed and arranged substantially as described, and for the purpose set forth.

171,669. CROSS-DAMPERS. John R. Underwood, Nelsonville, Ohio. (Filed Oct. 2, 1875.)

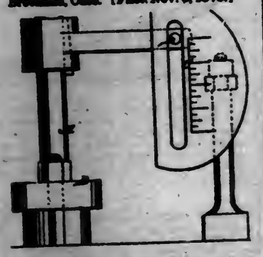


171,669.

171,669.

A sliver-damper, composed of cross-bars having the antipenult cavities D and lateral end holes E, as and for the purpose specified.

171,070. COOKING-STOVES. Isaac Van Benschoten, New York, N. Y., assignor to Jos. Christian, Shrewsbury, Pa., and S. Christian, Putnam Valley, N. Y. (Filed Oct. 27, 1875.)



1. The air-flue a, between the fire-space and oven, passing through the bottom plate of the stove, and provided with a damper, and opening at the upper part through the front or back plate of the stove into the flue r, as set forth.

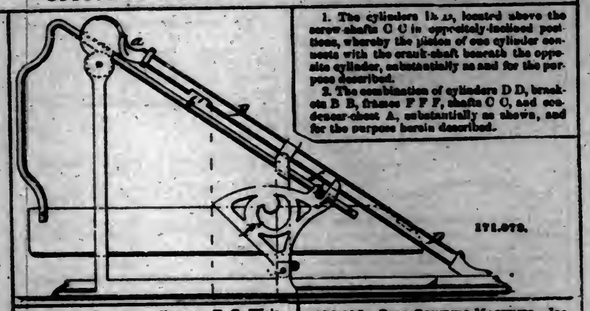
2. The air-space 12, between the plate a and top oven-plate g, and having an outlet for the heated air through the back plate d, in combination with the flue 16, plate 17, and opening into the air-flue a, as and for the purposes set forth.

3. The combination, with the air-space 12 above the top of the oven, of the flue r at the base of the stove, and the opening 23 through the back plate d, as set forth.

4. The combination of the flue r, at the back of the stove, with the flue s between the oven and fire-space, the damper 3, pipe 5, and branch pipe 8 to the smoke-flue t, for the purposes set forth.

171,071. VALVE-INDICATORS. J. B. Wallace, Brentland, Ohio. (Filed Nov. 6, 1875.)

The combination of the sliding rod A, pointer D, and indicator-scale C with a slide-valve, as and for the purpose set forth.



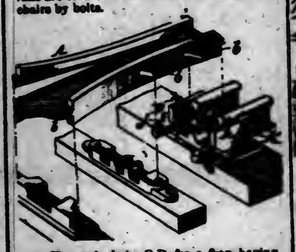
171,072. BREAD-CUTTERS. Maurice Walsh, Sillery Cove, and Maurice Ahearn, Ottawa, Canada. (Filed Sept. 11, 1875.)

Brief.—In front of the diagonally-sliding knife is a pivoted gage-piece, against which the loaf abuts as it is pushed forward. As the knife descends a pin on its frame strikes the gage, and turns it up out of the way, then allowing the cut slice to be removed.

1. The knife-frame, provided with a projecting arm engaging in the notch or fork of pivoted swinging gage-piece, for lifting the same out of the way, to allow a removal of the cut pieces, as set forth.

2. The inclined tube of the main frame, having longitudinal slot and end recess, in combination with the cross-head of the knife and, for introducing and retaining the knife in the guide-slot, substantially as set forth.

3. The middle guide-post of the triangular main frame, having a recess or slot for the passage of the gage-operating pin *f* on the knife-frame, substantially as specified.



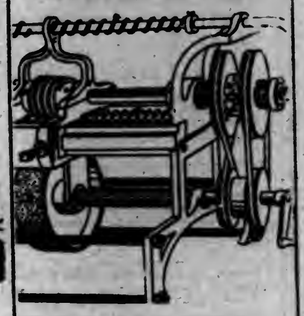
171,073.

1. The cylinders I and J, located above the screw-shafts C C in oppositely-inclined positions, whereby the piston of one cylinder connects with the crank-shaft beneath the opposite cylinder, substantially as and for the purpose described.

2. The combination of cylinders D D, brackets B B, frames F F F, shafts C C, and condenser-chest A, substantially as shown, and for the purpose herein described.

171,074. RAILWAY-FROGS. F. C. Weir, Cincinnati, Ohio. (Filed May 11, 1875.)

Brief.—A railway-frog which is reversible, and has a covered body with strengthening partitions, and a slot in the heel, into which takes a vertical flange upon the rear frog-chair. The sides of the front end of frog are parallel, and fit in between outer vertical flanges upon the front frog-chair, whereby lateral displacement is prevented. The track-rails are secured to the vertical flanges of the chairs by bolts.

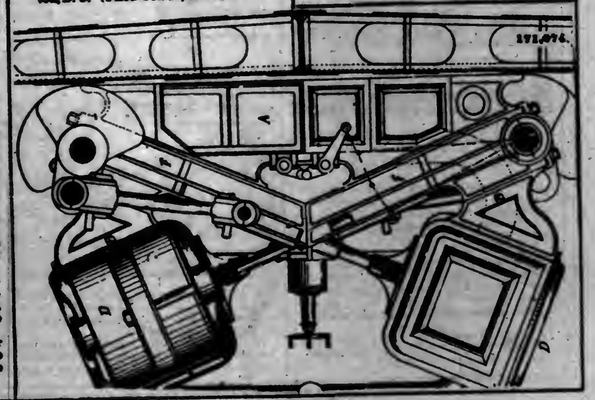


1. The end chairs C D for a frog, having the flanges *e h*, to overlap the joint between the frog and rails, and laterally support the frog, substantially as and for the purpose specified.

2. A reversible frog having coved compartments G and partition H, substantially as and for the purpose specified.

3. A frog having parallel side faces *e e* at one end, and a gap or slot, *d*, at the opposite end, for affording lateral support to the same, substantially as and for the purpose specified.

4. In combination with the chairs C D *e h* and rails J, the connecting-bolts K, connected and operating substantially as and for the purpose specified.



171,075. CARD-GRINDING MACHINES. Jos. P. Wicks, Providence, R. I., assignor to B. F. Chapin, same place. (Filed July 24, 1875.)

1. In a card-grinding machine, the combination of a grinding-wheel, its driving-shaft, and a grinding-wheel carriage mounted on a slide, with the stationary rack and the worm-gear, operated by a traversing shaft arranged to be reversed in opposite directions, and controlled by a clutch and an automatic shipper, substantially as described.

2. In a card-grinding machine, the combination, with a grinding-wheel carriage mounted on a slide and a traversing mechanism for moving the carriage on its slide, of a grinding-wheel mounted on a splined shaft controlled by the carriage, and located below the carriage and traversing mechanism, substantially as described, whereby the entire moving portions of the machine are so located with reference to the grinding-wheel that they are not liable to contact with abrasive matter thrown from the wheel, as set forth.

171,076. RESERVE FOR TWIN SCREW-PROPELLERS. George R. Whiting, Washington, D. C. (Filed Oct. 16, 1875.)

171,076. UMBRELLA TIP-CUPS. H. Winter, Jersey City, N. J. (Filed Nov. 18, 1875.)

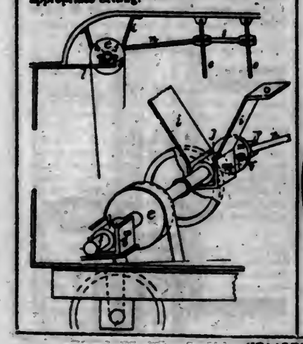
In combination with the tip-cup a, tube b having flange c, and spring d, the shoulder f when formed upon the stick of the umbrella, as and for the purpose set forth.

171,077. BARRELS. David Wright, Auburn, N. Y. (Filed Dec. 8, 1875.)

A barrel containing a partition or division, dividing the same into two separate and distinct departments, with vacant spaces between the edges of the staves thereof, substantially as above described.

171,078. SCREWS FOR KNOBS. Wilbur F. Arnold, Winthrop, Conn. (Filed Oct. 26, 1875.)

Brief.—The wings prevent the knob from turning on the screw. The serrations prevent the withdrawal of the screw from the knob.

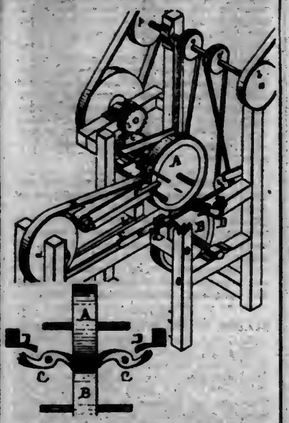


1. A headless pointed wood-screw, with wings *a a*, serrations *c c*, and reduced end *d*, as a new article of manufacture.

2. A headless screw, B, with wings *a a* upon the shank at the upper end of the thread, in combination with a knob, A, substantially as described.

171,079. DEVICES FOR COOLING AND VENTILATING RAILWAY-CARS. JAS. P. Babcock, Bangor, Me., assignee of one-half his right to Flavius O. Beal, same place. (Filed Sept. 27, 1875.)

Brief.—Fans are suspended from the upper part of the car, to which a swinging motion is communicated by a belt passing around the axle of the car-wheel, and over a shaft within the car. This shaft is so hung as to adapt itself to the motions of the truck-frame and car-body, and operates a series of fans, either by a connecting-rod eccentrically attached to said shaft by a universal or ball joint, or by appropriate belting.



1. The combination of the driving-shaft *f*, hanger *i*, rocker-boxes *h j*, and spring-bearing *l* with the belt *o*, communicating motion to said shaft from the car-axle, all arranged substantially as specified, for the purpose set forth.

2. The combination of the driving-shaft *f*, hanger *i*, rocker-boxes *h j*, spring-bearing *l*, and belt *o* with the connecting-rod *n*, eccentrically attached to said shaft by a universal joint, and operating a series of fans, *o*, substantially as and for the purposes set forth.

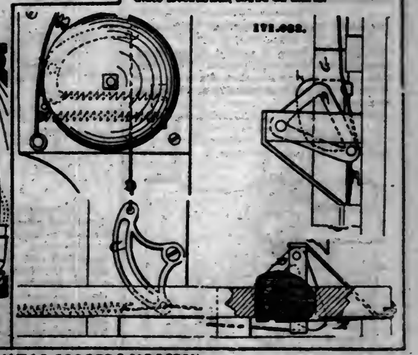
171,080. MACHINES FOR PRESSING TAMPICO. Jonathan D. Baker, Burlington, Vt. (Filed Oct. 16, 1875.)

Brief.—The bolding-wheels have absorbing peripheries. The revolving combs upon each side are cleaned by stationary fingers. The carrying-belt delivers the material on a table, over the table, where it is fed into the machine.

1. The revolving wheels A and B, having their peripheries formed of cork, as and for the purpose described.

2. The combination of the wheels A and B, belt E, revolving cam-combs C, fixed combs D, and table c, as set forth.

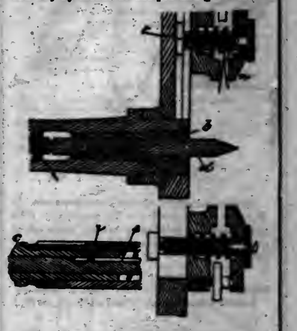
3. The combination of the wheels A and B, feed-belt E, table c, gage e, vibrating batter G, cleaners D, and cam-combs C, substantially as described.



4. The combination of wheels A and B, feed-belt E, table c, and endless belt I with exhaustable side combs, substantially as described

171,081. LAMPS. Charles H. Ball, Philadelphia, Pa., assignor to C. S. Bradford, Jr. (Filed Nov. 16, 1875.)

171,081.



171,082.

The deflector for a gas-lamp, composed of the inclined plates U and E, attached to the wick-burner and gas-burner respectively, and terminating at their upper extremities in vertical walls to produce a more perfect union of gas and vapors at the point of combustion, and cause the flame to ascend in a straight line without veering to either side, substantially as shown and set forth.

171,082. CRUCES AND CRUTCHERS. George F. Ballou, Boston, assignor to H. W. Fisher and John M. Whitcomb, Waltham, Mass. (Filed Sept. 20, 1875.)

Brief.—The jaws are adjustable in radiating slots by means of screw-bolts, and are double, the outer piece being used to clamp an article to the inner. The pump-center is jointed, and held forward by a spring when projecting from the face-plate, and may be held back out of the way by means of the pin and groove.

1. The spindle a, in combination with bushing b, nut c, jointed pump-center d, longitudinal groove e, annular groove g, pin i, and spring k, substantially as above described.

2. The revolving spindle d, in combination with inclined tapering bushing b, and straight and jointed pump-center d, in the manner and for the purpose substantially as above set forth.

3. The pump-center d d, constructed in two pieces, and joined together by a socket or ball joint, in combination with the drawing-back arrangement and knob A.

4. The clamp of universal chuck, consisting of two jaws, n n', head-screw o, with spring r and corresponding recesses for the same, and tightening-screw p, with the milled heads in front of the face-plate, the upper jaw to swing independently from the lower jaw n', for the purpose and in the manner above set forth.

5. The universal chuck, consisting of the clamps n n, in combination with face-plate, spindle a, bushing b, pump-center d, nut c, substantially as above described.

171,083. RAILROAD-SIGNALS. J. H. Berger, Baltimore, Md. (Filed Nov. 4, 1875.)

Brief.—The car-wheels passing over the rail depress the spring, and, through the intermediate mechanism, sound an alarm.

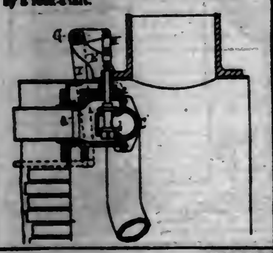
The bar I, fastened to, and forming part of, the spring E, and working through a slot in the guard-bar G, in combination with the lever D, rods, and alarm, all substantially as set forth.

171,004. GALL-BELLS. Elijah G. Barton, East Hampton, Conn., assignor to the Gong-Bell Manufacturing Company, same place. [Filed Oct. 9, 1875.]

Brief.—The spring hammer is deflected by the finger, and when released its elasticity causes it to strike the bell.

The combination of the spring-hammer D E (with or without the finger-piece *b*) with the supporting-stand and bell or bell-shell of a table call-bell, substantially as herein specified.

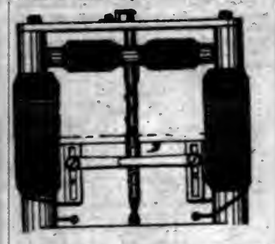
171,005. FLY-TRAPS. William J. Bennett, Beaver Dam, Wis. [Filed July 22, 1875.]



1. In a fly-trap, the bottom D, formed with the passages *a* and the outwardly-bent covering-lips *b*, substantially as and for the purposes herein set forth.

2. The combination of the cage A and the stiffening-wire G, formed in a single piece, attached to said cage by passing through the wire-gauze at two opposite points, and bent over to form the two half H, substantially as herein set forth.

171,006. THROTTLE-VALVES. R. Hester, Chicago, Ill. [Filed Oct. 6, 1875.]

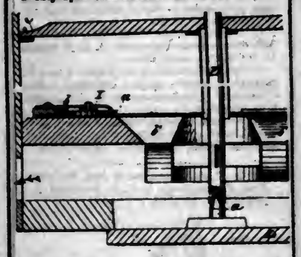


Brief.—The valve is located in the cross-head of the cylinder supply-pipes. The valve-stem passes through a stuffing-box in the shell of the boiler, and is attached to and operated by a rock-shaft.

The combination, with the shell A of the valve-chamber, of the valve B, the stem C, the stuffing-box *a*, and the rock-shaft D, arranged and operating substantially as and for the purpose set forth.

171,007. ELECTRO-MAGNETIC ENGINES. J. Bishop, Sugartown, assignor to Samuel S. White, Philadelphia, Pa. [Filed Aug. 6, 1873.]

Brief.—The commutator upon the spindle of the motor is in the form of a spiral, running in the direction of the axis, so that by shifting the contact-springs longitudinally along the axis the motor may be reversed.



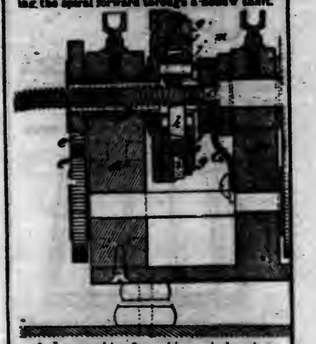
1. The combination of the spiral break and spindle of the armature, substantially as set forth.

2. The combination of the shifter-bar E, provided with pins and springs, as described, bar D, slotted plate *c*, and spiral break, substantially as set forth.

3. The combination of the spiral break and shifting mechanism with the electro-magnets and armature, substantially as set forth.

171,008. WATER-WHEELS. J. J. Bourgeois, St. Cloud, Minn. [Filed Oct. 30, 1875.]

Brief.—A particular arrangement of gates or cut-offs, in combination with the wheel and the detachable chutes and sleeve around the wheel-shaft. The gates are provided with rack-bars, and arranged to move in unison in opposite directions, so as to open and close evenly upon both sides of the wheel.



1. The combination, with the pinions I I of the sliding gates, provided with rack-bars *a a b b*, and arranged to move in unison in opposite directions, so as to open and close evenly upon both sides of the wheel, substantially as and for the purpose described.

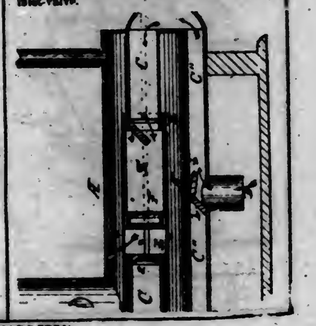
2. The combination, with the wheel and its shaft, the partition D, the sleeve F, and the attached chutes, of the pinions I I and the oppositely-sliding gates, having rack-bars *a a b b*, substantially as described.

171,009. MACHINES FOR MAKING SPIRAL SPRINGS. Saml. L. Bower, Auburn, N. Y. [Filed July 3, 1875.]

Brief.—The wire is fed from a roll through a grooved guide-plate to a revolving mandrel, against which it is pressed by adjustable rollers journaled in elastic bearings on a revolving disk, the rollers having their faces arranged obliquely to the mandrel, and directing the spiral forward through a hollow shaft.

1. In a machine for making spiral springs, the combination, with the mandrel *c*, of the pressure-rollers *b b*, adjustably mounted in the revolving head H, with their surfaces arranged obliquely to the mandrel *c*, substantially as described, and for the purpose set forth.

2. The plate J, provided with a spiral groove *i*, gradually diminishing in depth from the periphery of the plate to its center, and provided with the pivoted segment *m*, in combination with the mandrel *c*, whereby the wire is fed and delivered to the mandrel, substantially as described.



3. The plate J, having the groove *i* and segment *m*, in combination with the rolls *b b* and mandrel *c*, whereby the wire is spirally coiled and pressed around the mandrel, substantially as described.

4. The frame E, carrying the adjustable slide F and pulley P, in combination with the plate J, having the groove *i* and segment *m*, rolls *b b*, mandrel *c*, and rotary tubular shaft D, whereby the wire is fed, coiled, and pressed around the mandrel, and delivered from the machine, substantially as described.

5. The circular head H, provided with the tube *f f*, in combination with the slides *g g*, bifurcated bearings *b'*, rolls *b b*, spring *c*, and right and left screw-shaft, substantially as described.

171,010. DOUBLE-ACTING PUMPS. L. Bouvier, San Jose, Cal. [Filed July 21, 1875.]

Brief.—From the ends of a cylindrical vessel project inwardly two tubes. Over the tubes slide cylinders, connected together by rods, which rods also guide a loose piston-valve, which plays between the inner ends of the cylinders. The innermost ends of the tubes are provided with valves opening inward, the outer ends of the tubes communicating with external water-ways, controlled by a double inlet-valve.

1. In a double-acting pump, the combination, with the tubes B B, of the cylinders C C, the loose piston-valve D, and the double inlet-valve E, substantially as described.

2. The combination, with the cylinders C C, of the tubes B B, rigidly secured together at a short distance apart, and a loose piston-valve playing between the ends of said tubes, substantially as described and shown.

3. The combination, with the cylinder A, of the pipes O O, passages O' O', water-way O'', tubes B B, loose piston-valve F, and valves *a b*, when the several parts are arranged to operate substantially as described and shown.

171,011. GRAIN-GRATES. H. A. Boynton, New York, N. Y. [Filed Apr. 11, 1874.]

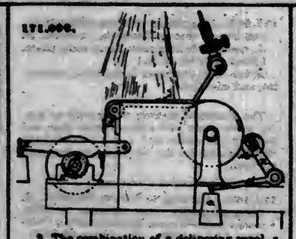
Brief.—The main grate may be rotated independently of the supplemental grate, and lower or supplemental grate may be moved horizontally without giving motion to the main grate.

1. In combination with a main grate provided with a central opening, and arranged to rotate around its axial center, a supplemental grate placed below said central opening, capable of being moved laterally in a horizontal plane beneath the same, and having between its upper surface and the lower surface of said main grate a horizontal clearing-space, substantially as and for the purpose specified.

2. In combination with a main grate provided with a central opening, and arranged to rotate around its axial center, a supplemental grate, placed below said central opening, capable of being moved laterally in a horizontal plane from beneath the same, said supplemental grate being entirely independent of the rotary motion of said main grate, substantially as and for the purpose shown.

171,012. WHEEL-HARROWS. F. Brunet, Little Falls, N. Y. [Filed Oct. 6, 1875.]

Brief.—A series of disks placed in gangs upon two shafts, each gang facing in opposite directions to prevent side draft. A series of cleaners attached to a single bar for each gang, and arranged to operate simultaneously by a lever.



In combination with a gang or series of rotating harrow-disks, the cleaners or scrapers united to a reciprocating bar, adapting them to be operated simultaneously by means of a lever, substantially as and for the purpose set forth.

171,013. MACHINES FOR DAMPENING PAPER. Wm. Bullock, Philadelphia, Pa., (R. Voss, administrator.) [Filed June 20, 1866.]

Brief.—The paper is led from the dry-roll, the shaft of which is held by a friction-brake, over a table, where it is sprinkled; thence over the driving-roll, and wound upon a roll which leans against the driving-roll, and is held in contact therewith with a pressure adjusted by a weight upon an arm from the shaft from which extend the arms in which the damp-roll is journaled.

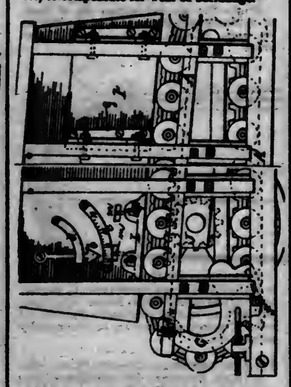
1. The combination of a spool for holding dry paper with a driving-roller and a spool for winding up damp paper; but this combination is claimed only where the axes of the arms which support the latter spool are mounted with reference to the driving-roller, substantially as described.

171,014.

2. The combination of a delivering-spool, a driving-roller, and a winding-up spool mounted on arms whose axes are arranged with reference to the driving-roll, as described, with an apparatus for throwing a spray of water upon the paper in its passage from the delivering spool to the winding-up spool, the combination being and acting substantially as set forth.

3. The combination of a delivering-spool, a driving-roller, and a winding-up spool mounted on arms whose axes are arranged with reference to the driving-roll, as described, with a table or platform located between the delivery-spool and the winding-up spool, the combination being substantially such as set forth.

4. The combination, substantially as described, of a delivering-spool, a table, a jet-nozzle, a driving-roll, and winding-up spool mounted on arms whose axes are arranged with reference to the driving-roll, as described.



5. The combination of these elements, viz., a winding-up roll, weights to regulate the pressure thereof upon a driving-roll, and a delivery-roll, the combination being substantially such as described.

6. The combination of the following elements, viz., a winding-up roll, weights to regulate the pressure thereof upon a driving-roll, a delivery-roll, and nozzles or jet-pipes, the combination being substantially such as described.

7. The combination, substantially as described, of these elements, viz., a winding-up spool, a driving-roll, a delivery-roll, and weights to regulate the pressure of the winding-up spool on the driving-roll; but this combination is claimed only when the bearings of the arms for supporting the winding-up spool are arranged with reference to the driving-roll, as described.

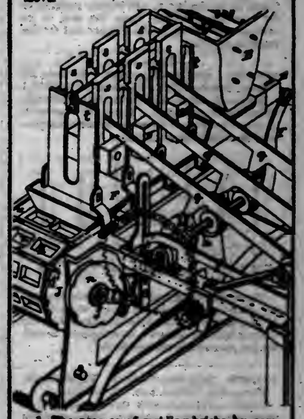
171,015. HORSE-POWERS. Wm. H. Butterworth, Trenton, N. J. [Filed Aug. 11, 1875.]

Brief.—The curved portion of the track admits of minute adjustment of length of chain. Guard-plates for holding the links of endless chain in gear with pinions are made adjustable, to compensate for wear or shrinkage.

1. The combination, with the railway or track A A', of the curved adjustable section C, constructed substantially as and for the purposes herein set forth.

2. In an endless-chain horse-power, the links E, provided with the projections or bosses *b b*, through which the rods G pass, substantially as and for the purposes herein set forth.

3. The combination, with the links E, rods G, and wheels B, of the adjustable plates L, arranged to operate substantially as and for the purposes herein set forth.



4. The combination, with the frame-post having a series of perforations, *c*, of the angular plate *a*, having bent arm *a* pivoted thereto, and said plate adjusted up or down within the post for holding the brake-lever to suit the different positions of the main belt, as set forth.

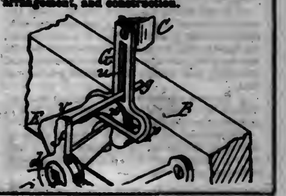
5. The indicator consisting of the pointer *b*, graduated plate *c*, and the protector or shield *d*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

6. The combination, in a horse-power, of the counter-bored wheels B, the rods G, turned to correspond with said counter-bores, and the L-shaped tract A A', substantially as and for the purposes herein set forth.

171,016. BRICK-MACHINES. Thomas B. Burridge, St. Louis, Mo., assignor of two-thirds his right to William E. Smith and Jeremiah Fruhe, same place. [Filed July 26, 1875.]

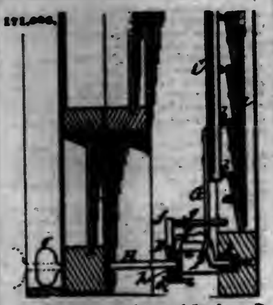
Brief.—The bricks are molded by compressing by plungers varying in face area. The intermittently-moving molds pass under the series of hammers or plungers, and have their bottoms formed by the trough over which they move.

1. The process of molding bricks by compressing the clay in the molds by the action of hammers (as M N O) of increasing face area, substantially as set forth.



2. The combination of intermittently-moving molds H, hammers M N O, differing in face area, as described, and trough F, whose bottom G forms the bottoms of the molds while filling, substantially as set forth.

3. The combination of feed-block E, operating-lever T, provided with stops T', and mold-chain H, having joint-rods I, provided with projecting ends, as set forth.

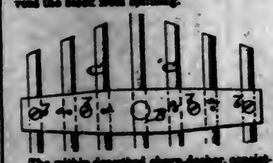


4. The combination of chain of molds H I, wheels J K *a*, pawl and pawl-arm *s t*, pitman *g*, arm *f*, and cam *b* with lug *a*, constructed and operating substantially as set forth.

171,017. BLIND-SLAT ADJUSTERS. Wm. W. Byam, Rochester, N. Y., assignor of one-half his right to E. C. Byam, Fort Dodge, Iowa. [Filed Oct. 12, 1875.]

Brief.—The claims very fully point out the invention. A mere novelty of combination, arrangement, and construction.

171,096.

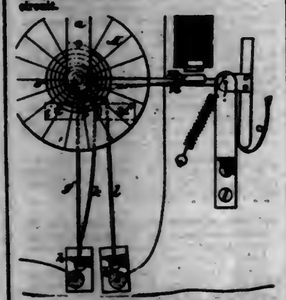


1. The device consisting of the frame D, with the guide-rod f, cam C, connecting-rod G, with stirrup p, and the movable shaft H, the whole combined to operate in the manner and for the purpose specified.

2. The cam E, constructed with the journals b i, crank portion c, spiral e, and eccentric s, in the manner and for the purpose specified.

3. The combination, with the cam E and frame D, of the bar h, and rubber packing n, for producing friction upon the cam to its turning movement, in the manner and for the purpose specified.

171,097. CHUCK-DAMPER. Rodney M. Cass, Auburn, N. Y. (Filed Nov. 6, 1875.)



Brief.—A blank has perforations, through which wood rods pass. These rods are held in place by nuts. Screws are used to prevent the blank from splitting.

The within-described clamp-dasher, consisting of the perforated head B and wooden rods C, passed through the same and fastened by the nuts a and the screws b, substantially as and for the purposes herein set forth.

171,098. REGULATING CLOCKS. Elijah Clark, Paris, Ky. (Filed Apr. 26, 1875.)

Brief.—Armature-lever forked and used as escapement-lever. Balance-wheel controls circuit.

1. In the herein-described electric clock, the combination of the detent f, balance-wheel A, detent-spring p, and tongues h i, constructed as shown, and operating in connection with the magnets, for the purpose of making and breaking the circuit, substantially as specified.

2. The armature-lever a n, having one end forked, in combination with spring i, disk d, and pin c, constructed and arranged as shown.

3. The combination of the balance-wheel A, detent f, detent-spring p, tongues h i, and spring armature-lever a n i, constructed and arranged as shown.

171,099. PROCESSES OF COMPOUNDING PAPER-PULP. George Charleton, Paterson, N. J., assignor to Benjamin Kent, same place. (Filed May 18, 1875.)

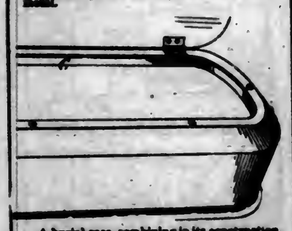
Brief.—Ball the paper in the acids, neutralize, and add fiber.

The process of making paper-pulp by mixing waste paper with silk or cotton fiber, and treating the same with sulphuric and nitric acids, as and for the purpose described and set forth.

171,100. AUTOMATIC BOILER-FEEDERS. S. Cook, Magnolia, Iowa, assignor to Automatic Boiler-Feeder Manufacturing Company, St. Louis, Mo. (Filed Nov. 16, 1875.)

Brief.—Water flows into the tank, raising the float to operate an oscillating valve. Said valve admits steam to a valve-piston, which opens ports to admit steam above the water in the tank, and to allow the water from the tank to flow into the boiler.

1. In combination with the piston-valve P cylinder O, and weighted wheel, actuated by the rise and fall of the float, an intermediate oscillating valve, N, actuated by the movement of the wheel, and controlling the admission of steam to the piston-valve, substantially as set forth.



2. The cylinder O, and piston-valve, consisting of the parts P P' P'', constructed and arranged substantially as set forth.

3. The combination of the valve-piston P P'', with the induction-pipe X opening between them, and the ports H and F, substantially as set forth.

4. The cylinder constructed with ports O' O'', and ports leading to pipes F and H, G, I, and K, and X, substantially as set forth.

171,101. COFFINS. James M. Currier, Portland, Me. (Filed Nov. 24, 1875.)

Brief.—The top and bottom are of wood, as is also a strengthening-rim, upon which the top abuts. The sides and ends are of sheet metal.

A burial-case, consisting in its construction, a wooden bottom and frame-piece, C, parallel thereto, and sides or ends formed by extending sheet metal from the wooden frame to the wooden bottom, and a cover, E, substantially as set forth.

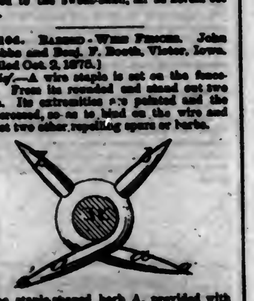
171,102. REFRIGERATOR-CASE FOR FILES. John C. Davis, Baltimore, Md., assignor of one-half his right to T. J. Maynard and R. L. Bartlett, same place. (Filed Nov. 6, 1875.)

Brief.—An extension-cap for repairing partially-decayed piles, constructed of metal, in two parts, to be clamped and firmly secured to the top of the piles, where the wood is sound, after the top has been sawed off below the point of decay.

171,103.

The divided or two-part extension-cap for piles, constructed and adapted for application in manner substantially as herein set forth.

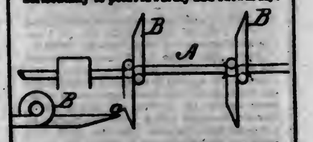
171,104. HAT-VENTILATORS. J. B. Dilleway, Boston, Mass. (Filed Sept. 10, 1875.)



Brief.—The ends of the outer plate are clamped over and upon the inner plate, thereby connecting both. Flues are formed by flanging up the inner plate midway its length, in a vertical line, to aid the currents of air, and to keep the plates separated. The device is inserted between the sweat-band and side crown, and at the front, rear, or sides of the hat.

The hat-ventilator herein shown and described, the same consisting of the two metallic plates a and b, one of which is attached to the hat-body, and the other constructed with a series of partitions or flutes, d, and overlapped at its ends by the other plate and secured to the sweat-band, all as herein set forth.

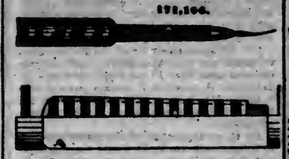
171,105. RAISED-WIRE FENCES. John Dobbs and Benj. F. Booth, Victor, Iowa. (Filed Oct. 2, 1875.)



Brief.—A wire staple is set on the fence-wire. From its rounded and staid cut two spurs. Its extremities are pointed and the legs crossed, so as to bind on the wire and project two other repelling spurs or barbs.

The staple-shaped barb A, provided with spurs b b' and pointed legs a, adapted to be bent around a fence-wire, substantially as described, and for the purpose set forth.

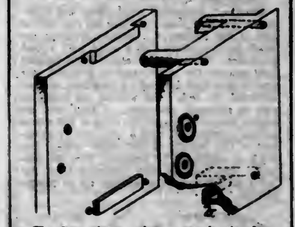
171,106. RAISED FENCE-WIRE. John Dobbs and Benj. F. Booth, Victor, Iowa. (Filed Aug. 7, 1875.)



Brief.—The horizontal wire is deflected in each post, where a V-shaped or duplex wire barb is pressed upon it, and its legs crossed horizontally to point inwardly and outwardly.

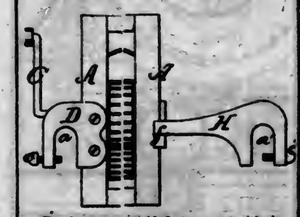
The wire A, having a shoulder, b, formed on each of its sides, and opposite each other, in combination with the barb B, with its legs spread laterally, and clamped to the wire at its shoulders, in the manner described.

171,107. WELDING-BURNER HANDLES FOR DENTAL TOOLS, &c. R. B. Donaldson, Washington, D. C. (Filed Dec. 1, 1875.)



171,108.

1. The described method of making rubber handles for dental and other implements, by covering a body or core with strips or pieces of rubber of different colors, placing such rubber-wrapped core in a mold, tightening and compressing the mold upon it, and then submitting the whole to the action of superheated steam to vulcanize and harden the rubber, all substantially as set forth.



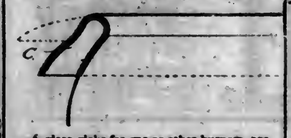
2. As a new article of manufacture, a handle consisting of a core covered with strips or pieces of vulcanized rubber of different colors or patterns, substantially as and for the purposes described.

171,109. LETTER-JACKS. Alex. Duncan, Duncan's Mills, Col. (Filed May 17, 1875.)

The face plates, when made in the form shown and described, and united together by means of the bolts and nuts, so that there will be a slot of quadrilateral shape at the top and bottom of the plates to form a bearing and support for the lifting-bar, as set forth.

171,110. CLAMPS FOR WASHING-MACHINES AND WRINGERS. Wm. A. Dunham, Syracuse, N. Y. (Filed Oct. 2, 1875.)

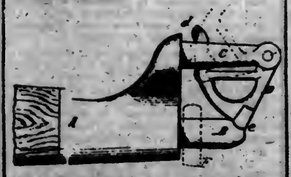
The frame A, provided at one end with the rigid arm D, having the recess a and cut-cover c, the opposite end of said frame being provided with a swinging arm, H, having a recess, c', and cut-cover c', whereby the frame is adapted to fit different-sized tubs, and at the same time to be held firmly in place, substantially as described.



171,111. LAMPS. John A. Sturm, West Meriden, Conn., assignor to the Bradley & Hubbard Manufacturing Company, same place. (Filed Oct. 19, 1875.)

The combination of the socket B, constructed to be attached to the fixture, and with the central spindle O and internal projections f, with the lamp-feast constructed with the central rest D, corresponding to the said spindle, and with the annular flange notched to correspond to the said projections, substantially as and for the purpose described.

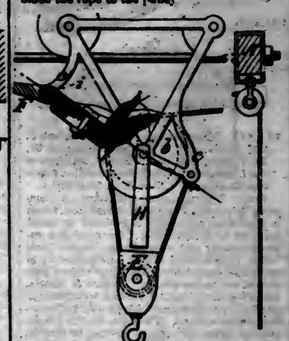
171,112. CHUCKS FOR BURNERS. B. Evans, Lynn, Mass. (Filed Nov. 23, 1875.)



Brief.—The flange is coated to produce a reflecting-surface.

A glass globe for gas or other burners, provided with a projecting and prepared flange, C, substantially as herein described, and for the purpose specified.

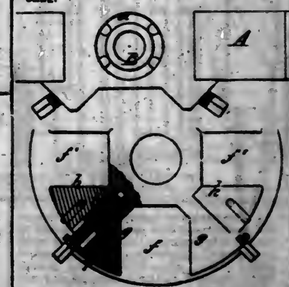
171,113. WRENCH-STEMS. James R. Finley, Delphi, Ind., assignor of one-half his right to Jas. M. Watts, same place. (Filed Sept. 9, 1875.)



Brief.—A gravitating-latch secures the brace on whiffletree-hook.

In a brace-fastener, the combination, with the brace-pin, of a projection or lug, C, arranged above the pin, and a gravity-latch, D, pivoted to the projection or lug, and resting normally upon or near to the brace-pin, substantially as set forth.

171,114. HAY-ELEVATOR DOGS. J. B. Fimhouse, Indiana, Pa. (Filed May 28, 1875.)



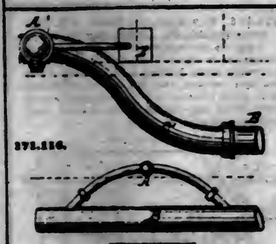
Brief.—A carriage with fall-catch attached, running on a rod in the roof of the barn, has a pivoted catch, holding it to one end of the rod canal the fork, reaching its full elevation, strikes and releases it. The butt-end of such catch, being cam-shaped and corrugated, then binds the rope to the pulley.

In a hay-elevator, and as an improvement upon my patent of September 1, 1874, the eccentric lock F, the corrugated heel of which is at right angles to its body, and the lower edge of the heel below a line drawn through the pivot i of the said lock, and pivot of hoisting-pulley b, substantially as specified.

171,115. MILLSTONES. Hans J. Fogh, Jodsted Molle, Denmark, assignor to Wm. H. Corlin and Laurits T. C. Fogh, Creston, Wyo. (Filed Oct. 28, 1875.)

Brief.—By means of screws the adjustable segments are made to press against the balance-rynd, which is itself regulated by screws passing against a cup placed within the balance-rynd, and resting upon the spindle, the whole to cause the stone to run without wabbling.

1. The segments g on plate C forming recesses f f, in combination with the adjustable segments A A, forming recesses f' f' to receive the lintrs of the balance-iron, substantially as specified.

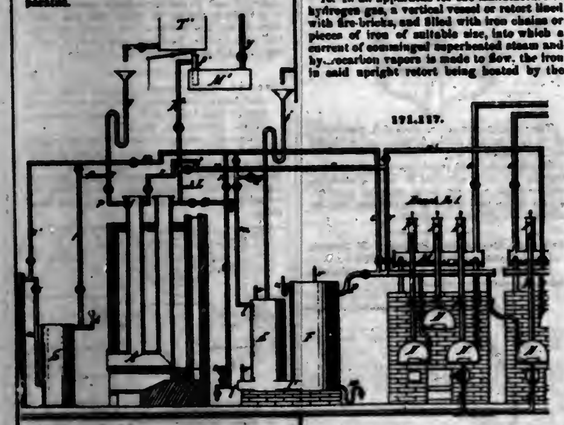


2. The adjustable segments A, on plate C, in combination with the adjustable cup B to the balance-iron A, substantially as described.

171,116. STREET-CONNECTIONS FOR HYDRANTS. Michael Pollard, Brooklyn, and Wm. T. Travis, Flat Bush, N. Y. (Filed Nov. 15, 1875.)

Brief.—The device shown allows of a free circulation from the main to and from the hydrant, thus preventing freezing, as the temperature of the water in the main and hydrant is practically the same.

The combination of a return-bend with the street-main B, and with a hydrant, A, situated either on the sidewalk or inside of a building, said return-bend being formed substantially in the manner herein shown and described.



HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

171,116.

171,117. MANUFACTURE OF GAS. Joseph P. Gill, Newark, N. J., assignor to Robert W. Butterfield and Joseph P. Gill, trustees of the Illuminating Gas Apparatus Construction Company. (Filed Nov. 20, 1874.)

Brief.—Hydrogen is manufactured continuously by passing steam over heated iron, which is decomposed as rapidly as oxidized by small amounts of hydrocarbon. The hydrogen enters an empty still or vaporizing-chamber, into which hydrocarbon enters simultaneously in regulated quantities. Resultant vapors pass into an expansion-chamber, thence to retorts, receiving on the way, if desired, an additional quantity of superheated steam and hydrocarbon, either or both. From the retorts the gas may be taken to holders for use, or may be taken to mains, where it is mixed hot with ordinary hot coal-gas, passing in either case through the usual purifying processes and apparatus.

171,117.

1. The process of manufacturing hydrogen gas continuously from superheated steam by the use of hydrocarbon to decolidize iron when in process of oxidation by contact with superheated steam, substantially in the manner herein described, and for the purpose set forth.

2. The process of manufacturing illuminating gas by combining hydrogen gas, and superheated steam, and the vapors of hydrocarbons, and then converting them in red-hot retorts into a final illuminating-gas, substantially in the manner herein described, and for the purpose set forth.

3. The combination of hydrogen gas, produced in the manner herein described, and gas made from coal, and gas from hydrocarbon liquids, substantially in the manner herein described, and for the purpose set forth.

4. The combination of illuminating-gas, produced from commingled hydrogen gas, superheated steam, and hydrocarbon vapors, as herein described, and coal-gas in the hydraulic main, substantially in the manner herein described, and for the purpose set forth.

5. In the apparatus for the manufacture of illuminating-gas, a duplex steam vessel or double still, wherein liquid hydrocarbon is vaporized, and the vapors commingled with hydrogen gas and superheated steam, no liquid of any kind being filled into or allowed to accumulate in said still, substantially in the manner herein described, and for the purpose set forth.

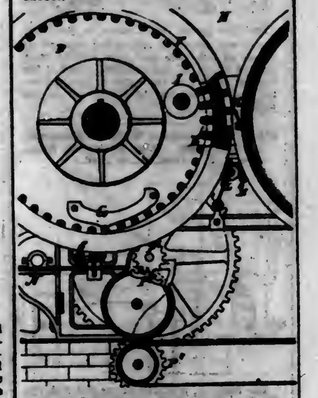
6. In an apparatus for the manufacture of gas, a movable dip-pipe with two floats and cap attachments to the bridge-pipe and movable lever, substantially in the manner herein described, and for the purpose set forth.

7. In an apparatus for the manufacture of hydrogen gas, the combination of the boiler B, pipes *a* and *a'*, superheater S, pyrometer h, pipe *p*, tank T, siphon-pipe J, retorts A A' A² A³ A⁴ A⁵ A⁶ A', stand-pipes B², floats and cap attachments, and movable dip-pipe and lever F¹, hydraulic main M', pipes *g g'* X Y Y', condensers Q, exhauster U, purifiers U², station-meter V, boiler K, substantially in the manner herein described, and for the purpose set forth.

8. In an apparatus for the manufacture of hydrogen gas, the combination of boiler B, pipes *a* and *a'*, superheater S, pyrometer h, pipe *p* (*s n q m*, branch pipes *s s'*, closed duplex vessel or double still E F, tank T, siphon-pipes *j*, steam-gage *t*, pressure-gages *u*, thermometers *v*, siphon-pipe *w*, pipes F' *r z*, retorts A A' A² A³ A⁴ A⁵ A⁶ A', stand-pipes B², floats and cap attachments, and movable dip-pipe and lever F¹, hydraulic main M', pipes *g g'* X Y Y', condensers Q, exhauster U, purifiers U², station-meter V, boiler K, substantially in the manner herein described, and for the purpose set forth.

9. The process of making a vapor of commingled superheated steam and hydrocarbon by introducing the hydrocarbon liquid in small quantities simultaneously with superheated steam into an otherwise empty duplex still, or vaporizing, commingling, and expanding chambers, for illuminating and heating purposes, substantially in the manner herein described, and for the purpose set forth.

10. In an apparatus for the manufacture of hydrogen gas, a vertical vessel or retort lined with fire-bricks, and filled with iron chains or pieces of iron of suitable size, into which a current of commingled superheated steam and hydrocarbon vapors is made to flow, the iron in said upright retort being heated by the combustion of the said superheated steam and hydrocarbon vapors, and then the said superheated steam being decomposed into hydrogen gas by the combined action of the heated iron and hydrocarbon, substantially in the manner herein described, and for the purpose set forth.



11. In an apparatus for the manufacture of illuminating-gas from a combination of hydrogen gas, superheated steam, and hydrocarbon vapors, the combination of boiler B, pipes *a* and *a'*, superheater S, pyrometer h, pipe *p*, tank T, siphon-pipe J, retorts A A' A² A³ A⁴ A⁵ A⁶ A', pipe *q*, pipes *i m n r*, tank T, siphon-pipe *j*, branch pipes *s s'*, double still E F, steam-gage *t*, pressure-gage *u*, thermometers *v*, siphon-pipe *w*, pipe F', pipe *c*, branch pipes *b*, retorts in bench No. 1, N', stand-pipes B², floats and cap attachments and movable dip-pipe and lever F¹, hydraulic main M', pipes *g g'* X Y Y', condensers Q, exhauster U, purifiers U², station-meter V, boiler K, substantially in the manner herein described, and for the purpose set forth.

12. In an apparatus for the manufacture of illuminating-gas from a combination of gas made from a combination of hydrogen gas, superheated steam, and hydrocarbon vapors with coal-gas in the hydraulic main, the combination of boiler B, pipes *a* and *a'*, superheater S, pyrometer h, pipe *p*, tank T, siphon-pipe J, retorts A A' A² A³ A⁴ A⁵ A⁶ A', pipe *q*, pipes *n s* (*r*, tank T, siphon-pipe *j*, branch pipes *s s'*, duplex still E F, steam-gage *t*, pressure-gage *u*, thermometer *v*, siphon-pipe *w*, upright retorts B², floats and cap attachments to the bridge-pipe and movable lever, substantially in the manner herein described, and for the purpose set forth.

13. In an apparatus for the manufacture of illuminating-gas, the combination of boiler B, pipes *a* and *a'*, superheater S, pyrometer h, pipe *p*, pyrometer h, pipe *i*, pipe *z*, tank T, siphon-pipe *j*, duplex still E F, pipes P *z*, steam-gage *t*, pressure-gage *u*, thermometers *v*, siphon-pipe *w*, upright retorts A', filled with iron and heated from within, pipe P', pyrometers F F', damper D, ensemble-stand W, discharge-pipe U to condensers, exhauster, purifiers, station-meter, and boiler, constructed substantially in the manner herein described, and for the purpose set forth.

171,118. BRICK-MACHINE. William A. Graham, Carlisle, Pa., assignor to William H. Philip, trustee for himself and others. (Filed Dec. 4, 1875.)

Brief.—A polygonal mold-wheel and cylindrical feed and pressure wheel are run close to each other in the bottom of a hopper, forcing the brick by compression in a mold with radial plungers. The pressure-wheel is adjustably held against the mold-wheel by a screw, and elastic bearings maintain a constant contact between the two. The wheels are made to run at different velocities. A cam with an elastic support engages the ends of the stems of the plungers, to give a preliminary pressure as the bottoms of the molds before the brick is completed by pressure from the outside. The faces of the plungers, after the brick is delivered, are cleaned by an elastic rubber.

1. In combination with the hopper, the polygonal mold-wheel D and cylindrical feed and pressure wheel C, having its adjustable bearings elastically mated, forcing the wheels together in the line of their axes, substantially as set forth.

2. In combination with the mold-wheel and radial plungers and pressure-wheel C, the cam I, giving an impact to the clay in the bottom of the mold from the center outward, and thereby completing its compression by pressure applied in the opposite direction, substantially as set forth.

3. In combination with the mold-wheel and radial plungers, the cam I, resting on an elastic bearing, substantially as set forth.

4. In combination with the mold-wheel and brush L, supported against the solid rim of the mold-wheel, substantially as set forth, an auxiliary knife, K, bearing on the said rim to clean it of clay and give a clean track to the friction-wheels of the former.

5. In combination with the mold-wheel, with radial plungers and cam for projecting the latter, a rubber, S, for cleaning the faces of the wheel and plungers, substantially as set forth.

6. In combination with the hopper, the mold-wheel D and feed and pressure wheel C, adapted to run with different peripheral velocities, substantially as set forth.

7. In combination with the knife L and its frame, the india-rubber spring M', adjustably held in position by the yoke N' and set-screws N².

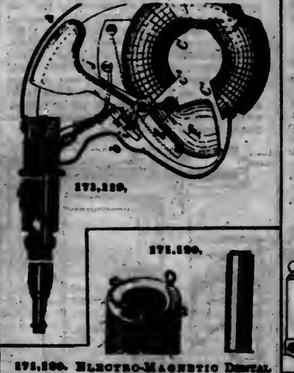
8. The molds constructed in the rosette on the periphery of the flanged mold-wheel by inserting the steel plates O O', substantially in the manner set forth.

171,119. ELECTRO-MAGNETIC DENTAL PLUGGER. George F. Green, Kalamazoo, Mich., assignor to Samuel S. White, Philadelphia, Pa. (Filed Aug. 5, 1875.)

1. The frame A, composed of the steel-bars *a b*, the barrel B, and the electro-magnet C, substantially as described.

2. The combination, with the magnet C, of the armature, connected with the mallet, to serve as a counter-balance thereto, and pivoted upon the magnet, and vibrating between its poles, substantially as described.

3. The combination of the frame A, the barrel B, the casing, and the reciprocating spindle H, substantially as described.



4. The combination of the frame, the barrel, the casing, the spindle, the mallet, the armature, and the magnet, substantially as and for the purposes described.

5. The combination of the hammer head, the combined counter-weight and armature, the mallet-shaft, and the magnet, substantially as described.

6. The cushioning-slide *h*, in combination with the hammer and spindle, substantially as described.

7. The combination, with the fixed barrel B, of the rotating section of the casing and the pistol-stock-shaped case A, substantially as and for the purpose described.

8. The combination of the mallet and armature, connected directly together, as set forth, whereby the armature forms the counter-balance for the mallet, for the purpose specified.

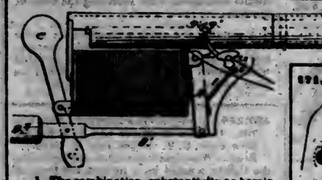
171,120.

171,120.

171,120. ELECTRO-MAGNETIC DENTAL PLUGGER. George F. Green, Kalamazoo, Mich., assignor to Samuel S. White, Philadelphia, Pa. (Filed Aug. 5, 1875.)

1. The combination of the electro-magnet, the mallet reciprocating therein, and the revolving reciprocating spindle carrying the tool, substantially as described.

2. The combination, with the casing of a dental plugging-instrument, of the helix, the fixed core, the reciprocating mallet, and the spindle carrying the tool, substantially as described.



3. A circuit-breaker spring, actuated by the flange of the mallet, for the purposes described.

4. The combination of the shoulder in the fixed hollow grooved core, or its equivalent, with the collar *e* on the spindle, or its equivalent, and the coiled spring *f*, for the purposes described.

5. The combination of the helix, the flanged mallet, and the grooved fixed core.

6. A mallet for an electro dental plugger, provided with a flange, for the purpose of breaking the electric circuit, substantially as described.

171,121. ELECTRO-MAGNETIC DENTAL PLUGGER. George F. Green, Kalamazoo, Mich., assignor to Samuel S. White, Philadelphia, Pa. (Filed Aug. 5, 1875.)

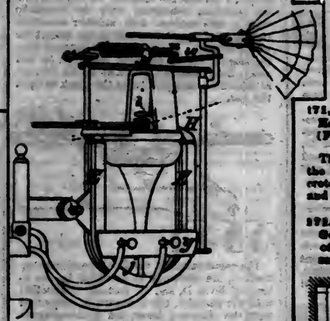
171,121.

1. The combination, substantially as herein before set forth, of an electro-magnet and a mallet-plugger mounted directly thereon.

2. The combination, in one instrument, substantially as set forth, of an electro magnet, a mallet mounted thereon and vibrated thereby, and a reciprocating plugging-tool.

3. The combination, substantially as set forth, of a plugging-tool, an electro-magnet, a vibrating mallet, and a counter-balance, to insure malleting with uniform force in any position.

4. The combination, substantially as set forth, of a plugging-tool, a mallet, an electro-magnet, and an automatic circuit-breaker actuated by the mallet.



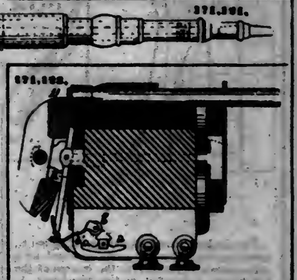
5. The combination, substantially as set forth, of an electro-magnetic dental plugger and circuit-breaking mechanism, actuated simply by pressure upon the point of the plugging-tool.

6. The combination, substantially as herein before set forth, of a rotating case-section and the electro-magnetic dental plugger, for the purpose described.

7. The combination of the electro-magnet and the two armatures C D, substantially as described.

171,122. ELECTRO-MAGNETIC FAN. Geo. F. Green, Kalamazoo, Mich., assignor to Samuel S. White, Philadelphia, Pa. (Filed Aug. 5, 1875.)

Brief.—Designed for use in dental operations. The fan is worked by an electro-magnetic motor, and the apparatus is so suspended from a bracket as to be easily adjustable to any position.



1. The combination, substantially as herein before set forth, of the rotating electro-magnet, its gearing, the fan-shaft, crow-bracket M, and the crooked pitman-connections between the fan-shaft and gearing, whereby the fan is vibrated by the rotation of the magnet.

2. The combination of the fan, the electro-magnet, and its adjustable supporting-bracket, through which the circuit passes; these members being constructed and operating in combination, substantially as herein before set forth.

3. The combination, substantially as set forth, of the electro-motor, the adjustable bracket, and the circuit-breaking lever, through which the current passes to the brushes.

4. The combination of the horizontally adjustable bracket, the electro-magnet, and the insulated vertically-adjustable joint between the bracket and magnet.

171,123.

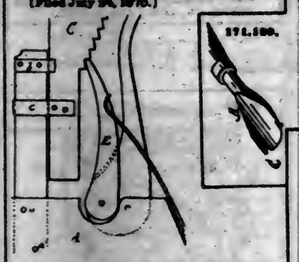
171,123. ELECTRO-MAGNETIC DENTAL PLUGGER. George F. Green, Kalamazoo, Mich., assignor to Samuel S. White, Philadelphia, Pa. (Filed Aug. 5, 1875.)

1. The combination, substantially as set forth, of the duplex electro-magnet, the oscillating armatures, the plugging-tool, and the circuit-changing mechanism.

2. The combination, substantially as set forth, of the oscillating armatures, the rocking arm K, carrying the wheel *p*, and the circuit-breaker block, with the magnet.

3. The combination of the magnet, its frame, the bearings, the tool movable endwise therein, and the spring-cams which holds the tool and oscillating armature, substantially as and for the purpose described.

171,124.



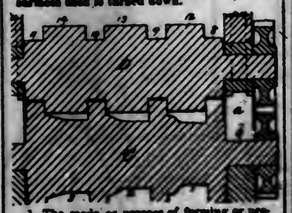
171,124. CORSETED SHIRTS AND DRAWERS. Henry H. H. Greenleaf, Philadelphia, Pa. (Filed Oct. 18, 1875.)

The combined shirt and drawers, having the rear flap C extending forward under the crotch and upward in front, substantially as and for the purpose set forth.

171,125. BALANCED VALVES AND CUT-OFFS. Gordon W. Hall, Havana, N. Y., assignor of one-half his right to A. C. Whittemore, same place. (Filed Oct. 16, 1875.)

The connected cut-off valves G G, combined with valve D and with false ports *r r* and vents *t*, substantially as described.

171,186. LETTUCE-JACKS. Harvey D. Hazeldon, Hartford, Vt., assignor of one-half his right to Curtiss S. Hamilton, same place. (Filed July 24, 1875.)

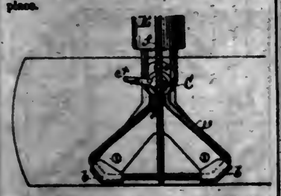


171,186.

The combination of the sliding lifting bar C, provided with a ratchet and operated by a spring-pawl, E, pivoted to the bottom of the hand-lever, fulcrumed to the base-block A, which is recessed to receive the end of the pawl, and divided to provide for the movements of the lever, substantially as shown and set forth.

171,187. MANUFACTURE OF CUTTER-STOCKS. L. Hardy, Worcester, Mass. (Filed Nov. 27, 1875.)

Brief.—The bar of steel is placed longitudinally upon the edge of the bar of iron and projecting therefrom. They are welded together by hand at one end, brought to a red heat, borax applied, then raised to a welding heat, withdrawn and placed between clamping-jaws to cause their surfaces to adhere, reheated, and passed through the different surfaces upon the rolls. To further reduce the steel edge the adjusting bolt nearest the last surfaces used is turned down.



1. The mode or process of forming or producing a combined iron and steel bar (shown in Fig. 7) from iron and steel bars of the form shown in Figs. 3 and 4, by the mode or process shown and described.

2. The combination, with the rolls C, provided with projections 4, 5, 6, and 7, and peculiarly-formed recesses 1, 2, and 3, of rod D, provided with projections 12, 13, and 14, and recesses 8, 9, 10, and 11, substantially as and for the purposes set forth.

171,188. BRUSH-HOLDER. Isidor Heller, New York, N. Y. (Filed Oct. 30, 1875.)

Brief.—The handle is provided with a wire bent into triangular form, with a narrow neck near the handle. The back of a brush carries a plate with turned-up corners and a button, under which the wire fits and is clamped in place.

The plate or frame B, constructed with the slot d and enlarged opening e, and provided with a handle, E, in combination with the plate A, having the overhanging lips b b, and the swivel-button C, the whole constructed to operate substantially as shown and described.

171,189. TACK-EXTRACTORS. M. Hermann, Brooklyn, N. Y. (Filed Apr. 12, 1875.)

Brief.—The tack-extractor consists of a concave-convex metallic tool, converging to an edge at its outer end, and provided near each corner with notches for receiving the head of the tack.

A metallic tool made convex on its under side, and concave on its upper side, converging to a square or straight edge, and provided with notches or slots near each corner of its edge, as and for the purposes set forth.

171,190. ELECTRIC GAS-LIGHTING APPARATUS. Charles H. Hinde and A. T. Smith, New York, N. Y. (Filed July 21, 1875.)

Brief.—When gas is turned on and lighted at the burner, a small jet is lighted, the torch is then automatically carried around, lighting the remaining jets, the supply to the small jet being cut off as it completes its revolution.

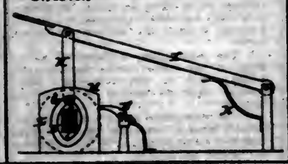
1. In an electric gas-lighter, a traveling torch, K, adapted to operate in conjunction with electrodes B C, substantially as described.

2. A traveling torch K, combined with a gas-supply source and with electrodes B C, substantially as described.

3. The combination of a pawl, I, ratchet J, armature O, and electro-magnet H, with the traveling torch K, substantially as described.

4. In combination with the traveling torch K, a gas-supply source composed of the way *b*, groove *c*, and orifice *d*, substantially as described.

5. The cut-off *f*, constructed as described, in combination with the traveling torch K, the groove *c*, way *b*, and orifice *d*, substantially as set forth.



171,191. LIGHTING GAS BY ELECTRICITY. Charles H. Hinde and Adolph T. Smith, New York, N. Y. (Filed June 2, 1875.)

Brief.—Closing circuit of portion of battery through an electro-magnet throws a movable electrode connected with the armature thereof into contact with another electrode over gas-burner, thus establishing circuit for whole battery. Breaking circuit through electro-magnet throws movable electrode to fall away, thus breaking circuit of whole battery at electrodes, and producing the spark to light the gas.

The combination of the fixed insulated electrode C, the electrode B, mounted in the vibrating lever D, and in metallic connection with the gas-pipe, the armature O, connected with the vibrating lever, the electro-magnet H, the key K, and the galvanic cells L M, connected with the key K, the electro-magnet, gas-pipe, and insulated electrode C, substantially as and for the purpose described.

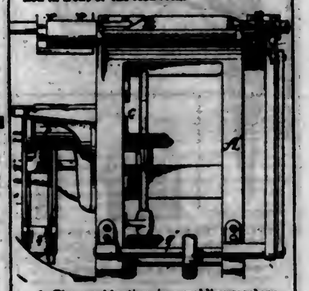
171,192. MECHANICAL MOVEMENTS. Wm. H. Hermann, New York, N. Y. (Filed Nov. 27, 1875.)

1. The shaft A, slotted disk C, lever I, or similar device, having reciprocating motion, and guide-plate N, combined and operating substantially as above described.

2. The combination of the ratchet-wheel C, mounted on the shaft A, and the spring-pawl E, with the lever I, or similar reciprocating device, substantially as described.

3. The adjustable guide-plate N, within the opening or slot in groove-plate M, substantially as and for the purpose set forth.

171,193. PAPER-REGISTERS. William H. Hermann, New York, N. Y. (Filed Nov. 27, 1875.)



1. In a registering apparatus, the combination of two cylinders, A B, one working inside the other, and geared together to move at different velocities in a cylindrical case, C, with a slot, *s*, the inner cylinder A being divided off in hundred spaces containing figures, as shown, while the outer cylinder B is marked with the figures from 0 to 9, arranged on a spiral line alongside of apertures *g*, all constructed and operating substantially as shown and described.

2. The combination, in a registering apparatus, of the two cylinders A B, one working inside the other, with the supplemental registering mechanism composed of a worm, *j*, and wheels *k m n*, substantially as set forth.

171,194. MOLDING-MACHINES. L. Houston, Montgomery, Pa. (Filed Nov. 24, 1874.)

Brief.—A firm bearing is afforded for the outer end of the cutter-shaft, and the work-table is supported at a point immediately beneath the cutter by means of a slotted standard or curved arm, secured to the base of the main frame at its outer side, extending outside of the work-table, and provided at the top with an axially-removable bearing-block. The work-table is of a uniform height at both sides of the cutter, and the upper surface of said table is slightly depressed at or near its outer end below the level of the rest of the table, and extending to the center of the lower feed-roller, for the purpose of lessening the friction in front of the feed-rolls.

1. The combination, in a molding-machine, of the vertically-adjustable work-table E and the standard D, secured to the frame below the table, and provided at the top with a bearing for the spindle of the outside cutter-head, as set forth.

2. The work-table E, of a uniform height at both sides of the cutter, and depressed at and near one end, as and for the purpose set forth.

171,195. DEVICES FOR IMPREGNATING TIMBER WITH ANTISEPTIC FLUIDS. John Huntington, Cleveland, Ohio. (Filed Dec. 6 1875.)

Brief.—The entire cap is composed of cast-iron material, so that it may be plugged onto logs of different diameters, and it is formed into close contact by a clamping-bolt. The dogs or draw-rods are secured in lugs on the cap, and are provided with screw-threads and nuts.

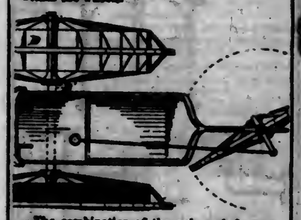
171,196.

1. The combination of the elastic cap A and clamping-band B with tube B, the parts being constructed and arranged substantially as and for the purpose set forth.

2. The combination of the elastic cap A, clamping-band B, tube B, and dogs or draw-rods I, constructed and arranged substantially as and for the purposes set forth.

171,196. DEVICES FOR IMPREGNATING TIMBER WITH ANTISEPTIC FLUIDS. John Huntington, Cleveland, Ohio. (Filed Dec. 7, 1875.)

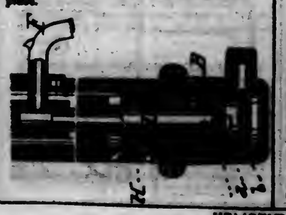
Brief.—The cap is provided with a clamp-nut. Draw-rods, provided with screw-threads and nuts, extend from the cap to the clamping-bolt, and are secured in lugs at each end. A rubber gasket is secured to the inside edge of the cap, to fit over the log to be treated.



1. The clamping-band B and draw-rods I, in combination with the cap F and gasket E, substantially in the manner as set forth, and for the purpose specified.

2. The combination of the metallic cap C and the inner of packing E, secured thereto by a projection or projections, substantially as and for the purpose set forth.

171,197. VELOCIPEDE. Marsden Hurst, Penn Township. (Filed Nov. 23, 1875.)

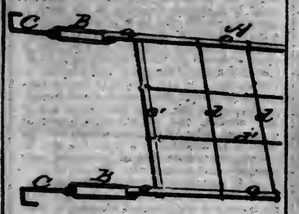


Brief.—Propelled by dogs working in cages within the wheels.

The combination of the axle and driving-wheels and their cages with the front wheel and seat or body of the vehicle, arranged together in the manner shown and described, to bring the greater portion of the weight of the vehicle and the occupant thereof directly over the axis of rotation of the driving-wheels and their cages.

171,198. HYDRANT-VALVES. Henry James Hudson, N. Y., assignor to Gilbert Brothers, same place. (Filed Aug. 28, 1875.)

Brief.—Above the spring in the tubular valve-case is the expansion-ring shown. When the valve is raised this is so compressed as to cut off the water from the waste-water ports; but the valve being seated, waste takes place.



1. The combination, with the expansion-ring H, loosely arranged in the space between the valve D and valve-seating C, in combination with a washer and a compressing-spring, I, substantially as specified.

2. The combination of a compression-ring H, with spring J, valve D, seating C, and fluid cut K, substantially as specified.

171,199. PUNCHING FOR TYPE-WRITING MACHINES. Wm. O. Johnson, Newburyport, Mass. (Filed Oct. 23, 1875.)

Brief.—The fabric is attached to the frame of the machine, extending between the ink-ribbon and the paper, to prevent blotting and blurring.

The books C, elastic band B, and reticulated frame A, combined and adapted for use substantially as specified.

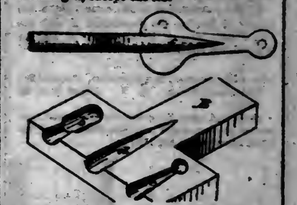
171,200. COAL-BURNING BOILER. Edwin H. Jones and Henry D. Bruce, Williamsburg, Pa., administrators of Ethelred Jones, deceased. (Filed Jan. 2, 1875.)

Brief.—The turned shanks of the teeth are made very nearly of the size of the barrel holes of the cylinder, may be tapering, and are driven into and out of the holes.

The within-described coal-breaking rod, consisting of a hollow cast-iron cylinder, combined with wrought-iron or steel teeth, the turned shanks of which are so driven into holes bored through the said cylinder that they will retain their places therein, but can be driven therefrom from the inside of said cylinder, all as set forth.

171,201. MANUFACTURE OF GUTTA-PERCHA. J. C. Klein, Pittsburg, Pa. (Filed June 24, 1875.)

Brief.—Blank first swaged in dies to thin out and centre the end; second, heat and welded; and, third, swaged in finishing-dies.

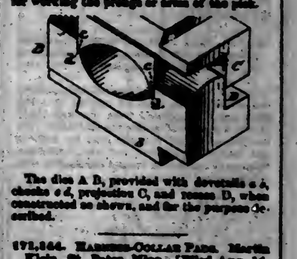


1. The herein-described improvement in the art of forming the plate and eye of grub-hoes, &c., consisting in, first, fastening the plate between dies A B; second, heating and welding the eye on block C; third, setting down the metal around the eye, and forming the ridge on the blade by means of dies E F, substantially as herein shown and described.

2. The dies A B, with recesses *a b*, for forming the fastened end C of the blank for grubbing-hoe, in combination with the plate D, provided with stud *d* and pin *e*, for fastening and welding the eye, and the dies E F, having hole *c* and punch *f*, for finishing the grubbing-hoe, as herein described and shown.

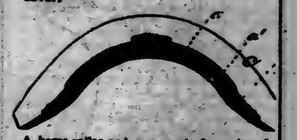
171,202. MANUFACTURE OF LATCHES. Simeon J. G. Klein, Pittsburg, Pa. (Filed June 17, 1875.)

Brief.—A round rod is upset in dies to form a collar; then placed in die to taper it; then in die to form a bulb on the end; and, lastly, in die, when the place mentioned is upset to fastening it, except the slit.



1. The herein-described improvement in the art of turning the tops of fire and other shovels, viz., first forming the collar on the bar; second, tapering the end and forming the bulb, and, finally, fastening and drawing out the end between dies, substantially as shown and specified.

2. The dies E F, with concavities *a b c d* for forming the taper, bulb, ridge, and flattened end, substantially as shown and described.



171,203. MANUFACTURE OF PICKS, &c. J. C. Klein, Pittsburg, Pa. (Filed June 17, 1875.)

Brief.—The lips *abc* for preventing the formation of fins, and the projection and recess for working the presser or arm of the pick.

The dies A B, provided with dovetails *a b*, cheeks *c d*, projection C, and recess D, when constructed as shown, and for the purposes described.

171,204. HARNESS-COLLAR PADS. Martin Klein, St. Peter, Minn. (Filed Aug. 14, 1875.)

A horse-collar pad composed of a series of metal leaves, *a a' a²*, riveted together and interposed between leather covers, substantially as shown and described.

171,205. PULLEY-TAKERS. R. M. Lanahe and George F. Gregson, New York, N. Y. (Filed Nov. 19, 1875.)

1. In a folding table, seat, or other article, the combination of the legs E, provided with pivots *b*, turning inwardly, and the plate or bar D, provided with sockets *d*, with the top A, substantially as herein described.

2. The socket G, having the cams or bear-

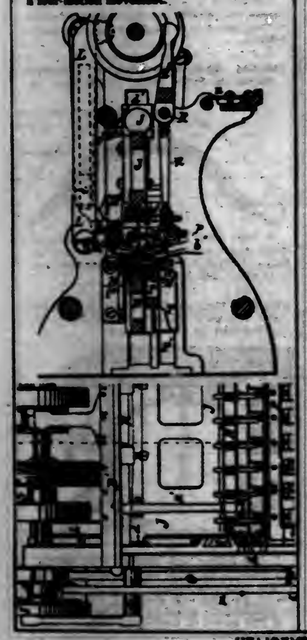
ing surfaces *g g*, in combination with the brace E and studs *c c* carried thereby, substantially as shown and described.

3. The arm F, formed on the brace E, and provided with the lips or loops *f f*, in combination with the hooper H and its depression A, constructed, arranged, and operating substantially as shown and described.

4. The combination of the spring-bolt I, the hooper H, having the depression A, and the arm F and brace E, substantially as and for the purposes shown and described.

171,146. STOVE-PIPE SHELVES. George W. Langdon, Geneva, N. Y. (Filed Apr. 6, 1875.)

Brief.—A cover hinged to the shelf, and supported in an upright position, when lifted, by arms attached to the hinges.



1. The combination, with the stove-pipe C, of the hinged cover D and the arms *f f*, projecting from the hinges thereof, substantially as and for the purposes herein set forth.

2. The combination of the hinged collar B D, provided with hooks *b b*, and perforated arm *d*, the shelf C, with pin *a*, hinged cover D, and arms *f f*, all substantially as and for the purposes herein set forth.

171,147. WAX-THREAD SEWING-MACHINES. Albert Leavitt, Boston, Mass., assignor to M. H. Simpson, same place. (Filed Aug. 20, 1875.)

Brief.—Several sets of needles, awls, presser-feet, and cast-offs, each set carried by a separate bar, are operated from the same shaft, to sew a number of seams at one time. The needles, awls, and cast-offs have an endwise and lateral adjustment, and the thread-carriers carry the thread around the needles with a four-motion movement.

1. The combination of a series of barbed needles, set in or mounted on, and operated by, a single horizontal bar or carrier, adapted to be reciprocated in a vertical direction by mechanism acting upon each end thereof, and a series of awls, also set in or mounted on a single horizontal bar, arranged in to reciprocated in a vertical direction by mechanism acting upon each end thereof, and automatically-operating mechanism, adapted to intermittingly feed the goods to be sewed in a right line, and at right angles to the motion of the needles, substantially as herein set forth and described.

2. The combination of a series of barbed needles, set in or mounted upon a single horizontal bar or carrier, adapted to be reciprocated in a vertical direction, as set forth, a series of cast-offs, also set in or mounted upon a single horizontal bar, adapted to be reciprocated in a vertical direction, as described, a series of thread guides or loopers set in or attached to a single horizontal bar, adapted to vibrate about an axis, and to be moved endwise to carry the thread in each of said thread-guides around the line of the path of one of said needles, and automatically-operating mechanism, adapted to intermittingly feed the material to be sewed in a right line, and at right angles to the motion of the needles, substantially as described.

3. The awl-carrier J, provided with a journal as either end thereof, in combination with the bases *d d* fitted to, and adapted to slide vertically in, slots *d'* and mechanism substantially as described, for imparting to said carrier a vibratory motion about said journals, and a reciprocating motion in a vertical direction, as and for the purposes set forth.

4. A series of awls, set in or mounted to a single horizontal bar or carrier, adapted to be vibrated about an axis, and reciprocated in a vertical direction, as set forth, in combination with a series of barbed needles set in or mounted upon a single horizontal bar, and a series of cast-offs, also set in and operated by a single horizontal bar, when said needle and cast-off bars are operated by mechanism acting upon each end thereof, substantially as described.

5. In combination with a series of barbed needles, cast-offs, and awls, each series attached to and operated by a single horizontal bar driven by mechanism acting upon each end thereof, a series of presser-feet attached to a single horizontal bar connected with and operated by the awl bar or carrier, substantially as described.

6. The combination of the cast-off bar P, having secured thereto a series of cast-offs, *l l*, the connecting-rod *n*, lever Q, and cam 1, all arranged and adapted to operate as and for the purposes described.

7. The combination, in a machine for sewing two or more seams at the same time, of the awl-bar carrier J, awl-bar J', bobbin-bolts *h h*, and cast-screws *g g*, all adapted to operate as and for the purposes described.

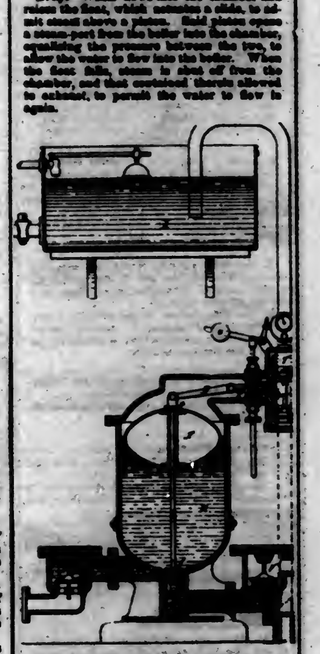
8. The combination, in a machine for sewing two or more seams at the same time, of the carrier-bar H, needle-bar H', bobbin-bolts *h h*, and cast-screws *g g*, all adapted to operate as and for the purposes described.

9. The combination of the cams B B, levers L L and K K, slides *f f* provided with the pins *f' f'*, awl-carrier J provided at each end with a journal, about which it may be vibrated, and a slot, *c*, by means of which, and box *d*, it is connected to the slide *f*, substantially as described.

10. The combination of the cam disk F, provided with the path *e*, formed in its side, the cylinder-cam G, having the path *g* formed therein, lever R' carrying at its upper end two cam-tracks, with their axes at right angles to each other, rocker-shaft R mounted in bearings in which it may be rotated and moved endwise, the depending arms R' R', horizontal bar R, and a series of thread guides or loopers, *p*, all arranged to operate as and for the purposes described.

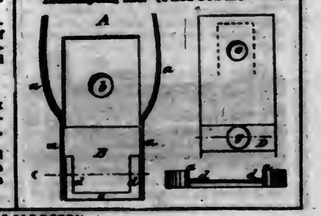
11. In combination with a vibrating and reciprocating frame or bar, carrying a series of thread-guides, as set forth, one or more friction-brakes, S, applied thereto, and arranged to operate substantially as described.

171,148. PUNCHES FOR MAKING NUT-LOCK WASHERS. Kellogg H. Loomis, Philadelphia, Pa., assignor to Wm. A. Lightbody, Brooklyn, N. Y. (Filed May 19, 1875.)



Brief.—The path for cutting the central hole is made excentric on the punch to give a more acute edge, and in combination with whgs (any desirable number) to cut radial slots.

The combination of the punch R, with excentric cutting-edge *c*, hub or disk-shaped shoulder O, and cutting-rings or edge-cutters D D, with the hollow mandrel A and fluting screw-sleeve G, substantially as and for the purposes herein set forth.



171,149. WARM-FURNACE FOR STEAM-BOILERS. P. H. J. Mandelon, Paris, France. (Filed Apr. 20, 1875.)

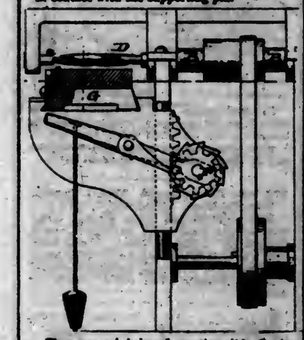
Brief.—Water flows into the chamber and raises the float, which actuates a slide, to admit steam above a piston. Said piston opens a steam-port from the boiler into the chamber, equalizing the pressure between the two, to allow the water to flow into the boiler. When the float falls, steam is shut off from the chamber, and that contained therein allowed to exhaust, to permit the water to flow in again.

The combination, in a water-feeder for steam-boilers, of the receiver B, inlet-valve F, outlet-valve V, the vertical rod *i*, provided with collars *s f*, the float F working freely up and down said rod, the steam-cylinder T, the valve G connected with the said rod *i*, a double piston, *a a'*, and slide-valve D, actuated by said pistons, and the passages *r* from the space between the pistons to the receiver, and alternately opened and closed to admit steam to and exhaust it from the said receiver, substantially as set forth.

171,150. COACH-PADS. Stephen A. Barber, Indianapolis, Ind. (Filed Oct. 28, 1875.)

The recessed ledge *f*, on the slide G, in combination with the guide-pin *c*, on the frame A, and with a cutter, D, all arranged as specified.

171,151. DIES FOR FORGING CARRIAGE-SHAFT EYES. William B. McElroy, West Meriden, Conn., assignor of one-half his right to Excelsior Manufacturing Company, same place. (Filed Aug. 9, 1875.)



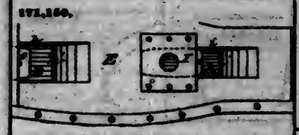
Brief.—Improvement on Letters Patent No. 136,262.

The shaping-die *c d*, constructed at the shank and with the abutments *c c*, substantially as described, whereby the shank is shaped for welding and nearly separated from the bar.

171,152. MACHINERY FOR MAKING CHAR-MOLDS. Thomas D. McGuire, Brooklyn, N. Y. (Filed June 12, 1875.)

Brief.—A pattern gage-board regulates the depth of cut for the rotary cutter by coming in contact with the supporting-pin.

The recessed ledge *f*, on the slide G, in combination with the guide-pin *c*, on the frame A, and with a cutter, D, all arranged as specified



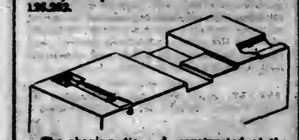
---

171,153. CHILD'S-CARRIAGE HANDLE-SOCKETS. A. McLaughlin, Cambridge, Mass. (Filed Nov. 30, 1875.)

1. The handle-socket consisting of the parts A B B, combined to operate substantially as and for the purposes specified.

2. In a child's carriage the socket B, bracket A, and joint B, to operate in combination with the body *a*, spring *c*, and handles *e*, substantially as and for the purposes specified.

171,154.



1. The herein-described device for securing the shirt to the pad-plate of a comb-pad, consisting of the clasps A, projecting from the body of the plate and united by the cross-plate *a*, so as to form an opening, B, having the interior shoulders or ventricle *d*, in combination with the shirt C, having the slide D secured thereto, all arranged and operating substantially as and for the purposes hereinbefore set forth.

2. The combination of the pad-plate B, constructed as described, with the hinge-plate A, perforated top plates H I, and removable nuts G, substantially in the manner and for the purpose herein before set forth.

3. The combination of the pad-plate A, having tenons L and pad-screw K, with the pad F, having the pad-plate E, recessed at *h* and *i*, plates H I, bottom plates J, and removable nuts G, all constructed and arranged for operation substantially in the manner and for the purpose herein shown and specified.

171,155. DIES FOR FORGING CARRIAGE-SHAFT EYES. William B. McElroy, West Meriden, Conn., assignor of one-half his right to Excelsior Manufacturing Company, same place. (Filed Aug. 9, 1875.)

Brief.—Improvement on Letters Patent No. 136,262.

The shaping-die *c d*, constructed at the shank and with the abutments *c c*, substantially as described, whereby the shank is shaped for welding and nearly separated from the bar.

171,156. MACHINERY FOR MAKING CHAR-MOLDS. Thomas D. McGuire, Brooklyn, N. Y. (Filed June 12, 1875.)

Brief.—A pattern gage-board regulates the depth of cut for the rotary cutter by coming in contact with the supporting-pin.

The recessed ledge *f*, on the slide G, in combination with the guide-pin *c*, on the frame A, and with a cutter, D, all arranged as specified

---

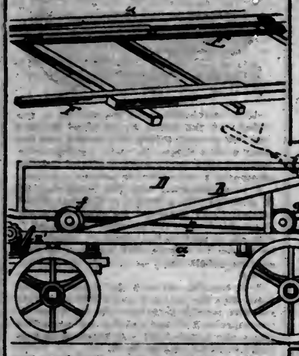
171,157. CHILD'S-CARRIAGE HANDLE-SOCKETS. A. McLaughlin, Cambridge, Mass. (Filed Nov. 30, 1875.)

1. The handle-socket consisting of the parts A B B, combined to operate substantially as and for the purposes specified.

2. In a child's carriage the socket B, bracket A, and joint B, to operate in combination with the body *a*, spring *c*, and handles *e*, substantially as and for the purposes specified.

171,158.

1. The combination, with the handles A A', of the cup B and curved plate C, each provided with one or more colanding slots, *d*, substantially as and for the purposes hereinbefore set forth.



2. The combination, with the handles A A', cup B, and pressure-plate C, of one or more studs or spurs, *c*, formed on the inner surface of the cup, substantially as and for the purposes hereinbefore set forth.

171,159. STOVE-PIPE SHELVES. Andrew Jackson Mills, Scott, assignor of one-half his right to E. P. Smith, Seneca Falls, N. Y. (Filed May 6, 1875.)

The stove-pipe shelf herein described, consisting of the center-plates B, having circular convex ends *b* and pivotal lugs *c*, in combination with the collar A, provided with the groove *a*, lip *b*, and flexible tongues *p*, and spring fastening-band A, substantially as described, and for the purpose set forth.

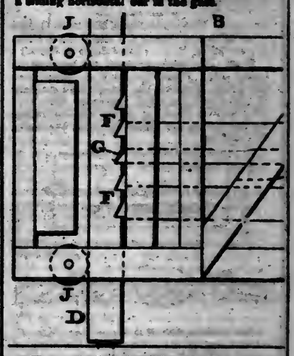
171,160. DUMPING-WAGONS. James Mills, Wilmington, Del., assignor to himself and Philip Combs, same place. (Filed Sept. 28, 1875.)

1. A dumping wagon or cart in which a movable body, D, mounted upon wheels or rollers, is combined with inclined strips B at the sides, and with strips F at the rear, all substantially as and for the purposes set forth.

2. The combination of the sliding strips F with wags E, secured to the frame of the wagon within the side strips *c*, and with supplementary rollers *b* secured to the under side of the wagon at the rear of the same, all as set forth.

3. The combination of the body D and its wheels or rollers, the inclined strips B, the strips F, and the trestle H.

171,161. MODES OF MANUFACTURING PUTTY-SPREADERS. John Mitchell, Philadelphia, Pa. (Filed Nov. 20, 1875.)

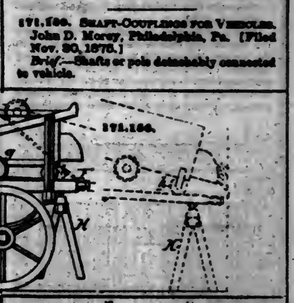


The mode herein described of manufacturing plates-springs—that is to say, first, forging a bar of steel to the shape, Fig. 1, and then coiling the bar, as set forth

---

171,162. SWINGING GATES. Jas. A. Moore, Kewanna, Ind. (Filed Aug. 30, 1875.)

Brief.—This gate revolves upon and with a vertical post near its rear. It may be adjusted at any altitude by a ratchet to this post, and a sliding horizontal bar in the gate.



The vertically-adjustable gate B, carrying the rollers J, in combination with the serrated post D, formed with notches F, and the sliding bolt G, substantially as and for the purposes set forth.

171,163. SHAFT-COUPLINGS FOR VEHICLES. John D. Morey, Philadelphia, Pa. (Filed Nov. 30, 1875.)

Brief.—Shafts or pole detachably connected to vehicle.

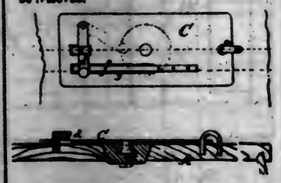
171,164.

1. The combination of the shaft or pole of a vehicle connected to the same by open hooks *a* with the levers D and arms F, substantially as set forth.

2. The combination of the shafts, with their open hooks, the levers D, their arms F, and the curved bar E, with the spring-rod I, projecting into the vehicle, as set forth.

171,160. CHUCKS. George W. Moulton, Bridgeport, Conn., assignor of one-half his right to J. M. Bliss, same place. [Filed Oct. 20, 1875.]

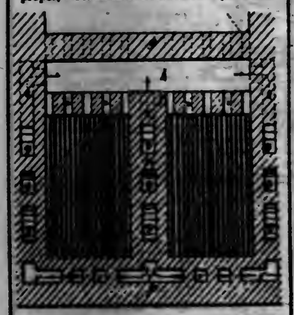
Brief.—A plate having on top cam-grooves, into which the jaws project, and by which they are moved, and on the bottom spaced pins near the circumference, to engage with the worm-screw which rotates the plate.



1. The disk B, having segmental recess *d* upon its inner side, provided with spaced pins *e*, and having eccentric cam-grooves *g* upon its outer face, in combination with an operating worm-screw, H, and griping-jaws U, having lugs adapted to engage with grooves of disk B, substantially as set forth.

2. In combination with rotating cam-plate B and shell A, the ring K and set-screws *d*, substantially as described.

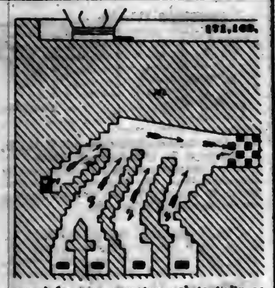
171,161. FASTENINGS FOR BUNGS IN CASKS OR BARRELS. Jacob Ott and John Weller, New York, N. Y. [Filed June 11, 1875.]



Brief.—The plate supports the bung on its under side. When the latch is passed over the spring, as shown, the bung is held securely in place, and the latch prevented from slipping back by a bend or shoulder in the spring. By depressing the spring the bung can easily be removed.

The combination of a supporting-plate, C, latch *d*, and spring-catch *f* with the bung of a cask or barrel, substantially in the manner and for the purpose herein shown and described.

171,162. GAS-FURNACES. Alex. Parkes, Gravelly Hill, Erdington, England. [Filed Nov. 4, 1875.]



Brief.—The carbonic oxide resulting from the smothering combustion of the charges in the generators, and the heated air circulating through the passages in the furnace-sides, discharge into a common flue-chamber in front of and opening into the metallurgic furnace proper, wherein their combustion is perfected.

1. The combination of the generator or generators, in which the gaseous fuel is formed, with the hollow bridge *f g* A, forming one side of the generator or generators, and constituting a hot-air flue or combustion-chamber, in which the air is mixed with the gaseous fuel, and the combustion of the gaseous fuel is effected, said parts being constructed and arranged for joint operation substantially as and for the purposes described, and illustrated in the accompanying drawings.

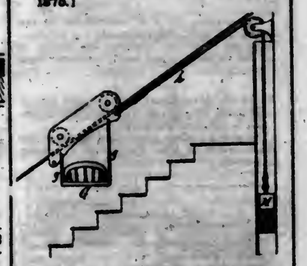
2. In combination with the generator or generators and hot air flue or combustion-chamber *f h g*, arranged for operation as described, the retorted flues or channels in the walls of the generator or generators, for heating the air to be mixed with the gaseous fuel in the hot-air flue or combustion-chamber, substantially as and for the purpose described, and illustrated in the accompanying drawings.

3. In combination with the generator or generators and hot-air flue or combustion chamber *f h g*, forming one side of the said generator or generators, as described, the flues in the walls of the generator or generators, and the arched flues above the said generator or generators, for increasing the heat of the air supplied to the hot-air flue or combustion-chamber, substantially as hereinbefore described, and illustrated in the accompanying drawings.

171,163.

171,164.

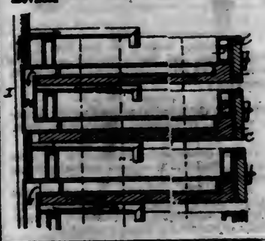
171,165. LAMP-FILLING-CAN TOPS. Orson N. Perkins, West Meriden, Conn., assignor to Edward Miller & Co., same place. [Filed Nov. 30, 1875.]



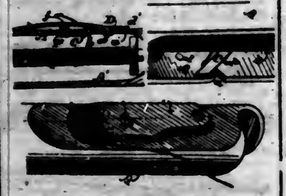
In combination with the air-vent of a lamp-filling-can top, the perforated trap D over the said vent, substantially as and for the purpose specified.

171,166. PLOWS. Norman G. Pinney, New Hudson, Mich. [Filed Oct. 8, 1875.]

The combination of a plow-point made of an imperforated bar of steel or iron, sharpened at both ends, and with parallel surfaces on all sides, with a slotted leg secured to or cast with the land-side, and a set-screw, by means of which the point is adjustably secured, and adapted to be changed end for end or side for side, as shown and described.



171,167. ELEVATORS FOR DWELLINGS. G. B. Potter, Buffalo, N. Y. [Filed Dec. 1 1875.]



The combination, with the inclined rail or cable B, of the carriage F, suspended rest O, hangers *g*, and actuating weight and cord F A, constructed and operating substantially as and for the purpose hereinbefore set forth.

171,168. ICE-MACHINES. Thos. L. Rankin, Emporia, Kans. [Filed Nov. 4, 1875.]

Brief.—Refrigerant passes through tortuous passages beneath the water-pans, and is pumped up to the condenser. Water flows from a main to transit pipes over water-pans. Pans have non-conducting bottoms under refrigerant-chamber. One end of pan is removable

171,169. SEWING-MACHINE SHUTTLES. A. Pesler, Fort Dodge, Iowa, assignor to I. F. Oleson and E. A. Daring, same place. [Filed June 10, 1875.]

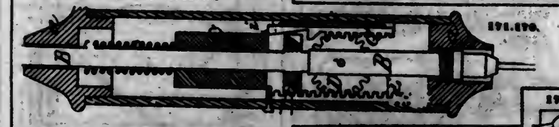
1. In combination with the shuttle A, provided with the recess *a'*, the wheel D, fitted into and pivoted within said recess, and provided with a flange, *d'*, which extends over the contiguous upper surface of said shuttle, substantially as and for the purpose specified.

2. In combination with the tension-spring E, provided with a recess, *e*, that has radial notches *e'* and *e''* around its sides, the screw F, provided, upon the periphery of its head *f*, with one or more radial points, *f'*, which may be caused to engage with any one of said notches, substantially as and for the purpose shown.

3. In combination with the shuttle A, provided with the diagonal slot *a*, the bar C, secured at one end to or upon the lower face of the upper wall of said shuttle, and extending diagonally across said slot, substantially as and for the purpose set forth.

4. In combination with the shuttle A, provided with the slot *a* and recess *a'*, the bar C, the flanged wheel D *d d'*, the spring E *e e'*, and the screw F *f f' f''*, said parts being constructed to operate in the manner and for the purpose shown and described.

171,170. CAR-COUPLINGS. Wm. Robinson, Bellefontaine, Ohio. [Filed Oct. 4, 1875.]



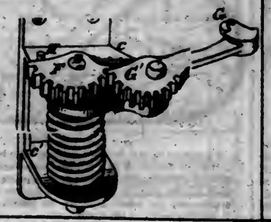
The tongue D, constructed as described, with front projection *e p p'*, curved slot *f*, and rest *a*, in combination with the two-mouthed draw-head B, provided with the chambers, as described, and with the recess *a'*, and the tongue loosely connected therein by the pin *b*, all as and for the purposes herein set forth.

171,172. SAW-MILLS. Alexander Rodgers, Muskegon, Mich. [Filed Mar. 20, 1875.]

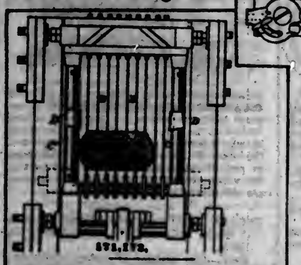
Brief.—The necessity for an extra width of saw-frame is obviated by attaching to the stiles of the frame cutters, which, as the frame reciprocates, cut away all projecting parts of the log.

The combination, with the stiles or side supports of a saw-frame, of the cutters D, for removing knots or projections from the log, substantially as set forth.

171,173. DENTAL PLUGGERS. R. S. Rider, Cattlettsburg, Ky., (G. W. Rider, administrator.) [Filed May 28, 1875.]



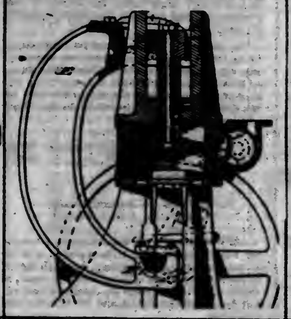
171,170.



1. A dental-plugger, having a reciprocating shaft, an anvil, a hammer, and suitable mechanism, whereby a series of successive blows is given to the plugger by means of a continuous and even pressure thereon, substantially as described.

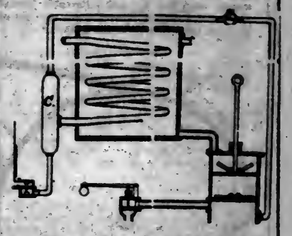
2. The hammer C, and wire movable on shaft B, and having annular lip *i*, in combination with an endwise-movable rock-bar, G, having projections *f' f'' f'''*, substantially as specified.

171,174. CHUCKS. Jas. A. Robbins, Boston, Mass., assignor to Nathaniel Corning, North Londonderry, N. H., D. W. B. Jackson, Boston, G. W. Hobbs, Uxbridge, and William Keach, Milford, Mass. [Filed Oct. 11, 1875.]



Brief.—A spiral spring, in a suitable frame, is fastened to the jamb, and operates on the door by means of a lever-arm, the two being connected together by two intermediate eccentric cogged segments—one attached to the stem of the spring, and the other formed on the inside end of the lever-arm; the combination and construction being such that the leverage shall be least when the door is closed, and increased as the spring is wound up in opening the same, the relative power of the spring thus increasing as the door closes, although its positive power decreases.

171,175.



171,176. STEAM-ENGINES. John B. Root, New York, N. Y. [Filed Apr. 20, 1875.]

The crescent E, in combination with the piston, cross-head, and guides, when constructed substantially as described.

171,176. CONDENSERS. John B. Root, New York, N. Y. [Filed May 18, 1875.]

Brief.—The water of condensation is separated from the non-condensed steam, which is conveyed to a jet-condenser and air-chamber, which includes a combined air and lift pump, that supplies cold water to the condensing coil. A weighted valve controls the induction to the vacuum-chamber.

1. The combination of a jet-condenser with a surface-condenser and a combined air and lift pump, substantially in the manner and for the purpose described.

2. In a combined jet and surface condenser, the combination of a separating-chamber, C, with a combined air and lift pump and a feed-pump, substantially as and for the purpose described.

3. In a combined jet and surface condenser, the combination of a combined air and lift pump with an automatic valve fitted or placed in the pipe, through which is conducted the condensing-water, substantially as and for the purpose described.

171,177. PRESERVING HIDES. Frederic H. L. O. Secn, Neufchatel, Switzerland. [Filed Nov. 27, 1875.]

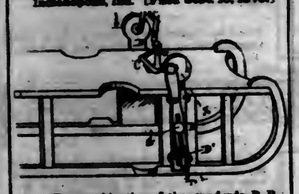
The process of preserving green hides by the employment of chromic acid, pure or combined, substantially in the manner and proportions set forth.

171,178. SHEET-DELIVERY APPARATUS FOR PRINTING-PRESSES. Albt. B. Sardo, Washington, D. C., assignor of one-half his right to John A. Ives & Bro., Baltimore, Md. [Filed July 26, 1875.]

Brief.—The sheet is clamped between the gripers and points on the sliding throw-off plate, which plate is operated by cams from the griper-shaft, so as to deliver the edge of the sheet under the curved guides as soon as it has passed the delivery-roll. Tapes are dispensed with, and the sheet receives a calender-press, after printing, between the cylinder and felt-covered delivery-roll.

1. The throw-offs M', attached to the plate M, in combination with the arms on the shaft F, by which they are projected, substantially as set forth.

2. In combination with the throw-offs, radially projected, the points N, which hold the make-ready sheets, and at the same time serve as guides for the throw-offs, substantially as set forth.



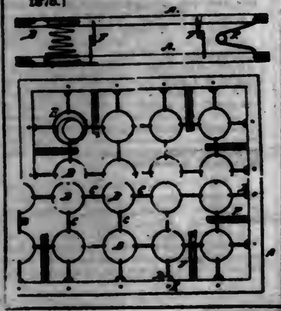
3. In combination with the shaft E' and pinion F, carrying the throw-off pinion, and plates to which they are attached, the lever F', for operating and releasing the make-ready sheets, substantially as set forth.

4. In combination with the sliding throw-offs, and arm for projecting them, the spring O, for instantly retracting them, substantially as set forth.

5. In combination with the cylinder, and with the sheet-delivering apparatus, the roller P, covered with hair or cloth, and acting against the surface of the sheets, substantially as set forth.

6. In combination with the roller, the guides Q, constructed so as to direct the sheet downwardly onto the fly, and adjustable jointed arms, which may be turned to one side out of the way, substantially as set forth.

171,178. SLED-PROPELLERS. C. Schweiger, Indianapolis, Ind. [Filed Sept. 16, 1875.]

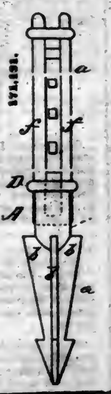


1. The combination of the standards B B, face-plates b b, reciprocating levers D D, and independent crank-shafts C C, when the several parts operate substantially as described and shown.

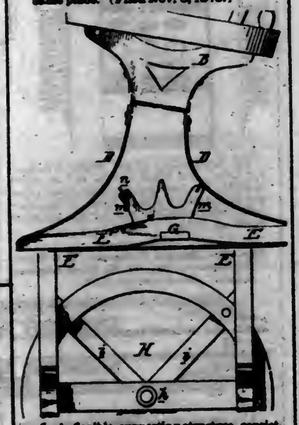
2. The combination of the standards B B, face-plates b b, reciprocating levers D D, independent crank-shafts C C, and standards c, when the several parts operate substantially as described and shown.

3. The yielding pitmen D', in combination with the levers D, as and for the purpose set forth.

171,180. LOOSE BED-BOTTOMS. Alonzo D. Seaman, Milwaukee, Wis. [Filed Aug. 12, 1875.]



Combination of the frames A A, spring B, connected together by hooks C, and attached to the frames A A by loops D, and the springs F, substantially as and for the purpose set forth.

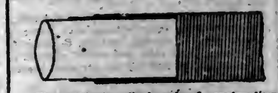


171,181. FENCE-POSTS. Ira L. Sherman, New Albion, N. Y. [Filed Aug. 28, 1875.]

The metallic fence-post A, having the perforated and longitudinally-grooved shank d, wings b b, and point a, in combination with the rod c and tie-bar D, substantially as described, and for the purpose set forth.

171,182.

171,183. CHARM. Asher B. Stevens, Philadelphia, Pa., assignor of one-half his right to Henry S. Hale, Artemus Kilburn, J. W. Hale, Chaney Kilburn, and Warren Hale, same place. [Filed Nov. 6, 1875.]



1. A flexible supporting-structure, consisting of two curved springs, D D', the hangers B B' attached to the object to be supported and secured to the upper ends of the springs and bars E, to which the lower ends of the springs are attached, all substantially as set forth.

2. The springs D D' made of one bent bar, in combination with the hangers B B' and re-enforcing-plates I, through the medium of which the said springs are secured to the hangers, all substantially as described.

3. The combination of the projections n n, secured to the bars E, and having rubber pads o, with the springs D D, substantially as described, and for the purpose set forth.

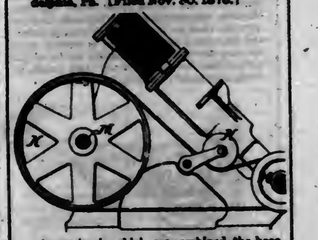
4. The combination of a chair, having spring-supports, with a base, H, having a ring, I, and a central pin or bolt, on which the chair can turn, all substantially as described.

171,184. INSULATING METAL WIRE. Henry Spitdorf, New York, N. Y. [Filed July 20, 1875.]

The within-described mode of constructing insulated wire by first coating the wire directly with shellac or other non-conducting gummy material, then winding silk or other thread on the wire, and finally heating the whole to unite the gummy coating and thread, substantially as described.

171,185. MANUFACTURE OF STEEL. Profit. J. Slade, Trenton, N. J. [Filed May 10, 1875.]

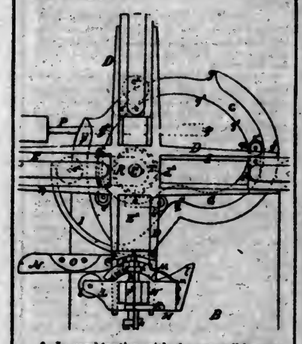
Brief.—The amount of carbon, chromium, titanium, or other steadier, is regulated by addition or subtraction to the amount required to sufficiently supplement the action of the phosphorus, and produce the desired quality of steel.



The process of forming steel by regulating, to an alloy of iron, manganese, and phosphorus, the quantity of carbon, silicon, chromium, or titanium to supplement the steadifying action of the phosphorus already in the steel to the desired extent, substantially as described and set forth.

171,186. NAILS FOR WIRE FENCES. E. S. Smythe, Aurora, Ill. [Filed May 31, 1875.]

As a new article of manufacture, a staple for wire-fences, having a short prong, c, with chisel end, and a long prong, b, which latter is provided with an elevated beveled heel, a chisel end, and rearwardly-inclined barbed notches, substantially as and for the purpose described.



171,187. SCRAPE-HOOKERS AND DRIVING APPLIANCES. Samuel R. Upham, Jr., Philadelphia, Pa. [Filed Nov. 20, 1875.]

An engine in which are combined the base A, the two frames B and B', the downwardly-inclined double-cylinder engine, the crank-shaft H, its pulley J situated between the frames, and the shaft M, with its pulley K, all substantially as set forth.

171,188. COMBINED RIBBLE AND RAKER FOR HARVESTERS. Abraham Stoler, Philadelphia, Pa. [Filed June 12, 1875.]

Brief.—Devices for projecting the reel-fingers over the standing grain, and for giving the reel-rake the quadrantal sweep, and restoring it to resting position.

1. In combination with the extensible arms E E and segment I, the rollers e^1, for preventing the extension of said arms when rising from the platform, substantially as shown and described.

2. In combination, with the extensible arm E', bearing the segmental rack h^1, the pivoted cradle H, sustaining the shaft h, holding the pinion h^1, substantially as shown and described.

3. In combination with the cradle H', pivoted on the extensible arm E', the cam-guide N for holding down said cradle, and producing an extension of said arm, substantially as shown and described.

4. In combination with the pivoted cradle H, having the upwardly-projecting end F, the cam-guide O, for restoring the beam F to its transverse position with reference to the platform A, substantially as set forth.

5. In combination with the pivoted cradle H, pinion and fixed segmental rack h^1, formed with recess n^2, the spring M for holding the beam F in a position transversely to the platform A, substantially as shown and described.

6. In combination with the extensible arm of a harvester-reel, a rake, constructed and arranged substantially as described, so as to make a straight and quarter turn sweep over the platform, as set forth.

7. A combined harvester reel and rake, having extensible arms constructed and arranged substantially as described, so as to project over the standing grain and draw up to clear the platform in their transit over it, one of said extensible arms being provided with a rake-beam, so constructed and arranged as to make a straight and quarter turn sweep, substantially as shown and described.

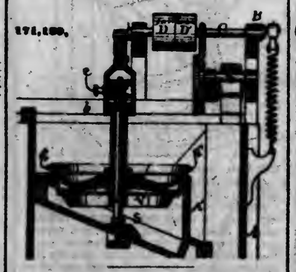
8. In combination with the reel-rake shaft C, bearing the eccentric E, the weighted brake-lever F, substantially as shown and described.

9. In combination with the extensible arms E or E', the rollers e^1, borne on the transverse bars e out of true line of said arms, so as to afford leverage and prevent binding, as set forth.

171,189. ORE-JIGGER. Abraham Stroh, Manch Chunk, Pa. [Filed Nov. 20, 1875.]

Brief.—The pan is terraced and perforated at the side and bottom. Valve controls communication between side and bottom, and is vertically adjustable relatively to pan. Coiled spring assists in lifting jigging-pan. Coal passes over edge of pan, slate down through annulus. Water rising through perforations, when pan goes down, washes slate off the terraces. Carriers convey separated material to chutes.

1. In a jigger for separating coal, ore, &c., the ore-receptacle, consisting of the cylindrically-shaped walls T T, terraced and perforated, as explained, and the terraced perforated bottom Q, of a diameter less than that of the interior of said walls T, substantially as and for the purpose specified.



2. The combination, with the ore-receptacle T T Q, having terraced and perforated sides and bottom, of the slate-valve V, located immediately beneath said ore-receptacle, substantially as described, for the purpose explained.

3. The ore-receptacle T T Q, terraced and furrowed, and provided with water-apertures, as herein described, in combination with the slate-valve V and vertically-adjustable spindle E and its operating mechanism, substantially as set forth.

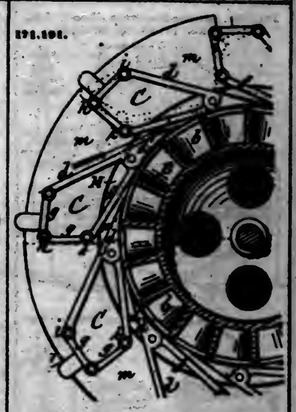
4. The combination of the shaft C, carrying the eccentrics E E', the hanger W, rod spindle E, with the ore-receptacle T T Q and slate-valve V, all substantially as specified.

5. The combination of the spring X with the shaft C, eccentrics E E', ore-receptacle T T Q, and intermediate operating mechanism, substantially as specified.

171,190.

171,190. HARNESS FOR FIRE-ENGINES, &c. Edward O. Sullivan, San Francisco, Cal. [Filed Aug. 4, 1875.]

1. The arrangement and combination together, in a harness, of the hinged collar A, with its hames f, the hinged breeching D, the inner trace B, and the divided outer trace C C', connected to the collar and the whiffletree, and provided with the buckle and spring-slip l m, as described, and for the purpose specified.



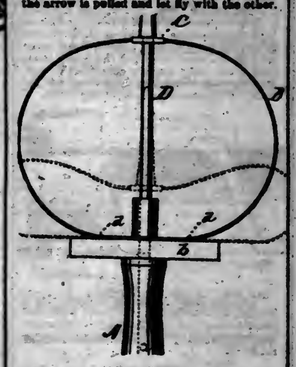
2. The hinged breeching D, with a hinge, a, to enable the outer side to open and be thrown back, as described and specified.

3. The combination, with the harness for a fire-engine or like apparatus, of a device for suspending said harness above the place occupied by the horse when attached to the apparatus, substantially as and for the purpose set forth.

171,191. WATER-WHEELS. Thomas Tait, Rochester, N. Y. [Filed Oct. 18, 1875.]

Brief.—Trapezium or lozenge shaped guides or cut-offs constructed with the fixed plates, swinging plates, and jointed angle-plates, whereby the water-ways are of regular wedge shape under all degrees of opening, the narrow end of the wedges resting against the periphery of the wheel, so that the water will be discharged nearly at right angles. There is also a flange projecting from the periphery of the wheel at a point between the top and bottom, in combination with a ring set into the edge of the curbing, on a line with the floor of the water-way, and projecting over the flange, as shown and described, and for the purpose specified.

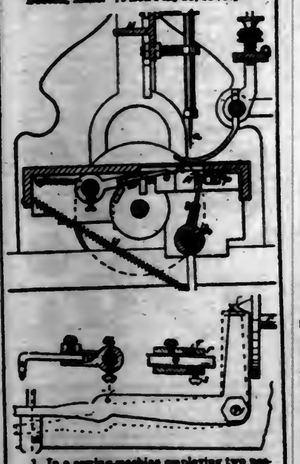
171,191.



1. The trapezium or lozenge shaped guides or cut-offs C, constructed with the fixed plates d, swinging plates f, and jointed angle-plates f g, whereby the water-ways or arc of regular wedge shape under all degrees of opening, the narrow end of the wedges resting against the periphery of the wheel, the chute arranged as described, so that the water, under varying heads, or under different degrees of opening, will be discharged directly in contact with the buckets, and nearly at right angles thereto, as shown and described.

2. The flange p, projecting from the periphery of the wheel B, at a point between the top and bottom of the wheel, in combination with the ring M, set into the edge of the curbing on a line with the floor of the water-way, and projecting over the flange, as shown and described, and for the purpose specified.

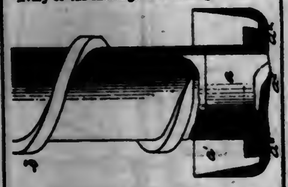
171,192. BOWS AND ARROWS. C. F. Tood, Elmira, N. Y. [Filed Nov. 6, 1875.]



Brief.—One hand grasps the handle, and the arrow is pulled and let fly with the other.

The bow and arrow herein described, consisting of the tubular handle A, cross-piece b, spring B, having guide-loop C, and the arrow D with shoulder p, combined to operate substantially as set forth.

171,196. SEWING-MACHINE. Chas. F. Toll, Boston, Mass. [Filed July 16, 1875.]



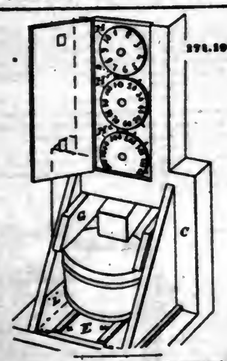
1. In a sewing-machine employing two needles, the upper one moving vertically and the under one horizontally, the combination, with the under needle and its operating-shaft, of a connecting mechanism between the two, whereby the said under needle can be moved and brought to and from the under side of the cloth plate of the machine into a convenient position to be threaded, substantially as described.

2. The take-up bar P and its spring *s*, in combination with the surface *d*, arranged and operating together to nip and free the under thread, substantially as described, for the purpose specified.

171,194. CORE-ADJUSTER. O. W. Townsend, Pond du Lac, Wis. [Filed June 2, 1875.]

Brief.—The cutter-head is provided with an inner and an outer ring, to which the knives or cutters are attached, and the lower inner side of the inner ring and the upper inner side of the outer ring are chamfered or bevelled, for the purpose of facilitating the delivery of the shavings and cutting a core.

The cutter-head A, having its inner ring *a* beveled or chamfered at its lower edge, and its outer ring *a'* at its upper edge, substantially as shown and specified, and for the purpose set forth.



171,195. CRANE-TALLIER. Henry L. Townsend, Bath, N. Y. [Filed Nov. 9, 1875.]

1. The register, having the casing constructed with the hollow posts O, fastening the rods *p*, attached to the cross-rod *k*, the said rods *p* being connected with the casing by the springs *n*, and coupled to the hinged platform, as and for the purposes set forth.

2. In combination with the platform E and rods *p* and *d*, and springs *n*, the sheets G, as shown, for the purposes set forth.

3. The register, consisting of the three disks mounted upon the toothed wheels, as shown, the uppermost being on a ratchet-wheel, the pawl *i*, and detent *k*, the rods *k*, *p*, and *d*, springs *n*, platform E, the casing provided with the hollow posts O, and sheets G, all as and for the purposes set forth.

171,196. ROTARY PAPER-FOLDING MACHINE. Stephen D. Tucker, New York, N. Y. [Filed Sept. 7, 1875.]

Brief.—The sheets are supplied to a revolving drum, in which are journaled folding-blades, which, by their independent revolution, are protruded from the drum and press the doubled edges of the sheets into the bite of folding-rollers, whence they are carried to further folding devices or to delivery. Several modifications are described.

5. The combination of the vibrating sheet-controlling roller I, pulleys or roller s^3, guiding tapes *q*, and drum B, substantially as shown and described.

6. The combination of stationary gages J, vibrating sheet-controlling roller I, and feed-table Y, substantially as shown and described.

7. A revolving folder-carrying frame, a rotating single or double folding-blade, and devices into which the sheet is folded or doubled, combined and coacting substantially as shown and described.

8. A revolving folder-carrying frame, a rotating folding-blade, and stationary folding-rollers, combined as shown and described.

9. In combination with a rotating carrying-frame or drum, mechanism for alternately seizing and releasing the sheet, and a folding-blade having a part rotation to project it outward from the periphery of the drum or carrying-frame for folding the same, substantially as shown and described.

10. A folding-blade hung in or near the periphery of a revolving carrier or drum, and intermittingly rotated a part revolution to project it outward, to double or crease a sheet of paper, in combination with devices which receive said doubled sheet, substantially as shown and described.

11. A folding-blade hung in a revolving drum or carrier, and traveling in a circular path therewith, and capable of independent rotation therein, substantially as shown and described.

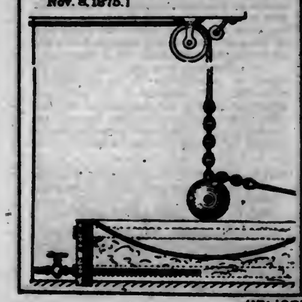
12. A folding-blade having intermittent part rotations in its revolving carrying frame or drum, in combination with a locking mechanism to retain it in its normal position during the intervals of time between its rotary movements, substantially as shown and described.

13. The combination of rotating folder-shaft, notched hub, and spring-detent, substantially as shown and described.

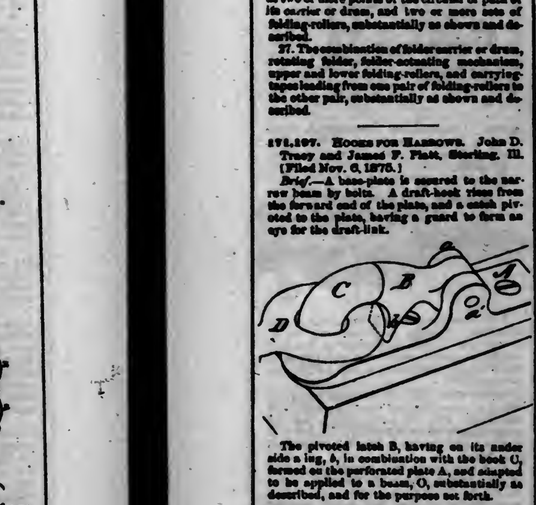
14. The method of causing the folding-blade to move in a circular path, and be projected outwardly from the periphery of the supporting-drum, by means of a flying-cam, substantially as shown and described.

15. The combination of flying-cam W, stationary cam V', and folding-blade, substantially as shown and described.

16. The combination of folding-blade, its rotating carriage or drum B, flying-cam, and stationary cam V', substantially as shown and described.



17. The combination of revolving sheet-supporting and folder-carrying drum, the independent rotating folding-blade, flying-cam, and stationary cam, substantially as shown and described.



171,197. HOOKS FOR HARROWS. John D. Troxy and James P. Platt, Sterling, Ill. [Filed Nov. 6, 1875.]

Brief.—A metal plate is secured to the narrow beam by bolts. A draft-hook rises from the forward end of the plate, and a catch pivoted to the plate, having a guard to form an eye for the draft-link.

The pivoted latch B, having on its under side a lug, *b*, in combination with the hook C, formed on the perforated plate A, and adapted to be applied to a beam, O, substantially as described, and for the purpose set forth.

171,198. MAKING SHEET-METAL WARE. John Tregoner, New York, N. Y. [Filed Nov. 6, 1875.]

1. The method herein described of folding paper by means of a revolving drum, upon which a sheet is supported, a folding-blade rotated within and projected from said drum, and devices which receive said sheet, substantially as shown and described.

2. The method of folding paper by means of a revolving drum, upon which a sheet is supported, a folding-blade rotated within and projected from said drum, and a pair of rollers which receive the sheet, substantially as shown and described.

3. The method of folding paper by means of a revolving carrier, supporting a folding-blade rotated in and projected from it, and conducting devices, which carry the sheet within the range of action of the folding-blade and one set of folding-rollers, and, when once folded, convey it away from the one set and return it to a second set of folding-rollers, again within the range of action of the folding-blade, where it is again folded, substantially as shown and described.

4. The combination of sheet gages or stops, intermittingly-acting bronzing-roller, and endless tapes and pulleys s^3, substantially as shown and described.

18. The combination of revolving folder-carrying drum, independently-rotating folding-blade, flying-cam, stationary cam, and folding-rollers, substantially as shown and described.

19. The combination of revolving folder-carrying drum, independently-rotating folding-blade, folding-rollers, and sheet-carrying tapes, substantially as shown and described.

20. The combination of revolving folder-carrying frame, independently-rotating folding-blade, flying-cam W, stationary cam V', rollers s s', and sheet-delivering tapes, substantially as shown and described.

21. The female or stationary cam V', constructed with a divided face, whereby is provided a guiding-way for directing the movements of the folding-blade, and a recess for the passage of the point of the flying-cam, substantially as shown and described.

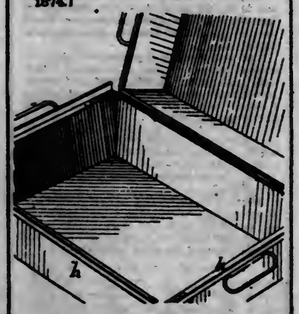
22. The combination of gear-wheels I I^1, flying-cam W, folding-blade U, drum B, stationary cam V', and folding-rollers s and s', substantially as shown and described.

23. In combination with the sheet-supporting drum and folding devices, the air-pipe F^1, substantially as shown and described.

24. In combination with the sheet-supporting drum and folding devices, the sheet-directing guards *u*, with or without the tapes r^1, substantially as shown and described.

25. A revolving carrier or drum, supporting a rotating folding-blade, and means for projecting said blade beyond the periphery of the carrier or drum at two or more points, substantially as described and shown.

26. The combination of a revolving carrier or drum, a folding-blade rotating therein, means for projecting it beyond the periphery at two or more points of the circular or path of its carrier or drum, and two or more sets of folding-rollers, substantially as shown and described.

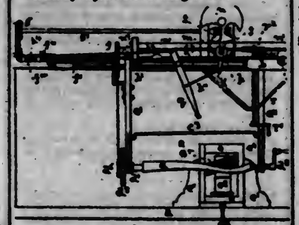


27. The combination of folder-carrier or drum, rotating folder, folder-actuating mechanism, upper and lower folding-rollers, and carrying-tapes leading from one pair of folding-rollers to the other pair, substantially as shown and described.

171,199. ATTACHMENTS FOR HEELS OF BOOTS AND SHOES. Robert S. Van Sandt, Williamsburg, N. Y. [Filed Mar. 12, 1875.]

A heel attachment or ice-creeper having a band, A, divided into two parts, A^1 A^2, connected together by a hinge, *b*, lugs a^1, and screw E, and having a series of projections, *c*, extending under and partially across its base, and provided with pins *d* beneath the under side of the heel F, as shown and described.

171,200. BAKING AND ROASTING. William Wache, Covington, Ky. [Filed June 12, 1874.]



1. In a covered bake-pan, the flanges *h h h*, formed of the same piece of sheet metal as the lower part of the pan by bending the edges outwardly, so as to receive and incase the upper part or cover of the pan, substantially as and for the purposes described.

2. A covered sheet-metal bake-pan, the two parts of which are hinged together, and so adjusted relatively to each that they may be used either as a single covered or as a double open pan, substantially as and for the purposes described.

171,201. LATHES FOR TURNING IRREGULAR FORMS. George N. Westcott, Cortlandville, N. Y. [Filed Nov. 2, 1875.]

Brief.—The blank from which the article is to be turned is placed between centers in a swinging frame, which also has a reciprocating movement, its motions being governed by suitable guides, the cutting being done by a vertically-adjustable rotating cutter.

1. The oscillating supports or hangers s' and s'', for the cutting-lathe S^1 and the pattern-lathe S, in combination with a cam, *h*, running on ways, substantially as set forth.

2. The foot apparatus or device, composed of the cams *f*, wheel *j*, and shaft *m*, in combination with the rod *n* and cam *h*, as set forth.

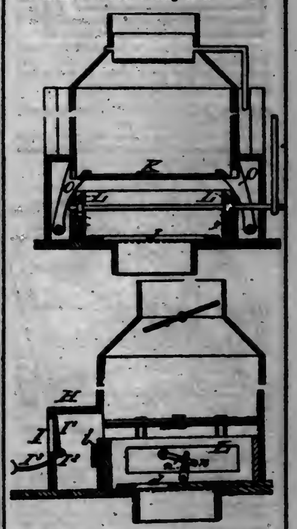
3. The hand-feed, composed of the devices r, r^1, r^2, and r^3, in combination with the cam *b* and hangers s' s'', substantially as set forth.

4. The hand-lever *q* and rods b^1 b^2, in combination with the clutch f'' and eccentric *h*, for throwing simultaneously the feed and the lathe motions in and out of gear, as described.

5. The slide-rod and revolving shaft f', in combination with the tube f'' and cam *b*, as described.

6. The tube f', in combination with the cam *b* and hangers s' s'', as set forth.

7. The combination of saw-cutters, the hangers or supporting-arms s' s'', the oscillating tube f', and the adjustable tail-screw and center S^2, for cutting a taper in the blank either greater or less than that of the pattern, as set forth.



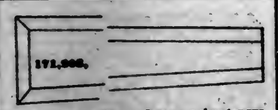
8. The sliding rest S''', adjustable on the rest *a*, in combination with the weighted guide S', for the purposes and uses set forth.

9. The car *k*, running on the rails or ways a', and moved by the screw and pinion f, in combination with the hangers s' s'', the lathe or pattern holder S, and the blank-lathe S^1, suspended from and beneath the car, in combination with the saw-cutters S^2 and pattern-guides f *i*, operating as one machine, substantially as set forth.

10. The oblique or drunken saws or cutters S^2 on the mandrel S^1, in combination with the adjustable frame s and set-screw s^2, whereby the saw or saws or cutters are adjusted to the blank *d* in the lathe S^1, as set forth.

171,202. FRUIT-DRIERS. Leo Whittlesey, Sturgis, Mich., and Franklin Whittlesey, Rochester, N. Y. [Filed Nov. 11, 1875.]

Brief.—The upper edges of the carrier is cut away or notched, so that it will not strike the detents. The extension affords room for the movement of the self-closing door.

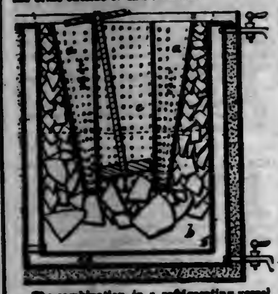


1. The combination, with the kiln, of detents O, and a reciprocating carrier, having notches or recesses arranged in respect to said detents, substantially as and for the purpose set forth.

2. The combination of the carrier L, rock-shaft M, having arms connected to the carrier, and operating-arm, as specified.

3. The combination of the kiln, its extension H, opening I, and self-closing door I' hung at the lower edge, and opening inward, substantially as and for the purpose set forth.

4. The trays K, constructed, adapted to, and combined with, the carrier L and detents, as described, so as to bear against the lowest tray of the column, and raise the latter before moving the detents, for the purpose set forth.



171,203. SHOE-TURNING. W. J. Washburn, Boston, Mass. [Filed July 9, 1875.]

As an improved manufacture, a shoe-tongue composed of two sheets of material, *a b*, cemented together, and having the outer one or both folded and fastened or pasted down upon the lining or lower one along the outer edge or edges thereof, all as described and shown.

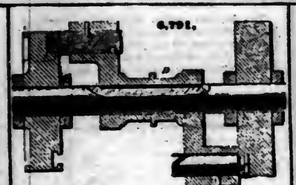
171,906. REFRIGERATING APPARATUS. L. B. Woolfolk, Lexington, Ky. [Filed June 29, 1875.]

Brief.—Refrigerating-box is partly filled with brine, its annular part with salt, and ice is fed through the center, and pressed down by the dasher, in order that it may rise in the brine outside of salt-chamber.

The combination, in a refrigerating-vessel, of the salt-vessel *a*, having ice-passage *c*, the dasher *d*, ice and brine holder B, and waste-pipe C, substantially as set forth.

171,906. PLOWS. John Worrell, Clayton, Ind. [Filed Nov. 27, 1875.]

Brief.—Oscillating clamp for plow-beam upon a rack-bar, which is vertically adjustable at either end of the yoke.



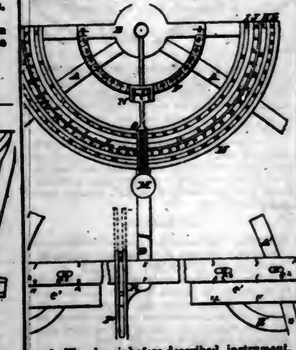
The pieces *c c*, secured to the plow-beam C by means of staples and nuts *d*, and having pivoted between them the oscillating bar *e*, in combination with adjustable bearings *f*, arched bar D, and arms E, pivoted to the vertical portions *a a'* of an arched axle, B, substantially as described.

REISSUES.

6,791. MACHINES-CLOTHING. Abt. B. Rent, New Haven, Conn. Patent No. 148,103, dated Mar. 3, 1874; reissue No. 6,215, dated Jan. 19, 1876. [Filed Nov. 23, 1875.]

Brief.—The movement of the looking-sleeve toward the wheel to be clothed causes the rotation of the bolt having the spiral groove by means of a pin engaging in the groove. This causes the nut in the number T-shaped groove to advance on the threaded end of the bolt, and clamp the flanges bordering said groove against the shoulders of the inner end of the bolt, and thereby clutch the wheel.

6,791.



1. In a machine-clutch, a pulley constructed with a concentric groove or flange of substantially T shape in radial section, and loose upon the shaft, combined with mechanism, in connection with the shaft, whereby, through said groove or flange, the pulley is engaged with or disengaged from the said shaft, substantially as specified.

2. In combination with a shaft, and pulley loose thereon, and the sleeve D, in connection with said shaft, so as to revolve therewith, but free for longitudinal movement, the bolt or bar I, in connection with the pulley and with the sleeve, so that a longitudinal movement of said sleeve will impart a rotative movement to said bolt or bar, and thereby cause the said bolt to engage the pulley with or disengage it from the shaft, according to the direction of the movement of said sleeve, substantially as described.

3. A clutch-pulley constructed with a T-shaped groove or flange, L, combined with a bolt, I, and a nut, *f'*, in said groove, and means, substantially such as described, for imparting a rotative movement to said bolt, to engage or disengage said pulley.

6,792. SURVEYING-INSTRUMENTS. John L. Bogy, St. Genevieve, Mo. Patent No. 147,472, dated Feb. 17, 1874. [Filed Dec. 2, 1875.]

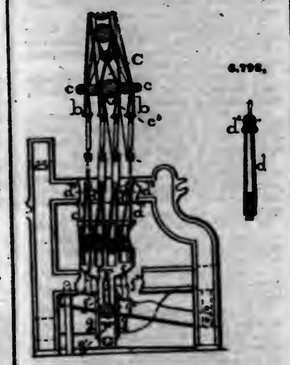
Brief.—Two converging arms are attached to a disk, from which is suspended a pendulum and two fixed graduated arcs. By means of the arcs the horizontal distance and difference in level between the arms is obtained.

1. The herein-before-described instrument, consisting of the head B, legs A A', main brace C, semicircle F, pendulum M, and square P, combined and operating substantially as described.

2. The herein-before-described instrument, consisting of the head B, legs A A', main brace C, semicircle H pendulum M, and square P, combined and operating substantially as shown.

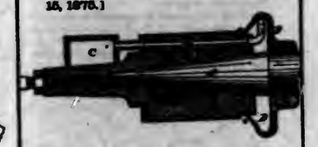
3. The legs A A', head B, main brace C, semicircles F and H, pendulum M, and square P, combined and operating substantially as described.

6,793. SHEDDING MECHANISMS FOR LOOMS. Robert Elliott, Chester, Pa. Patent No. 110,040, dated Jan. 3, 1871. [Filed May 31, 1875.]



1. The pivoted frame C and guide-rollers *r s*, combined and connected with the heddles, straps, and upper rollers, substantially as and for the purpose set forth.

2. The combination, with the jack-bars, of the guides F with slots *f*, and shanks *f'* with slots *f''*, brackets G with flanges *g*, slots *g'*, and bolts *g''*, substantially as and for the purpose set forth.



3. In combination with the heddle and jack-bars, the strap *d'*, which is formed into a loop, and provided with a headed pin, *d''*, whose stem projects from the looped strap, and its head is held secured between the folds of the strap, the stem of the pin being connected to the heddle-bar, and the loop of the strap receiving the jack-bar, substantially as and for the purpose set forth.

4. The jack-bar provided with the slot *e* and pin *e'*, in combination with the connection *d''* between the jack-bar and heddle, substantially as and for the purpose set forth.

6,793.

6,794. LUBRICATORS. Johannes A. Oesenbrunk, Hemelingen, Germany. Patent No. 126,274, dated Apr. 30, 1872. [Filed Nov. 15, 1875.]

1. In combination with the shaft A and stationary bearings B, a revolving oil or grease cup, D, that is secured to the said shaft, and made to revolve around the end of the bearing, substantially as and for the purpose specified.

2. The combination of a bearing or pulley, an oil or grease cup that revolves around said bearing, or with the pulley, and a pipe for gathering the oil or grease from the inside of the cup, and forcing it into the bearing, as specified.

3. In combination with a bearing, a revolving cup that is attached to the shaft, a pipe for forcing the oil through the bearing, and a stationary oil or grease box that is attached to or formed with the bearing, substantially as set forth.

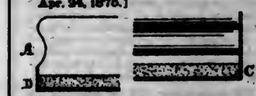
4. The chambers *d*, channel-way *m*, and pipe *b* in the shaft-bearing, in combination with a centrifugal cup, D, fast to the revolving shaft, and pipe J, fast to the upper part of the shaft-bearing, and connected with the lubricating-cup *c*, substantially as described.

5. The chambers H in the loose pulley F, closed by suitable caps D, in combination with pipes V W, attached to the shaft, and connected through suitable holes or channel-ways with a groove, *s*, or with the internal bearing of said pulley, and operating in the manner and for the purpose set forth.

6,795. GARNET-LININGS. John M. Perkins, Asbury, N. J., assignor to R. R. Perkins, same place. Patent No. 76,342, dated Apr. 7, 1868. [Filed June 9, 1875.]

A lining, consisting of a sheet of aromatic wood, combined with textile fabric or paper applied to the surface or surfaces of said wood, substantially as and for the object specified.

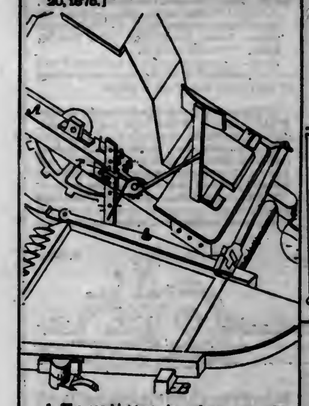
6,796. COMBINED HAT HOLDERS AND ORNAMENTS. J. R. Smith, Waterbury, Connecticut, assignor to the Smith & Griggs Manufacturing Company. Patent No. 102,982, dated May 10, 1870. [Filed Oct. 28, 1875.]



Brief.—A hat or other article is held between the jaws of the suspending-clamp by the sliding ring, the duplicate check thereof being first removed by the custodian and presented to the owner of the article.

1. The clasp made of a strip of metal, folded to form the loop *a*, and the ends bent toward each other to form the jaws *b*, in combination with the suspending-ring E and sliding ring B, substantially as set forth.

2. The removable check C, in combination with the clasp A *b*, and sliding ring B, substantially as described.



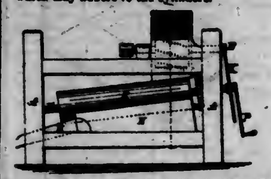
6,797. BLACKBOARD AND OTHER RUBBERS. Benj. Y. Conklin, Brooklyn, N. Y. Patent No. 152,622, dated Oct. 20, 1872. [Filed Apr. 24, 1875.]

1. The rubber, consisting of a body or handle, A, and a rubbing portion, B, composed of a sheet or sheets of felt gummed or otherwise secured to said body, substantially as and for the purpose set forth.

2. The rubber herein described, consisting essentially of a body or handle, A, provided upon its rubbing-face with a sheet of felt permanently secured thereto, and formed with sharp angular sides C D, substantially as and for the purpose set forth.

6,798. HARVESTERS. C. Crook, New Hope, Pa., assignor, by mesne assignments, to J. I. Hendryx. Patent No. 17,300, dated May 5, 1857; reissue No. 646, dated May 4, 1858; reissue No. 2,209, dated Apr. 30, 1869; extended seven years; reissue No. 5,420, dated May 27, 1873. [Filed Sept. 20, 1875.]

1. The combination, in a harvester, of a main frame, supported on a driving-wheel, without any front truck, and a separate cutter-frame loosely jointed thereto in rear of the driving-wheel, and being located or arranged wholly outside of the main frame, substantially as described.



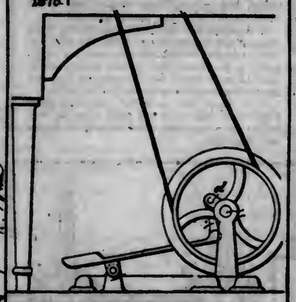
2. In combination with a cutter-frame, located outside of the main frame, and hinged loosely thereto in rear of the driving-wheel, a lever pivoted to the main frame, and connected to the cutter-frame, substantially as described, whereby the front end of the latter can be raised or lowered at will, as set forth.

3. The combination of a main frame, a hinged adjustable cutter-frame, an independent suspending device for suspending said cutter-frame, and a lifting device having a flexible connection to the platform, substantially as described.

4. In combination with a main frame and an adjustable cutter-frame, a suspending device independent of the lifting device, constructed to operate substantially as described, whereby the cutter-frame may be adjusted and held at any desired height, and be free to rise above and fall to its adjusted position without affecting the lifting device, as set forth.

6,799. CIDER-MILLS. Enos Curtiss, Finley, Ohio. Patent No. 160,307, dated Mar. 2, 1875. [Filed Nov. 24, 1875.]

Brief.—The drum is provided with teeth to grate the apples to a fine pomace, which falls upon the cylinders placed parallel and close together, and at an inclination, forming a trough, down which the cider runs to the spout. Metal scrapers remove any pomace which may adhere to the cylinders.



1. In a cider-mill, the inclined rollers E, geared together so as to revolve toward each other, and forming a trough, down which the cider runs to the receiver, as specified.

2. In a cider mill and press, the inclined rollers E, in combination with the shafts D, cog-wheels M, handle P, and spout H, substantially as shown.

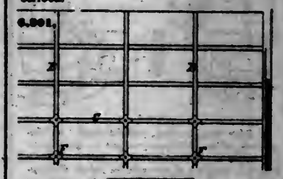
3. The combination of the inclined rollers E and their shafts D with the frame A, toothed drum F, hopper I, pinion B, driving-wheel K, handle P, cog-wheels M, scrapers S, and spout H, substantially as described.

6,800. TREADLES. W. J. Demorest, New York, N. Y., assignor, by mesne assignments, to S. S. White, Philadelphia, Pa. Patent No. 60,976, dated Oct. 23, 1867; antedated Oct. 12, 1867. [Filed Nov. 27, 1875.]

1. The portable treadle-power herein-before described, consisting of the combination of the base or frame, adapted to be moved, its pedal, link, crank-shaft, and balance and driving-wheel, all constructed to operate in combination, substantially as herein-before set forth.

2. The combination, substantially as set forth, of the movable treadle-power, the driven pulley, and the driving-belt, whereby the relative position of the treadle-power and the machine driven by it may be varied.

6,801. PRINTERS' GAUGE. Alexander T. De Pey, New York, N. Y., assignor to R. Hoe & Co., same place. Patent No. 114,278, dated May 2, 1871. [Filed Nov. 24, 1875.]



1. A type-case tie partitions of which are secured at their points of intersection by means of metallic ties, braces, clamps, or clasps, substantially as shown and described.

2. A metallic tie, brace, clamp, or clasp, for united the severed parts of intersecting partitions of a type-case, which is constructed so as to engage with the free part of one partition and secure it to the unbroken part of another partition, substantially as shown and described.

3. The combination of a metal tie, brace, clamp, or clasp, having one or more branches or arms adapted to engage with the free part or parts of a partition of a type-case, with a nail, for securing it to the solid or unbroken part of an intersecting partition, substantially as shown and described.

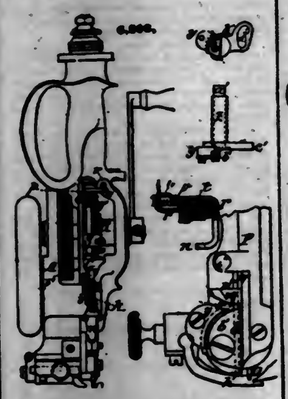
4. The metal fastening for securing the joints formed by intersecting partitions of a type-case constructed with depending ledges, whereby it is adapted to engage with the said partitions, substantially as shown and described.

6,801.

6,802. HEATERS AND FEEDERS. R. Garstang, St. Louis, Mo. Patent No. 152,360, dated June 23, 1874. [Filed July 20, 1875.]

1. The compartments H I J, tubes or pipes G, and filter L, combined and arranged, and having pipe-connections for operating substantially in the manner described.

2. The cast-metal ends A B, and cylindrical attachments O D, provided with tube-sheets *a d*, and forming the ash and sediment chambers, respectively, in combination with the metal cylinder K, forming an intermediate chamber, I, and tubes G, connecting the upper and lower chambers or reservoirs, substantially as set forth.



3. The combination of chamber J, filter L in lower part of same, water-induction pipes G beneath the filter, and outflow-water pipe in the lower part of chamber J, above the filter, and blow-off pipe T at the top of said chamber, all substantially as set forth, and for the purpose described.

4. The condensing-chamber I, surrounding the water-tubes G, and provided with steam-inlet N and water-outlet Q at bottom, and water-inlet P and steam-outlet O at top, as set forth.

6,803. PRODING-MACHINES. Louis Godde, Boston, Mass., assignor, by mesne assignments, to the American Cable-Screw-Wire Company, same place. Patent No. 97,302, dated Nov. 23, 1869. [Filed Nov. 27, 1875.]

Brief.—An oscillating nail block or transferrer, provided with a single nail-tube, receives the nail outside of the line of movement of the driving mechanism, and intermittently and alternately presents the tube in position to receive the nail, also to receive the action of the driver.

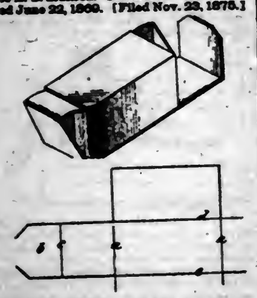
6,866.

1. The combination, substantially as described, of the stationary cutter c, the movable cutter a, the transferrer b', their eccentric fulcra or shafts e e', the slotted rails f f thereof, the movable T-piece M, and its operative cam-wheel R, the whole being applied to the stock or frame, and connected with mechanism for advancing the wire, severing it, and driving it, all substantially as specified.

2. The combination of the cable-gage r, as set forth, with the handle B of the stock A, and with the stop-pin o of the pawl-lever of the wire-feeding mechanism.

3. The combination of the cone-gage r, as set forth, its stops v v, and operative spring o with the stock A and its handle B, and the stop s, and operative lever o of the wire-feeding mechanism.

4. In machines in which nails are cut previous to being driven from a continuous wire in the manufacture of boots and shoes, the combination, with wire and work feeding devices and a vertically-operating driver, of an intermittently-oscillating and single-tube transferrer-block and a wire-severing device, substantially as herein set forth.



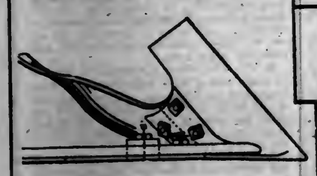
5. In combination with an intermittingly-oscillating and transferrer or block, which receives in a single tube the wire outside of the line of action of the vertical driver, and across the path of the cutters, and a work-feeding device, of an adjustable edge-guide for the nails, substantially as herein set forth.

6,866. CANDLE-HOLDERS. Chas. Kirchhof, Newark, N. J. Patent No. 72,508, dated Dec. 24, 1867. [Filed Nov. 19, 1875.]

As an improved article of manufacture, the candle-holder c, in combination with the hook a b and rod A, arranged to connect with a suitable weight, f, in the manner and for the purposes substantially as described.

6,867. PAPER BOXES. James L. Kober, Chicago, Ill., assignor, by mesne assignments, to R. B. Munson. Patent No. 91,666, dated June 22, 1869. [Filed Nov. 22, 1875.]

1. A paper box formed from a blank consisting of one piece, which is held together without the use of any fastening means other than tongues b, when it is folded into tubular box form, substantially as shown and described.



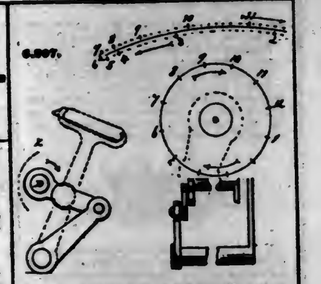
2. A paper box formed in one piece, which, when partially or wholly unfolded, is capable of being packed flat for storage or shipment, and provided with means for securing it in tubular form, substantially as shown and described.

3. Paper boxes formed from a blank consisting of one piece, and having the body, end pieces, and tucking-flaps shaped and folded substantially as shown and described.

4. A paper box the body and closing flaps thereof are formed in one piece, the said box being adapted to fold flat for storage or shipment, to be formed into tubular shape and to have its ends closed and fastened by the said flaps, substantially as shown and described.

5. A paper box provided with end flaps adapted to fold over and tuck into the box and to close the same, substantially as shown and described.

6,868. PLOWS. Wm. E. Harrell, Clarinda, Iowa, assignor to himself, T. B. Chamberlain, and D. C. Chamberlain. Patent No. 128,141, dated June 18, 1872. [Filed Nov. 1, 1875.]



1. In a sod-plow, the fin extended above D, adapted to cut the sod and completely across the width of the furrow before it begins to turn or is turned over, substantially as set forth.

2. In a sod-plow, the narrow mold-board or turning device, adapted to turn the sod after it is cut without bearing upon its whole width, substantially as set forth.

3. The combination, in a sod-plow, of a fin extended above the furrow in advance of the mold-board, and a narrow mold-board or turning device which turns the sod without bearing upon its whole width, substantially as set forth.

6,869.

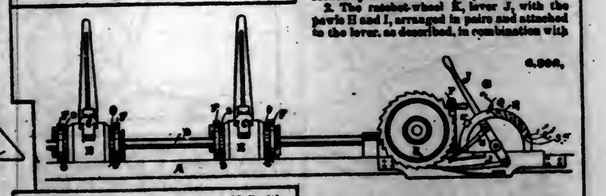
1. The combination, with the needle-carrier and the shuttle-driver, of crank mechanism, substantially as described, arranged for operation substantially as specified, whereby the needle is retarded in the cloth and forms a loop for the shuttle to enter, and the shuttle is advanced and passed through the loop while the needle's movement is retarded, for the purposes set forth.

2. The combination, with the needle-carrier and the shuttle-driver, of crank mechanism, substantially as described, arranged for operation substantially as specified, whereby the motion of the shuttle is extended after passing through the loop during the final upward motion of the needle, for the purposes set forth.

3. The combination, with the needle-carrier and the shuttle-driver, of crank mechanism, substantially as described, arranged for operation substantially as specified, whereby the movement of the needle after the passage of the shuttle through the loop is accelerated, while that of the shuttle is retarded, for the purposes set forth.

4. The combination, with the needle-carrier and the shuttle-driver, of crank mechanism, substantially as described, arranged for operation substantially as specified, whereby the motion of the shuttle when passing through the loop is accelerated, while that of the needle is retarded, for the purposes set forth.

5. The combination, with the shuttle, the carrier-lever H, and the primary shaft D, provided with a crank, of the connecting-link J, as and for the purposes described.



6,870. HEAD-BLOCKS FOR SAW-MILLS. F. J. Staley, Indianapolis, Ind., assignor, by mesne assignments, to H. O. Frink, same place. Patent No. 98,215, dated Dec. 21, 1869. [Filed May 19, 1875.]

Brief.—The setting lever is controlled by an arc so graduated as to regulate the thickness of the lumber cut by the machine.

1. The sleeve E, furnished with the flanges F and pawls S S', and keys e e, concentric piece E, furnished with cogs f f and ratchets O O, in combination with the setting-shaft D, furnished with the hand crank-wheel P and keeps C C, all constructed and arranged substantially as and for the purpose set forth.

2. The ratchet-wheel K, lever J, with the pawls H and I, arranged in pairs and attached to the lever, as described, in combination with

6,869.

6,907. SEWING-MACHINES. Davis H. Smith, New York, N. Y., assignor to Marguerite B. B. Smith. Patent No. 20,176, dated May 4, 1869; extended seven years. [Filed Sept. 9, 1875.]

Brief.—The shuttle-carrier and needle-arm are actuated positively by crank mechanism. The operation of the mechanism is such that the needle is retarded in the cloth, and forms a loop for the shuttle to enter, and the shuttle is retarded after passing through the loop during the final upward motion of the needle. The motion of the needle is accelerated during its final upward stroke, as is also the motion of the shuttle while passing through the loop.

the bevel-wheels L and M, cutting shaft D, and segmental arch Q, constructed and arranged to operate the knees of the head-blocks, substantially as specified.

3. The segmental arch Q, in combination with the lever J, pawls H I, ratchet K, and cutting-shaft D, constructed and operated substantially as and for the purpose set forth.

4. The segmental arch Q, having holes properly spaced and drilled therein, in combination with the lever J and stops B' and E, pawls H and I, constructed and operated as herein specified, for the purpose of putting frictional parts of an head, substantially as described and set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 25. TUESDAY, DECEMBER 21, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1876 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time.

R. H. DUELL, *Commissioner.*

COMMISSIONER'S DECISIONS.

CHAPMAN *et. al. vs.* MORRISON.—*Interlocutory Appeal.—Interference.*

[*Appeal from the Examiner of Interferences in the matter of the interference between the patent of M. T. and M. C. Chapman, granted March 4, 1873, and the reissue application of Jos. E. Morrison, filed November 30, 1874, for* ADJUSTABLE VALVES FOR BORED OR DRIVEN WELLS.—*Decided December 7, 1875.*]

An objection to a question based upon a patent which was not first introduced in evidence, nor a certified copy thereof, sustained.

Where testimony was taken by the defence to show that their opponents had not "manufactured, sold, or used" the invention during a certain time while the witness was employed at their establishment, on which point no testimony had been taken by the latter parties in their testimony-in-chief: *Held*, That testimony taken in rebuttal to show use of the invention at another place than at the establishment during the time mentioned was properly rebutting, and not direct evidence.

Objections to questions not made at the time considered as waived.

The Office, however, reserves the privilege of considering what testimony is or is not material to the issue.

The common law rules of evidence will be continued to be applied strictly in all practice before the Office.

DUELL, *Commissioner:*

This is an appeal from the decision of the EXAMINER of Interferences upon a motion to strike out certain testimony taken by the later applicants, the Chapmans.

First. The latter parties, in their testimony-in-chief, commenced to question a witness regarding the contents of their patent, when neither that patent nor a certified copy thereof was introduced, or attempted to be introduced, in evidence. The question was objected to for that reason, and the objection properly sustained by the Examiner of Interferences.

Second. Certain testimony was taken by Morrison tending to show that the precise invention in controversy was not "manufactured, used, or sold" by the Chapmans' between May 20, 1872, and August 10, 1872, the time he was in their employ. No testimony apparently had been taken, in their examination-in-chief by the Chapmans, showing the extent and character of use by them of this invention, so that the above testimony on the part of Morrison was upon a matter not previously touched upon. And by this course Morrison opened the door for rebutting testimony on the same point. This their opponents availed themselves of, and one Hayward was introduced to show that the Chapmans put substantially the same valve-seat now claimed by the parties into his well at his home in Aurora, Illinois, in July, 1872. This was in the nature of direct rebuttal of the above testimony on the part of Morrison.

The Examiner evidently overlooked the scope of the questions proposed to Morrison and his witnesses by his counsel, as in his decision he appears to confine his consideration of the adverse testimony of Morrison to the single fact of the *selling* by the Chapmans at their establishment of the device in controversy during Morrison's employment there. But it will be seen that this is a mistake. For instance, question 30, to Jos. E. Morrison, is as follows:

Were all the valve-seats *manufactured, used,* and *sold* by the Chapman Brothers during the time you were in their employment screw-threaded at the lower end, and screwed into the coupling, so as to compress the packing between the shoulder on the valve-seat and upper end of the coupling as the valve-seat and coupling were screwed together?

A. They were all screw-threaded, and screwed into the coupling, as far as I know. I did not see them all put in.

Other questions of the same tenor had been previously asked.

Now, Hayward's testimony tends to show that in his case at least a valve-seat was used of a different character than what Morrison mentions, and one like the device in dispute, thus directly rebutting the testimony of Morrison as to the use of that device by the Chapmans during the time mentioned. The exhibit "E" introduced by Hayward confirms his statements. On this point, therefore, the Examiner of Interferences is overruled, and Hayward's testimony will be considered, and all other rebutting testimony, on the part of the Chapmans, tending to show use, sale, or manufacture by them of the device in controversy during the time above set forth.

Third. The Examiner refuses now to consider objections to certain questions not made at the time the questions were propounded. In this he is right, as he but follows a well-known rule of evidence that objections to questions not made at the time are to be considered waived.

The Office, however, also reserves the privilege of considering what testimony is material, and what immaterial, to the issue, as the case is considered by the various tribunals before which the case may pass.

It is here remarked that as the law gives the power to the Commissioner to establish rules for the taking of testimony in contested cases before the Office, and also prescribes that the regulations for the conduct of proceedings before the Office shall not be inconsistent with law, the only proper course left for him to do in matters of evidence is to adopt the common law rules relating to the same, as expounded in the standard textbooks and the decisions of the courts. And, in my opinion, no better course could be pursued for the maintenance of the rights of all parties in these disputes.

Rule 116, therefore, which prescribes that the well-established rules of evidence will be applied strictly in all practice before the Office, will continue to be observed.

The case is returned to the Examiner of Interferences for his further consideration, in view of the above rulings.

JESSE JOPLING.—*Interlocutory Appeal.*

[*Appeal from the Primary Examiner in the matter of the application of Jesse Jopling, for letters patent for an* "IMPROVEMENT IN SUBMARINE TORPEDO-BOATS."—*Decided December* 22, 1875.]

In a submarine torpedo-boat, of the construction described, the lighting and ventilating devices constituted necessary elements in the production of the result, and without which the boat would be inoperative: *Held*, therefore, that these devices need not be the subjects of separate applications.

DUELL, *Commissioner*:

The invention of the applicant relates to the construction and arrangement of a submarine torpedo-boat. Part of the devices embraced by the application relate to the form of the boat and the means of propelling, and part to the means of lighting and ventilating the same.

The Examiner declines to act upon the case on the ground that the devices relating to lighting and ventilating comprise distinct inventions not necessarily connected with the form and general construction of the boat. He states that it is not uncommon to provide torpedo-boats of various forms and structures with valves, pumps, dead-lights, &c., for the purpose of ventilating and lighting the same; and he adds that it is not perceived there is any special adaptation of the means of lighting and ventilating more than is required in other vessels used for similar purposes.

The rule to be observed in the division of application has very recently been reiterated in the case of Noyes, 8 OFFICIAL GAZETTE, 818, coming from the same class as the present one. The general doctrine is there stated to be that where the devices are used in connection to subserve a common end, or adapted to each other, all co-operating to produce a given result, and the use of each device, or its equivalent, is necessary to that result, although each device, when considered by itself, may amount to a new invention, yet, when so combined, they constitute an exception to the general rule, that separate inventions should form the subjects of separate applications.

The Examiner cites the case of Abel Combs, C. D, 1871, p. 209, and also that of Franklin, 1873, p. 116. In the Combs case it was objected by the Examiner that the application embraced several distinct and separate improvements in watches, and the Commissioner, in sustaining this objection, added that he failed to see that there was any such connection between the improvements specified as to make any particular one of them necessary to the presence and successful operation of any or all of the others. But he also distinctly intimates that where several improvements have a community of operation, separate applications were unnecessary. And this, also, is the doctrine set forth in the Franklin case. These decisions clearly indicate the course to be pursued in the present case.

The submarine torpedo-boat of the form and construction, and to be operated in the manner described by applicant, would be inoperative and of no use or value whatever without the lighting and ventilating devices. They are essentially necessary to the accomplishment of the result proposed. If old in this case, and form the subjects of independent claims, they should be met with proper references, but unless so answered they should stand as essential elements in this application.

The decision of the Examiner is reversed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, EASTERN DISTRICT OF MISSOURI.

INTERFERING PATENTS.

ALFRED T. FOSTER *vs.* WM. M. LINDSAY.

[*Before* TREAT, *J.—Decided October* 28, 1875.]

INTERFERING PATENTS—SEC. 4918 OF REV. STATS. CONSTRUED.

Section 4918 of the Revised Statutes of the United States in respect of *interfering patents* construed, and held to vest the power in the circuit court to adjudge *either* of the interfering patents void in whole or in part, and upon proper issues and proof to authorize a decree that both patents are void.

TREAT, *J.*:

This is a suit in equity under sec. 4918 of the Revised Statutes of the United States, concerning alleged

interfering patents. The defendant's patent was prior in date to plaintiff's; also the application therefor. The plaintiff claims that the invention was by him; that he had, previous to any knowledge thereof by the defendants, not only invented the patented composition, but actually reduced it to a practical and successful test; that he had shown to the defendants the manufactured article, and when, as their foreman in the brick business, he was consulted thereafter about manufacturing fire-brick by means of which they could obtain a large and profitable order, he called their attention to the fact that he had exhibited to them before entering upon their service a specimen brick of the needed quality, that thereupon he, as their foreman, directed various experiments to be made at defendants' brick-yard; that when the defendants suggested subsequently that they proposed to obtain a patent for that mode of making an improved fire-brick he remonstrated against their doing so, claiming that he was the original inventor, and alone entitled to a patent, if one was obtainable.

On the other hand, the defendants claim that it was only after a series of experiments under their direction and supervision, in their own establishment, the success of the mode patented was ascertained.

Without analyzing the testimony with the view of determining whether the plaintiff, in his isolated experiment, prior to entering into the service of defendants, had invented the patented mode of securing the desired result, or had merely experimented so far as to ascertain that the use of sand-rock would furnish the needed glazing in his pottery business, and without inquiring further whether he had not abandoned all purpose of pushing his experiments to ultimate success for fire-bricks, and also without determining to what extent he and the defendants respectively suggested the experiments made in defendants' establishment which first resulted in an ascertained and definite value from the compound, whereby the rights of the respective parties as employer and employee would arise, we will first consider the true construction of the act of Congress. The language of the section is peculiar, and the object designed by it is not free from doubt. The section is as follows:

Wherever there are interfering patents, any person interested in any one of them, &c., may have relief against the interfering patentee and all parties interested under him, by suit in equity against the owners of the interfering patent; and the court, on notice, may adjudge and declare either of the patents void in whole or part, or inoperative or invalid in any particular part of the United States, according to the interest of the parties, &c. But no such judgment or adjudication shall affect the right of any person except the parties to the suit, &c.

So far as known this section has not received any express adjudication. In *Mowry* vs. *Whitney*, (14 Wall., 434,) an allusion is made to a somewhat similar provision in the act of 1836. The latter act in the section referred to covered two distinct classes of cases, viz: First, where there were interfering patents; and second, where the examiners refused to issue a patent applied for on the ground of interference with a prior patent. In each of those cases a bill of equity would lie at the instance of either of the parties, and the court could determine in the latter class of cases whether the applicant should have a patent issued to him; and, in the former, might adjudge either of the patents void in whole or in part, &c.

In ordinary cases, where a patentee brings suit for infringement, the defendant can assail the validity of the patent in the manner prescribed; and the decree of the court is binding on the parties. It is contended that, inasmuch as this suit is not for an infringement, the defendant must be confined to the respective merits or claims of the patentees *inter sese*, irrespective of the validity of either. The defendant in this case, among other defenses, has set up that the patented compound or process had been anticipated and in use before either of the interfering patents had been claimed or issued. The evidence fully establishes the fact. In a suit for an infringement, a defense for want of novelty would, under the evidence in this case, be successful, whether the one or the other of the interfering patents was the basis of the action. The case of *Mowry* vs. *Whitney* goes no further than to hold that if a patent is to be annulled *ab initio*, the proceeding must be at the direct instance of the Government, but it does not decide that the question between conflicting patents may not be fully and finally determined as to the parties to suit for interfering patents.

The plaintiff in this case contends that he has the prior and better right, although his application and patent are of subsequent date, and that the court is bound to adjudicate solely as between his and the interfering patent, leaving one of the patents to stand for subsequent adjudication when assailed in a proper suit.

The act of Congress provides for a suit in equity against the owners of the interfering patent for such relief as equity would furnish. If the act stopped there, would a court of equity grant relief to a complainant who had no equity? If it would not, could not the court inquire, through proper pleadings and evidence, into the equities of the complainant? But the section proceeds to authorize the court to adjudge *either* of the interfering patents void in whole or part. If it adjudged the plaintiff's patent void, should not a decree to that effect be entered, instead of a simple decree dismissing his bill? If it ascertains that the defendant's patent is void, and the plaintiff's also, must the decree be restricted to a judgment against the defendant's patent, leaving the plaintiff's patent as if in full force and of established validity; so that if a new suit were brought by the same plaintiff against the same defendant for an infringement of plaintiff's patent, the defendant would then for the first time be able to dispute the validity of plaintiff's patent for want of novelty, &c.? Why two suits between the same parties to adjust the controversies between them when one suit would accomplish the end according to the well-known purposes of equity proceedings? Unless the terms of the statute restrict the court, sitting in equity, so that it can not do full and complete justice between the parties and end the litigation between them, it would seem to be its duty to pass upon the whole controversy when fairly and fully presented. The statute says that the court may adjudge *either* void in whole or part. How can it do so consistently with law and equity, unless each of the patents is under consideration in all respects? It may conclude that in some respects there is an interference, and in others none, so that the decree would be only for an annulment in part; or it may decree that there is an interference *in toto*, and consequently annul one of the interfering patents, leaving

the other to stand as valid. But what would be the position of one who had previously used the patent declared void, when suit was subsequently brought against him by the other patentee for an infringement? Could he assail the validity of the patent which had already, as between the same parties, been adjudged at least impliedly to be valid? It seems that the suits in equity authorized in cases of interfering patents should not be restricted to the narrow limits urged. The controversy is between two patentees or those claiming under them. If neither has a valid patent, the court should adjudge both void, and thus end the strife. It is on this theory that the defendant was permitted to set up in his answer the lack of novelty, not of plaintiff's patent alone, but of his own. True, he might voluntarily have surrendered his patent, and contested the plaintiff's right in a suit for infringement; but why should he not, when sued, insist upon a full defense, whereby a second suit could be avoided. The power vested in the court to adjudge either of the interfering patents void, in whole or part, is held to confer full authority, where the evidence justifies, on issues fairly made, to decree, not one of the patents alone, but both to be void.

The court so adjudges in this case, and the decree will be accordingly at the costs of the plaintiff.—*St. Louis Central Law Journal, No.* 48, *page* 768.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date December 21, 1875.]

8,852.—**Gates and Panels.**—FRANCIS O. HANSON, Philadelphia Pa. Application filed November 15, 1875. Term of patent 3½ years.

8,853.—**Gates.**—FRANCIS O. HANSON, Philadelphia, Pa. Application filed November 15, 1875. Term of patent 3½ years.

8,854.—**Head of Stair-Carpet Fasteners.**—MORITZ KEICKL, New York, N. Y.—Case A. Application filed November 22, 1875. Term of patent 7 years.

8,855.—**Organ-Case.**—JOHN R. LOMAS, New Haven, Conn., assignor to B. SHONINGER, same place. Application filed November 30, 1875. Term of patent 14 years.

8,856 to 8,859, inclusive.—**Oil-Cloths.**—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Applications filed December 13, 1875. Term of patents 3½ years.

8,860.—**Collar and Cuff Boxes.**—LOUIS TIM, Philadelphia, Pa. Application filed November 22, 1875. Term of patent 3½ years.

8,861.—**Parlor-Stoves.**—NICHOLAS S. VEDDER and FRANCIS RITCHIE, Troy, N. Y., assignors to SWETT, QUIMBY & PERRY, same place. Application filed December 10, 1875. Term of patent 7 years.

8,862.—**Parlor-Stoves.**—GEORGE A. WELLS and EDMUND J. CRIDGE, Troy, N. Y., assignors to FULLER, WARREN & CO., same place. No. 1. Applications filed December 15, 1875. Term of patent 7 years.

8,863.—**Cooking-Ranges.**—GEORGE A. WELLS and EDMUND J. CRIDGE, Troy, N. Y., assignors to FULLER, WARREN & CO., same place. No. 2. Application filed December 15, 1875. Term of patent 7 years.

8,864.—**Cooking-Stoves.**—GEORGE A. WELLS and NICHOLAS S. VEDDER, Troy, and THOMAS S. HEISTER, Lansingburg, assignors to FULLER, WARREN & CO., Troy, N. Y. No. 3. Application filed December 15, 1875. Term of patent 7 years.

8,865.—**Pack of Playing-Cards.**—JOHN DAVID D. MORTIMER, Chicago, Ill. Application filed December 3, 1875. Term of patent 3½ years.

3,268.—**Manufactured Cigars and Tobacco.**—JONES BROTHERS & CO., Richmond, Va. Application filed December 11, 1875.
"word 'Stonewall,' and a pictorial representation of the Jackson statue at Richmond."

3,269.—**Playing-Cards.**—ISAAC LEVY, New York, N. Y. Application filed December 13, 1875.
"word 'SQUEEZERS.'"

3,270.—**Playing-Cards.**—ISAAC LEVY, New York, N. Y. Application filed December 13, 1875.
"representation of a human hand holding and displaying an open or spread quantity of playing-cards."

3,271.—**Crayons and Pencils.**—NATIONAL TALC (FRENCH CHALK) CRAYON AND PENCIL COMPANY, Monmouth, Ill. Application filed November 19, 1875.
"word 'NATIONAL.'"

3,272.—**Paper-Weights.**—F. A. PACKARD & CO., Boston, Mass. Application filed December 11, 1875.
"word 'CENTENNIAL.'"

3,273.—**Cigars.**—LUCIUS C. PARDEE, Chicago, Ill. Application filed November 29, 1875.
"words and letters 'Don Quixote de La Mancha' and 'Lucius C. Pardee.'"

3,274.—**Cigars.**—LUCIUS C. PARDEE, Chicago, Ill. Application filed November 29, 1875.
"words and letters 'El Dante. L. C. Pardee.'"

3,275.—**Bosom-Shirts.**—ROTHSCHILD BROS. & GUTMANN, New York, N. Y. Application filed November 5, 1875.
"word 'PROGRESS.'"

3,276.—**Wool-Oil.**—SECOMB, KEHEW & THAYER, Boston, Mass. Application filed November 2, 1875.
"words 'FRENCH OLEINE,' and the figure of a sheep."

3,277.—**Medical Preparation.**—THOMAS H. SMART, Philadelphia, Pa. Application filed November 27, 1875.
"words 'SELF CURE.'"

3,278.—**Poison and Poisonous Compositions for the Destruction of Squirrels, &c.**—JAMES G. STEELE, San Francisco, Cal. Application filed November 18, 1875.
"words 'Steele's Squirrel Poison,' and a cut representing a group of five squirrels."

3,279.—**Wine.**—M. WERK & SONS, Cincinnati, Ohio. (Re-registration.) Application filed February 21, 1871.
"words 'GOLDEN EAGLE.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date December 21, 1875.]

442.—Title: "**Animal Meal.**"—W. H. BOWKER, Boston, Mass. Application filed December 13, 1874.

443.—Title: "**Dunn's Elixir of Wild Cherry and Tar.**" FRANCIS DUNN, Brooklyn, N. Y. Application filed December 14, 1875.

444.—Title: "**A Certain Cure for Gonorrhœa and Gleet.**" BENJAMIN FALKENBERG, Philadelphia, Pa. Application filed August 5, 1875.

445.—Title: "**Sympathetic Writing Fluid.**"—LAURITZ FOSS, Chicago, Ill. Application filed December 11, 1875.

446.—Title: "**German Nerve Balm.**"—BELLS K. HOTT, Providence, R. I. Application filed December 13, 1875.

447.—Title: "**Dr. Martin's Ague Pills.**"—ISRAEL W. MARTIN, Irvin, Ind. Application filed December 10, 1875.

448.—Title: "**Moriarty's Vegetable Canadian Balm.**" E. J. MORIARTY, Clarence, Iowa. Application filed December 10, 1875.

449.—Title: "**Echo.**"—F. RATCHFORD STARR, Litchfield, Conn. Application filed December 11, 1875.

450.—Title: "**Dr. Henricus' Compound Santal Oil Troches.**"—HENRY SOHL, Boston, Mass. Application filed December 13, 1875.

451.—Title: "**Henry Tetlow's Blanc Illusion.**"—HENRY TETLOW, Philadelphia, Pa. Application December 14, 1875.

452.—Title: "**Dr. Gunn's Aromatic Elixir Bitters.**"—ALONZO VAN ALSTINE, San Francisco, Cal. Application filed December 16, 1875.

453.—Title: "**Lapalme's Fire Weed.**"—D. F. WARD & CO., Philadelphia, Pa. Application filed December 9, 1875.

454.—Title: "**Excelsior Dry Hop Yeast.**"—F. P. YEAWIRE, Keokuk, Iowa. Application filed December 13, 1875.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing.

COPIES OF PATENTS ISSUED SINCE JULY 1, 1871.

For the convenience of manufacturers, the various subjects of invention have been classified, (Subject-Matter Index, 1871,) and a list is kept of all the patents issued since July 1, 1871, in the various classes, so that an order given for the patents of a class will be filled as to patents since the above date, and subsequent patents in the same class will be forwarded from week to week, (postage paid,) as they may issue.

Those desiring copies of patents under this arrangement should deposit a sum of money, not less than three dollars, with the Commissioners of Patents; when the deposit is exhausted they will be notified.

In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this Office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by giving the number, name, and date of each patent.

The cheapness of the copies, (ten cents apiece when ordered in quantity or by the whole class,) and the comparatively small number of patents in each of the 176 classes, render an order by class by no means an onerous undertaking.

INDEX OF INVENTIONS PATENTED DECEMBER 21, 1875.

	Class No.	No. of Patent.
Anti incrustation compound, L. N. Lye	148	171,297
Axles, apparatus for setting metal, F. Fox	31	171,343
Bale tie, P. K. Dederick	7	171,315
Bale tie, R. Montfort	7	171,393
Barrel, A. Wyckoff, (reissue)	49	6,814
Barrel headings, baling, J. Keppler	49	171,329
Barrel machine, A. Wyckoff, (reissue)	49	6,813
Bee hive, D. Cox	9	171,314
Belt tightener, O. Cooley	87	171,354
Bird cages, feed cup for, Osborn and Drayton	170	171,309
Bit stock, angular, J. W. Anthoine	29	171,335
Boiler, steam, J. Shackleton	148	171,436
Boilers and pipes, covering for steam, J. C. Reed	149	171,425
Book and music support, L. Berg	146	171,260
Book backing machine, J. E. Coffin	15	171,306
Boot and shoe nailing machine, McKay and Fairfield	16	171,300
Boot and shoe pegging machine, W. D. Orcutt	16	171,414
Boot jack, I. Massie	16	171,308
Bottle stopper, T. W. Murray	1	171,410
Bottle stopper, S. S. Newton	1	171,304
Bottling mineral water, &c., J. B. Newbrough	1	171,240
Boxes, corner joint for, G. S. Sterne	30	171,346
Braces and suspenders, combined shoulder, H. S. Archer	38	171,207
Bracket for supporting shelves, M. D. Jones	62	171,326
Brick machine, E. L. Wagner	20	171,433
Bridge, iron truss, F. Schmemann	21	171,323
Buck board, C. Neligh, Sr	34	171,412
Burner and gas generator, hydrocarbon, A. J. Griffin	90	171,278
Button, sleeve, G. A. Allen	23	171,254
Buttons, manufacture of glass, I. and G. Lehmann	23	171,394
Calendar, J. Keller	146	171,227
Calendar, C. Z. O'Neill	146	171,308
Can opener, G. L. Witsil	88	171,463
Can, powder, F. Egge	136	171,364
Can receptacle, milk, N. Littlefield	45	171,294
Candy heater, steam, B. and H. Stern	155	171,444
Car brake and starter, W. Scott	122	171,246
Car coupling, E. P. Harrington	122	171,220
Car coupling, Klingler, Bolender, and Stem	122	171,239
Car dumping apparatus, J. Wiland, Sr	122	171,460
Car, sleeping, J. L. Mitchell	121	171,238
Car, sleeping, J. L. Mitchell	121	171,239
Carpet linings, machine for making, W. Lewis	95	171,292
Carpet stretcher, L. Nolton	62	171,307
Carriage, child's, Galt and Blaisdell	31	171,370

	Class No.	No. of Patent.
Carriage wheel, E. Brown	31	171,348
Carriages, die for making stay ends and offsets for, D. Wilcox	31	171,457
Cartridge, blasting, Smith and Egge	124	171,441
Chair, dental, E. T. Starr	46	171,443
Chair, folding, F. Born, (reissue)	62	6,815
Chair seat, P. Buckley	62	171,212
Check box and cash indicator combined, W. I. Ripley	42	171,344
Churn, D. M. D. D. Brown	45	171,265
Churn, J. Watson	45	171,331
Clasp, J. Perkins	23	171,314
Cock, stop, J. G. L. Boettcher	152	171,344
Coke oven, E. S. G. Gobiet	61	171,371
Cooking apparatus, R. H. Murray	154	171,411
Cooking utensil, W. Lacy	154	171,231
Cooler, milk, N. D. Ferguson	45	171,219
Cooler, milk, I. H. Wanser	45	171,251
Coop, folding, D. M. Sullivan	116	171,446
Cork for bottling beer, &c., C. Pfannenstiehl	1	171,315
Corpses and other organic matter from decomposition, apparatus for preserving, J. Whelan	39	171,332
Cradle, treadle, J. A. Kirchner	60	171,398
Cultivator, J. Pierpont	43	171,420
Curry comb, Kellogg and Trussell	144	171,396
Curtain fixture, E. M. Judd	62	171,385
Dental hammer, J. C. Dean, (reissue)	46	6,817
Desk, school, J. A. Dole	62	171,372
Digger, potato, Heydemann and Klinkmann	114	171,224
Distilling and rectifying liquors, apparatus for, J. W. Reford	47	171,426
Dredger, rotary, A. Hawley	82	171,360
Drier, I. B. Cottrell	48	171,355
Drill and fertiliser distributer, A. S. Wishart	133	171,461
Drills, chuck for metal, T. Hoppe	100	171,383
Drilling apparatus, well, D. H. Muir	51	171,406
Eaves trough hanger, J. P. Abbott	126	171,253
Elevator, water, L. H. Thompson	118	171,330
Electroplating statuettes, &c., Worthen and Gillespie	113	171,464
Engine, steam, J. S. Foster	150	171,375
Engines, valve for steam pumping, L. J. Knowles	152	171,390
Envelope, R. S. Jennings, (reissue)	146	6,820
Envelope, E. J. Nolin	146	171,306
Fabrics, machine for creasing fluted, J. H. Brown	38	171,264
Fence, iron, F. O. Hanson	52	171,377
Fence, portable, I. W. Pancoast	52	171,311
Fence, portable, H. Tell	52	171,329
Fence wire, barbed, F. Armstrong	52	171,208
File blank holder for grinding, J. Garland	70	171,377
Filter, packing, T. R. Sinclaire	107	171,439
Fire arm, breech loading, C. E. and C. W. Saeider	18	171,442
Fire place, J. S. Lester	154	171,305
Fires in buildings, extinguishing, S. S. Newton	118	171,305
Fountain, hanging or portable, F. I. Shafer	107	171,437
Furnace, hot air, C. Clark	154	171,351
Furnace, hot air, T. F. Hemmich	154	171,281
Furnace, hot air, R. C. Sayre	154	171,431
Furnace, metallurgical, E. Savage	85	171,381
Furniture spring, J. Flinn	62	171,369
Gage, pressure, J. Powers	148	171,317
Gas, condenser for illuminating, G. W. Edge	66	171,363
Gas meter, J. Morgan	64	171,407
Gas regulator, G. McMillan	64	171,236
Gas, treating natural, McElroy and Young	66	171,400
Glass furnace, J. Nicholson, Jr	68	171,241
Glaziers' points, machine for cutting, J. M. Jay	68	171,386
Grain, apparatus for storing and preserving, H. P. C. Lassen	59	171,290
Grave vault, W. C. Peckham	7	171,418
Grease distributer, J. T. Horton	133	171,285
Hammers, lifting device for drop, C. O. Wilder	60	171,458
Harness pad, R. M. Selleck	72	171,334
Harrow attachment for cultivator plows, F. D. Ladenberger	43	171,391
Harrow, convertible revolving, Devoe and Mease	73	171,217
Head rest, Cushman and Cockburn	62	171,356
Heating drum, J. J. Hardenbrook	154	171,378
Hook, snap, C. Dudley	23	171,361
Hoops, machine for shaving half round, G. B. Selden	40	171,247
Horn polishing machine, C. B. Fish	173	171,220
Horse collar, J. Mayer	73	171,404
Horse detaching apparatus, J. H. O'Brien	31	171,242
Horse power, F. Trulender	159	171,450
Horseshoe, Z. V. Pardy	60	171,421
Horseshoe machine, H. J. Batchelder	60	171,258
Horseshoe machine, D. I. Pruner	60	171,320
Hydrant, M. Allen	167	171,206
Hydrants from freezing, preventing, B. Kent	167	171,228
Ice machine, T. Cook	83	171,267
Ice tongs, N. P. Nelson	83	171,413
Index clip board, T. Orton	146	171,415
Indicator, electrical station, J. F. Kettell	50	171,387
Iron, machine for cutting, Lakey and Mills	119	171,233
Journal bearing, G. Draper	87	171,359
Knife, corn stalk, P. C. Moore	44	171,303
Lamp filler, W. C. Cross	90	171,269
Lantern, signal, G. F. Pashley	90	171,417
Lathe for turning stone, S. L. and E. A. Beebe	153	171,259
Liquid packages, device for filling and discharging, J. M. Hopkins	167	171,381
Liquors, apparatus for aging, J. B. Baux	19	171,341
Loom shuttle guard, W. M. Parker	95	171,416
Loom take up motion, J. Lyall	95	171,396
Mail bag, P. S. Thomson	102	171,250
Marking stamp, L. Ballinger	117	171,257
Mash attemperator, W. Paddon	19	171,310
Mat, spittoon, J. Lee	62	171,291
Measure, liquid, J. M. Hopkins	132	171,382
Mechanical movement, J. F. McCormick	67	171,399
Millstones, balancing, W. Goodhorn	57	171,373
Millstone driver, H. Wilhelm	57	171,459
Molding machines, adjusting pressure feet of, J. S. Loomis	173	171,296
Molding, dressing enameled, A. C. White	173	171,455
Monument, L. J. Milliman	54	171,405
Mortising machine, J. J. Berger	173	171,261
Mortising machine, S. Duck	173	171,360
Motor, spring, E. Shiver	67	171,438
Nail separator, I. N. Bumbaugh	103	171,213
Neck tie, G. G. Struhar	38	171,327
Nursing bottle, M. S. Burr, (reissue)	156	6,809
Oiler, machinist's, O. J. Backus	87	171,339
Paper braid, J. W. Partridge	109	171,312
Paper collar blanks, knife for cutting, A. Dewes	109	171,270
Paving block, W. F. Prentiss	110	171,318
Peat machine, A. E. Barthel	61	171,210
Photograph, carbon, C. L. Lambert	111	171,392
Pipe, drain and sewer, D. C. Sage	110	171,245
Pipe, water, E. W. Smith	167	171,440
Pipes, machine and process for making veneer, R. M. C. Broas	163	171,347
Pipes, making veneer, R. M. C. Broas	163	171,346
Pipes, trap for steam, C. A. Read	149	171,424
Planer, shingle, W. A. Kitts	173	171,230
Planing machine, surface, W. C. Margedant	173	171,397
Planter, corn, G. D. Haworth, (reissue)	133	6,818
Planter, corn, Thomson and Ramsey, (reissue)	133	6,821
Planter, corn, S. Wishard	133	171,462
Plow, J. Sewell	114	171,435
Plow, gang, J. R. McCormick	114	171,299
Plow, sulky, H. Richardson	114	171,427
Plows, harrow attachment for cultivator, F. D. Ladenberger	43	171,391
Pocket safety attachment, D. Goldy	38	171,372
Press, C. H. Hersey	26	171,282
Press, cutting and punching, M. Von Calin	119	171,432
Presses, cotton and other, H. K. Burnett	7	171,349
Printers' leads, machine for cutting, H. J. Stone	117	171,248
Printing presses, inking apparatus for, Potter and Hubbard	117	171,243
Propeller, steering, I. T. Payne	139	171,313
Radiator, steam, A. L. Ide, (reissue)	147	6,810
Railroad track, street, I. Quigley	120	171,422
Rake bundle, drag, Smith and Galbraith	77	171,325
Rake, horse, C. B. Perkins	77	171,419
Rake, horse, W. C. Raynor	77	171,423
Refrigerator, J. H. Wickes	58	171,456
Roll for rolling iron, J. H. Webster	125	171,454
Roof, sheet metal, C. W. Evans	126	171,368
Roofing slates, machine for trimming and punching, E. R. Davis	153	171,358
Safe, provision, C. D. Harb	88	171,379
Sash fastener, J. Bittenbender	24	171,262
Sash lift, J. Sweet	24	171,240
Saw handle, crosscut, E. C. Atkins	20	171,327
Saw set, G. N. Gove	131	171,375
Scoop, sugar, G. W. Woodward	88	171,252
Scraper, road, F. W. Schuls	51	171,431
Separator, clover, Metzger and Kohler	159	171,237
Separator, grain, L. W. Hasselmann	159	171,222
Sewing machine, broom, H. Behren	134	171,342
Sewing machine driving mechanism, R. H. St. John	134	171,445
Sewing machine ruffler, J. Bolton	134	171,263
Sewing machine thread guard, L. Roosevelt	134	171,428
Shingle edging machine, J. E. Austin	174	171,338
Shirt front, H. Converse	38	171,352
Shoe fastening, W. Edmister	16	171,274
Shoe fastening, W. J. McKee	16	171,301
Shutter fastener, J. Arnold	24	171,336
Sight protector, M. H. Meadenhall	90	171,403
Sled, bob, F. Dillon	31	171,271
Sleigh knees, manufacture of, W. H. Lloyd	125	171,295
Spike, T. R. Timby	103	171,447
Spike, T. R. Timby	103	171,448
Spinning machine, N. Marshall	142	171,298
Spittoon mat, J. Lee	62	171,291
Spool holder, J. J. Elliott	38	171,365
Stage scenery, G. P. Gordon	54	171,231
Stair rod, H. Iverson, (reissue)	24	6,819
Steering apparatus, M. Townsend	137	171,449
Stone, lathe for turning, S. L. and E. A. Beebe	153	171,259
Stove pipe joint, D. H. Klotz	154	171,389
Stove pipe shelf, G. Hilbirt	88	171,283
Stump extractor, Hart and Grove	79	171,379
Table, ironing, L. P. Lawrence	91	171,393
Table legs, device for fastening, W. K. Sawyer	62	171,322
Tallow, &c., apparatus for treating, J. Tardos, Jr	47	171,328
Teaching drawing, device for, E. L. Crall	54	171,268
Telegraph, railroad, B. Cade	50	171,350
Telegraphic apparatus, T. A. Edison	158	171,373
Ticket, J. M. Savin	146	171,429
Tin scrap, utilizing, H. Fraech	136	171,276

	Class No.	No. of Patent.
Tire upsetter, G. D. Jacoby	60	171,225
Toy, dancing, B. D. De Forest	143	171,216
Toy gun, C. A. Pillinsky	143	171,316
Toy pistol, &c., E. Savoral	143	171,430
Trace fastening, Lake and McDevitt	72	171,229
Trap, fly, T. C. Dunn	143	171,362
Trap, fly, J. Parker, (reissue)	143	6,811
Truck, W. A. Estes	31	171,367
Truck, Vlall, Townsend, and Hill	31	171,451
Trunks, corner clamp for, W. B. Gould	162	171,374
Tubes, joint and coupling for, G. Matheson	163	171,234
Tubes, &c., machine for bending, M. McWilliams	125	171,402
Type wheel, G. H. Morgan	164	171,408
Type writing machine, R. T. P. Allen	117	171,335
Upholstering, preparing vegetable fiber for, J. S. Cutter	62	171,357
Valve, hydraulic cushion, C. E. Emery	153	171,218
Varnish, Jenkins and Richards	107	171,384
Vehicle dash frame, M. Seward	31	171,434
Vehicle hub, D. C. Holman	31	171,284
Vehicle running gear, E. Booth	31	171,211
Vehicle running gear, J. W. Little	31	171,293
Vehicle spring, N. Provost	31	171,319
Vehicles, manufacture of hand plates for, J. Jensen	31	171,287
Velocipede, A. Schmackers	31	171,432
Ventilator, T. W. Bracher	166	171,345
Ventilator, A. L. Meyer	166	171,409
Violins, chin rest for, H. W. White, (reissue)	102	6,812
Wagon brake, O. T. Baker	31	171,340
Wagon spring, A. W. McKown	31	171,401
Wagon tongue caps, blank bar for, J. Jensen	31	171,288
Washing and wringing machine, W. Card	91	171,266
Water proof compound, A. Barnard	93	171,209
Water wheel and gate, O. S. Hazard	168	171,223
Water wheel, centrifugal, O. J. Backus	168	171,256
Weather strip, C. A. Wilhelmi	30	171,334
Whiffletree hook, E. Maynard	31	171,235
Wood bending machine, J. W. Griffiths	176	171,376
Wrench nut, J. Conway	100	171,353
Wrench, pipe, J. A. White	100	171,333
Wringer, J. Brinkerhoff, (reissue)	91	6,816

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED DECEMBER 21, 1875.

	Patent No.
Abbott, J. P., Eaves trough hanger	171,253
Allen, G. A., Sleeve button	171,254
Allen, M., Hydrant	171,206
Allen, R. T. P., Type writing machine	171,335

TITLES, DRAWINGS, AND CLAIMS

OF

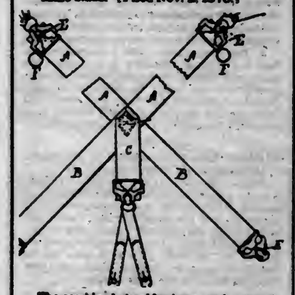
PATENTS GRANTED DECEMBER 21, 1875.

171,206. HYDRANTS. Michl. Allen, Natick, Mass. [Filed Nov. 6, 1875.]

Brief.—The stock has the panel arrangement shown, for the purpose of lessening the weight. The waste-hole extends through the guide-pin and cross-bar of the valve.

1. The stock or open panel-section B, provided with grooved rib F, for the purpose hereinbefore set forth.

2. The combination, with the open panel-section B, of the curved staves or panel-covers G, for the purpose hereinbefore set forth.



3. The combination of the sections A, B, and D, secured together by means of ordinary flanges and bolts connecting sections A and B, and by bored-headed bolts d connecting sections B and D through lugs e upon section d, and slots e in the panels of sections B, in the manner substantially as described, for the purposes hereinbefore set forth.

4. The detachable cross-web or guide-bar c, perforated for the guide-stems of the valve, and also with a waste-water passage or passages, o, in the manner substantially as described, for the purposes hereinbefore set forth.

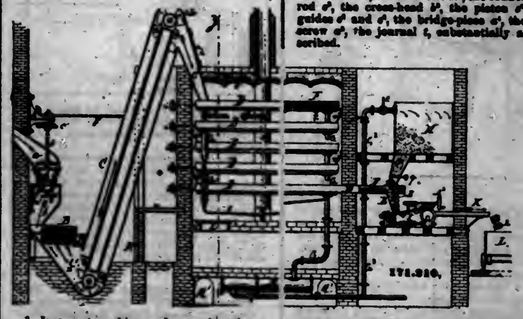
5. The valve V, shaped substantially as described, and provided within its base with screw-threads for its screw-stems S, and with guide-stems g g, one or both perforated by a waste-water passage or passages, o, in the manner substantially as described, for the purposes hereinbefore set forth.

6. The combination of the guide-web or cross-bar c, valve V, and screw valve-stem S, all constructed, arranged, and operating substantially in the manner hereinabove described, for the purposes set forth.

171,207. CORRUGATED SHOULDER-BRACES AND SUSPENDERS. Horace S. Archer, Haverhill, Mass., assignor to G. W. Wentworth, same place. [Filed Nov. 2, 1875.]

The combined shoulder-brace and suspenders, composed of the straps A, A, B, B, and C, and fastenings E and F, combined and arranged substantially as described, and for the purpose set forth.

171,208. BARBED FENCE-WIRE. Frank Armstrong, Bridgeport, Conn. [Filed Oct. 11, 1875.]



The metal-fence barb B, reduced in width, as at c, to form shoulders b, and split as at d, in combination with the two strands A' A' of the fence-wire A, in the manner and for the purpose described.

171,209. WATER-PROOF COMPOUNDS. A. Bernard, Cincinnati, Ohio, assignor to himself, W. H. Gettle, and J. Messenger, same place. [Filed June 2, 1875.]

A compound made of asbestus, paraffine, bees-wax or other wax, and coal-tar or pine-tar, substantially in the manner and in about the proportions herein specified, and for the purposes set forth.

171,210. PEAT-MACHINES. A. B. Barthel, Detroit, Mich. [Filed Sept. 27, 1875.]

Brief.—Peat is ground in the peg-mill; it passes through a bolting reel, drops into a receptacle, is conveyed into a chamber heated by hot air, distributed upon drying-pans, and when sufficiently dried it is molded into blocks.

1. In a peat-machine, and in combination, a grinding-mill, A, a bolting-reel, B, and an intermediate receptacle, b, constructed and arranged substantially as and for the purposes set forth.

2. In a peat-machine, and in combination, a grinding-mill, A, an intermediate receptacle, b, a bolting-reel, B, and a receptacle, b', connecting said reel with the entrance end of a conveyer-spout, the parts named being arranged one above the other, substantially as and for the purposes set forth.

3. The series of double-bottomed pans D, arranged one above the other, in combination with the conveyer F, the pipe G, substantially as and for the purposes set forth.

4. The combination of the mill A, bolting-reel B, the elevator C, the pans D, and conveyer F, substantially as described.

5. In combination, the conical hopper E, the conical endless screw E', and the conveyer F, substantially as and for the purposes set forth.

6. The combination of the mill A, the bolting-reel B, the elevator C, the drying-pans D, the conveyers F, with the conical hopper E.

7. The combination of the mill A, bolting-reel B, elevator C, drying-pans D, conveyer F, conical hopper E, with the conical endless screw E'.

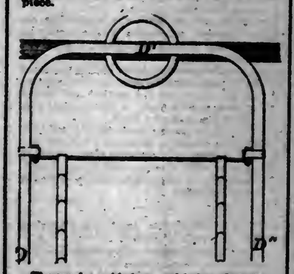
8. The combination of the steam-pipe G', reservoir H, pipe g, with the conical hopper E and the conical endless screw E', substantially as described.

9. The combination of the swage-block K', the bed-piece c', the set-screw c', with the bridge-piece c', substantially as described.

10. The combination of the main shaft a', the eccentric a', the connecting-rod c', the cross-head b', the piston c', and the guides c' and c', substantially as described.

11. The combination of the swage-block K', the bridge-piece c', with the frame I and the bed-piece c', substantially as described.

12. The combination of the frame I, the swage-block K', the bed-piece c', the main shaft a', the eccentric a', the connecting-rod c', the cross-head b', the piston c', the guides c' and c', the bridge-piece c', substantially as described.



13. The combination of the conical hopper E, the conical screw E', with the swage-block K', the bridge-piece c', the main shaft a', the eccentric a', the connecting-rod c', the cross-head b', the piston c', and the guides c' and c', substantially as described.

14. The combination of the mill A, bolting-reel B, the elevator C, the drying-pan D, with the conveyers F, the conical hopper E, with the conical endless screw E', the main frame I, the swage-block K', the bridge-piece c', the bed-piece c', the main shaft a', the eccentric a', the connecting-rod c', the cross-head b', the piston c', the guides c' and c', substantially as described.

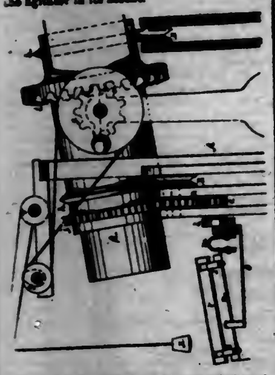
15. The combination of the mill A, bolting-reel B, the elevator C, the drying-pans D, with the conveyers F, the steam or hot-air pipes G', the hopper p, the conical hopper E, with the conical endless screw E', the main frame I, the swage-block K', the bridge-piece c', the bed-piece c', the main shaft a', the eccentric a', the connecting-rod c', the cross-head b', the piston c', the guides c' and c', the bridge-piece c', the set-screw c', the journal f, substantially as described.

171,211. REVERSING-GEAR FOR VEHICLES. Ezra Booth, Columbus, Ohio. [Filed Aug. 16, 1875.]

Brief.—The reach or side bars are in one piece.

The reach or side bars and bolster D D' D'', bent from a continuous piece of material or bars, and supported by the rear axle and fifth-wheel, substantially as and for the purposes set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.



171,813. CHAIR-SEATS. Peter Buckley, Binghamton, N. Y., assignor of one-half his right to E. M. Fitz Gerald, same place. [Filed July 26, 1875.]

The combination of the warp-pin C, warp-channel B, consisting of separate pieces for each passage across the seat, and roof *b*, constructed as herein described, for the purpose set forth.

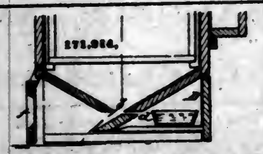
171,814. NAIL-SEPARATORS. Isaac N. Bumbaugh, Pittsburg, Pa. [Filed Oct. 18, 1875.]

Brief.—The plate-holding frames are adjustable on the frame of the agitator, which is provided with a cleat to restrict its movements, is suspended by means of springs, and has both a vertical and a horizontal movement. The weights are arranged to fall upon the agitator in its ascent.

1. A nail-separating machine consisting of a revolving cylinder, A', and a separator provided with V-shaped grooves, said separator having a shaking and agitating motion, substantially as herein described, and for the purpose set forth.

2. A nail-separator consisting of a revolving cylinder and a separating device provided with V-shaped grooves, and having a shaking and agitating motion, in combination with a nail-blowing device or cylinder, substantially as described, and for the purpose set forth.

3. The nail-separator consisting of the frame A, adjustable frames a, plates *l*, and sheet *c*, substantially as herein described, and for the purpose set forth.



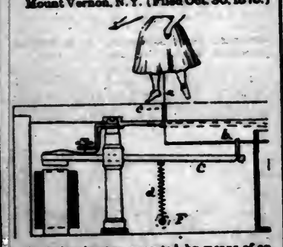
4. In a nail-separator, the separating device described, suspended by the springs *n*, substantially as herein described, and for the purpose set forth.

5. A nail-separating device having V-shaped grooves, suspended to operative mechanism which will impart to it a vertical and lateral movement, substantially as herein described, and for the purpose set forth.

6. A nail-separating device having V-shaped grooves, to which is imparted a vertical and lateral motion, in combination with moving weights or other shaking and jarring device, substantially as herein described, and for the purpose set forth.

171,815. BEE-HIVES. Daniel Coe, Kingston, Mo., assignor of one-half his right to A. F. McCray, same place. [Filed May 18, 1875.]

Brief.—A drawer placed beneath one of the inclined sides of the bottom of the hive communicates with the brood-chamber. The moth-entrance is through this inclined side, and below the bee-entrance, to prevent the moths entering the hive. The moth-entrance extends entirely across the hive.

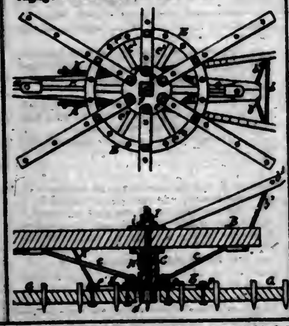


The drawer D, forming a moth-trap, in combination with the moth-entrance *d*, arranged below the bee-entrance *b*, and extending the entire width of the hive, all arranged and constructed substantially as and for the purpose set forth.

171,816. BALE-TIES. Peter K. Dederick, Albany, N. Y. [Filed Mar. 10, 1874.]

A wire band or tie constructed with a loop or eye at one end, and a double point or locking end at the other, substantially as described, and shown in Fig. 2.

171,817. DANCING TOYS. R. D. De Forest, Mount Vernon, N. Y. [Filed Oct. 20, 1875.]



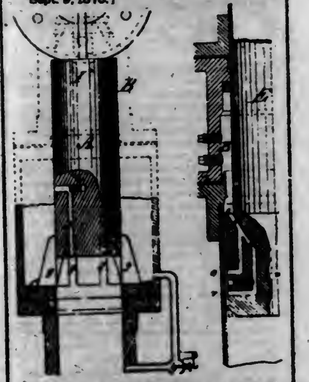
1. A dancing toy, operated by means of an electro-magnet, combined with a table or floor for the toy to vibrate or dance upon, substantially as described.

2. The combination of a wire-frame, having one or more upright arms, a, and provided with stem *b*, with vibrating lever C of an electro-magnet, and table E, having one or more guide-holes, *c*, substantially as described.

3. The combination of a regulating-shaft, F, and spiral spring *d*, with the vibrating lever C of an electro-magnet, substantially as and for the purpose set forth.

171,818. CONVERTIBLE REVOLVING HARROWS. Benjamin D. Dorcas, Kenton, and George E. Mason, Upper Sandusky, Ohio. [Filed Oct. 26, 1875.]

Brief.—To the centrally-pivoted disk are pivoted radial arms, provided with harrow-teeth. These arms are adjusted on an outer ring, to bring them closer together or farther apart. The harrow, when desired, is prevented from revolving by hooked arms, that engage with holes in the outer ring.

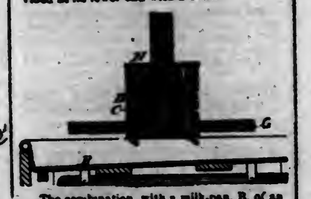


1. In a revolving harrow, the disk or rim E, constructed substantially as described, in combination with a series of removable and adjustable radial arms or beams pivoted thereto and secured in position in the manner and for the purpose specified.

2. The pole B and links K, in combination with the disk or rim E, substantially as and for the purpose specified.

3. The combination of the disk or rim E, having a recess formed in its lower face for the purpose described, the hub H and axle D, constructed as set forth, with the pole or beam B, pendent socket or sleeve C, and the brace-rods *c*, when constructed to operate as described.

171,819. HYDRAULIC CUSHION-VALVES. Charles B. Emery, Brooklyn, N. Y. [Filed Sept. 9, 1875.]

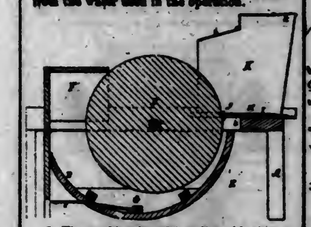


1. The combination of a hip-packing, turned toward a pressure-chamber, with a plunger constructed to reciprocate in and out of the packing, suitable guides being provided to direct the plunger within the packing, when said plunger is being moved toward the packing, substantially as and for the purpose specified.

2. The combination of a pressure-chamber, provided with packing at both ends thereof, with a plunger and attached cylinder, when the plunger is arranged to operate in and out of the chamber, and one of the packings, substantially as and for the purpose specified.

3. The combination, with a pressure-chamber, and plunger operating in and out of the same, of a channel or channels in the plunger, arranged to run inside the pressure-chamber, thereby regulating the escape of fluid, and bringing the plunger relatively to rest, substantially as and for the purpose specified.

171,820. MILK-COOLERS. N. D. Ferguson, Carthage, N. Y. [Filed Oct. 28, 1875.]



Brief.—The inner cylinder is filled with ice. The air passing down the tube is brought in contact with the ice and cooler, whence it passes up into the outer cylinder, thence out and through the perforated pipe, and in contact with the milk. The perforated pipe serves for heating the milk. The milk-pan has its bottom forming an inclined plane, and provided at its lower end with a tube.

The combination, with a milk-pan, B, of an ice-cooler, consisting of the concentric cylinders C D, perforated bottom and tubes G, cover H, with tube I, and valve or register *b*, all substantially as and for the purposes herein set forth.

171,821. MACHINES FOR POLISHING HORNS. Chas. B. Fish, Leominster, Mass. [Filed July 20, 1875.]

Brief.—A separator is provided which removes the debris of the article being ground from the water used in the operation.

1. The combination of the adjustable cleaner H with the wheel B and the trough D.

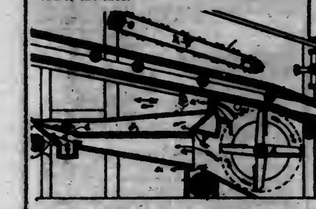
2. The bonnet K, provided with the air-discharge opening in its top, in combination with the wheel B and its trough D.

3. The adjustable arm-rest F, in combination with the trough D and the wheel B.

4. The mud-interceptor or guard-plate I, arranged and combined with the perforated cleaner H, and the bonnet K, the wheel B, and trough D.

5. The combination of the adjustable trough D and its rest F, the wheel B, the bonnet K, and the adjustable cleaner H, all arranged in manner, and in a frame, as specified.

171,822. SPADE-SUPPORT. G. P. Gordon, Brooklyn, N. Y. [Filed Nov. 10, 1875.]



1. The combination, with one or more bars or rods, B, of a wing, C, or flat E, and hooked rod D, substantially as and for the purposes described.

2. The combination of one or more bars, B, a wing, C, or flat E, hooked rod D, and the corners or rollers *a*, substantially as and for the purposes indicated.

171,823. GRAIN-SEPARATORS. Lewis W. Hendelman, Indianapolis, Ind. [Filed Mar. 22, 1875.]

Brief.—Means for directing the blast upon the grain, &c., as it descends from the carrier-board to the shoe, and for adjusting the tail-end of the shoe.

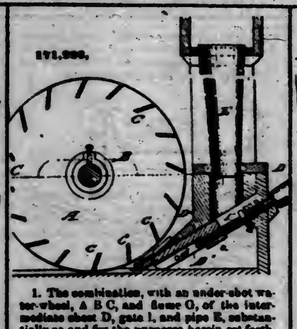
1. The combination of the hinged adjustable floor-board F, having the inwardly-bent upper edge or angle board W, adjustable finger G, and adjustable tension-rod H, constructed and operated substantially as set forth.

2. The deflector F', in combination with the divider P, arranged and operating in connection with a fan, to separate and guide the currents of air, so as to bring it in contact with the grain and riddles, substantially as and for the purpose hereinbefore set forth.

171,824. WATER-WHEELS AND GATES. O. S. Hazard, Coventry, R. I. [Filed July 8, 1875.]

Brief.—An undershot wheel having buckets set at an incline (of the top of the bucket toward the gate) with the stream; an inclined gate operated by a screw; a flume and chest tailed by a tapering overfall-pipe.

171,825. TIME-UNDERTAKERS. Geo. D. Jacoby, Berwick, Pa., assignor of one-half his right to J. G. Jacoby, same place. [Filed Nov. 27, 1875.]



Brief.—The jaws are pivoted to a piece which has a lug to let into a hole in the blacksmith's anvil, and are forced together by a screw, the lug being slotted to allow play to the screw.

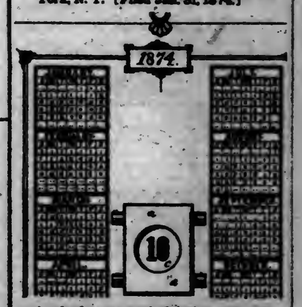
In a shrinking-machine, the standard A, provided with the jaws C C, pivoted at D, in combination with the corrugated connector E E, the corrugated legs F F, and the shaft G, provided with a cam-screw, and operating in the legs F F, substantially as described, and for the purposes set forth.

171,826. POTATO-DIGGERS. Robert Heydemann, Kroberg, and August Klinkmann, Grabowalde, Prussia. [Filed Oct. 2, 1875.]

Brief.—The digging apparatus is mounted upon four wheels, and consists of a share, which is adjusted as to depth by two swivel-screws. The separator consists of a series of longitudinal bars and an endless toothed belt, hinged to the share, and having a vertical jarring motion by means of a cam over the rear axle-tree.

1. The swinging plow of a potato-digging machine, steadied through adjustable screw-braces, in combination with an up-and-down shaking separator, E G, hinged to the plow.

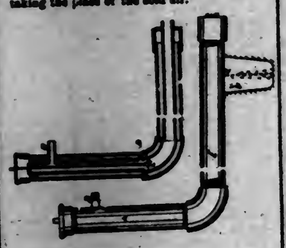
1. The combination, with an under-shot water-wheel, A B C, and flume G, of the intermediate chest D, gate I, and pipe E, substantially as and for the purposes herein set forth.



2. The combination of the chest D, gate I, and wheel A B C, the wheel having floats set at an incline, as shown and described, all as and for the purpose specified.

171,827. BRACKETS FOR SUPPORTING SHELVES. Melville D. Jones, Boston, Mass. [Filed July 20, 1875.]

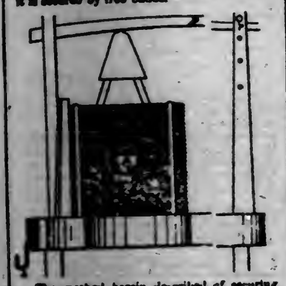
The combination of the swinging brackets, each formed in two parts, united by vertical pivots, with the disks G, arranged to turn on vertical axes on the outer parts of the brackets, and the shelf F, supported and held by said disks, these parts being arranged for joint operation, as shown and set forth.



171,828. CALENDARS. John Keller, New York, N. Y. [Filed Jan. 21, 1874.]

A calendar composed of the box or receptacle *a*, for holding and operating the rotary dating-ribbon, constructed, arranged, and operating as described, in combination with the fixed printed calendar-card, substantially as set forth.

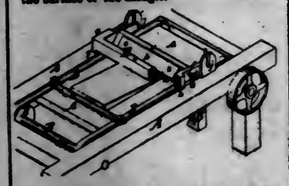
171,866. PREVENTING HYDRANTS FROM FREEZING. Breadth Kent, Binghamton, N. Y. [Filed Mar. 1, 1875.]



Brief.—A continuous current of warm air from the chamber below will be kept up, and as there is no outlet at the upper part of the shell, freezing is prevented by the warm air taking the place of the cold air.

The combination, with the inclosing-shell A, which is closed at the upper end and is provided with an opening, *d*, of the warm-air chamber *d*, substantially as set forth.

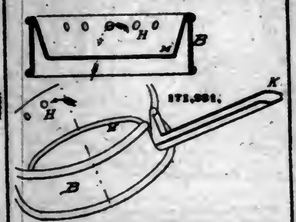
171,870. BALING BASKET-HEADINGS. John Kapple, Edwardsport, assignor to himself and Oliver R. Daugherty, Indianapolis, Ind. [Filed Aug. 6, 1875.]



Brief.—The bands are placed in a press, and while the package is in a compressed state it is secured by iron bands.

The method herein described of securing together packages composed of barrel-heading, for shipping.

171,880. SHINGLE-PLANERS. W. A. Kitts, Corwin, N. Y. [Filed Apr 7, 1875.]

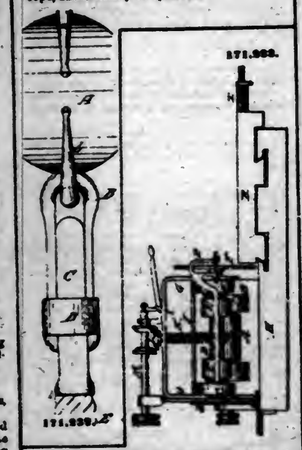


Brief.—The traveling carrier is provided with wedge-shaped guides, which govern the position of the shaving-knife while dressing the surface of the shingle.

In a shingle-planer, the combination of the endless belt or chain carrier B, provided with the lifting shoes or cams, and cross-bar W, the stationary knife *a* on the frame A, and the downwardly-pressed and self-adjusting knife-head H, bearing the knife *b*, all arranged and operating substantially as herein specified.

171,881. OILING UNDERLA. Walter Lacy, Milwaukee, Wis. [Filed Nov. 23, 1874.]

A combing utensil consisting of a double-walled annular horizontal shell, B, provided with a perforated cover, A, and with a handle, K, placed at the lower edge of a slot or notch set in the upper edge of shell B, and also provided with the perforations H and lower interior rim M, substantially as hereinbefore set forth, and for the purposes mentioned.



171,881.

171,889. TRACE-FASTENING. James K. Lake and Bernard McDevitt, Chicago, Ill. [Filed Aug. 9, 1875.]

1. The combination of the wedge-passes U, staple or eye B, and ring D with the rope or trace E, substantially as specified.

2. The plate A, provided with the hook *a* and hook *b*, or staple B, substantially as and for the purpose specified.

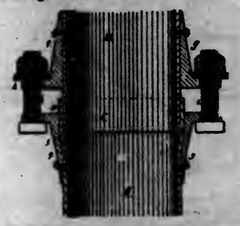
3. The wedge C, provided with corrugations or serrations to fit the strand of the rope, substantially as specified.

171,889.

171,888. MACHINES FOR CUTTING IRON. J. H. Lakey and J. G. Mills, Turner Junction, Ill. [Filed May 22, 1875.]

Brief.—Two horizontal bars, hinged at one end to a pulley-shaft, carry at their opposite ends an arbor, on which is a plain metallic cutting-disk and pulleys, all supported by and within a frame, and movable up and down therein by a screw. On the bed are two slides, movable in directions perpendicular to one another; and upon the upper slide is a rotatable table, provided with clamping devices for holding the bar to be cut at any desired angle to the cutting-disk.

1. The arms C C and shaft D, carrying the cutting-tool F, in combination with the supports O, bars I J, screw K, wheels L L' L'', and shaft M, substantially as and for the purposes set forth.

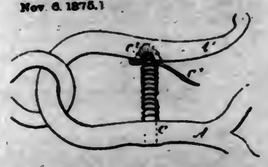


2. The cutting-tool F, having a central depression or recess upon its face, in combination with the shaft D and collars *e f*, substantially as and for the purpose specified.

3. In a machine for cutting metals, the rotating table U, in combination with the sliding tables T and R, substantially as and for the purposes specified.

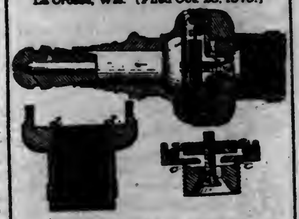
4. The adjustable guide P, situated on the shaft carrying the cutting-tool F, whereby the guide swings on a circle corresponding with the outer edge of the cutting-tool, substantially as described.

171,894. JOINTS AND COUPLINGS FOR TUBES. Geo. Matheson, McKeesport, Pa. [Filed Sept. 20, 1875.]



Brief.—The female part is made larger, as shown, for the entrance of the male portion. The lugs have slots, so that by slightly unscrewing the nut the bolt may be removed.

1. As an improvement in joints and couplings for tubes, the tube A, enlarged so as to receive the tube B, as hereinbefore described, in combination with the slotted lugs *g*, bolts *i*, and screw-nuts *j*, substantially as described and set forth.



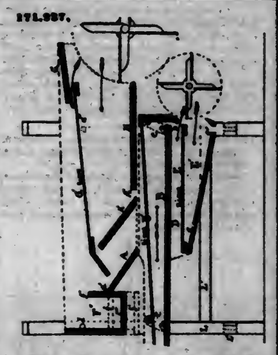
2. The combination of the slotted lugs *g*, bolts *i*, and screw-nuts *j*, with the tubes A and and B, substantially as herein described, and for the purpose set forth.

171,895. WHIFFLETREE-HOOKS. Ezra Maynard, North Washington, Ohio. [Filed Nov. 6, 1875.]

In combination with the hook A A', the latch-bar C, sliding in the shank A, and at right angles thereto, and carrying the thumb-piece and guide C', substantially as set forth.

171,896. GAS-REGULATORS. G McMillan, La Crosse, Wis. [Filed Oct. 28, 1875.]

1. In self-regulating gas-burners, arranged with flexible diaphragm and valve depending therefrom, the combination of metallic ring *a* with diaphragm *a a* and upper vertical wall of valve-section, for the purpose of holding the diaphragm and valve in place, as described, and for the purpose set forth.



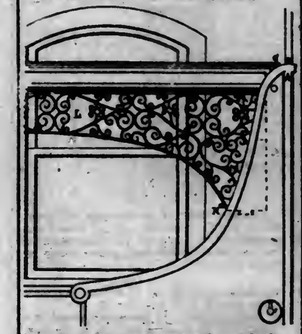
2. The gas-apertures *e e e e*, arranged in combination with internal screw *d*, as shown, so that by screwing the valve-section, Fig. 3, up or down, the apertures *e e e e* are enlarged or diminished, as described, and for the purpose set forth.

3. The combination of valve-section with base-section by means of screw *d*, as shown, so that a chamber for the transmission of gas is left between the two sections, and the gas-apertures *e e e e* may be enlarged or diminished, substantially as described.

171,897. CLOVER-SEPARATORS. George F. Metzger and J. P. Kohler, West Fayette, N. Y. [Filed Aug. 21, 1875.]

Brief.—Improvements in the internal arrangement of the upper and lower shoe of a "thrashing-mill" separator.

171,897.



1. The spout A, in combination with the sleeve G', chute A', opening A'', bottom board H, and fan F', substantially as and for the purpose described.

2. In combination with the fan F' and upper separator-shoe, consisting of sleeve G', spout A, chute A', and bottom board H, arranged substantially as described, the sleeve B' arranged to receive the separated material from the upper shoe, substantially as set forth.

3. The combination, in a clover-separator, of the sleeve B', shaking-board B', arranged to leave the discharge-aperture *b* at the end nearest the blast, the sleeve E, chute E', and fan F, substantially as and for the purpose set forth.

171,898. SLEEPING-CARS. Jas. L. Mitchell, Pueblo, Colo. [Filed June 21, 1875.]

1. The brackets L, hinged to the seat-backs, as described, and combined therewith, and with the seat ends to form, when dropped down, a continuous front arch-support fastened together for the aisle side of the upper couch, and turned out of the way when the seat-backs are lowered, as herein set forth.

2. The brackets L, hinged to the seat-backs, as described, in combination with the fastening device H P', by which said brackets are held in place when folded.

3. The brackets L, hinged to the seat-backs, as described, in combination with the seat-fastening device, as shown and described.

4. The brackets L, hinged to the seat-backs, as described, each having a boot-extension provided with a bolt, M, which serves as the means by which the brackets are both secured in their arched and folded positions, as described.

5. The combination with the vertical sliding panels C D of the crank-shaft E F, and the cords and pulleys *a' a''* connecting said panels with the winding and unwinding shafts, whereby the panels are raised and lowered from the floor of the car.

171,899. SLEEPING-CARS. Jas. L. Mitchell, Pueblo, Colo. [Filed Nov. 27, 1875.]

1. The upper berth N, having a sliding hinge-connection with the side of the car, substantially as shown and described, whereby it is adapted to be raised and assume a horizontal position, or to be lowered and maintain a vertical position against or parallel to the wall, as shown and described.

2. The detachable partition-sections J, having the hinged and folding parts, and provided with fastenings, as described, whereby it is adapted to be secured in a vertical position as a partition, or horizontally alongside the upper berth, to form a panel-protector for the same, as shown and described.

3. The combination, with a lower seat-section having a rabbet along the front edge, and studs *s'*, set vertically therein, of a detachable part, T, having folding legs, and provided with holes in its ribs X, to receive said studs when in either of its allotted positions, as shown and described.

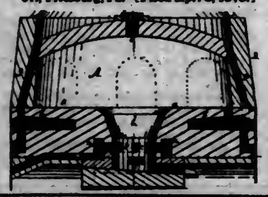
4. The combination, with the upper berth, arranged to fold down against the side of the car, of the side rail N, forming the ledge below the window, and the section J, forming the side panel of the car-body, substantially as specified.

5. The combination of the hooks C, having the parts *b a d*, and the slotted plates D, having upper wide notch E, with the upper berth and the car-body, substantially as specified.

6. The combination of convex plates on the seat-legs with cavity-plates O in the car-floor, substantially as specified.

7. The combination, with movable seats having a slide-bolt and spring-catch in the leg, of a catch-plate in the floor, substantially as specified.

171,900. BOTTLING MINERAL WATERS, &c. John B. Newbrough, New York, N. Y. [Filed Oct. 29, 1875.]

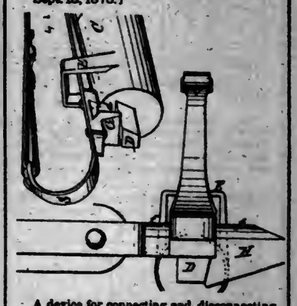


Brief.—As the cork leaves the plunger, it strikes a thin patch of rubber placed over the bottle's mouth. Both enter the neck, and, from the quickness of the movement, that portion of the elastic film below the bottom of the cork and that which covers the lower portion of said cork expand sufficiently to cover the bottom and sides of the stopper. The film is so thin that the liquid does not become impregnated with a rubber taste; yet it is sufficient to protect the cork from deleterious action.

1. The mode described of bottling mineral waters, &c.—that is to say, applying a sheet of flexible or elastic material to the mouth of the bottle, and then carrying the cork to a position above the sheet, and forcing it downward against the sheet, and into the mouth, so as to stretch the material over the inserted portion of the cork.

2. The combination of the bottle, the cork, and the intervening independent sheet of rubber distended upon that portion of the cork within the bottle during the process of bottling, as set forth.

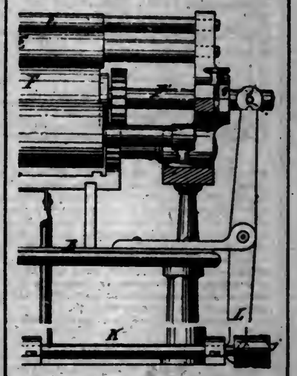
171,941. GLASS-FURNACES. J. Nicholson, Jr., Pittsburg, Pa. [Filed Apr. 6, 1875.]



1. In a melting-furnace for the manufacture of glass, the combustion-chamber *f*, provided with air-openings *r*, and surrounded with the air-space *s*, in combination with the pot-chamber and fire-chamber, substantially as and for the purpose hereinbefore described and set forth.

2. In a melting-furnace for the manufacture of glass, the crown D, provided with the opening *e* and valve *f*, in combination with the stack and pot or melting chamber, substantially as and for the purpose hereinbefore described and set forth.

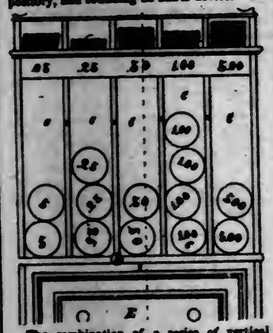
3. In a melting-furnace for the manufacture of glass, the flues *b c d* under the melting-pots, so arranged that the heat passes from the chamber A through flue *b*, circulates under the pots through the flues *c d*, and escapes through the flue *g*, substantially as described and set forth.



171,942. HORSE-DETACHING APPARATUS. James H. O'Brien, Pittsburg, Pa. [Filed Sept. 18, 1875.]

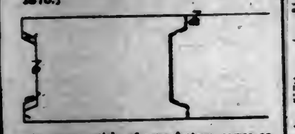
A device for connecting and disconnecting traces from a whiffletree, consisting of the flanged hook H, pin D, and spring-block G, constructed with an opening, *d*, having guides for the flanges of the hook, whereby said hook is raised and disconnected from the pin of the whiffletree, substantially as shown and specified.

171,943. INKING APPARATUS FOR PRINTING-PRESSES. Charles Potter, Jr., and James F. Hubbard, Plainfield, N. J. [Filed Feb. 23, 1875.]



Brief.—The reciprocating bed, through a telescopic lever, rocks a shaft which is journaled in the lower part of the frame, and carries on one end a grooved cam, engaging a pin on the lower end of a pivoted lever, the upper end of which is jointed to the shaft of the distributing-roller, which thus receives longitudinal reciprocation.

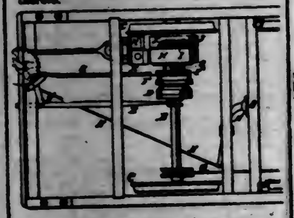
In combination with the reciprocating bed C, and a lever connecting the same with the rocking shaft K, the grooved cam J, fixed on the shaft E, the lever L and its connections, and the distributing-roll F, as herein specified.



171,944. COMBINED CHECK-BOXES AND CASH-INDICATORS. William I. Ripley, Indianapolis, Ind. (Filed May 10, 1875.)

Brief.—The checks are held within the several receptacles until impressed through the transparent front, when a spring-slide is operated, precipitating them into the locked depository, and sounding an alarm device.

The combination of a series of vertical ticket or check receptacles, C, provided with transparent fronts and orifices F, spring-slide K, alarm device J, and the depository E, as and for the purpose set forth and described.



171,945. DRAIN AND SEWER PIPE. De Witt C. Sage, Cromwell, Conn. (Filed Nov. 18, 1875.)

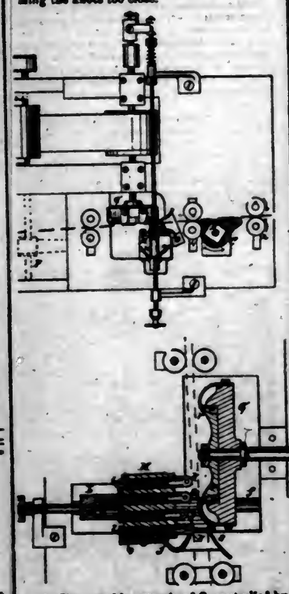
As a new article of manufacture, sewer or drain pipe sections, having their ends constructed with tongues and recesses to receive the tongues, substantially as described.

171,946. CAR BRAKES AND STARTERS. W. Scott, Chicago, Ill. (Filed July 9, 1875.)

Brief.—Spiral spring wound when brakes are applied, and by its expansion operating to start car. Improvements in details relative thereto.

1. In combination, the clutch D, sleeve F, teeth F' F', drum H, and ratchet J', all mounted on the same axis, stop-pawl G, push-pawl I, and spring s', all operating together, substantially as described, in connection with the shoe K and a clutch-lever, the said shoe, stop-pawl, and lever being connected to the same rod M.

2. The combination of the yielding shoe K, spring-drum H, ratchet J', pawl I, a fixed wheel, and a friction-shoe, the latter and the shoe K being connected to the same brake-rod or shaft, for the purpose set forth.



3. The combination of the drum H, provided with a groove in one end, and the sleeve F, carrying the pawl e projecting into the said groove, the said drum and sleeve being connected by a spring, s', substantially as and for the purposes specified.

4. In combination, the clutch-block D, sleeve F, provided with the teeth F' F', stop hook or pawl G, drum H, provided with the push-pawl I, spring s', attached at one end to the drum and at the other to the sleeve, shoe K, ratchet J', clutch-lever E, push-bar L, and brake-rod M, substantially as and for the purposes specified.

5. The combination of the wheels C C, brake-shoes P P, actuated by means of a lever connected to the brake-rod M, yielding shoe K, also actuated by means of an arm connected to the rod M, and the spring drum H, substantially as specified, whereby the starting mechanism may be controlled either independently or simultaneously with the brakes P P.

171,947. MACHINES FOR SHAVING HALF-ROUND HOOPS. George B. Golden, Rochester, N. Y. (Filed Feb. 20, 1874.)

Brief.—The movable cutter head, which shaves the flat side of the hoop, is controlled in its action by a series of elastic pressure-rollers, forming a knot passer on the bark side, which are supported in a pivoted frame, yield sufficient for the passage of knots without thinning the hoop, and cause the cutter-head to conform to the curves of the stock. The knots are trimmed by a movable cutter-head held against the bark side of the hoop by a spring, and controlled in its operation by a yoke-frame swiveled about the head, and provided with adjustable rests before and after the head, for preventing the cutter from trimming the knots too close.

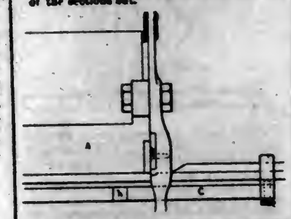
1. The movable cutter-head G, controlled by the yielding knot-passer M on the bark side of the hoop and the supporting-rest q, traveling with the head G, in combination with the stationary rest s, substantially as described.

2. The movable cutter-head G, when provided with the ring r, in combination with the yielding knot-passer M on the bark side, operating substantially as described.

3. The knot-cutter C, in combination with the movable cutter-head G, provided with the internal ring r and the knot-passer M on the bark side, operating substantially as and for the purposes set forth.

4. The movable cutter-head G, provided with the internal ring r and knot-passer M on the bark side, in combination with the angular feed-roll 2 or 3, either or both, operating substantially as described, for the purposes set forth.

5. In combination with the movable cutter-head G, controlled by the yielding knot-passer M on the bark side, the supporting-rest q traveling with the head.



6. The combination of the movable cutter-head G, controlled from the bark side by the knot-passer M with the rest s.

7. In combination with the movable cutter-head G, provided with the ring r, the pivoted knot-passer frame M, containing a series of rollers, k l, operating to control the head and pass the knots, substantially as described.

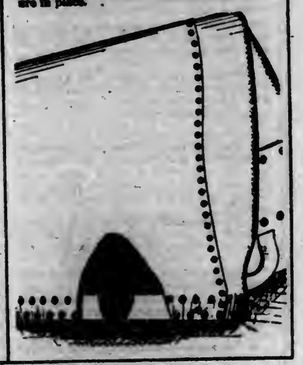
8. The movable cutter-head G, when provided with the internal ring r, in combination with the yielding roll R on the bark side of the hoop, operating substantially as described.

171,948. MACHINES FOR CUTTING PRINTERS' LEADS. H. J. Stone, New Haven, Conn. (Filed Apr. 12, 1875.)

Brief.—The gage in front of the cutter, which supports the lead being cut, is connected with a gage in the rear of the cutter, which contains a sample lead, to determine the length of the sections cut.

The combination, with a lead-cutter, A, of an extension-rest, B, and adjustable gage C, substantially as and for the purposes set forth.

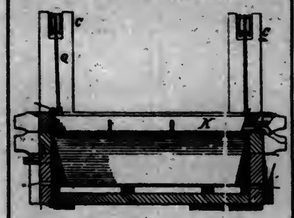
171,949. SASH-LIFTS. John Sweet, Providence, R. I. (Filed Sept. 13, 1875.)



Brief.—A curved fishtail-shaped projecting arm, with suitable base-plate, is secured to the side of the sash, carving, with or without any suitable lock, as a convenient reversible right or left hand sash-lift.

As a new article of manufacture, a reversible sash-lifter, consisting of the base b and projecting arm a, adapted for attachment to the side of a window-sash, substantially as herein described.

171,950. MAIL-BAGS. P. S. Thomson, Jersey City, N. J. (Filed Nov. 17, 1875.)

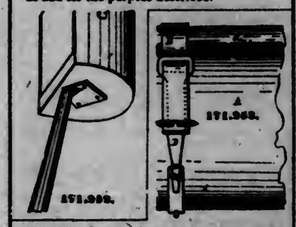


Brief.—A struck-up bottom is secured by a double row of rivets to the body of the bag, to prevent abrasion when the bag is dragged along the ground, and to hold the whole structure in place.

A mail-bag having a bottom with turned up circumferential flange, and having sides overlapping said flange, and secured thereto by two or more rows of metal-headed rivets, substantially as described.

171,951. MILK-COOLERS. Isaac H. Warner, Elgin, Ill. (Filed June 9, 1875.)

Brief.—Water flows out of a perforated pipe through the covering-pan into a hopper communicating with the water-vats, which incloses the milk-pan, and throughout that pan. The covering water-pan is vertically adjustable.

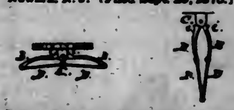


1. A cooling pan or vat, provided with a perforated pipe at one end, one or more ventilators at its bottom, and a discharge-pipe regulated by a stop-cock at the other end, as a cover for, and in combination with, a milk or cheese vat, surrounded by a water-space having an inlet-pipe, an overflow-pipe, and a pipe through which the water may be wholly withdrawn from the said water-space, substantially as and for the purposes set forth.

2. In a milk-cooler or cheese-vat, the upright C, provided with the pulleys D, in combination with the pan K, provided with the cords Q and weights R, substantially as and for the purposes set forth.

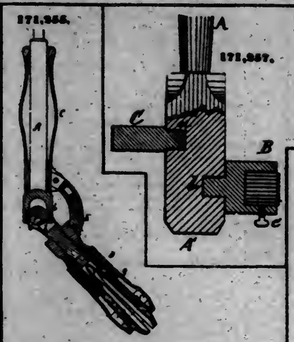
171,952. SUGAR-SCOOPS. Geo. W. Woodward, Fayetteville, N. C., assignor of one-half his right to G. P. McNeill, same place. (Filed Sept. 10, 1875.)

As a new article of manufacture, the scoop C, provided with a pointed metallic handle, A, as and for the purpose described.



171,953. RAVEN-TROUGH HANGERS. J. P. Abbott, Cleveland, Ohio. (Filed Nov. 20, 1875.)

1. The bar D, gains or notches c, and ring H, in combination with the strap B, in the manner as described, and for the purpose set forth.

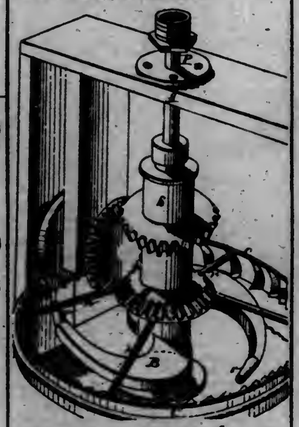


2. Flange F, gain c, point b, and button C, in combination with the bar D and trough A, substantially in the manner as described, and for the purpose set forth.

171,954. SLEEVE-BUTTONS. Geo. A. Allen, Newark, N. J. (Filed Sept. 29, 1875.)

In a sleeve-button, the curved spring-arms B, having the shoulders i, and pivoted to the shank C, in combination with the straight arms D, jointed at E, so that when closed the arms D are drawn out of the horizontal line, and the joint E forced up against the shank, as and for the purpose set forth.

171,955.



171,956. ANGULAR BIT-STOCKS. James W. Anthoine, Miller's Falls, Mass. (Filed Oct. 20, 1875.)

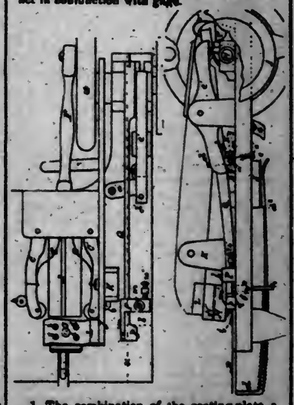
In the described angular bit-stock or brace, in combination with the furcated tubular shanks A B, connected by a universal joint, as described, the bifurcated tubular handle C and shaft-supporter D, hinged together at their prongs, and provided with slotted curved arms, and a clamp-screw and nut therefor, all substantially as set forth.

171,957. CENTRIFUGAL WATER-WHEELS. Oscar J. Backus, Newark, N. J. (Filed Aug. 20, 1875.)

Brief.—Water is introduced through the supply-pipe into the revolving chamber, and passes directly into the hollow arms, from whence it is thrown, with all its weight and centrifugal force, out of the jets against the curved linear buckets, which causes the wheel to revolve in opposite directions.

1. The hollow arms B, revolving inside of the wheel C, to operate said wheel in an opposite direction by the force of the discharging water from the jets r r r upon the buckets 1 and 2, thereby offsetting a double sum of the water as a motor-power.

2. A reversible centrifugal water-wheel, C, provided with adjustable buckets 1 and 2, operating by means of centrifugal revolving hollow arms B, substantially in the manner and for the purpose set forth.



3. The combination of hollow arms B upon the water-cylinder S, revolving in opposite direction to the wheel C, which rotates upon the stationary bearing of and around the adjustable cylinder S, arranged substantially as specified.

171,958. MARKING-STAMPS. L. Ballinger, Trenton, Mo. (Filed Aug. 30, 1875.)

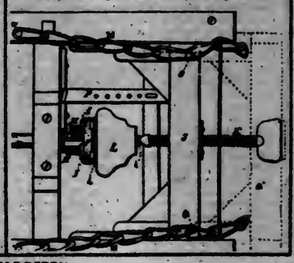
The combined post-office marking and canceling stamp herein described, consisting of a handle, A, having the head A', which is provided with screw-thread recesses a and b, arranged opposite to, but not in a line with, each other, and the elastic canceler C, and type-bar or marker B fitted into said recesses, all combined and operating substantially as and for the purpose herein before set forth.

171,959. HORSESHOE-MACHINES. Hiram J. Batchelder, Fitchburg, assignor to himself and Theodore S. Very, Boston, Mass. (Filed Apr. 23, 1875.)

Brief.—The blanks are cut and ends reduced at the same time; then bent, creased, "seated," and discharged, to be afterward punched. The separate mechanisms for forming and punching are operated by the same driving-shaft. The creasers are made expansible by attachment to carrier at one end only. The punch-stock is provided with a flange to act in combination with gage.

1. The combination of the seating-plate c and sliding former D with the creaser-carrier M and its creasers g g, substantially as shown and described.

2. The expanding creasers g g, formed and applied to their carriers substantially as shown, and for the purpose set forth.

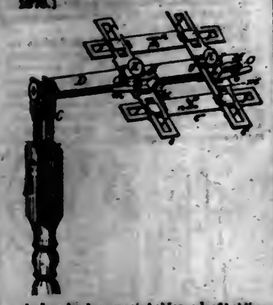


3. The combination, with the head-block L and the creaser-carrier M, of the intermediate adjustable block N, substantially as and for the purpose set forth.

4. The combination, with the movable head-block F, provided with a fixed shear or cutter, a, of the head p, provided with a shear, a', and having the inclined shoulders g g' disposed on opposite sides thereof, substantially as shown and described, and for the purpose set forth.

5. The combination, with the adjustable head-block F, of the holding set-screw a', as and for the purpose set forth.

6. The combination, with the gage s', the spring-plate a', and fixed punch c', of the movable punch-stock, provided with a punch, d', and flange g', the whole being arranged in manner and for the purpose set forth.



171,960. LATHES FOR TURNING SPOKES. S. L. Beebe and H. A. Beebe, North Ridgeville, Ohio. (Filed Nov. 8, 1875.)

1. The carriage or feed block J, screw center K, and chuck M, in combination with the frame A, mandrel C, and chuck F, substantially in the manner as described.

2. The chuck herein described, consisting of the head F, provided with radial grooves e, adjustable blocks G, screws H, and nuts I, in the manner substantially as described, and for the purpose specified.

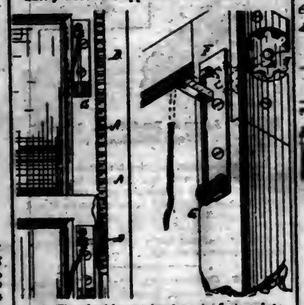
171,869. HOOP AND HOUSE SUPPORTER. L. Berg, Minneapolis, Minn. (Filed June 10, 1875.)

1. In a hoop or mesh holder, a leaf holding device consisting of the upright L, having the perforation M, bracket N, and spring O, the latter arranged so as to operate the sharp or thumb-lever n, substantially as and for the purpose herein before set forth.

2. A hook or mesh support consisting of the upright A, sliding standard C, revolving horizontal arm D, hook-bearing frame a, c', c'', and c''', hooks p, clamps I, thumb-levers n, and leaf-holders n', all constructed and arranged substantially as and for the purpose herein-before set forth.

171,870. MORTISING-MACHINES. J. Johnson Berger, Cannon Valley, Minn. (Filed June 10, 1875.)

Brief.—Mortises or gains of varying dimension to cut by means of a square cutter-head, provided with rear adjustable side cutters, and a bit or drill for cutting deeper than the side cutters, which is inserted and adjustable in a vertical tubular shaft, and operated by suitable mechanism, the whole mounted in a laterally-adjustable supporting-frame, which is longitudinally adjustable upon the main guiding-frame. The length and width of the mortise or gain are regulated by pivoted spring-catches, and the depth of cut of the bit by a sliding catch.



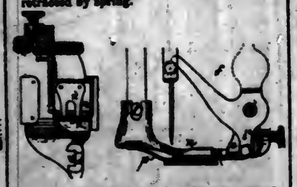
1. The combination of the cog-wheel F, pinion H, vertical tubular shaft G, bit R, having the screw-thread R', and cutter-head P, having the cutters P' P' P', substantially as and for the purpose herein-before set forth.

2. The combination of the bit R, having a screw-thread, R', with the clamps r r and wedge b, substantially as and for the purpose herein-before set forth.

3. The combination of the slotted cross-piece O with the sliding plate K, united by the standard I with the sliding shaft i, to the head of which, g, is pivoted the clamps r r, substantially as and for the purpose herein-before set forth.

171,909. SASH-FASTENERS. James Hittenbender, Beaver Valley, Pa. (Filed Oct. 12, 1875.)

Brief.—A double ratchet-bar within the window-frame serves for both the upper and lower sash, by its peculiar combination with a toothed wheel and spring, and a suitable gear-wheel, the spring being arranged on the surface or side rail of each sash, and a suitable cord from inside the room operating alternately either the upper or lower sash.



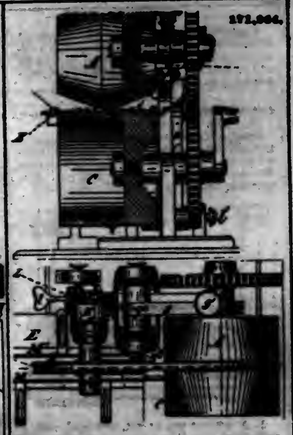
1. The double ratchet-bar A, fastened to the window-frame B, in combination with the gear-wheel D upon the sash, substantially as set forth.

2. The toothed wheel F and spring-catch G, in combination with the gear-wheel D and double ratchet-bar A, substantially as specified.

171,868. RUFFLING FOR SEWING-MACHINES. James Bolton, Chicago, Ill., assignor to Singer Manufacturing Company, New York, N. Y. (Filed Sept. 11, 1875.)

Brief.—The ruffling-blade has positive movement forward, imparted by needle-bar, and is retracted by spring.

1. The combination, in a ruffler, of the standard, the three-armed lever embracing the standard, and the ruffling-blade and its retracting-spring, with the presser, the forked holding-pieces n, and its supporting projection, the separator, and an adjusting device, all substantially as described.



2. The combination of the lever, its attached ruffling-blade, and a separator, with a spring to retract the blade as the needle-bar descends, the lever being adapted to be operated positively to form a fold in the material to be ruffled as the needle-bar is completing its operation, substantially as described.

3. The frame A, adapted to be secured to the presser-bar and the presser p, in combination with the separator, the lever adapted to be operated by the needle-bar, and the spring to retract the blade, all substantially as described.

4. The presser, the lever f, and its attached ruffling-blade, in combination with a spring to retract the blade as the needle descends, and a screw to regulate the descent of the arm f of the lever, and the movement backward of the blade with reference to the point of the needle, substantially as described.

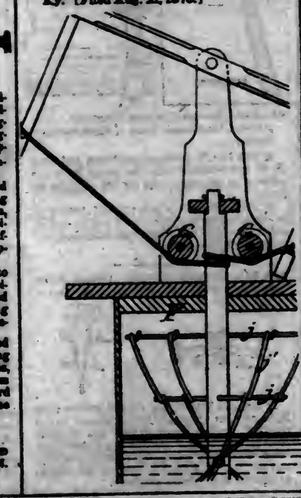
171,864. MACHINERY FOR CHEMICALLY PLOTTED PAPERS. John H. Brown, New York, N. Y. (Filed Sept. 9, 1875.)

171,864.

1. The endless bands A A and d d in combination with the presser-roller A and cylinder C, and the wheels B and D, when constructed and arranged to operate substantially as and for the purpose set forth.

2. In a machine for crossing dotted fabric the combination of the cylinder C with the presser-roller A, mounted upon a movable center and controlled by a spring for the purpose of varying the pressure, as desired, substantially as described.

3. The band-rollers B and D, mounted on opposite ends of a vibrating beam, for the purpose of equalizing the tension of the bands, substantially as described.



4. The band-wheels B and D with the lever L and the screw l, combined and arranged substantially as described.

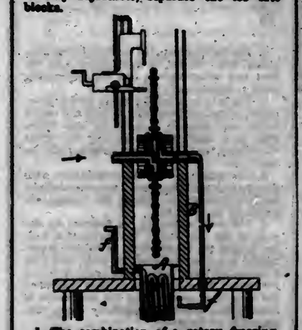
5. In a machine for crossing dotted fabric the combination of the presser-wheels A and C, geared with the band-wheels B and D, substantially as described.

6. In a machine for crossing dotted fabric the combination of the table E with the band-wheels B and D, substantially as described.

7. In a machine for crossing dotted fabric the combination of the table E with the guides M M', substantially as described.

171,866. CRUTCHES. Daniel McCarty Dennison Dandridge Brown Cropper's Depot, Ky. (Filed Aug. 21, 1875.)

A dasher consisting of a revolving perpendicular shaft, having transverse, horizontal, and spirally-arranged arms, of equal length, passing through its axis, and two pairs of wires near the periphery, forming, with the transverse beam, a semicircular elevator on each side of the axis, substantially as described, and for the purpose set forth.



171,866. WASHING AND WRINGING MACHINE. William Cord, Ripley Township, Huron County, Ohio, assignor of one-half his right to William Lewis, same place. (Filed Aug. 10, 1875.)

The combination of rollers C C C' C', spring-bearings E e, and gearing D D, with the movable shaft f and gearing H, wringer-rollers G' G, spring L, and follower K, substantially as and for the purpose set forth.

171,867. ICE-MACHINES. Thomas Cook, New York, N. Y., assignor of one-half his right to James H. Nuttman, and said Cook and Nuttman assignors to the Union Ice Company. (Filed July 2, 1875.)

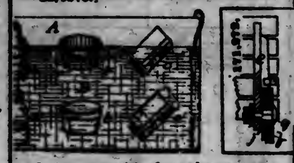
Brief.—The volatile refrigerant passes from one port in the axis through the wheel, and out at the other port, and through coil in water-tank. Water is sprayed onto wheel. Tank is movable vertically. Its water washes ice on wheel. Cutters, vertically and horizontally adjustable, separate the ice into blocks.

1. The combination of a rotary freezing-wheel with a vertically-adjustable tank, in which the lower edge of the wheel rotates, substantially as described.

2. The combination of a rotary freezing-surface with an adjustable horizontal cutter, substantially as and for the purpose described.

3. The combination of a rotary freezing-surface with an adjustable vertical cutter, substantially as and for the purpose described.

4. The combination of a rotary freezing-surface with an adjustable horizontal and an adjustable vertical cutter, substantially as and for the purpose described.



5. The combination of a rotary freezing-surface with spray-pipes arranged to spray water upon such surface, substantially as described.

6. The combination of a rotary freezing-surface with spray-pipes arranged to spray water upon such surface, and with a tank into which the lower edge of the wheel dips, for the purpose of wetting such surface, substantially as described.

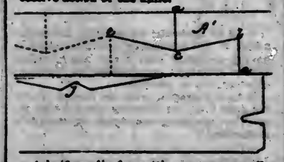
7. The wheel A C, composed of a hollow shaft, a suitable central support or hub, and a pipe or pipes arranged in convolutions around the hub, substantially as described.

8. In a freezing-wheel, the pipe C, having the convolutions through which the refrigerant returns from the periphery of the wheel arranged between the convolutions through which said refrigerant moves outward from the hub, substantially as described.

171,868. DEVICES FOR TRACING DRAWING. Egbert L. Orull, Ashtabula, Ohio. (Filed Oct. 22, 1875.)

1. As a new article of manufacture, a copy-book for teaching free-hand drawing, consisting of sheets of drawing-paper A, having the designs a b c to be copied by the pupil printed at the top, alternated with transparent sheets or vurishers B, having fac-similes of figures a b c printed upon them, substantially as and for the purpose herein shown and specified.

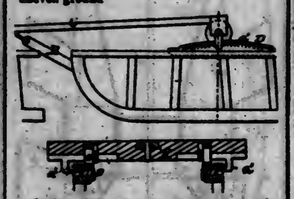
2. As a new article of manufacture, a correcting or verifying plate for free-hand drawing, consisting of a plate of clear glass having cemented upon it a sheet of thin tracing-paper or tracing-cloth, imprinted with a duplicate copy or fac-simile of the figure or design from which the drawing is to be made, substantially as and for the purpose herein shown and described.



171,869. LAMP-FILLERS. William C. Cross, Boston, Mass. (Filed June 11, 1875.)

In a lamp, the oatch-funnel A, provided with the slot a, in combination with the feed-tube B, provided with the stud b, substantially as and for the purpose set forth.

171,870. KNIVES FOR CUTTING PAPER-COLLAR BLANKS. Abednego Dower, Brooklyn, N. Y. (Filed Nov. 3, 1875.)



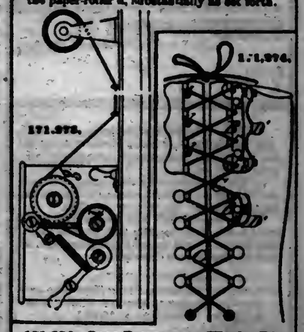
Brief.—By reason of the peculiar arrangement of the cutting-edges, two complete blanks are severed from the strip at each successive action of the knife.

A knife or die for cutting out paper-collar blanks from a strip or sheet of paper, the edges of which form three similar, equal, acute angles, a b c, b c d, and d e c, whereby two complete collar-blanks are cut from the strip or sheet of paper at each successive action of the knife thereon, substantially in the manner described and specified.

171,871. BOB-SLEDS. Francis Dillon, Walcott, N. Y. (Filed May 15, 1875.)

Brief.—To prevent strain in passing over uneven ground

In bob-sleds, the plate D, having curved trunk a and flanges a', both curved upward correspondingly with the plane of the trunk, in combination with the axle H, forming a bearing for the roller G, and provided with a rectangular hook, c, substantially as and for the purpose set forth.



171,872. SCHOOL-DESKS. James A. Dole, Bangor, Me. (Filed Oct. 16, 1875.)

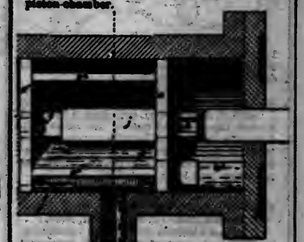
The improved hinge for school desks and seats, formed by the supports b b, having the square hole g and circular grooves h h therein, in combination with the arm a, provided with the circular hole i and the lugs j j, and the bolt l, having the square head and tip, and rounded center and wash. r o, all constructed and operating substantially as and for the purpose set forth.

171,873. TELEGRAPH APPARATUS. Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. (Filed Feb. 16, 1875.)

1. The combination, with the rollers g h, actuated by a train of gearing, of guides for a strip of telegraphic paper, and a table or rest contiguous to such strip, upon which the message is transcribed, as set forth.

2. The combination, with the rollers g h and the removable winding-roller l, of the guides for the strip of telegraphic paper, and the paper-roller a, substantially as set forth.

171,873.



171,874. SHOP-FASTENINGS. Warden Bemister, Hunt's Station, Ohio. (Filed Oct. 20, 1875.)

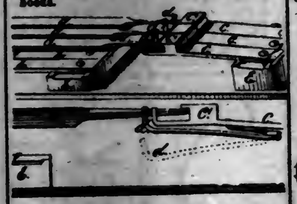
Brief.—The shoe may be put on and taken off the foot by disengaging the hooks from the eyes, without untying the lacing.

In a boot or shoe fastening, the combination of a clasp, B B', and a lacing, C, operating substantially as described.

171,875. STEAM-ENGINES. Joseph S. Foster, Salem, Mass., assignor of one-half his right to Chester L. Johnson, Utica, N. Y. (Filed May 18, 1875.)

Brief.—The piston is hollow and divided by a longitudinal partition. One chamber receives live steam through the side of the cylinder, and admits it alternately to opposite sides of the piston through a valve which is opened by striking the cylinder-head. The exhaust takes place in the same way through the other piston-chamber.

1. In combination, the cylinder, the inlet and exhaust passages formed in the cylinder, and the piston and its sliding stems and exhaust ports j k, constructed and adapted to operate substantially as described.



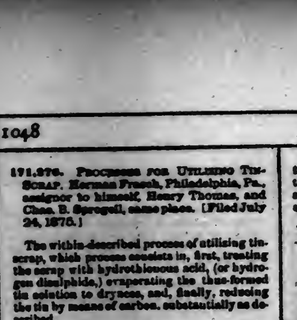
2. The combination of the cylinder and piston, provided with steam ports and spaces f k, with the pipe e, for equalizing the pressure of the steam on the piston, substantially as described.

171,976. PROCESSES FOR UTILIZING TIN-SCRAP. Hermon French, Philadelphia, Pa., assignor to himself, Henry Thomas, and Chas. B. Spregell, same place. [Filed July 24, 1875.]

The within-described process of utilizing tin-scrap, which process consists in, first, treating the scrap with hydrothionous acid, (or hydrogen disulphide,) evaporating the thus-formed tin solution to dryness, and, finally, reducing the tin by means of carbon, substantially as described.

171,977. FILE-BLANK HOLDERS FOR GRINDING. James Garland, Central Falls, R. I. [Filed Nov. 6, 1875.]

Brief.—The file-blanks are arranged on elastic supports, and held in place by [illegible] hooks.



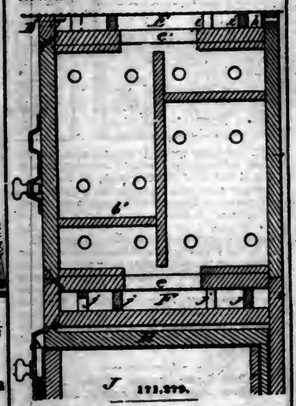
1. The combination of the spring *d* for holding the file-blank, with an elastic support for the file-blank, substantially as and for the purpose described.

2. The combination of the springs *b b* and the springs *c c*, with the springs *d d*, substantially as and for the purpose specified.

3. The combination, with the springs *b b* and springs *c c*, of the bolsters E E, provided with the screws *f f* and raised bearing-surfaces, as and for the purpose described.

171,978. HYDROCARBON-BURNERS AND GAS-GENERATORS. Alvah J Griffin, Lowell, Mass. [Filed Nov. 9, 1875.]

1. The retort having the transverse partitions P P P of its chambers arranged relatively to the longitudinal partitions *a b*, as described and represented.

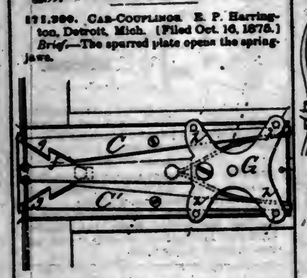


2. In combination with the retort, the steam and gas pipes H and I, arranged to discharge [illegible] with it, as described, said pipe H K being situated on the sides and ends of the retort, substantially as shown, so as to be exposed to the flame of the combined jets of steam and vaporized petroleum, as explained, when the apparatus may be in operation.

171,979. PROTECTOR-SAFES. C. D. Hart, Anderson, Ind. [Filed Sept. 11, 1875.]

Brief.—An interior double-wall ventilating partition. A meat-cutting board, connected with a scrap-drawer by a hatch, so that the two are drawn out together, or disconnected at pleasure.

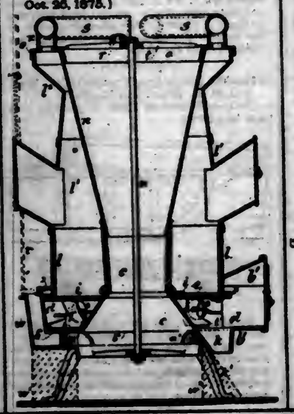
1. In a meat-chest, the subdivided double-wall partition, communicating with the compartments A A, and also with air-circulating chambers B F, substantially as described.



2. In combination with the chest mounted on the horizontal wire G, a sliding box, the top of which serves as a cutting-board, H, and the drawer J, provided with a latch, operated substantially as described, and for the purpose set forth.

171,979.

171,980. CAR-COUPLINGS. E. P. Harrington, Detroit, Mich. [Filed Oct. 16, 1875.]

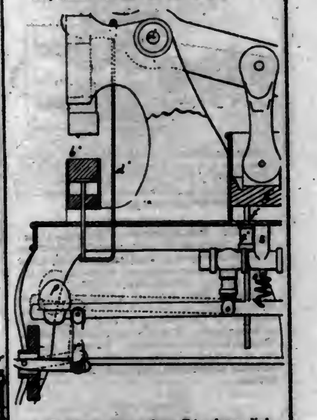


Brief.—The sparred plate opens the spring-jaws.

1. In an automatic car-coupling, the combination of the pivoting or oscillating plate G, having operating pins *p*, with the vibrating hooked arms C C', embraced by the said pins, substantially as specified.

2. In combination, with the hooked vibrating arms C C', the vibrating sparred plate G, and their operating mechanism, substantially as specified.

171,981. HOT-AIR FURNACES. Thomas F. Hemrich, Reading, Pa., assignor to himself and Elias Fritz, Sr., same place. [Filed Oct. 25, 1875.]

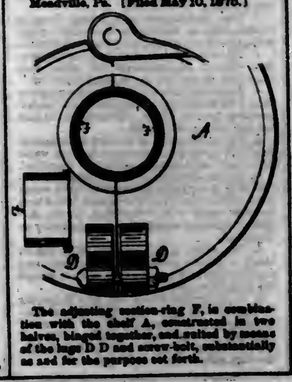


1. The annular channel *d* and ring-frame *f*, in combination with the grates *e*, scrapers *f'*, and means for revolving the grate, substantially as set forth.

2. The ring *o*, tubes *r*, and annular flue-pipe *s*, in combination with the central air-casings *c n*, and external casings *l P P*, as set forth.

3. The base *w*, with a central opening for atmospheric air, and provided with flanges or supports *x* for the furnace, in combination with the annular fire-space and pots, substantially as set forth.

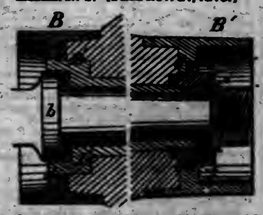
171,982. PRESSES. Charles H. Harvey, Boston, Mass. [Filed Oct. 25, 1875.]



1. The bar or stamp, the walking-beam, link, piston, and cylinder, in combination with the inlet and outlet valves, and valve-operating lever *n*, substantially as described.

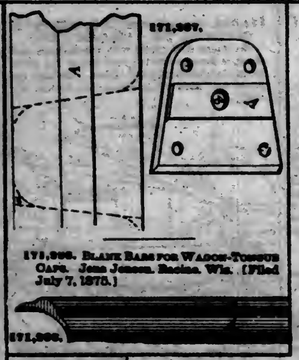
2. The lever *n*, pivoted directly on the valve-stems, in combination with the inlet and outlet valves, and adapted to move on each valve-stem as a fulcrum when moving the other valve-stem, and to operate substantially as described.

3. The mold and die *b'*, in combination with the stamp *b*, walking-beam, and connected piston and cylinder, to operate the stamp, substantially as described.



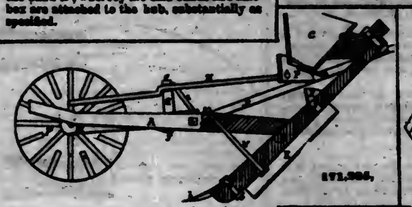
4. The lever *n*, having its fulcrum on the stem of the inlet-valve, in combination with the stem of the outlet-valve, to which it is connected at a point between its ends, and with a connected lever adapted to operate it, and with a weight or spring to depress the end of the lever most remote from the inlet-valve to retain the outlet-valve partially open, substantially as described.

171,983. STOVE-PIPE SHELVES. G. Hilbirt, Mendville, Pa. [Filed May 10, 1875.]



The adjusting suction-ring F, in combination with the shelf A, constructed in two halves, hinged together, and united by means of the lugs D D and screw-bolt, substantially as and for the purpose set forth.

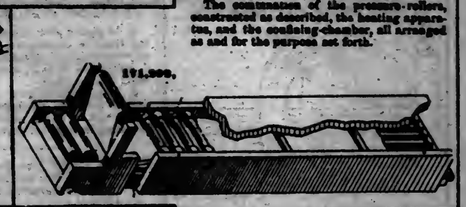
171,984. VEHICLE-HUBS. D. O. Holmes, Adams, N. Y. [Filed Nov. 27, 1875.]



In a vehicle-hub, the combination, with band B, having inner annular flange *a*, and band B', having a similar flange, *a'*, of the axle-box D, having cylindrical enlargement D' with annular flange *d* and a screw-threaded end, *e*, and the clamp-nut R, having exterior flange *f*, abutting against flange *a'* of the band B', whereby the said bands and axle-box are attached to the hub, substantially as specified.

171,985. BLADE BARS FOR WAGON-TONGUE CAPS. Jens Jensen, Racine, Wis. [Filed July 7, 1875.]

171,986.



171,985.

171,987.

171,988. MACHINES FOR MAKING CARPET-LININGS. Willard Lewis, Walpole, Mass. [Filed Sept. 4, 1875.]

The combination of the pressure-rollers, constructed as described, the heating apparatus, and the cooling-chamber, all arranged as and for the purpose set forth.

171,989.

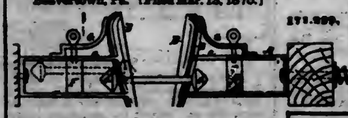
171,990. VEHICLE RUNNING-GEARS. Jacob W. Little, Cedarcoon, Iowa. [Filed Nov. 19, 1875.]

In the running-gear of vehicles, the cross-reaches H H', having raised stops or shoulders *s*, substantially as and for the purpose herein shown and described.

171,991. SPITTOON-MATS. John Lee, San Francisco, Cal. [Filed Oct. 12, 1875.]

A spittoon-mat consisting of a central portion, A, surrounded by a margin or rim, provided with cells, cavities, or depressions *b b*, substantially as and for the purpose described.

171,992. MACHINES FOR MAKING CARPET-LININGS. Willard Lewis, Walpole, Mass. [Filed Sept. 4, 1875.]



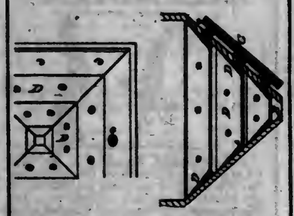
The combination of the pressure-rollers, constructed as described, the heating apparatus, and the cooling-chamber, all arranged as and for the purpose set forth.

171,993. GUARD-DISTRIBUTERS. James T. Horton, Wilcoxen's, S. C. [Filed July 31, 1875.]

Brief.—To the plow-beam is pivoted a forked wheel-shank, in which is journaled a ribbed bearing-wheel, for giving vibratory motion to the seed-trough.

The pivoted wheel-shank M and block K, both constructed as set forth, in combination with the ribbed wheel F, standard B, provided with the tube E, and plow-point I, funnel R, shoe P, hopper C, and lever N, substantially as described, and for the purpose set forth.

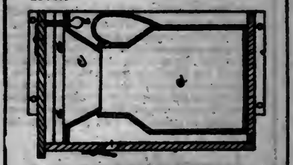
171,994. CAR-COUPLINGS. Jos. W. Klingler, Daniel Bolender, and Samuel H. Shoen, Reevertown, Pa. [Filed Mar. 13, 1875.]



171,994.

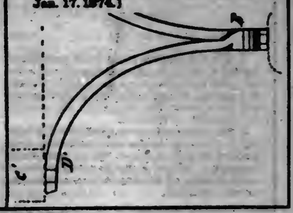
1. In combination with the draw-bar A, provided with the concussion-block F, adapted to receive and hold the coupling-pin, the sheet-metal buffer-head B, made in form described, and secured to the draw-bar, as specified.

2. In combination with the buffer-head B and draw-bar A, the brace G, as specified.



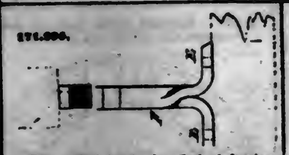
171,995. APPARATUS FOR STORING AND PRESERVING GRAIN. Hans P. C. Lassen, Chicago, Ill. [Filed Nov. 2, 1875.]

Brief.—This bin has the form of a funnel. On one of the sides there are a series of three or more perforations, arranged in a line from the top of the chute to the bottom, through which pipes are inserted for introducing air for cooling and drying the grain.



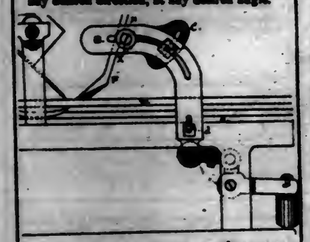
In a bin for storing grain, the combination of the chute B with the slats D, forming air-chambers *a*, pipes *c*, and main pipe C, constructed and arranged substantially as and for the purpose hereinbefore set forth.

171,996. MILK-CAN RECEPTACLES. Hobson Littlefield, Portland, Me. [Filed Dec. 2, 1875.]



In an ordinary letter-box for doors, &c., the combination of the adjustable tunnel-shaped conductor *c*, grooves *d*, set-screw *f*, lid *b*, and can *a*, substantially as and for the purpose herein set forth.

171,997. MANUFACTURE OF SLEIGH-KNEES. W. H. Lloyd, Spring Valley, Minn. [Filed Jan. 17, 1874.]

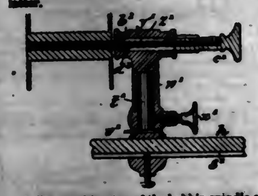


171,890.

The welted herein described of forming wrought-iron sleigh-bases, consisting in first welding together at F the curved wrought metal bars D D', and then bending and twisting the upper ends of the latter while in a heated state, so as to form the horizontal arms E E at right angles to the arms D D', substantially as described.

171,892. ADJUSTABLE PRESSURE-FOOT OF MOLDING-MACHINES. John B. Loomis, Brooklyn, N. Y. [Filed Nov. 2, 1875.]

Brief.—The pressure-foot has slotted shank, pinned to a slotted head-block, which works in slotted curved arms, with slotted braces, to aid the free movement of the pressure-foot in any desired direction, at any desired angle.



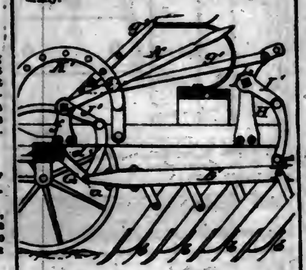
The pressure-foot F, with slotted shank R, operating at different angles upon the screw-pin X, in combination with the slotted transverse head H and arms B, with the supporting-brace C, all arranged and operating in the manner and for the purpose set forth.

171,897. ANTI-INCRUSTATION COMPOUNDS. Lewis N. Lye, Allen County, assignor of one-half his right to Francis J. Lye, Delphos, Ohio. [Filed Nov. 19, 1875.]

A composition, to remove and prevent incrustation and foaming in steam-boilers, compounded of crude coal-oil, concentrated lye, coal-oil, lime-wax, and stearine, substantially as directed, and for the purpose set forth.

171,898. SPRING-MACHINES. H. Marshall, Plattsburgh, N. Y. [Filed Oct. 28, 1875.]

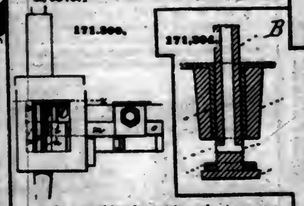
Brief.—By advancing or rounding the screw, and then compressing or relaxing the spring in the first classes of the claim, the friction or drag of the spindle is regulated. The "arm" of the second classes has a die on its inner end, that runs in the grooves of a double-threaded screw, whereby the standard and bobbin are traversed to guide the yarn properly on the bobbin.



1. The combination of the bobbin-spindle d^3, having a collar, F, spiral spring S, and tubular screw C, which serves the twofold purpose of a bearing for one end of the bobbin-spindle and of a means for regulating the tension, substantially as specified.

2. The combined standard and bobbin-bearing f e f', in combination with the fixed grooved shaft b c, arm c', die c^2, and revolving nut C, having a double-reversed thread c^3 c^4 thereon, all substantially as and for the purpose specified.

171,899. GANG-PLOWS. J. R. McCormick, Georgetown, Tex. [Filed Oct. 9, 1875.]



Brief.—A rock shaft, with crank-arms and lever, is attached to the rear end of the plow-beams, and another at the front. On both the plows and their connections may be slid laterally.

1. In a gang-plow, the beams B, pivoted to the rod a, in combination with the bifurcated connections G, adjustable as rod d, links J, adjustable arms J', and lever K, substantially as described.

2. In combination with the front adjusting devices described, the links I, adjustable arms I' on shaft I^2, arm g, connecting-rod g', and adjusting-lever g^2, substantially as specified.

171,900. BOOT AND SHOE NAILING MACHINES. Gordon McKay, Cambridge, and H. P. Fairfield, Boston, Mass. [Filed Nov. 11, 1875.]

1. In a machine for uniting soles to uppers, a stationary cutter and two movable cutters, adapted to serve the nail, and to hold and carry the nail beyond the stationary cutter, substantially as described.

2. The tube-bar of a nailing-machine, a stripper, and a stationary cutter, in combination with two cutters to sever and move a nail past the stationary cutter and hold it, substantially as described.

3. The tube-bar of a nailing-machine and a stationary cutter, in combination with the movable nail severing and holding cutters and the head-cutter, substantially as described.

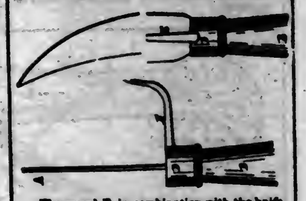
4. The head-cutter, in combination with a cutter adapted to be held in a fixed position during the action of the heading-cutters, and to be then released, substantially as and for the purpose set forth.

171,901. SHOE-FASTENINGS. W. J. McKee, Pittsburg, Pa. [Filed July 28, 1875.]

A shoe-fastening, consisting of the loops c c, attached to the inside of the front quarters of a shoe, and the straps c c, attached to the outside of the boot quarters in a line slightly above the loops, and adapted to operate substantially in the manner and for the purpose specified.

171,902. HALE-TIES. Richardson Mumford, Butler, Ga. [Filed Nov. 27, 1875.]

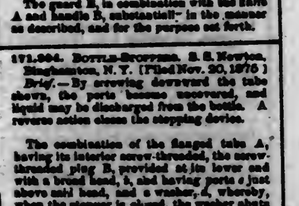
171,902. B



1. The bale-tie buckle A, having hexagon-shaped slot a, and downwardly-bent lips b, having slot C, substantially as specified.

2. In combination with wire binder B the buckle-plate A, having slot a, downwardly-bent ends b, and slots c, substantially as and for the purpose specified.

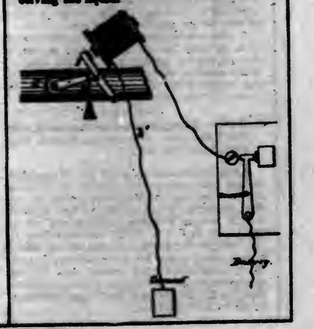
171,903. CORN-STALK KNIVES. Peter C. Moore, La Fayette, Ohio. [Filed Nov. 8, 1875.]



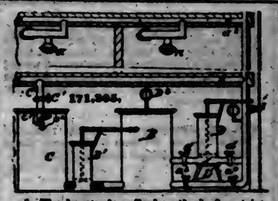
Brief.—A knife for cutting down corn-stalks is provided with a suitable guard, projecting from the former at right angles to the side of the blade, the entrance end curving upward and slightly outward, to protect the hand and assist somewhat in holding the severed corn-stalks together.

The guard B, in combination with the knife A and handle B, substantially as and for the purpose set forth.

171,904. BOTTLE-STOPPERS. S. S. Newton, Binghamton, N. Y. [Filed Nov. 20, 1875.]



Brief.—By screwing downward the tube shown, the parts become unscrewed, and liquid may be discharged from the bottle. A reverse action closes the stopping device.



The combination of the flanged tube A, having its interior screw-threaded, the screw-threaded plug B, provided at its lower end with a bound head, b, and having ports c just above said head, and a washer, d, whereby, when the stopper is closed, the washer abuts against the lower end of the tube and the ports lie within the bore of the tube, substantially as described.

171,905. REINFORCEMENT FOR FIRE-HOSE. S. S. Newton, Binghamton, N. Y. [Filed Sept. 17, 1875.]

Brief.—The pipes are first filled with compressed air; then the water in the supply-reservoir is put under pressure by the air-pump. A fire breaking out, the cutter of the sprinkling-cannula is pushed, the check-valve therein lifts, the air escapes, and water flows through the pipes and floods the room. The thermostat shown is to be placed so as to be readily acted upon by heat. In case of accident, or if desirable to empty the pipes or reservoir, a suitable tank is provided for receiving the liquid.

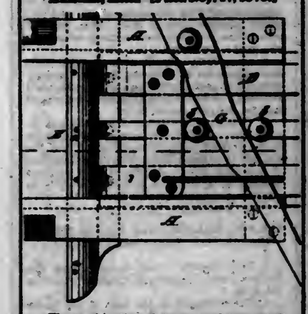
1. The herein-described method of restricting the discharge of water into the distributing-pipes by means of a valve, a^2, which is closed by compressed air, substantially as set forth.

2. The combination, with the distributing-pipes, of a receiving-tank, into which the water within such pipes may be discharged.

3. The combination of the valve a^2, its seat a, stem a', and springs F F', secured to each other to support the valve-stem a', substantially as set forth.

4. In combination with the supply-tank E, the pumps D' and D, and connecting-pipes, for filling the tank with liquid and compressed air, substantially as set forth.

5. In combination with the tank E and pipe A, and the check-valve a^2, the pressure-gage D' D², substantially as set forth.



6. In combination with the distributing-pipes and sprinkler, an electric circuit, or a series of electric circuits, each provided with magnet m, armature, and with a circuit-closer provided with easily-fusible solder, whereby, when such solder is fused, the water shall be discharged through the pipes, substantially as set forth.

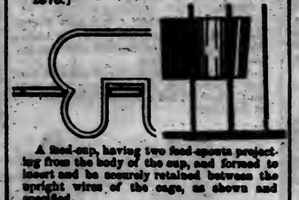
171,906. ENVELOPES. Ernest J. Hollis, Chicago, Ill. [Filed Apr. 27, 1875.]

As a new article of manufacture, the envelope or bag A, having in one side the horizontal opening a, arranged below the upper end thereof, and provided with the eyelets c' c', arranged in its upper end, and with the flap c arranged below the said eyelets and above the said opening, substantially as shown and described, and for the purposes set forth.

171,907. CALICO-STRETCHERS. L. Nelson, Hillsdale, Mich. [Filed Nov. 17, 1875.]

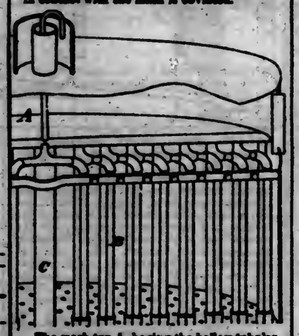
The combination of the grooved frame A B, with points C C, the sliding frame D, with toothed head E, the lever G, and pins b, substantially as and for the purposes herein set forth.

171,908. CALENDARS. Charles S. O'Neill, Boston, Mass. [Filed Nov. 2, 1875.]



171,908.

A paper clasp or suspender made of one piece of metal, having the longitudinal edges of the plate curved toward each other to receive and retain the sheets of paper by the elasticity of the metal, and having the plate partially severed by two slits to form the aperture-tongue O, whereby a means of suspension is provided.

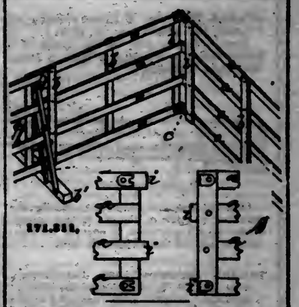


171,909. FUEL-CUPS FOR ROCK-GASES. G. B. Osborn, East Orange, N. J., and R. A. Drayton, New York, N. Y. [Filed Oct. 12, 1875.]

A fuel-cup, having two fuel-spouts projecting from the body of the cup, and formed to insert and be securely retained between the upright wires of the cage, as shown and specified.

171,910. MASH-ATTEMPERATORS. William Peddicord, San Francisco, Cal. [Filed Oct. 9, 1875.]

Brief.—The steam, passing up the central shaft, courses through the tubular rotating rake, and then exhausts in open air. Thus the disadvantage of having the steam come in contact with the mash is obviated.



The mash-tun A, having the hollow tubular tube B, which is arranged to take steam from the upright hollow central shaft C, and exhaust it through the exhaust-pipe f into the open air, substantially as and for the purpose described.

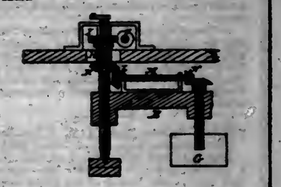
171,911. PORTABLE FENCES. Isaiah W. Pelmount, Libertyville, Iowa. [Filed Aug. 14, 1875.]

Brief.—The rails of the corner panels alternately project beyond their respective end battens, so that the panels, which are hinged together, are prevented from turning beyond a certain extent.

In a portable fence, the corner panels A A', hinged together at a, and having the ends b of battens b, alternately on and panel and on the other, projecting beyond the end battens, and abutting against the short cross-boards of the panels, whereby the panels are prevented from turning with each other a greater angle than a right angle, substantially as specified.

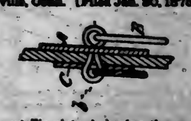
171,912.

171,912. FABRIC BRAIDS. J. W. Partridge, Boston, Mass. [Filed Nov. 9, 1875.]



Brief.—Interposes between the folds of the strands one or more sized strengthening threads or strips.

As a new article of manufacture, the herein-described paper braid, consisting of a series of folded flat strands, each of which being provided within its folds with one or more strengthening threads or strips, substantially as and for the purposes set forth.



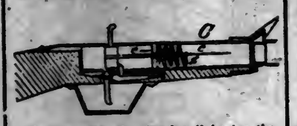
171,913. STEERING-PROPELLERS. Ira T. Payne, Essex, Conn. [Filed Aug. 16, 1875.]

Brief.—The paddles are fastened by a train of gearing leading from a collar on the central shaft. The paddles revolve around their own centers, as well as around the central shaft.

The devices K L M N O in combination with the revolving arm E and the steering devices H I J, for altering the position of the wheel K, substantially as and for the purpose herein described.

171,914. CLASPS. Joshua Purkiss, Danielsonville, Conn. [Filed Jan. 20, 1875.]

The metallic plate A, having the eyes a b in front and rear, in combination with the ring E, washer C, and the split ring E, substantially as described, and for the purpose set forth.

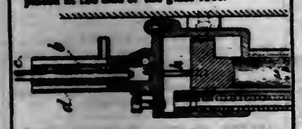


171,915. COMBS FOR BOTTLING BEER AND SIMILAR LIQUORS. Charles Pfannenstiel, Memphis, Tenn. [Filed Oct. 27, 1875.]

Brief.—The cork is saturated with oil to render it elastic. Corks so treated fit in closed ears to forced into the bottles filled to the top without bursting them.

As a new article of manufacture, a cork saturated with olive or other sweet oil, in order to render it sufficiently elastic to be forced in the neck of the bottle and the beer or other similar liquids, substantially as and for the purpose described.

171,816. TOY GUNS. C. Albert Pilinsky, St. Louis, Mo. (Filed Aug. 30, 1875.)



Brief.—The weapon, by the thrust of a spring-needle, is arranged to ignite a fulminate wafer or missile.

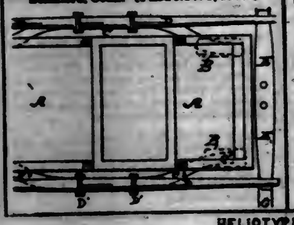
In a toy gun, the chamber C, having the partition c, needle c, plunger A, and spring-detent E, all combined to operate substantially as and for the purpose set forth.

171,817. PRESSURE-GAUGE. John Powers, New York, N. Y. (Filed Mar. 20, 1875.)

Brief.—A pressure-gage consisting of the small plunger, moving upward or downward in the chamber by the action of the pressure of steam against the end in the steam-chamber. The other end acts against a cross-bar, which carries two rods, leading down to another plunger which is floated in mercury or other liquid, in a lower chamber. The action of the plunger, rising and falling, causes the liquid to do the same, thus indicating the pressure, which is noted on a graduated scale placed at the side of the glass tube.

1. The combination, in a pressure-gage, of a direct-acting weight and a column of mercury, that contains the same at the zero or point of no pressure, with a sliding plunger, cross-head, and rings connected to said weight, and acting to lift the same out of the mercury as the pressure increases, substantially as set forth.

2. The plunger c, sliding in the guides 2 and 3 of the cylinder b, to which the pressure is admitted by the cock a, in combination with the cross-head i, sling-rods k, and weight f, which is progressively counterpoised by a hydrostatic column as it descends, substantially as set forth.



171,818. PAVING-BLOCKS. W. F. Preston, Northampton, Mass. (Filed June 7, 1875.)

Brief.—An iron paving-block consisting of a top bearing-surface with four legs—one at each corner—the interior of the frame being filled with a concrete filling, which is secured thereto by a central bolt having a nut on the lower end.

A paving-block formed of the metallic frame B, constructed and united, substantially as described, to the filling D.

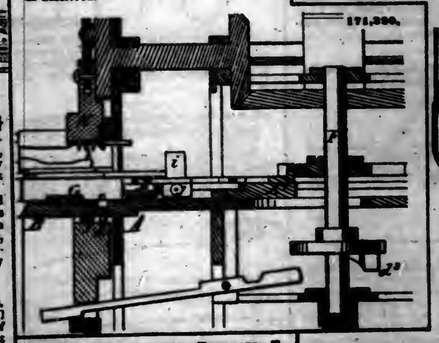
171,819. VEHICLE-SPRINGS. M. Provost, Stamford, Conn. (Filed Nov. 6, 1875.)

1. The springs C, having the straight part C^2 and the end C^3 curved sidewise under the body A, substantially as and for the purpose described.

2. The combination, with the box or body A and the thorough-braces D, of the springs C, having the straight part C^2 and the end C^3 curved sidewise under the body A, constructed substantially as described.

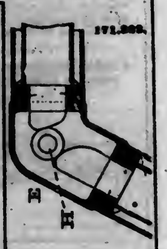
3. The combination, with the box or body A, thorough-braces D, and springs C, having the straight part C^2 and the end C^3 curved sidewise under the body A, of the semi-elliptic springs E, constructed and operating substantially as shown and described.

171,820. HORSESHOE-MACHINES. David I. Prosser, McVeytown, Pa. (Filed Nov. 6, 1875.)



Brief.—The jaws advance upon guides curved to give a dip to the creasers, which are attached to said jaws projecting from the inner sides thereof. The blank severed from the rod is fed up in a channel, from which it is freed at the proper time by lifters.

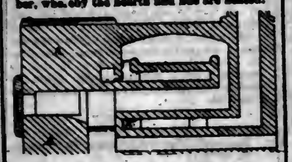
1. The creasers f and jaws E, combined with the curved guides h and means, substantially as described, for bending the shoe-rods about a former.



2. The guide-channel c and gage c', combined with the shear O, lifters d d, and devices for bending the shoe-rods about a former, substantially as described.

3. The follower H, having punches K fixed into its lower end, in combination with creasers f, benders e, and a former, G, substantially as described.

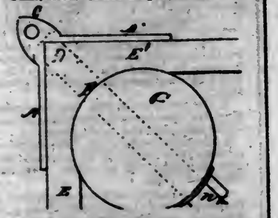
171,821. HORSE-POWERS. Friedrich Schmemann, Philadelphia, Pa. (Filed Nov. 6, 1875.)



171,822.

171,823. METALLURGICAL FURNACES. R. Savage, West Meriden, Conn. (Filed Sept. 13, 1875.)

Brief.—A flue extends from the first combustion-chamber through the second combustion-chamber to the smelting-chamber. A second air-flue passes through the walls of the furnace, and opens, by perforations, into the second combustion-chamber below the hearth of the smelting-chamber. The products of combustion which pass to the smelting-chamber are principally carbonic oxide, and are fully burned in the second combustion-chamber, whereby the hearth and flue are heated.



1. The combination, substantially as hereinbefore set forth, of the flue for conducting the heated gases from the first combustion-chamber to the smelting-chamber, and the second combustion-chamber for heating said flue.

2. The combination, substantially as hereinbefore set forth, of the flue for conducting the heated gases from the first combustion-chamber into the smelting-chamber, and the second combustion-chamber for heating said flue with a flue for admitting air into said second combustion-chamber.

3. The combination, substantially as hereinbefore set forth, of the flue for conducting the heated gases from the first combustion-chamber into the smelting-chamber, and the second combustion-chamber for heating said flue with a flue for admitting air into said second combustion-chamber.

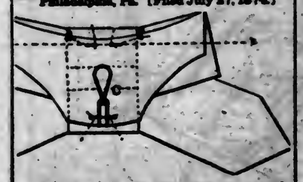
171,825. DEVICES FOR FASTENING THE LEGS OF A TABLE. William K. Sawyer, Three Oaks, Mich. (Filed Aug. 6, 1875.)

The combination of the clamp-plate A A', having shelf D and perforated leg C, the rails E E', leg C, and bolt F, having nut a, as described, and for the purpose set forth.

171,826. INDIA TRUSS-BANDAGE. Friedrich Schmemann, Philadelphia, Pa. (Filed Nov. 6, 1875.)

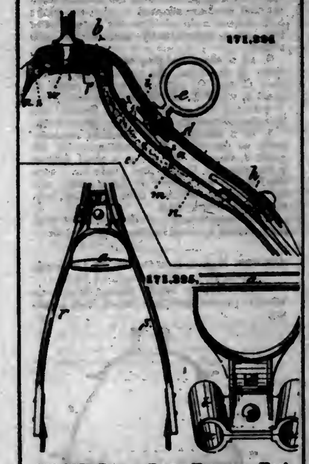
171,827. DRAG-RAKE HANDLES. Hugh Smith and Walter Galbraith, Pennsgrove, N. J. (Filed Apr. 6, 1875.)

Brief.—The handle of the rake is made of two distinct rods, which are united at the tail-end, the branches entering the head by means of bolts or otherwise. A sliding clamp, having a supplemental handle, is affixed to the rods at a convenient position, and is secured by a bolt and nut.



1. The adjustable clamp and handle, in combination with the limbs r r of the rake, as and for the purposes set forth.

171,828. CORNER-JOINTS FOR BOXES. Geo. G. Stearns, Chelmsford, Ohio. (Filed May 11, 1875.)

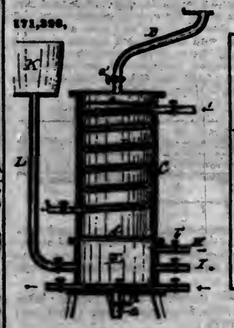


A corner-joint for boxes and drawers, consisting of pieces a b with beveled ends c, fines d f, and dovetail tongue and groove, all substantially as described.

171,829. NECK-TIES. George G. Strother, Philadelphia, Pa. (Filed July 27, 1874.)

A neck-tie formed of straps or scraps of textile material, united and secured to each other, and to the supporting shield at two points only—that is to say, top and bottom—by means of a single metallic clasp at each point, and common to the fabric and shield, substantially as and for the purpose described.

4. The bearing for the harness-pad made of leather stiffened by a metal plate, over the edges of which the leather is drawn, and between which plate and the leather is a layer of card-board or similar material, substantially as set forth.



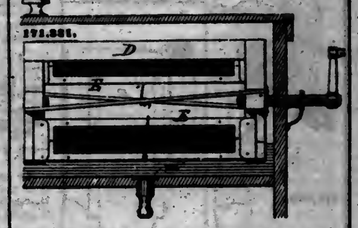
171,824.

171,825.

171,830. APPARATUS FOR TREATING TALLOW, OILS, &c. Jules Tardos, Jr., New Orleans, La. (Filed Nov. 6, 1875.)

Brief.—Material to be filtered flows from an elevated tank into a filtering-vessel containing charcoal or bone-black, which is heated by a steam-pipe. As the material to be filtered flows through the bone-black it falls into a tank, which is heated by a steam-pipe, to maintain the tallow in a fluid state, until ready for discharge. An elevated water-tank and pipe, entering at the bottom of the filter, serve to cleanse it when the process is over.

171,830.



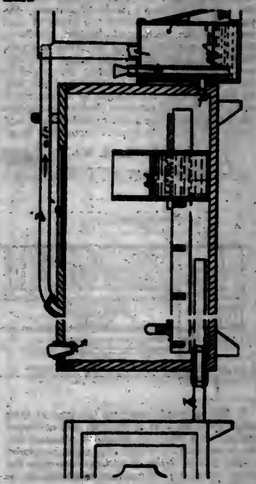
1. The filtering-vessel C, provided with strainers a b, and filled with charcoal or bone-dust between said strainers, the charcoal or bone-dust having passed through its mass the steam-pipe or worm D, to heat the same, substantially as described, as and for the purpose specified.

2. The combination, with the filtering-vessel C, of a reservoir, A, and pipe E, and of a receiving-tank, B, the latter provided with a steam-pipe or worm, F, direct steam-pipe I, air-exit pipe H, and discharge-pipe G, as described, and for the purpose specified.

3. The combination of the filtering-vessel C, receiving-tank B, steam-pipe I, worm F, supply-tank K, pipe L, and exit-pipe M, the whole arranged to operate substantially as described.

171,831. CHURNS. James Watson, Port Colborne, Canada. (Filed May 11, 1875.)

Brief.—A horizontal dasher having cross-arms at each end, each pair carrying, near the outer end, a horizontal dash-board. Intermediate between these dash-boards are set others of reticulated material, which may be drawn from the dasher, and the whole dasher, by drawing out the journals, may be withdrawn from the barrel.



171,831.

In a churn, the attachable and detachable wire sieves or perforated plates, in combination with a dasher, D, operating substantially as herein described.

171,832. APPARATUS FOR PRESERVING CORPSES AND OTHER ORGANIC MATTER FROM DECOMPOSITION. James Whelan, Zanesville, Ohio. (Filed June 5, 1875.)

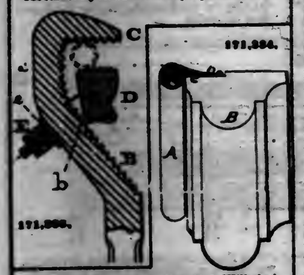
Brief.—Generates chlorine gas, washes it by passing through water, dries it by passing it over sulphuric acid, and admits it into a holder containing quicklime. Light may be admitted to holder to actinize the gas. From holder gas is admitted under natural or artificial pressure to the casket, where it is retained, displaced air passing through upper pipe. To empty casket of chlorine gas, open vent in top, and the communication with atomized ammonia-vessel, when the ammoniacal vapors carry the gas to the air outside of the apartment.

A gas-receptacle for the preservation of organic substances, provided with a glass-covered opening, in combination with an apparatus for manufacturing chlorine connected with said receptacle, and an apparatus for carrying off the gases contained in the latter, substantially as described, and for the purpose set forth.

171,833. PORTABLE FENCES. Horace Tell, Bristol, Md. (Filed Oct. 18, 1875.)

The combination, with the panels A A, made to collapse, and provided with a vertical brace at each end, of the cross-braces, framed together as shown and described, and passed between and binding on the top and second bars of the panels, for the purpose specified.

171,834. WATER-ELEVATORS. Leslie H. Thompson, Cedar Rock, Neb. (Filed Apr. 24, 1875.)



Brief.—A chain-bucket having the form of the segment of a circle, and provided at one of its corners with a discharge-tube, in combination with a chute and an open side guide.

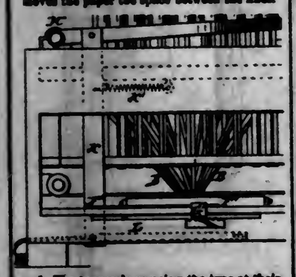
171,883. FUR-WRINGER. J. A. White, Dorlon's Mills, Pa., assignor of one-half his right to S. B. Dorlon, same place. [Filed Aug. 26, 1875.]

Brief.—A diagonal corrated stock with fixed jaw and a movable jaw, provided with an engaging-tooth, said movable jaw being pivoted to a spring-yoke embracing the stock.

The diagonal corrated stock B, with fixed jaw C, and the adjustable jaw D, having the teeth a, in combination with the yoke E, pivoted to the adjustable jaw, and carrying the plate c and pin d, and the spring e, interposed between said plate and the back of the yoke, substantially as and for the purpose set forth.

171,884.

171,885.



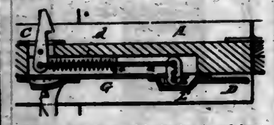
171,884. WEATHER-STRIP. C. A. Wilhelmi, Boston, Mass. [Filed Dec. 2, 1875.]

1. A weather-strip, having its elastic strip A attached by one edge, c, to the edge of the molding-strip B, and by the other edge, b, to the inner side of the said molding-strip, substantially as and for the purpose herein specified.

2. A weather-strip, having its elastic strip A attached to the molding-strip B, as described, and one edge, c, thereof projecting beyond the edge of the molding-strip, substantially as and for the purpose specified.

171,885. TYPE-WRITING MACHINE. Robt. T. P. Allen, Portsdale, Ky. [Filed Aug. 14, 1875.]

Brief.—The radiating type-rods are provided with offsets, so that as they approach the paper they move in vertical lines. Depressing a key to operate the typered also depresses the perforated hinged platform, which is connected to the ball-crank carrying the double pawl, which acts on the rack-bar, and allows the table carrying the paper to move one notch at each depression of the key. As the carriage is returned to commence a new line, the arm attached thereto operates a ratchet-wheel on the paper-cylinder shaft, and moves the paper the space between the lines.



1. The type-rods carrying the type at their lower ends, bent as described, and arranged radially and obliquely around a common center, in supports in which they slide, in combination with a series of vertical key-rods, the whole arranged to operate substantially as and for the purposes set forth.

2. The combination, as hereinbefore described, of the central type-key mounted on the rod F, the sliding plate G, rock-shaft H, levers K and M, rocker P, and spring R, attached to the traveling carriage O, for the purpose of shifting said carriage and moving the paper.

3. In combination with the movable carriage, as herein described, the rollers U V, the latter arranged to slide on a rectangular shaft, W, the toothed wheel mounted on said shaft, and the finger D', arranged on and moving with the sliding frame, for engaging with the wheel A' and cord S, attached to the traveling carriage, the whole arranged to operate substantially as and for the purposes set forth.

171,886. SHUTTER-FASTENING. J. Arnold, Newark, N. J. [Filed Nov. 20, 1875.]

Brief.—A recessed spring-controlled rod, connecting at one end with the outside catch, and at the other by means of a plate or connecting-link with an L-shaped handle, serves to disengage the catch from inside the room, the right-angular movement of the handle permitting it to be used either to push or pull in opening or closing the shutter.

The combination, with shutter A and bent C, of the rod a, spring d, plate b, and handle D, together with the box E and covering-plate G, all as and for the purposes herein set forth.

171,887. CHECKOUT-SAW HANDLES. Elias C. Atkins, Indianapolis, Ind. [Filed June 30, 1875.]

Brief.—A detachable tang or shank, for ornament or rip saws, is formed with two slotted or forked projections, for the insertion of the inner upper corner of the blade of the saw, and provided with two separate handles, for the purpose of operating the saw by either handle alone, or by using both at the same time.

The detachable tang or shank B, furnished with handles D D, and arranged in connection with a saw-blade, substantially as and for the purposes set forth.

171,888. MACHINERY FOR HEDGING SHINGLES. James B. Austin, Ionia, Mich., assignor to the Ionia Shingle-Machine Manufacturing Company, same place. [Filed Aug. 4, 1875.]

Brief.—Shingles of various widths can be trimmed so that their sides will be parallel at right angles with their lower edges, and both sides of the shingle will be edged and planed from the under side of the table by means of a stationary circular saw and a laterally-adjustable circular saw, both of which are mounted upon the same arbor, and provided with planing-cutters formed in their plates, in connection with suitable feeding mechanism.

1. In a shingle-edging machine, substantially as described, the combination of a stationary circular saw and a laterally-adjustable circular saw mounted upon the same arbor, each of the said saws having plane-cutters formed in the plate, set inwardly toward the other saw and beveled from the outside, when the said saws are adapted to edge and plane both sides of a shingle from the under side of the table, substantially as described and shown.

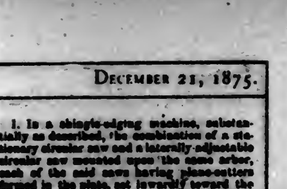
2. In a shingle-edging machine, substantially as described, the combination of the slide O, arm O', sleeve P, rod Q, pedal R, shaft S, sector T, arm U, and connecting-rod V with the feed-roll for carrying forward the shingles, substantially as shown and set forth.

3. In a shingle-edging machine, substantially as described, the combination of the guide d, sleeve b, bar c, arm e, shaft f, lever g, bell-crank i, link h, and guide-bar j with the frame A and shaves of the movable saw for adjusting the latter upon its arbor, substantially as described.

4. The combination of the pointer F with the bar-slide i, as and for the purposes set forth.

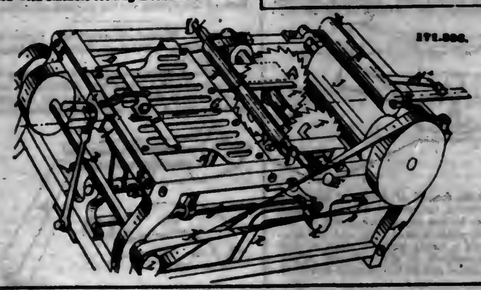
171,889. MACHINERY' OILERS. O. J. Backus, Newark, N. J. [Filed Sept. 27, 1875.]

Brief.—Rubber bands resting in grooves serve to protect the glass vessel from breaking.



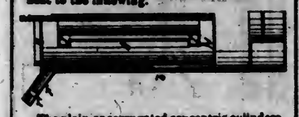
1. In combination with an oiler for sewing-machines and other purposes, constructed as herein described, the rubber bands a, for the purposes set forth.

2. The herein-described oiler, consisting of the transparent body A, provided with the rubber bands a, spring-bottom C, and needle B, the several parts being arranged substantially as and for the purposes set forth.



171,890. WAGON-BRAKES. Owen T. Baker, Wamego, Kans., assignor of one-half his right to Oscar M. Gay, same place. [Filed May 19, 1875.]

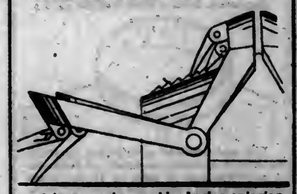
Brief.—On going down hill backward the wheel is locked by the lever end of the brake-block.



The combination, with the pivoted brake-beam C C, of the shaft or rod b with lever D and arm d, and the links e e, connecting the arm and lever directly to the top of the shoes, substantially as and for the purposes herein set forth.

171,891.

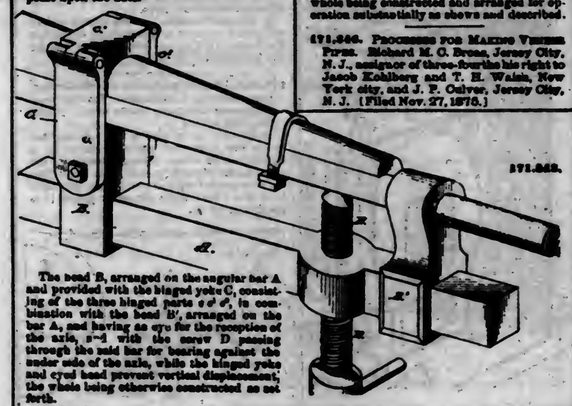
171,841. APPARATUS FOR ADDING LIQUORS. John B. Bauz, Oakland, assignor to James M. Curtis, San Francisco, Cal. [Filed Oct. 30, 1875.]



Brief.—The flue passing centrally of the boiler, and the flues surrounding the boiler, admit of regulating the direction of the products of combustion and heating the liquid uniformly. The inflowing and outflowing wines pass through an exterior chamber in such a manner that the outgoing wine gives up its heat to the inflowing.

The plain or corrugated concentric cylinders g h, with their reservoir I I, in combination with the heater A, with its centrally-arranged stack D, side flues F F, and pipes K l, all combined and arranged as and for the purpose above described.

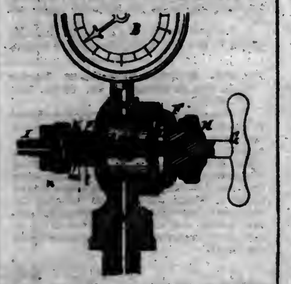
171,842. BROOM-SEWING MACHINES. Henry Behrea, Columbus, Ohio. [Filed June 6, 1875.]



Brief.—The several pairs of jaws that grasp the broom are arranged over each other, and are held against the broom by saws, which take into ratchets in the rear.

A broom-sewing machine having swinging jaws provided with pivoted parts of different lengths, and rack-plates at both sides of the rear end, hereof, for securing the jaws in position for sewing the seams of the broom, substantially as specified.

171,843. APPARATUS FOR SETTING METAL AXLES. Frederick Bee, Washington, D. C. [Filed Sept. 18, 1875.]

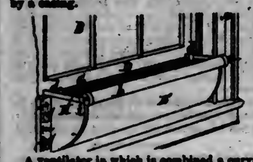


Brief.—Metallic axles that have become bent can be set by means of a metal bar of suitable form, provided at one end with a longitudinally-adjustable yoke formed of three hinged parts, and at the other with a longitudinally-adjustable head, having an opening in its upper part to receive the end of the axle, and a screw operating through a threaded part of the bar between the yoke and the head, and which can be brought to bear at any desired point upon the axle.

The bend B, arranged on the angular bar A and provided with the hinged yoke C, consisting of the three hinged parts c c' c², in combination with the head B', arranged on the bar A, and having an eye for the reception of the axle, a-2 with the screw D passing through the said bar for bearing against the under side of the axle, while the hinged yoke and cross head prevent vertical displacement, the whole being otherwise constructed as set forth.

171,844. STOP-COCKS. J. G. L. Scottcher, Brooklyn, N. Y. [Filed Nov. 27, 1875.]

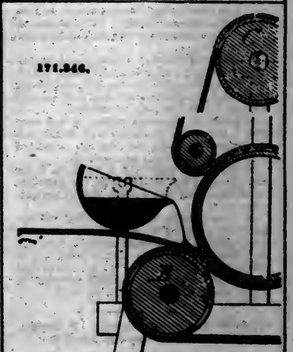
Brief.—The concave plate over the flexible valve is prevented from turning by having recesses formed in it, which engage with projections in the cap. In the discharge spout is placed a pressure-relieving valve, which can be regulated according to the pressure in the supply reservoir, and thus avoid undue pressure on the pipe connected with said spout.



1. The combination of the valve C, the flexible washer E, confined between the cap F and the valve-chamber A, the supporting guide-plate D, having the screw-shank f and recesses g', fitting over ribs h in the cap F, and the handle G, having a screw-socket fitting over the screw-shank of the guide-plate D, all substantially as shown and described.

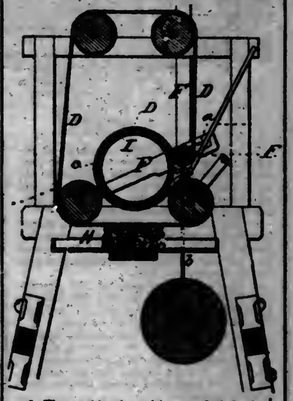
2. The valve-chamber A, provided with the passages a and b, and cylindrical extension l, in combination with the pressure-relieving valve m, arranged in said cylindrical extension of the valve-chamber, the valve C, its operating devices, and a pressure-gage, B, substantially as and for the purpose described.

171,845. VENTILATORS. Thos. W. Bracher, New York, N. Y. [Filed Sept. 20, 1875.]



Brief.—A window-ventilator having a top screen, which may be partially or entirely covered by a curtain, whose roller is hidden by a casing.

A ventilator in which is combined a curved deflector, E, a perforated plate, G, extending across the upper part of the deflector, a curtain, H, a casing, J, and a roller, I, arranged in said casing, and having finger-piece i, the whole being constructed and arranged for operation substantially as shown and described.



171,846. PROCESSES FOR MAKING VENEER PIPES. Richard M. C. Breen, Jersey City, N. J., assignor of three-fourths his right to Jacob Kohlberg and T. H. Walsh, New York city, and J. P. Culver, Jersey City, N. J. [Filed Nov. 27, 1875.]

171,846.

The described improvement in the art of making tubes or pipes, consisting in applying the liquid asphaltum to the blank or form at the point of contact between the form and the mandrel while the former is being wound upon the mandrel.

171,847. MACHINES AND PROCESSES FOR MAKING VENEER PIPES. Richard M. C. Breen, Jersey City, N. J., assignor of three-fourths his right to Jacob Kohlberg and T. H. Walsh, New York city, and J. P. Culver, Jersey City, N. J. [Filed Nov. 27, 1875.]

1. The combination, with a mandrel, I, of an endless belt, D, nearly surrounding said mandrel, substantially as and for the purpose set forth.

2. In combination with a mandrel, I, the endless belt D, nearly surrounding the said mandrel and passing over bearing-rollers E, and a guide or guide-roller, C, substantially as specified.

3. In combination with the spaced bearing-rollers E, and a guide roller or rollers, C, the detached mandrel I, and the single endless belt D passing over the said rollers and nearly inclosing the said mandrel, substantially as specified.

4. In combination with a mandrel, I, bearing-rollers E, a guide roller or rollers, C, and an endless belt, D, the automatically-adjustable tension-roller R, for taking up automatically the slack of the belt and allowing the blank to be wound about the mandrel, and at the same time continuing an equal pressure, substantially as specified.

5. In combination with a mandrel, I, the detachable textile covering *s* adapted to be wound around the said mandrel, substantially as specified.

6. In combination with the detached antifrictional mandrel I, the lateral guides F, for holding the same against endwise displacement, substantially as specified.

7. In a machine for forming veneer and asphalt pipe, the combination, with the operating-bolt D, of a scraper-bar, K, substantially as specified.

8. The combination, with the bolt D, operating the forming and bearing rollers, of a pipe-forming machine, the water-pan H, and sponge material I, placed beneath the said bolt for wetting it, substantially as specified.

9. In combination with rollers B C, a mandrel, I, and a loosely-applied belt, D, the tension-roller E, having its bearings in slotted guides F, substantially as specified.

10. In combination with a mandrel, I, for rolling veneer and asphalt pipe, the flame-jets *f f*, substantially as specified, and for the purpose set forth.

11. The process herein described of constructing pipe, by winding, by means of a damp endless belt, a blank around a mandrel, first covered with a wet textile band, to prevent adhesion, and drying the surface of said blank, and heating the asphalt covering by jets of flame, substantially as set forth.

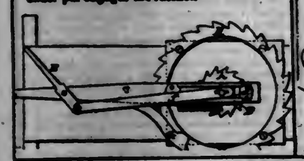
171,845. CARRIAGE-WHEELS. E. Brown, Greenville, Pa. [Filed Oct. 26, 1875.]

1. In combination with the axle A, threaded at its forward end, the open-ended ferrule B, provided with an interior screw-thread, the ferrule extending beyond the end of the axle to form an oil-receptacle, and being adjustably secured to the axle, substantially as and for the purpose set forth.

171,846.

2. In combination with the ferrule B, secured to the axle, the box D, open at both ends, and adapted to receive screw-nuts O P, to secure the box in place upon the ferrule and afford access to the oil-receptacle, substantially as hereinbefore set forth.

3. The box D, provided with the screw-threads A, in combination with two screw-ring flanges, P I, screwed up against the spokes from opposite directions, substantially as and for the purposes set forth.

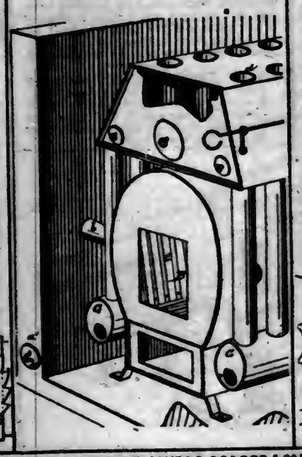


4. The ferrule B, constructed with a receptacle, B B', in combination with the disk-nut F, having a central screw-plug, G, substantially as and for the purposes set forth.

5. In combination with the ferrule B, having its rear end formed, as described, with an annular bridge, *d*, the nut C, constructed, as described, with its flanged forward end, to prevent the passage of oil and dirt, as hereinbefore set forth.

6. In combination with the ferrule and nut C, constructed as described, the spool-groove *a b* on the spindle or axle A, as and for the purposes hereinbefore set forth.

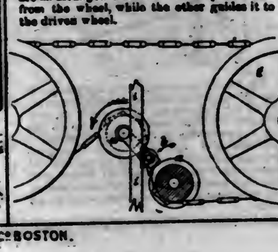
171,849. COTTON AND OTHER PRESSES. H. E. Barnard, Poughkeepsie, N. Y. [Filed Nov. 16, 1875.]



Brief.—On the top of a vertical winding-drum is a circular ratchet, outside of which, and concentric therewith, is another, operated by a pawl on the sweep, which latter lies on both, and has a slot in its end, through which passes loosely the drum-shaft. A connecting-rod connected to the chain, and to a hand-lever pivoted on the sweep, adapts the latter to be locked to the ratchet by sliding it endwise under pin engages the ratchet.

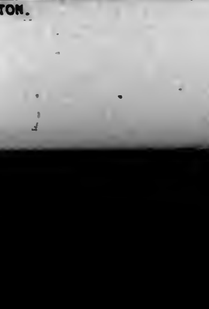
1. The combination, with the spring-casted abutting contact-arms C and the insulated plate F, of the sections of wire B, connecting alternately the arms upon opposite sides of the trunk, and the insulated plates G G' electrically connected with the opposite poles of the instrument upon the car, substantially as described.

2. The combination of the spring E, the insulated bent arms C, and the insulated metallic plate F, as and for the purpose described.



171,851. HOT-AIR FURNACES. Chas. Clark, Minneapolis, Minn. [Filed Oct. 22, 1875.]

1. In a hot-air furnace, the fire-box B, provided with the horizontal semi-cylindrical perforated air-chambers *c c*, in combination with the grate-lining C and air-pipes *b b*, substantially as and for the purposes set forth.



2. The fire-box B, provided with the semi-cylindrical perforated air-chambers *c c*, grate-lining C, and air-pipes *b b*, in combination with the radiator D, provided with vertical flues *d d*, the diaphragm E, provided with the damper *e*, and the flues *f f*, horizontal drums G, and tubes H H, all constructed to operate substantially as and for the purposes set forth.

171,852. SHAVE-FRAMES. Henry Converse, Sandusky, Ohio. [Filed Aug. 28, 1875.]

As a new article of manufacture, the shirt-band front consisting, essentially, of the bosom A and neck-band B, made to fit the breast and neck of the wearer, and permanently connected together, said front being otherwise constructed and arranged to be combined, incorporated with and form part of a complete shirt, substantially as described and shown, and for the purpose specified.

171,853. WRENCH-NUTS. James Conway, Baltimore, Md. [Filed Dec. 8, 1875.]

1. The wrench-nut having the external configuration of a nut, and formed with an oblong tapering opening, one or both sides of which are serrated or equivalently formed, substantially as set forth.

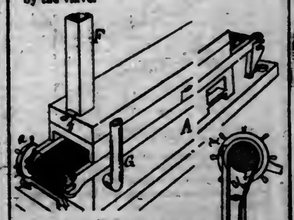
2. The combination, with the wrench-nut, of soft-metal washers or projections, applied to the faces of the nut, substantially as and for the purposes set forth.

171,854. BELT-TIGHTENERS. Orville Cooley, Brockport, N. Y., assignor to the Johnston Harvester Company, same place. [Filed Mar. 29, 1875.]

Brief.—The lower part of the belt runs between two connected rollers actuated by a spring, one of which passes downward; the other passes upward upon it. The two rollers are so arranged that one will strip the chain from the wheel, while the other guides it to the driven wheel.

1. The combination of two connected and pivoted pulleys, with a belt or chain passing between them and pressed in opposite directions by them, and a spring for applying the pressure to said pulleys, in the manner herein shown, for the purposes specified.

2. The combination of two connected and pivoted pulleys, with a belt or chain passing between them and pressed in opposite directions by them, and an adjustable spring for applying the pressure to said pulleys, substantially as described, for the purposes set forth.



3. The combination of the support *a b*, the forked arm *b b'*, and the pulleys *c c*, with the torsional spring *d*, in the manner and for the purposes substantially as shown and described.

4. The notched ring *e*, combined with the support *c b*, the spring *d*, and the pulleys *a c*, mounted on the arm *b b'*, substantially as described, for the purposes specified.

5. The combination of a pulley, *c*, arranged to strip the chain from the driving-wheel, a second pulley, *c*, arranged to raise the chain and guide it to the driven wheel, with a chain passing between the pulleys, and a spring, or its equivalent, for applying the pressure and taking up the slack of the chain, substantially as and for the purposes set forth.

171,855. DRYER. Isaac H. Cottrell, Bridgeville, Del. [Filed Aug. 7, 1875.]

Brief.—The supply of cold air is regulated by the valve.

1. The furnace A, covered with cone or its equivalent, bed B, covers C D E, E being provided with the vapor-chimney F and valve *f*, substantially as described, and for the purposes set forth.

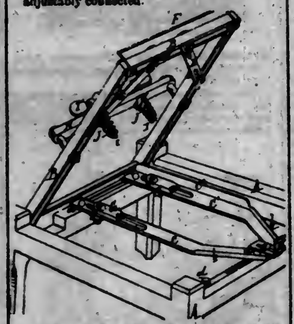
2. The valve *g*, in combination with the drums *a a* and the endless apron.

171,856. HEAD-BLOCKS. Henry C. Cushman and George T. Cockburn, Logansport, Ind. [Filed Sept. 25, 1875.]

1. The head-rest fastenings, consisting of the hooks E E', straps *h h*, and buckle K, or equivalent fastening, constructed and designed to operate as specified.

2. The upper hook E, having the sleeve or bearing D, and spring-pin *a* for the guide-arm and adjustment of the rest-bar, substantially as specified.

3. The adjustable socket L, adapted to be secured to the strap for the reception of the foot of the rest-bar, substantially as specified.

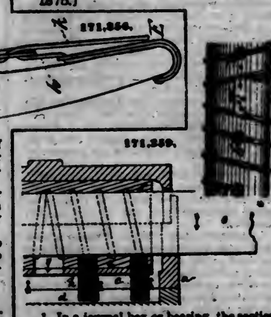


171,857. PROCESSES FOR PREPARING VEGETABLE FIBER FOR UPHOLSTERING. James S. Cutter, Brooklyn, N. Y., assignor to J. M. Davis, Plainfield, N. J. [Filed Sept. 2, 1875.]

As an improvement in the preparation of palmetto or other vegetable fiber, for the purposes set forth, the process herein described, consisting of the dampening of the fiber, the passage of it in this condition through a stripping or picking machine, and, finally its passage through heated or cold fluted rollers, substantially in the manner and for the purpose specified.

171,858. MACHINES FOR TRIMMING AND PUNCHING ROOFING-SLATES. E. R. Davis, Detroit, Mich. [Filed Oct 19, 1875.]

Brief.—The main frame carries a hinged frame, to which the punches and cutters are adjustably connected.



1. In a machine for cutting and punching roofing-slates the combination of the adjustable cutters and punches secured to a single hinged frame, substantially as described and shown.

2. In a machine for cutting and punching roofing-slates the combination of the frame A, carrying adjustable bearers and punch-holes, with the hinged frame B, carrying adjustable cutters and punches, and adapted to be operated by hand, in the manner substantially as described and shown.

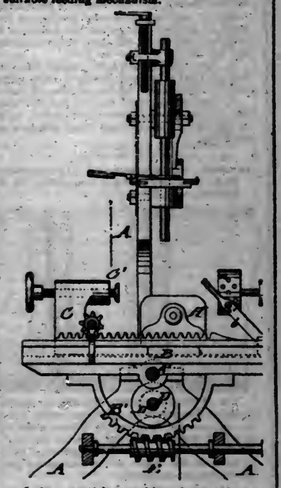
3. In a machine for cutting and punching roofing-slates the combination of the frame A, carrying the adjustable bearers C C', adjustable guide D, and adjustable anvils G of the hinged frame B, carrying the adjustable cutters E, adjustable punches I, springs J, and handle F, all substantially as described and shown.

171,859. BEARINGS FOR JOURNALS. George Draper, Hopedale, Mass. [Filed Oct. 23, 1875.]

171,860.

1. In a journal box or bearing, the sections *e f*, provided with oil-supplying and delivery openings, and with groove or spiral passages adapted to carry the oil from the supplying-openings toward the center of the bearing and to the delivery-opening, and with diagonal grooves, substantially as described.

2. In a journal-bearing, the grooves *j k* and intersecting diagonal grooves *x*, to carry the oil from the ends of the bearing into the grooves *j k*, substantially as described.



3. The combination, with a bearing, of friction to conduct oil or other lubricant to the inner side of the bearing, substantially as described.

4. The combination, with the bearing, grooved sections, and oil-chamber, of the tubes and bristles connecting the grooves and oil-chamber, and adapted to conduct oil to the grooves, substantially as described.

5. In a journal-bearing, the sections *e f*, provided with spiral grooves intersecting at *n*, and with an outlet, I, and an enlarged space, *m*, to allow the oil carried to the center of the bearing to pass to the oil-chamber, substantially as described.

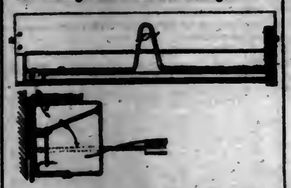
171,860. MORTISING-MACHINES. Simeon Duck, Victoria, British Columbia, assignor to himself and Joshua Davies, same place. Filed Sept. 4, 1875.]

Brief.—Square and angular mortises, of any desired inclination, can be cut by means of a tilting and movable bed, adjustable on a rock-shaft in longitudinal direction by a segmental cog cylinder and worm-shaft, and adjustable laterally by a screw shaft arranged below and transverse to the worm-shaft, and provided with a spool that engages with an interior projection on the bottom of the bed, and a vertically-operating tool, in connection with suitable feeding mechanism.

1. In a mortising-machine, the combination of a tilting bed-frame, having segmental cog-cylinder, with a worm-shaft for adjusting the bed in longitudinal direction to any inclination, substantially in the manner and for the purpose set forth.

2. The combination, in a mortising-machine, of the tilting and laterally-movable bed-frame or table B, longitudinally-adjustable frame C, fixed shaft A', screw-shaft D, collar D', cog-cylinder B', and worm-shaft E, as and for the purpose set forth.

171,861. SNAP-HOOKS. Chas. Dudley, New Haven, Conn., assignor to O. B. North & Co., same place. [Filed Nov. 23, 1875.]

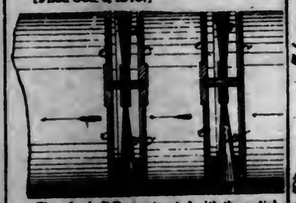


1. The combination, in a snap-hook, of the two parts D E, pivoted together, one forming a hook, the other an opposing surface, the one inclined inward upon its outer surface toward the other; one of the parts constructed with a loop or other means of attachment, and combined with a spring operating to close the two parts together, substantially as described.

2. In a snap-hook, the two sides O D, forming the U-shaped mouth, one of the sides open in the plane of the body, combined with a second part pivoted to the first within the said open side, and so as to lie against the other as the opposing surface, the said second part curved inward toward the pivot to form a hook shape, substantially as described.

171,865. FLY-TRAPS. T. C. Dunn, Fremont City, Iowa. [Filed Nov. 12, 1875.]

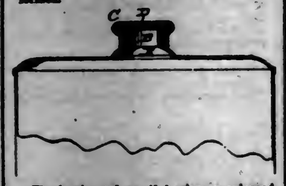
Brief.—An implement for catching flies resting on ceilings and walls, having a sliding spring-door, which is held open by an elbow-lever coming in contact with the wall, over which the brush is swept, dislodging the flies, and causing them to fall into the cage.



1. A fly-trap made of a box or receptacle, pivoted to the arms of a handle, and partially open at the top, in connection with a swinging and spring-acted lid, placed below the level of the top, and provided with an inclined lever for opening or closing the box as the lever comes in contact with the ceiling or is detached therefrom, substantially in the manner and for the purpose set forth.

2. The swinging and spring-acted lid, having inclined lever and brush at front edge, substantially as and for the purpose set forth.

3. The flanged front edge of the box having corner recess, in combination with a lip of the lid, for readily emptying the box, as specified.



171,866. CONDENSERS FOR ILLUMINATING-GAS. George W. Ridge, Jersey City, N. J. [Filed Oct. 4, 1875.]

The wheels B B, constructed with the radial spiral vanes, and arranged transversely within, and completely spanning the diameter of, the pipe leading from the retort to the purifiers, as shown and described, to admit of their rotation by the force of the current of gas, as shown and described.

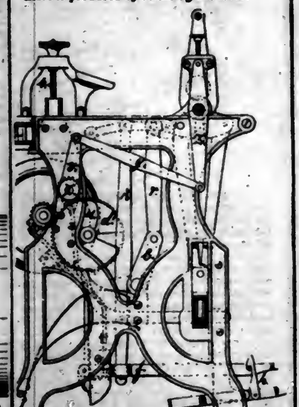
171,867. POWDER-CANS. Fredrick Rowe, Bridgeport, Conn., assignor to P. A. Oliver, Williamsburg, Pa. [Filed Oct. 9, 1875.]

Brief.—The screw-cap is constructed of a sheet-metal shell, formed to retain a soft-metal lining, in which the screw-thread is formed.

The hard-metal cap C, having an enlarged head, and provided with a soft-metal lining, D, having interior screw-threads cut therein, in combination with the neck B of the can, having exterior screw-threads, substantially as and for the purpose herein set forth.

171,868. SPOOL-HOLDERS. Jas. J. Elliott, Renovo, Pa. [Filed June 10, 1875.]

1. In a spool-holder, the hollow spindle G, constructed substantially as and for the purpose described.



2. The bobbin-holders K L N, when constructed and arranged substantially as set forth.

2. The combination of the needle-holder E, spool-holders G and I, and shuttle-bobbin holders K L N, substantially as set forth.

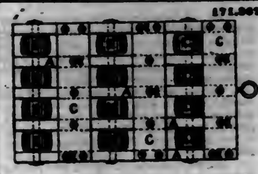
4. In combination with a spool-holder, the tension-guide O, constructed and arranged to operate substantially as herein shown and described.

171,869. BOOK-BACKING MACHINES. John B. Coffin, Mystic River, Conn. [Filed Sept. 8, 1875.]

Brief.—Depressing the foot-lever clamps the book, brings the roller down upon it, and sets the machine in motion, while the reverse effect is produced by releasing the lever.

1. The combination of the driving-wheel, the pinion, and the book holding jaws with a foot-lever and intermediate mechanism, substantially as described, whereby the machine is started and the jaws closed by one movement of the lever, and the reverse effect produced by its return movement, as set forth.

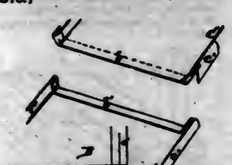
2. The combination, with the roller *p*, mounted in a hinged frame for inducing downward pressure, of the crank *u*, rod *y*, and arm *z*, substantially as described, whereby the roller is oscillated while pressed downward on the back of the book, as set forth.



3. The combination, with the revolving cam *a*, of the arm *i*, crank *s*, and bar *r*, connected with the cheek-piece *g*, constructed to operate so as to press the roller *p* against the book-back, substantially as and for the purpose described.

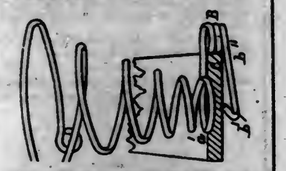
4. The combination, with the shifting-rod *c'*, of the segmental rib secured to the gear *d'*, and the clutch *b'*, arranged to operate together substantially as and for the purpose described.

5. In combination with the adjustable jaws *e* and *n*, the oscillating roller-frame secured to the cheek-pieces *g g*, and the automatic mechanism, substantially as described, by which the roller is pressed against the back of the book, as and for the purpose set forth.



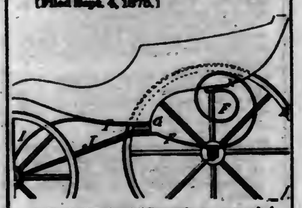
6. In a book-backing machine driven by power, the combination of the following elements: a foot-lever, by which the jaws are forced together, and the machine is set in motion; a cam, operating a combination of levers, by which the roller is forced against the back of the book held in the jaws automatically; and a rotating crank with intermediate mechanism, by which oscillating motion is imparted to the roller-frame, the whole operating together substantially as and for the purpose specified.

171,870. TRUCKS. Wm. A. Bates, Chino, Me. [Filed May 3, 1875.]



The series of parallel bars A, cross bars or pieces C, in combination with the anti-friction wheels L L' L'' L''', the two central series being on a line with each other, furnishing a steady bearing for the device when in a level position, and the two outer series being on a line above the central series, whereby a support for the ends of the device is furnished, and whereby there are two series of wheels on the ground all the time, all constructed and arranged as and for the purpose specified.

171,872. SHEET-METAL ROOFS. Chas. W. Evans, Cincinnati, Ohio. [Filed Nov. 17, 1875.]



In a sheet-metal roof, the sheets B, having folds *b b'*, ridges C C', and ridge-lap *c'*, when formed from a sheet having notches *c''*, substantially as described, and for the purpose specified.

171,873. FURNITURE-SPRINGS. John Filan, Philadelphia, Pa. [Filed Oct. 11, 1875.]

The coiled-wire spring, having the tangential extension of the wire of the bottom coil *a'*, the horizontal coils B, the clamping-bar *b''*, and the hooked end *b'*, the said parts being constructed and arranged in relation to each other, substantially as and for the purpose described.

171,874. CHILDREN'S CARRIAGES. Thomas Gelt and James Hazlehirst, Rock Island, Ill. [Filed Sept. 4, 1875.]

1. The body of a child's carriage, suspended on cross-bars between springs F F, and balanced over the rear axle, as shown and described, so that a slight pressure will tip it either forward or backward, and thus enable the vehicle to be easily operated by a child.

2. In a child's carriage, the double reach J J, with forward ends attached to front axle, and the rear crossed ends fastened to crossbar G, as shown and described.

171,871. COKE OVENS. Emil S. Gobiet, Mahrisch Ostrau, Austria. [Filed Nov. 27, 1875.]

Brief.—The products of the combustion of the coke pass from the upper part of each oven through a horizontal series of flues into two similar sets of flues on the further side of the oven from the chimney. Each of these flues begins at the center of the ends, goes to the end, returns below to the middle, joins two horizontal flues leading to a bottom flue, which leads from center to end of oven, and returns to center. Thence the products pass through two horizontal flues to the side of the oven nearer the stack, up it (as on the other side they descended) into a vertical flue at the center of the ends, and finally into the main oven and flue, connecting with the chimney.

The improved corner-clamp A, made with corrugated wings *a a*, and with a flat and plain corner that will rest flush against the body of the trunk, substantially as specified.

171,875. SAW-SETS. Geo. N. Gere, Fond du Lac, Wis. [Filed Nov. 8, 1875.]

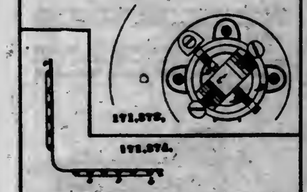
Brief.—The body of the teeth rests upon the inclined face of the anvil, while the point of the same rests upon, and projects slightly over, the sloping surface. The anvil at the point is cut away, so that when the hammer (the face of which is inclined to correspond with said surface) is brought down, the extreme end of the teeth will be bent into space, and all danger of its being swaged or flattened avoided.

1. The combination of side fines *b b' d d''* and bottom fines *f f'*, the fines *a*, with ends other and with an oven A, substantially as shown and described.

2. The combination of a series of ovens A, with side fines *b b' d d'*, bottom fines *f f'*, ascending fines *e*, the fines *a*, and a common main flue, *p*, substantially as set forth.

3. The combination of air-channels *r r* with the side fines *b b' d d'*, the fines *a*, and with an oven A, said channels serving to admit the requisite quantity of oxygen to support combustion, substantially as described.

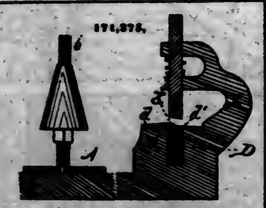
171,876. SAFETY ATTACHMENTS FOR FOCE-ENTS. Daniel Goldy, Philadelphia, Pa., assignor of one-half his right to J. M. Goldy, same place. [Filed Nov. 22, 1875.]



The within-described retaining device, consisting of the casing B, having one side open. In combination with the hook D, carrying a stud, *a*, and arranged to slide over the opening in said casing, as set forth.

171,878. BALANCING MILLSTONES. William Gombora, Waterloo, Pa. [Filed Apr. 24, 1875.]

Brief.—A millstone having bad adjustable by means of screws within eye of stone, and provided with band-sections or weights, arranged within the eye of the stone, and adjustable from the outside.

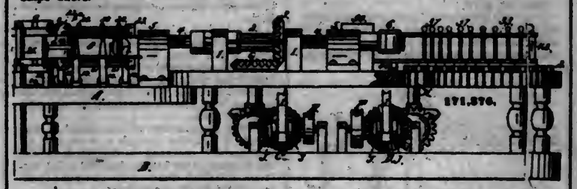


1. The adjustable bail C, having eookeye or point of suspension, and arranged within tube B, all within the eye of stone, as and for the purpose described.

2. The band-sections G made vertically adjustable from the outside, and arranged in the stone's eye about the tube B, as and for the purpose specified.

171,878. CORNER-CLAMPS FOR TRUNKS. William B. Gould, Montrose, N. J. [Filed July 17, 1875.]

171,875.



1. In a saw-set, substantially as herein described, the anvil D D' of otherwise ordinary construction, having on its top surface the rabbet or offset and the short bevel *d''*, substantially as and for the purpose set forth.

2. The combination of the hammer F, anvil D, formed with the beveled surfaces *d d' d''*, slide A, cone C, screw *b'*, substantially as herein shown and described.

171,876. MACHINES FOR BENDING WOOD. John W. Griffiths, Brooklyn, N. Y., assignor to H. M. Griffiths, H. E. Griffiths, O. F. Griffiths, Mary Susan Griffiths, and Buster Griffiths. [Filed Oct. 19, 1875.]

Brief.—The machine is designed for bending ship-timber and other large pieces of wood, and has a special attachment for bending ships' knees.

171,876.

1. In combination with the hinged cap 33 and removable bolts 37, the holders or clamps 35, the set-screws 41 and 42, and boy 36, as and for the purposes described.

2. The compressor 43, mounted upon centers 44, and constructed with friction-rollers 45 at the back, as and for the purposes described.

3. In combination with the compressor 43, with friction-rollers 45, the bulk-head 30, with treat 29, for bearing for the compressor, as described.

4. The hydraulic press 45 in the end of compressors 43, as and for the purposes described.

5. In combination with the compressors 43, the removable straps 46 and bolts 47, for securing the timber in place in the compressor, as described.

6. The combination, in a wood-bending machine, of revolving table 29, removable adjustable clamps 35, and compressor 43, as and for the purposes described.

7. The combination with the clamps or holders 33 and compressor 43, the straps b, placed outside of the timber, being bent within the clamps, and constructed to hold the timber while moving around the form, and to prevent breaking the outside surface thereof, as described.

8. In a timber-bending machine, the hollow curved fixed thrust-form 7, adjusted in the end of plunger 4, and constructed with a removable top and stationary bottom flanges, substantially as and for the purposes described.

9. The combination, in a timber-bending machine, or driving machinery C H, and 2, plunger 4, thrust-form 7, and roller 6, as and for the purposes described.

10. The knee compressors 9 9, mounted upon centers 10, and constructed of a long straight-faced trough, with lower projecting flange 15, as and for the purposes described.

11. In combination with the compressors 9 9 the sliding bars 19 and removable bolts 20, as and for the purposes described.

12. In combination with the compressors 9 9, the hydraulic pumps 17 17, situated in the head of each compressor, and adapted to operate against the timber contained therein, as described.

13. In combination with the compressors 9 9, the ribs 11 11, uniting the compressors at their inner ends, as and for the purpose described.

14. The central rib 12, with roller 13, working in a guide, 14, on the platform A, as and for the purposes described.

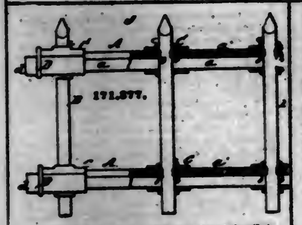
15. The cables 21 21, attached at top and bottom at each end to heads of compressors 9 9, passing through heads 11 11 at the inner ends thereof, and through top and bottom of ribs 11 11, uniting the whole together, as described.

16. The knee timber holding, bending, or forming devices or apparatus, consisting of compressors 9 9, mounted upon centers 10, ribs 11, central roller-rib 12, guide or way 14, hydraulic pumps 17 17, cables 21 21, and covering-bolts 20, all constructed and arranged as and for the purposes described.

17. The combination of knee-timber-holding devices, consisting of compressors 9 9, ribs 11 11, straps 18 19, and bolts 20, and thrust-form 7, as and for the purposes described.

18. The back brace or support for the compressors, composed of triangle-frame of four vertical rear shafts, 25 25, and short front shafts 26, resting upon the platform A and quadrants 24, mounted thereon, as and for the purposes described.

19. In combination with the frame or brace 25 26, the turn-buckles 27 and collars 28, uniting the parts, and for adjusting the angle of the quadrant, as described.

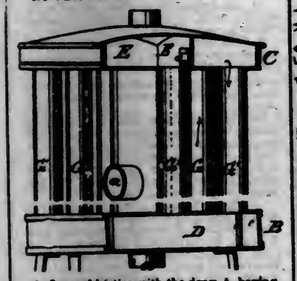


20. The double straps b, placed on opposite sides of the timber, studs 31, and links 32, for securing the straps in place when making compound bends, as described.

21. The combination, in a machine for bending timber, of knee bending and forming devices, consisting of compressors 9 9 and thrust-form 4, 7, and curved timber-bending mechanism, consisting of revolving table 29 30, clamps 35, and compressor 43, or their equivalents, each separate and distinct, but acting in connection, one with the other, as and for the purposes described.

22. The improved machine for bending timber, composed of the parts and constructed and arranged to operate substantially as and for the purposes herein set forth and shown.

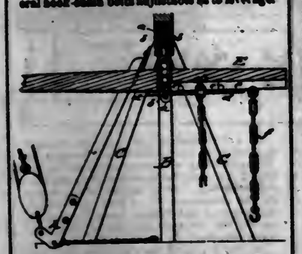
171,877. INGOT FINGERS. Francis O. Hanson, Philadelphia, Pa. [Filed Nov. 6, 1875.]



1. The combination of the horizontal rail A, made in long and short sections a and a', the notched vertical bars B, and the bands or loops holding the sections of said rail together, substantially as shown and described.

2. The fence-panel consisting of the sectional horizontal rails A, the vertical bars B B, loops or bands C, plates D, and nuts d d, the several parts being combined substantially as shown and described.

171,878. HEATING-DRUMS. John J. Hornbrook, Columbus Grove, Ohio. [Filed Nov. 20, 1875.]

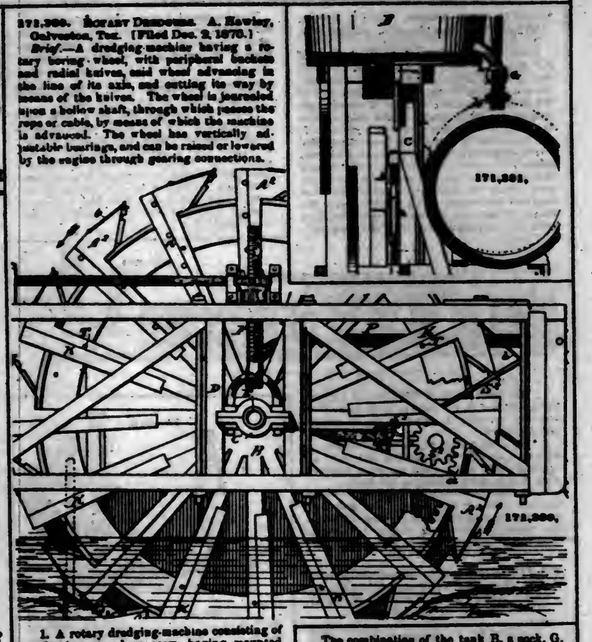


1. In combination with the drum A, having a damper, b, and opening c, the base B and cap C, having V-shaped partitions and damper-slides e in them, and communicating with each other by means of pipes G G' G², substantially as and for the purposes described.

2. The vertical V-shaped plates D E, arranged in reversed order in the base B and cap C, in combination with the vertical pipes G G' G², operating substantially as described.

171,879. STUMP-EXTRACTORS. J. A. Hart and Wm. A. Grove, Tionesta, Pa. [Filed Nov. 13, 1875.]

Brief.—A lever hung from a cross-beam supported on a portable frame has power-tackle attached to one end, and to the other two lateral hook-chain bolts adjustable as to leverage.



1. The combination of lever E, having slot e', the beam-connection, having link a passed through it, cross-pin b', and the cross-grooved plates d d, as and for the purpose set forth.

2. The combination of the pivoted V-braces, having chains at their lower ends, with the frame-connecting stiffening-chains, and the coupling double block, for connecting and disconnecting the braces as required, substantially as shown and described.

3. The combination of plates d d, detachable cross-pin e', and chain f, with a lifting-lever having the cross-holes b', as and for the purpose specified.

171,880. ROTARY DREDGING. A. Hawley, Galveston, Tex. [Filed Dec. 2, 1875.]

Brief.—A dredging-machine having a rotary boring-wheel, with peripheral buckets and radial knives, said wheel advancing in the line of its axis, and cutting its way by means of the knives. The wheel is journaled upon a hollow shaft, through which passes the rope or cable, by means of which the machine is advanced. The wheel has vertically adjustable bearings, and can be raised or lowered by the engine through gearing connections.

1. A rotary dredging-machine consisting of a floating vessel or scow, having mounted thereon a boring-wheel, provided with peripheral buckets and radial knives, said wheel jointed by an engine on board of the machine, boring in line of its axis by means of said knives as the machine is advanced by its motive power, all arranged and operating substantially in the manner herein before described, for the purposes set forth.

2. The combination of the pendent bearing C C with the adjusting-screws F F and shafting and gearing *e e e*, substantially in the manner herein before described, for the purposes set forth.

3. The hollow shaft E, forming the journals of the boring-wheel B, whereby said shaft is made to form a convenient warping-sheave or hawse-pipe, for the purposes herein before set forth.

4. A boring-wheel provided with radial knives, the said knives being attached to the arms of the wheel, and extending from the outward extremity of said arms to or near the hub of the wheel, for the purpose of cutting in the line of the axis of the wheel, in the manner herein before described, for the purposes set forth.

5. The combination of the wheel B and knives K with the buckets or scoops A², all arranged and operating as described, so that the contents of the knives shall fall to the bottom of the ditch and be elevated by the buckets, substantially as set forth.

6. The combination of the discharge-pipe P with the buckets A² and trough O, substantially in the manner herein before described, for the purposes set forth.

171,881. DEVICES FOR FILLING AND DISCHARGING LIQUID-PACKAGES. James M. Hopkins, Louisville, Ky. [Filed Sept. 10, 1875.]

Brief.—A lever is pivoted to the main frame, the inner end of which is connected by a link with the L-shaped frame. The outer end of the lever is held at any point desired by a ratchet plate or bar. The barrel or other package, being placed upon the horizontal part of the frame under the filling-cock, can, by this means, be raised and firmly held to it. A vent is made through the cock, communicating with a passage in the cut-off plug when the cock is open, and with a pipe reaching as high as the source from which the barrel is being filled, thus preventing loss by neglect or accident.

The combination of the tank B, a cock, C, provided with a vent, a, that reaches up to or above the highest level of the liquid in the tank, and an elevating-platform to raise the vessel to the cock, substantially as shown.

171,882. LIQUID-MEASURES. Jas. M. Hopkins, Louisville, Ky. [Filed Nov. 18, 1875.]

1. A measure having a cock for the inlet of liquids, that is provided with a passage for the outflow of displaced air, and a faucet for the outflow of liquid, that is provided with a passage, through which the air displaced from the cask into which the liquid flows from the measure is conducted to a pipe that communicates with the interior of the measure, as shown and described.

2. In a device for measuring liquids, the combination of the measure a, cock A, and faucet b with the gage and vent tubes d f, which enter the top of the measure, substantially as set forth.

171,883. CHUCKS FOR METAL-DRILLS. Theo. Hoppe, Lawrence, Mass. [Filed Nov. 29, 1875.]

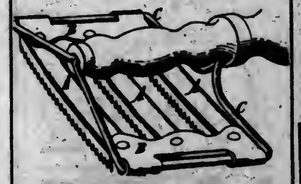
Brief.—The flange serves to hold the jaws and prevent them from being moved in the direction of their length independently of the outer casing.

The outer casing B, with its flange f, in combination with the dovetail jaws d, provided with slots e, and fitting into inclined dovetail grooves in the spindle A, all constructed and arranged to operate substantially in the manner and for the purpose set forth.

171,884. VARNISHES. John L. Jenkins and Augustus W. Richards, Silver Run, Ala. [Filed Nov. 6, 1875.]

Brief.—When the other ingredients are mixed, the nitric acid and antimonial wine are added.

A varnish composed of copal varnish, coach varnish, japan varnish, dammar varnish, boiled oil, turpentine, gum-shellac, alcohol, litharge, nitric acid, and antimonial wine, substantially as set forth.

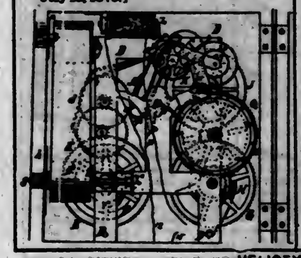


171,885. CURTAIN-FIXTURES. B. M. Judd, Brooklyn, N. Y. [Filed Aug. 21, 1875.]

A bracket composed of two parts, one of which is rigid and the other movable, the movable part being pivoted at c, and made to clamp the roller up against the rigid part by the spring f, substantially as shown and described.

171,886. CURRY-COMBS. Wm. P. Kellogg and John W. Trussell, Troy, N. Y. [Filed Nov. 16, 1875.]

Brief.—A raised wooden handle passes over the back of the comb, and is attached to the comb by wires, so as to form two griping-handles—one over the comb, the other at the side.

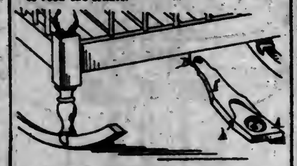


1. A curry-comb constructed with a continuous handle, D, placed at right angles to the bars above the back, and extended beyond the bars, so as to afford a double grasp, by which it may be raised immediately above the back, and also at the side, substantially as set forth.

2. In combination with the bars, a continuous handle, D, extending entirely across the back and to one side, so as to afford a double grasp, and a brace connecting the bars with the middle of the handle, in such manner as to perform the double function of a brace and a thumb-piece under the handle, substantially as set forth.

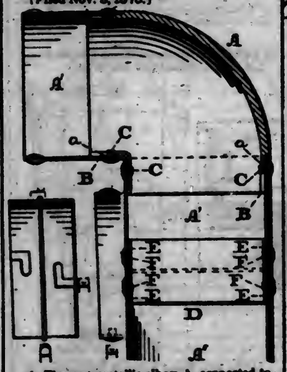
3. In combination with the bars and the elongated handle D, affording a double grasp, the shank-wires C C, extended to form also a brace attached to the middle of the handle, substantially as set forth.

171,887. ELECTRICAL STATION-INDICATORS. Jas. F. Estcott, Worcester, Mass. [Filed July 13, 1875.]



1. The combination of the electro magnet L and battery M with the axle of a car or other public conveyance, and with the release mechanism of a self-winding curtain of a station indicator, constructed substantially as and for the purpose set forth.

2. In combination with the release mechanism of a self-winding curtain, operating as a station-indicator, the dial-plate V, with its two graduated series, and the index-fingers U and X, substantially as and for the purpose set forth.



171,888. CRADLE-TREADLES. J. A. Kirchner, Chicago, Ill. [Filed Aug. 1, 1873.]

Brief.—The recessed part of the treadle is held by the heel of the nurse or attendant, while the hinged part is operated by the toe to rock the cradle.

The cradle-treadle described, consisting of the part A, provided with recess a, the part A', and strap B, in combination with a cradle, constructed and arranged substantially as described and shown.

171,889. STOVE-PIPE JOINTS. Daniel H. Klotz, Philadelphia, Pa., assignor of one-half his right to B. F. Dubois, same place. [Filed Nov. 3, 1875.]

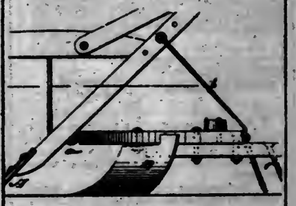
1. The cast metallic elbow A, connected to the lengths of pipe by locking-joints, consisting of slots and engaging-studs, substantially as and for the purpose set forth.

2. The elbow A and pipe A', in combination with concealed fastenings, consisting of L-shaped slots B in the elbow, and studs C, projecting inwardly from the inner faces of the pipe, substantially as and for the purpose set forth.

3. The studs C, formed with shoulders a, and projecting inwardly from the pipe, in combination with elbow A, having attaching-slots B, substantially as and for the purpose set forth.

4. The locking-band D, in combination with the lengths of pipe, substantially as and for the purpose set forth.

5. The bead d, in combination with the locking-band D and lengths of pipe, substantially as and for the purpose set forth.



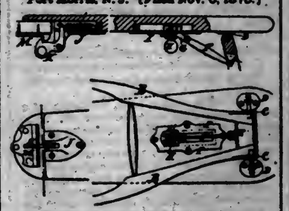
171,890. VALVES FOR STEAM PUMPING-ENGINES. Leonhe J. Knowles, Worcester, Mass. [Filed Oct. 26, 1875.]

1. The combination, with steam chest A, main steam-valve G, and the laterally-projecting cylinders a a, having steam ports l and exhaust-ports 2, of piston C, provided with slots c c, and parts being constructed and arranged substantially as and for the purposes set forth.

2. The combination, in a steam pump in which the main steam-valve is driven by a supplemental steam-operated piston, of an free piston, in combination with a thin cylinder made of brass or other similar sensitive and expanding metal, for the purposes stated.

171,891. HARROW ATTACHMENTS FOR CULTIVATOR-PLOWS. Fredk. D. Ledenberger, Glenbeulah, Wis. [Filed Sept. 17, 1875.]

Brief.—To the rear of an opening or shovel plow are hinged two diverging beams, that are made adjustable by a curved brace-bar. These beams each carry first a share, which throws the soil outward. The rear ends of the beams carry harrow-teeth, which level down the furrow made by the plow.



A combined implement, consisting of the shovel or breaking plow A, side plows B, and harrows C, the beams of the plows B and C being rigidly bolted together and made adjustable in width by a curved bar, D, and connected to the breaking-plow A by means of eyebolts a and brace-rods b, all constructed as and for the purpose specified.

171,892. CARBON PHOTOGRAPHS. Claude Leon Lambert, Paris, France. [Filed Jan 4, 1876.]

1. A compound consisting of eleven ounces of water, fifteen grains of sugar, one drop of liquid ammonia, and a few drops of permanganate of potassa, to form a bath in which a negative obtained from a transparent positive may be immersed, and then intensified.

2. The process of obtaining double-tinted prints in salts of chromium and on ordinary albumenized paper, by placing the sensitized paper in a press, the blank for the picture being covered with a black or yellow mask, and the whole being then precipitated by hyposulphite, as described.

171,893. IRONING-TABLES. L. P. Lawrence, Port Morris, N. J. [Filed Nov. 6, 1875.]

1. The combination of the air E, pivoted bar F, sliding block G, clamping screw H, and slotted plate I, with the board A and the hinged frame B, substantially as herein shown and described.

2. The combination of the plate J and the pivoted spring-latch K L, with the end of the board A, and with the flanged plate M, substantially as herein shown and described.

171,894. MANUFACTURED GLASS BUTTONS. Isaac Lehmaier and Gundebaut Lehmann, New York, N. Y. [Filed Dec. 7, 1875.]

171,396.

As an improvement in the manufacture of glass buttons, the formation of the button with a head or collar, *d*, produced by constructing the die in which the plastic glass is placed with a cylindrical receiving space or enlargement, *c*, in its mouth, for the surplus glass under pressure, substantially as shown and described.

171,396. FIRE-PLACES. James S. Lester, Atlanta, Ga. [Filed June 8, 1875.]

1. The combination, in a fire-place heater, of the adjustable deflecting-plate E, having legs *d d*, and the plate G, all constructed substantially as and for the purposes herein set forth.

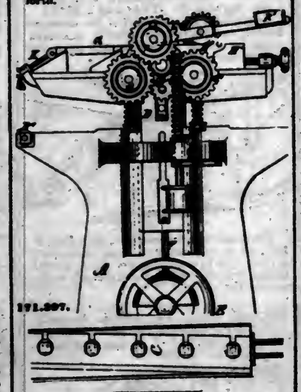
2. The combination, in a fire-place heater, of the arched heating-chamber C, draft-flue *c*, the adjustable deflecting-plate E, having legs *d*, and the plate G, all constructed substantially as and for the purposes herein set forth.

171,396. TAKE-UP MOTIONS FOR LOOMS. James Lyall, New York, N. Y. [Filed Oct. 20, 1875.]

1. The sectional rollers *i*, provided with transverse needle-points, *r*, and each having a ratchet, *l*, and pawl *o*, in combination with the take-up hand *a* and its rollers *b c*, substantially as set forth.

2. In a take-up mechanism for weaving irregular fabrics, a sectional roller, having transverse needle-points, in combination with ratchet-wheels and holding-pawls applied to the respective sections, substantially as set forth.

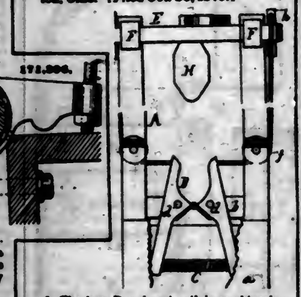
171,397. SURFACE-PLANING MACHINE. W. C. Marquedant, Hamilton, Ohio, assignor to Daniel Marquedant & Co. [Filed Nov. 26, 1874.]



Brief.—The cutter-head, consisting of a triangular tapering shaft, provided with three straight knives of uniform transverse dimensions, having their ends advanced at the smaller end of the shaft to the same circumferential arc described by the higher ends, in vertically adjustable sleeve a lever stationary bed fixed on a given horizontal plane, and between two independently-adjustable beds, and the material can be fed above the cutter by suitable gearing, operated by a worm-screw, corresponding to the full vertical adjustment of the cutter-head, and carried by a shaft in concentric bearings.

1. In a surfacing machine, the combination, with a lower stationary bed or table, A', remaining at a given horizontal plane, of the cutter-head C, adjustable vertically above the table A' and the tables G H, rising and lowering with the cutter-head, and also independently adjustable thereto, as and for the purposes described.

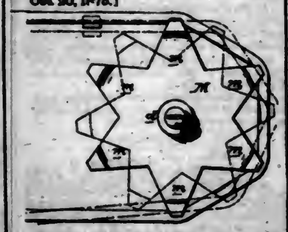
2. A cutter-head, consisting of a triangular tapering shaft, in combination with three straight knives of uniform transverse dimensions, arranged with their ends advanced at the smaller end of the tapering shaft to the the same circumferential arc described by the higher ends, substantially as and for the purpose described.



3. A worm-screw, corresponding in length to the full vertical adjustment of the cutter-head, and carried by a shaft in eccentric bearings, as shown and described, to allow worm-screws to be employed or disengaged, as set forth.

171,397.

171,398. BOOT-JACKS. Isaac Massie, Ironton, Ohio. [Filed Oct. 20, 1875.]

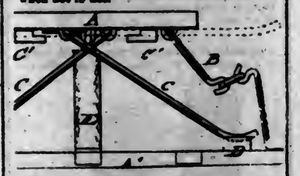


171,398.

1. The jaws B and spring C, in combination with the cords D, axle E, and lever I, substantially as specified.

2. The combination of the tongue H, axle E, lever I, cords D, and jaws B, substantially as stated.

171,399. MECHANICAL MOVEMENTS. Jas. F. McCormick, Philadelphia, Pa. [Filed Oct. 20, 1875.]

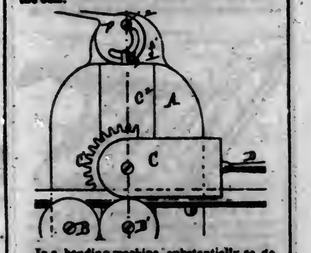


The within-described device, consisting of the revolving wheel M and its arms *m*, the oscillating hand K and the arm G, with its pin E, all being combined and operating substantially as set forth.

171,400. METHODS OF TREATING NATURAL GAS. John H. McElroy and Robt. Young, Pittsburg, Pa. [Filed Nov. 29, 1875.]

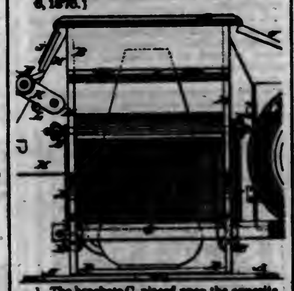
The process of preparing illuminating-gas from natural gas, which consists in heating the gas, thus converting the carbonic oxide into carbonic acid, which is afterward eliminated by lime purification, all substantially as set forth.

171,401. WAGON-SPRINGS. A. W. McKown, Shenandoah, Pa. [Filed Sept. 4, 1875.]



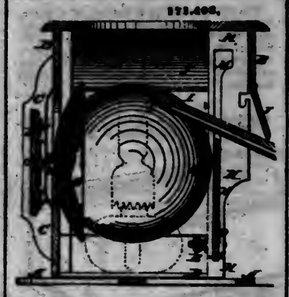
Brief.—Auxiliary springs adapted to be swung up and fastened to the body of vehicle when not in use.

The detachable torsion-springs C, arranged on the inside of outer springs B, as and for the purpose described.



171,402. MACHINES FOR BENDING TUBES, &c. Michael McWilliams, Detroit, Mich., assignor to himself, Joseph McWilliams, and Edward Devine, same place. [Filed Oct. 9, 1875.]

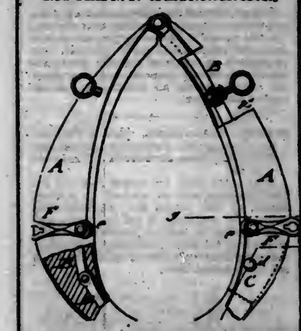
Brief.—The block to which is pivoted the former, and the block carrying the sheave, move in the same groove, and the first mentioned, carrying the former, is forced up by the cam.



In a bending-machine, substantially as described, the combination of the grooved sheave pivoted to a sliding block, with the grooved former also pivoted to a block sliding in the same ways in the bed-plate, substantially as described.

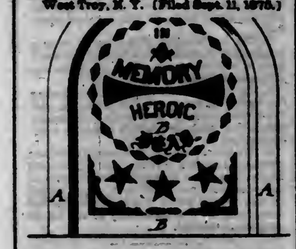
171,403. SHOT-PROTECTORS. Marmaduke H. Mendenhall, Wabash, Ind. [Filed Nov. 6, 1875.]

1. The hasteners C, placed upon the opposite sides of a hole in the back or door of the shot-protector, the plate D, the head-screws B, and the slotted plate F, in combination with each other and with the said back or door, to support the conveyer reflector G adjustably, substantially as herein shown and described.



171,404.

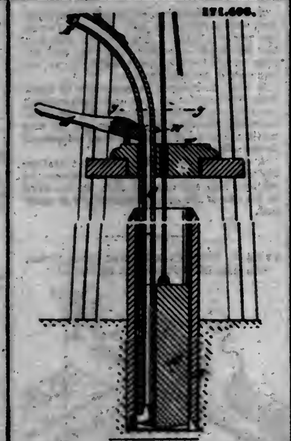
2. The pivoted arms E and their stop-pins or screws L, in combination with the flanges H, for supporting the deflector I adjustably, substantially as herein shown and described.



3. The combination of the notched and grooved bar O, made in two parts hinged to each other, the plate N of colored glass, and the head-screws B, with the slots M, formed in the flanges J that support the deflector I, substantially as herein shown and described.

171,405. HORSE-COLLARS. Joachim Meyer, New York, N. Y. [Filed Nov. 10, 1875.]

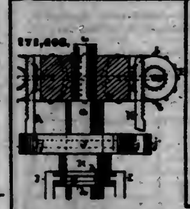
A horse-collar, stiffened by hinged metallic hames, and made to be closed and opened at the side of the neck, substantially in the manner and for the purpose set forth.



171,406. MOUNTAINTS. Lewis J. Millimen, West Troy, N. Y. [Filed Sept. 11, 1875.]

The combination, with a tomb or other memorial stone, of the plate B of finished glass, having a suitable inscription cut or otherwise engraved thereon, substantially as and for the purpose set forth.

171,407. GAS-METERS. Jos. Morgan, New Orleans, La. [Filed Nov. 20, 1875.]



Brief.—A pendulum-stop is suspended in the rear of the case, which, if the meter be "tilted," swings forward and engages lugs projecting from the drum; and stops the meter and the flow of gas.

1. In a wet-meter, the combination, with the revolving drum, of a stop or catch, thrown into action or position by the forward tilting of the meter to positively arrest the rotation of the drum, substantially as set forth.

2. The pendulum stop or bar applied to the meter-case, as described, in combination with the meter wheel or drum, and one or more projections or shoulders on the back of the latter for joint operation, as shown and set forth.

171,408.

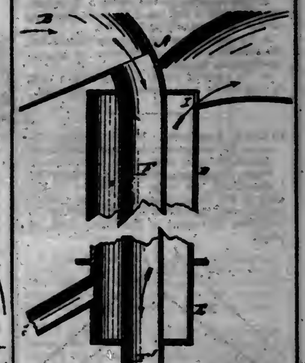
171,410.

171,409. TYPE-WHEELS. Geo. H. Morgan, Utchoville, Ohio. [Filed Nov. 2, 1875.]

1. A revolving wheel having a series of type-carriers, each carrying a single letter in different styles of type, and each made adjustable to receive a back-and-forth movement at the will of the operator, substantially as and for the purpose set forth.

2. An adjustable type-carrier, B, on which is formed or otherwise secured, in different styles or sizes of type, a single alphabetical character, sign, or numeral, either on the side or face of its periphery, substantially as and for the purpose set forth.

3. An adjustable type-carrier, B, having a single alphabetical character, sign, or numeral, in different styles or sizes of type, in combination with a revolving wheel, A, substantially as and for the purpose specified.



4. A series of adjustable type-carriers, B, each having a different single alphabetical character, sign, or numeral, in different styles or sizes of type, in combination with a revolving wheel, A, substantially as and for the purpose specified.

5. An adjustable type-carrier, B, in combination with a revolving wheel, A, and mechanism, substantially as described, for imparting a back-and-forth movement to the former, for the purposes set forth.

6. A series of adjustable type-carriers, B, in combination with a revolving wheel, A, and mechanism, substantially as described, for adjusting the type-carriers back and forth, substantially as and for the purpose specified.

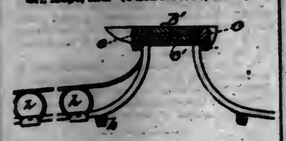
171,410. VENTILATORS. Alex. L. Meyer, Sherman, Tex. [Filed June 16, 1875.]

Brief.—The funnel or vane has a tail, so that while air is descending for ventilating purposes, vitiated air is rising and passes through the tail to the open air.

The vane A, with flaring mouth and hollow tail, in combination with the cylinder D, and the induction-pipe F and the ejection-pipe G, as and for the purpose set forth.

171,410. BOTTLE-STOPPERS. Thomas W. Murray, New York, N. Y., assignor of one-half his right to Henry Von Derbeck, same place. [Filed Nov. 27, 1875.]

Brief.—In this device a toggle or elbow joint is used in combination with the wire and flange-stopper.



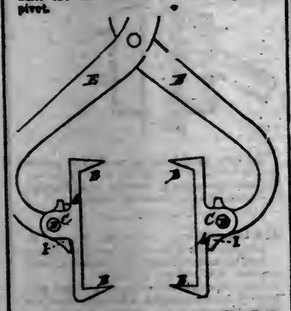
A stopper for bottles operating as herein described, in which a toggle or elbow joint is used, in combination with the wire P and the flange-stopper F, substantially as and for the purpose set forth.

171,411. COOKING APPARATUS. Reuben H. Murray, St. Paul, Minn. [Filed Jan. 27, 1876.]

The combination of the vessel A, having extended ears h h, side attachment H, curved exterior pipe F, openings e g, communicating with the pipes at the lower and upper parts of vessel A, and the tapering vessel E, having perforated false bottom D, leaving the annular steam-space e between the vessels, all constructed substantially as set forth.

171,412. BOOK-BOARDS. Charles Neligh, Sr., Hope, Ind. [Filed Nov. 13, 1875.]

1. In a book-board, the combination of the clasp-boards C C and bolts e e' with spring-stripe A B, recessed into a cent-board, B, substantially as specified.



2. The separate curved stripe A B, in combination with a cent-board, B, and a clasping device, substantially as specified.

3. In combination with a spring back-board, the rendering or flexible metallic rail D, substantially as specified.

4. The metallic rail D, having spaced coils h, adapted for use substantially as specified.

171,413. ICE-TONGS. Niels P. Nelson, Chicago, Ill., assignor of one-half his right to Anson S. Piper, Beth Piper, and Thomas Piper, same place. [Filed June 28, 1875.]

Brief.—At the lower extremities of the arms of the ice-tongs are projections extending between the ears of the grapple-plate, to limit the movement of the latter upon its pivot.

The combination, substantially as described, of the arms B, provided with projections I I at their lower ends, and the frame A, provided with spurs B and lugs C, as and for the purposes set forth.

171,414. PEGGING-MACHINES FOR BOOTS AND SHOES. William D. Cornet, Boston, Mass., assignor to himself and Oscar L. Noble. [Filed Nov. 10, 1876.]

1. In a machine for pegging boots and shoes, the combination, substantially as specified, of the rotatable head, with a stationary horn, and a non-rotating pegging-head.

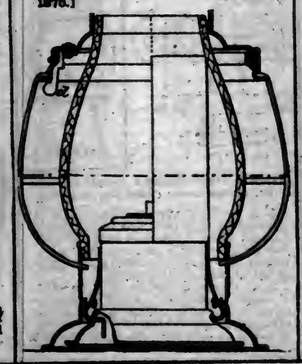
2. The combination, substantially as specified, with a stationary horn and a non-rotating pegging-bead, of the rotatory slide-bar, the lever connected therewith, and the ring which reciprocates vertically in an oblique cut in the said slide-bar.

3. The combination, substantially as specified, with a stationary horn and a non-rotating pegging-head, of the rotatory bevil, the slide-bar seated therein, the lever, and the ring which reciprocates vertically in an oblique cut in the said slide-bar.

4. In a pegging-machine, having a stationary anvil, into which the pegs are driven, the rotatory head moving the shoe on the anvil in the line of the pegs, substantially as specified.

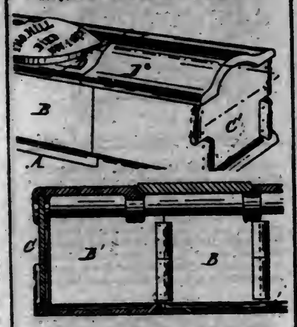
171,415. INDEX CLIP-BOARDS. Thos. Orton, Chicago, Ill. [Filed Aug. 13, 1875.]

1. A series of index-sheets, provided at their inner edge with eyelets, and held to a clip-board by one or more rods passing through the eyelets, in combination with a clip, said clip clasping the sheets in front of the rods, thereby firmly holding the contents of the clip in place, substantially as shown and described.



2. The combination of the clip-board A and clip B with the rods D, held by brackets C, or equivalent means, and index-sheets G, having eyelets h, or their equivalents, substantially as and for the purposes herein set forth.

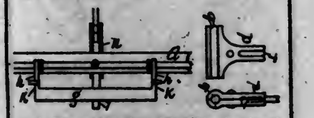
171,416. LOOM SHUTTLE-GUARDS. William H. Parker, Medford, Mass. [Filed May 6, 1875.]



The combination of the reed-cap a, stationary arms b c d, catch-arm e, spring f, and guard-rod l, when the several parts are formed, arranged, and connected substantially as shown and described.

171,417. SIGNAL-LANTERNS. George F. Pashley, Brooklyn, N. Y. [Filed May 14, 1875.]

The combination, in a lantern, of a globe, divided into vertical sections, clear and colored or of different colors, and a rotatable reflector, by which the light may be shown through the desired color, and shut off from the others, in the manner and for the purpose described.



171,418. GRAVE-VAULTS. W. C. Peckham, Troy, Ohio. [Filed Nov. 9, 1875.]

The grave-vault described, consisting of the end sections A' and A², provided with grooves, the side panels B' B², having projections, the head and foot panels C and C', provided with projections, and the head and foot cover panels D' D², having grooves, with or without the central section, all substantially as described and shown.

171,419. HORSE-RAKES. Chas. B. Perkins, Kenduskeag, Me., assignor to himself and William Higgins, same place. [Filed Oct. 4, 1875.]

Brief.—The teeth are hinged to a rod behind the axle, and are secured by a clasp formed of two pieces, and provided with grooves for admission of rod and teeth, and held together by bolts or screws. The rake is lifted by ball-crank hand-lever, connecting with rake-head by means of an intermediate rod and a forked lever.

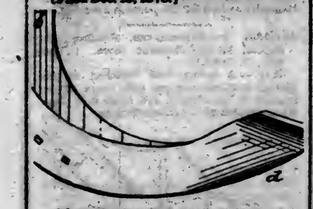
1. The combination of the lifting-bar f, and forked lever g, having arms h k; h k, and f, and hinged to the rod e, upon which the teeth are pivoted, as set forth, for the purposes specified.

2. The combination of the forked lever g, constructed as described, with the ball-crank lever n, and connecting-rod o, as and for the purposes set forth.

3. The improved clasp or jaw for securing the teeth, consisting of two parts, o p, provided with grooves q r and cavity s, and united and held in place by a bolt or screw, as herein specified.

4. The improved horse-rake, constructed and arranged as herein specified, having its teeth hinged to a rod, e, directly behind the axle A, and operated by a forked lever, g, also hinged to said rod by means of a ball-crank, n, and connecting-rod o, substantially as and for the purposes described.

171,420. CULTIVATORS. Joshua Pierpont, Bushnell, Ill. [Filed Nov. 6, 1875.]



Brief.—An adjusting-plate upon a cultivator-standard, for holding the beam at various lengths.

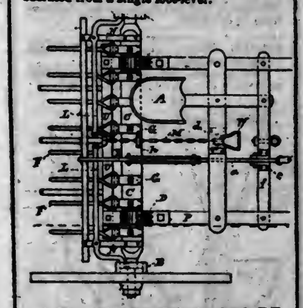
1. The block G, constructed, as described, with legs g, series of holes g', and prongs h, substantially as and for the purposes specified.

2. The block G, having prongs h and legs g, with a series of holes, g', combined for operation with the brace E, pin e, standards B, and plow-beams A, substantially as and for the purposes specified.

171,421. HORSE-RAKES. Zachariah V. Purdy, Washington, D. C., assignor of one-half his right to James O'Hard, Pittsburg, Pa. [Filed Dec. 12, 1876.]

A horse-rake having the inclined flanges C C and the outward beveled surface b b, substantially in the manner shown, for the purpose specified.

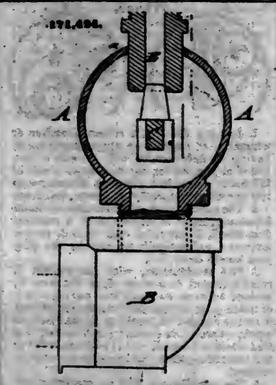
171,422. STREET-RAILWAY TRACKS. John Quigley, St. Joseph, Mo. [Filed Nov. 10, 1875.]



Brief.—A street-railway track in which the chairs and tie are of metal, and in one piece, the top of chair having dovetailed grooves, in which the rail and keys for securing the same are placed. The sides of the chair are bolted to better admit of being held by the ballast.

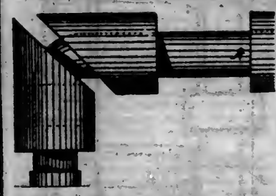
The combined metal tie A and chairs B D, constructed to fasten the rails by a key, and having the side recesses F, substantially as specified.

171,423. HORSE-RAKES. Wm. J. Rayner, Milwaukee, Wis. [Filed Mar. 20, 1875.]



Brief.—Friction-clutch for each wheel, both operated from a single foot-lever.

1. The combination of the two bands B B, attached to the wheels of a hay-rake, the two levers L L, provided with the friction clutch or brake O at their outer ends, arms H N, to which levers L L are pivoted, axle O, chain M, and treadle W, substantially as and for the purposes described.



2. The combination of the teeth-bars formed of the notched sections G and H, teeth F F F, formed with the square-ended loop f', and axle O, substantially as and for the purposes described.

171,424. TRAPS FOR STEAM-PIPES. Charles A. Reed, Bridgeport, Conn. [Filed Nov. 13, 1875.]

In traps for steam-pipes, the globe A, made movable around the plug E, and in a threaded socket of elbow B, as shown and described, whereby the relative position of valve to seat may be gaged.

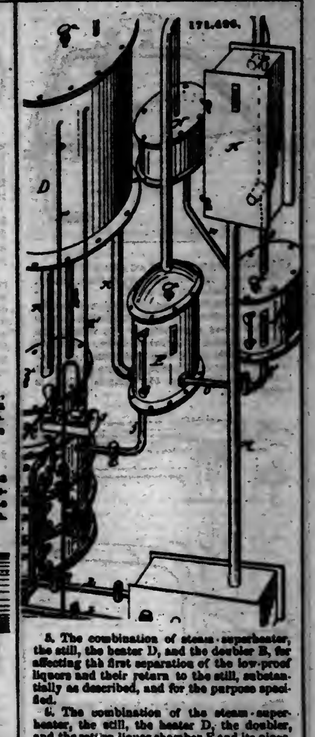
171,425. COVERINGS FOR STEAM BOILERS AND PIPES. John C. Reed, Millvale, assignor of one-half his right to Wm. Tegle and Andrew Johnston, Pittsburg, Pa. [Filed Oct. 15, 1875.]

As a new article of manufacture, a non-conducting covering composed of layers or wrappings of paper saturated with adhesive material, and compressed while being formed into tubular sections of a thickness of one-half inch, or more, substantially as shown and described.

171,426. APPARATUS FOR DISTILLING AND RECTIFYING LIQUIDS. Joseph W. Reford, New York, N. Y., assignor to Wm. Watt, same place. [Filed June 30, 1875.]

Brief.—The wash is pumped into heater, thence passes into charger, thence into stills. Each still is independent of the others. The vapors are gathered up and rise through the charger and heater. The doubler returns "low-wines" to the still. The drum-chest further rectifies, and the main condenser completes the process. A second return liquor-chamber returns "low-wines" from the safety-condenser attached to the heater, and from the drum-chest. The jacketed stills are treated by superheated steam, and the drum-chest by heated air.

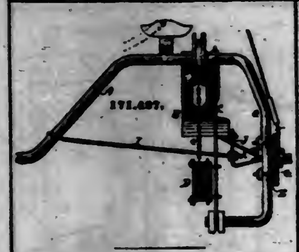
1. In a liquor-distilling apparatus the combination of two or more copper stills, each having a perforated bolting bottom, and surrounded with a steam-jacket, and connected by pipes having suitable cocks, whereby each still may be operated independently or all in conjunction, substantially as described, and for the purposes specified.



2. The combination, with a steam-superheater and connecting-pipes, of a series of independent jacketed stills, whereby the distilling capacity in actual use may be varied at pleasure, substantially as described, and for the purposes specified.

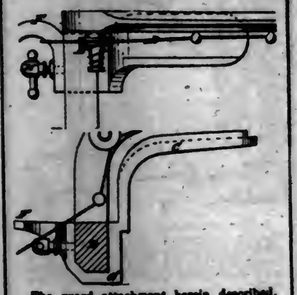
3. The combination of the still, the steam-superheater, the chamber H and mechanism therein, and the pipes K M, substantially as described, and for the purposes specified.

4. The combination of steam-superheater, the series of jacketed stills, the heater D, with the pipes K Q S, operating substantially as described, for the purposes specified.



171,427. SULKY-PLOWS. H. Richardson, Janesville, Wis. [Filed Nov. 3, 1875.]

Brief.—The vertical rod, on which the plow-beam coupling slides, made adjustable laterally. Device for adjusting the tread of the right wheel.



1. The adjustable rod C, running from the axle A to the plate B, and having the plow-coupling D placed thereon, substantially as and for the purposes herein set forth.

2. The plate B, carrying the spindle attachment C, and made movable on the axle, in combination with the adjusting-bolts, plate H, and axle A, substantially as shown and described.

171,426. SEWING-MACHINE THREAD-GUARDS. Lillian Roosevelt, Hempstead, Tex. [Filed July 31, 1875.]

Brief.—The two arms of the guard are for the purpose of causing the thread to proper position. One, extending in the rear of the machine, prevents the thread from running off the spool onto the spindle; the other, extending under the needle-arm, protects the thread from being struck by the material which is being sewed.

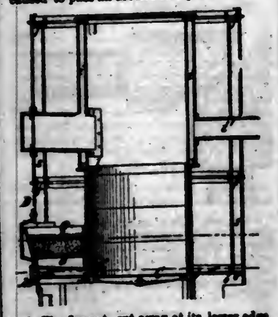
The guard attachment herein described, consisting of the clamp G, having the oppositely-extended arms C and F, as and for the purpose specified.

171,429. TICKETS. John M. Savin, Baltimore, Md. [Filed Nov. 4, 1875.]

A tipping ticket-drawback, consisting of a combination and a drawback coupon, and a sketch sheet, as printed in reverse that when folded the same names and numbers on the three coupons may be simultaneously punched, and then released and converted for the drawback-coupon may be destroyed, and the others retained as vouchers, substantially as set forth.

171,430. TOY PISTOLS. Jas. Edwd. Sherrod, New York, N. Y. [Filed Sept. 28, 1875.]

1. In a toy fire-arm, a ribbon chamber or magazine of circular or approximate form, having its axis parallel with the axis of the barrel to provide for the feeding of a coil of fulminate-ribbon in a direction transverse to the barrel, substantially as herein described.



2. The combination, with a fire-arm, in which fulminate-ribbon is employed, of a rotating feed-wheel, H, provided with teeth or projections A, substantially as and for the purpose herein described.

3. The combination, with the rammer I, spindle O, and feed-wheel H, of the lever P, pivoted between its ends and having a fork or notch, p, at its rear end, and the pin or stud n on the hammer M, working in said fork or notch, whereby, on cocking the hammer, the feed-wheel is rotated, and the ribbon is fed to the point of explosion, as herein shown and described.

4. The combination, with the magazine and feed mechanism, of the removable cap C, forming a casing for the same, substantially as herein described

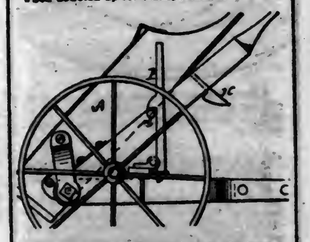
171,431. HOT-AIR FURNACES. B. C. Sayre, Montrose, Pa. [Filed June 14, 1875.]

Brief.—The evaporating pan rests upon strips upon the cover of the clinker-cleaning opening, whereby a current of heated air is caused to pass all around said pan.

1. The fire-pot, cut away at its lower edge, in the manner described and shown at N, in combination with the tube M, furnished with a door, and extending from the outer casing to the said passage, and with the section D of the hot-air furnace, in the manner and for the purpose described.

2. The evaporating-pan Q, constructed and arranged with a door, E, and within the section D of the outer casing, and supported upon ledges on top of the tube M, substantially in the manner described and shown.

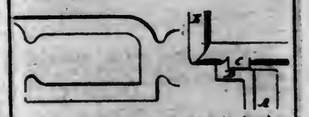
171,432. VELOCIPEDES. A. Schmachtenberg, Cincinnati, Ohio. [Filed Oct. 13, 1875.]



Brief.—The pressure on the saddle, causing it to rise and fall, imparts motion to the vehicle.

1. The combination of fixed stirrups M, vertically-reciprocating saddle O, lever H, pitman I, and propelling-wheel C, connected and operating substantially as and for the purpose specified.

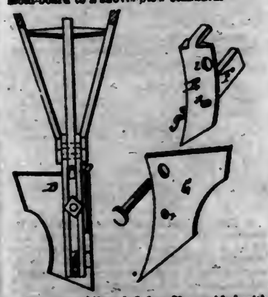
2. The combination of lever or bar H, crank-shaft J, and pitmen I, the latter being connected to the horse's hand, and operating substantially as and for the purpose specified.



171,433. ROAD-SCRAPERS. Friedrich W. Schuis, Mount Pleasant, Iowa. [Filed Nov. 15, 1875.]

Brief.—A spring-hook attached to the tongue cross-bar engages with a pin on the handles of the scraper, and holds it in place when doubled up for transportation.

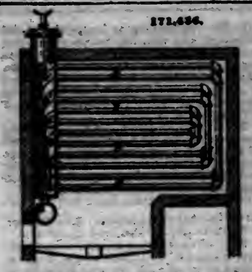
The spring-hook P, attached to the tongue cross-bar J, in combination with the handles D, pin f, scraper A, and hook H, substantially as and for the purpose herein set forth.



171,434. VEHICLE DASH-FRAMES. Moses Seward, New Haven, Conn. [Filed Nov. 26, 1875.]

As an article of manufacture, the herein-described carriage dash-foot, consisting of the shank or strap A, its upper and turned outward, and forming a cleat, C, from which the parts D E of the frame extend, substantially as described.

171,435. PLOWS. John Sewell, Bowdon, Ga. [Filed Sept. 10, 1875.]



Brief.—Device for securing a removable mold-board to a shovel-plow standard.

The curved bevided bar M, provided with land-side bar F, pins b d, hole c, and projection e, in combination with the slotted plow-foot B, having perforated toe, the mold-board G, with holes x y, and the bolt k, with nut t, all substantially as and for the purpose herein set forth.

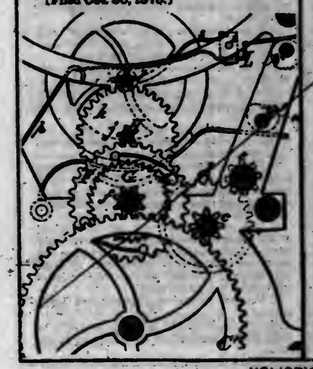
171,436. STEAM-BOILERS. Jos. Shackleton, Buffalo, N. Y. [Filed Oct. 26, 1875.]

171,436.

The combination of a series of return-tubes, having ascending branches, with an uptake and a deflector, D, the upper ends of all the said return-tubes being situated above, and their lower ends below, the deflector, as and for the object specified.

171,437. HANGING OR PORTABLE FOUNTAIN. Frank L. Shafer, San Francisco, Cal. [Filed June 25, 1875.]

Brief.—The pipe is connected with the supply, and the water led to the jets is thrown in spray and caught by the bowl, until the water-level rises high enough to lift the ball-float, when water flows up the pipe and charges the siphon, and causes it to draw off the water in the basin, until its level is reduced to a certain point. The float will then fall and close the valve, thus stopping the flow from the fountain. It thus acts automatically and without danger of overflow.



1. A hanging self-operating fountain, constructed as described, consisting of the supply and siphon discharge-pipes B D D E, provided with the valve e and opening f, and connected together by the pipe F, combined and arranged with the basin A and the jets c d, in the manner shown and described.

2. In combination with the self-operating fountain, as above described, the cone a and reflector b, within the basin, to hold and protect the light, as set forth and specified.

3. The combination and arrangement of the siphon-pipe D E with the pipe C, provided with the valve and ball-float e, and connected with the pipe F, operating in the manner and for the purpose set forth and specified.

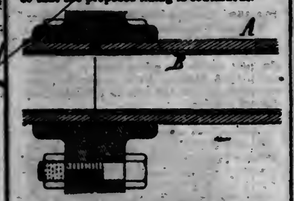
171,438. SPRING-MOTORS. Minhe Shiver, Baltimore, Md., assignor, by mesne assignments, to William C. Dreyer, same place. [Filed Oct. 30, 1875.]

1. In combination with a motor, constructed substantially as described, the brakes L L1 and their arms n n', the brake L having a treadle-rod, p, attached to its free end, substantially as described.

2. The springs S, composed of two or more ribbons firmly united at both ends, and inclosed in a suitable case, substantially as specified.

171,439. PACKING FILTERS. T. B. Sinclaire, New York, N. Y. (Filed Apr. 6, 1874.)

Brief.—A method of packing by which liquid can be properly filtered in increased quantities, without increasing the pressure or the construction of the machine.



1. The method or process herein described of packing the chamber of a filtering-vessel, by interposing a vertical stratum or column (one or more) of coarser, or more permeable or less resisting, substance than the body of the filtering material proper between the vertical wall or walls of the filtering-chamber and the wall or walls of a receiver or distributer, arranged or projecting wholly or partially within the said filtering-chamber, substantially as herein specified.

2. The combination, in a filtering chamber or vessel, of a vertical stratum or column (one or more) of coarser, or more permeable or less resisting, substance than the body of the filtering material proper, interposed between the vertical wall or walls of the filtering-chamber and the wall or walls of a receiver or distributer, arranged or projecting wholly or partially within the said filtering-chamber, with a stratum (one or more) of like or similar substance interposed between the top and bottom walls, either or both, of the said chamber or vessel and the wall or walls of the said receiver or distributer.

171,440. WATER-PIPES. Reuben W. Smith, New York, N. Y. [Filed May 1, 1875.]

Brief.—A pipe unaffected by salt-water, and avoiding galvanic action. After the metallic pipe has been prepared, as described, there is inserted a pipe composed of one part tin and nine parts lead. The contact is made as shown. The ends of the pipes have couplings with recessed flange-pieces, as described, so that the proposed lining is continuous.

1. The lining-pipe composed of tin and lead, in the proportions specified, in combination with an inclosing-pipe, A, forming a composite pipe, having the qualities herein set forth.

2. The soft-metal pipe composed of an alloy of tin and lead, in the proportions indicated, for the purposes set forth.

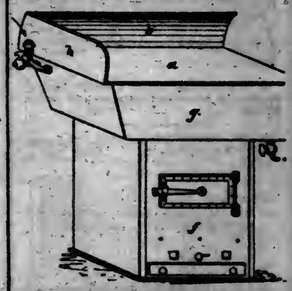
3. The recessed flange-pieces a a on the iron pipe A, in combination with a soft-metal lining-pipe, B, with its turned-out flange b, as and for the purposes specified.

171,441. BLASTING-CARTRIDGES. Frisbie W. Smith and Fredrick Egge, Bridgeport, Conn., assignors to Paul A. Oliver, Wilkesbarre, Pa. [Filed Nov. 18, 1875.]

A blasting-cartridge, A, formed of a tube of paper, muslin, or other suitable material, and having its bottom held in place by means of a solid plug, B, forced in from the inside, and an exterior cap, C, all substantially as and for the purposes herein set forth.

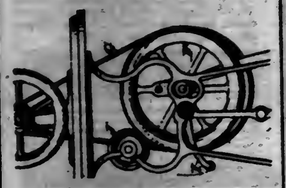
171,442. BREECH-LOADING FIRE-ARMS. Chas. E. Spalder and Chas. W. Spalder, Baltimore, Md. [Filed July 24, 1875.]

1. The locking-lever eccentrically pivoted at d, and secured to the rear extension of the breech frame by means of a screw-stud and adjusting-nuts, said stud working in a transverse slot in the extension O, as described.



2. The combination of locking-lever E, spring l, rigidly secured thereto at one end, and the stud m, whereby the lever E is automatically thrown into engagement with the extension of the barrels, substantially as shown and described.

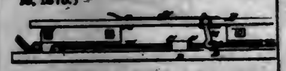
171,443. DENTAL CHAIRS. Eli T. Starr, Philadelphia, Pa., assignor to Samuel S. White, same place. [Filed Nov. 6, 1875.]



The chair-elevating apparatus herein before set forth, consisting of the combination of the base or frame, its collar, the nut fixed therein, the screw-spindle passing through the nut, and the slotted sleeve inclosing the spindle and moving endwise through the collar, as and for the purposes described.

171,444. STEAM CANDY-HEATERS. Bernhard Stern and Herman Stern, Chattanooga, Tenn. [Filed Oct. 15, 1875.]

The combination of the furnace f, the reservoir g on top of the same, the covering-plate e, heating-plate h, curved plate k, and the pipes c d i, all constructed substantially as and for the purposes herein set forth.



171,448. SEWING-MACHINE DRIVING MECHANISM. Roswell H. St. John, Springfield, Ohio. [Filed Nov. 27, 1875.]

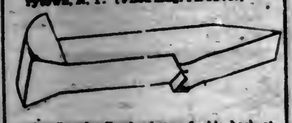
1. A sewing-machine driving-wheel, F, mounted in bearings on a vertically-movable frame or lever, I, for the purposes of tightening the band by the depression and gravity of the wheel, substantially as set forth.

2. The combination of the vertically-adjustable driving-wheel F, the friction-pulley J, and the hand G, substantially as herein set forth, to admit of placing the said wheel in operative connection with either the friction-pulley or the hand at will, and out of such connection with the other.

171,449. FOLDING COOPS. Daniel M. Sullivan, Montgomery City, Mo. [Filed Aug. 16, 1875.]

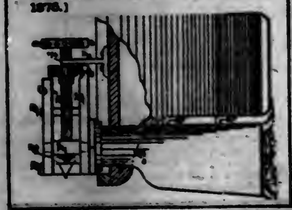
1. The bottom D, provided with sides E, in combination with the top B, provided with ends A, said sides and ends being hinged, by means of eye-screws, to said bottom and top respectively, substantially in the manner described.

2. The eye-screws forming an adjustable attachment for said sides and ends, in combination with the bottom D, sides E, top B, and ends A, as set forth.



171,447. SPIKES. Theodore B. Timby, Tarrytown, N. Y. [Filed Aug. 14, 1875.]

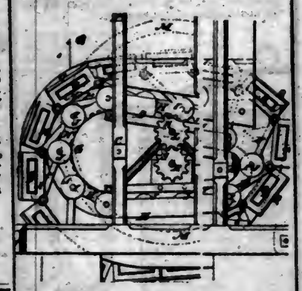
Brief.—The longitudinal rib serves to impart strength and rigidity to the spike where stiffness is most needed.



A railroad-spike constructed at its upper part with a longitudinal hook rib or fin, as and for the purposes specified.

171,446. SPIKES. Theodore B. Timby, Tarrytown, N. Y. [Filed Aug. 14, 1875.]

A railroad-spike having a double barb at or near its lower end, substantially as described.



171,450. STEERING APPARATUS. M. Townsend, Fort Norris, N. J. [Filed Dec. 1, 1875.]

In combination with the rudder A, the segments B C, swiveled post F, shaft D, pinion H, and hand-wheel G, the several parts being constructed and arranged to operate substantially as shown and described.

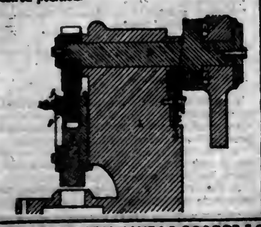
171,459. HORSE-POWERS. Frederick Translader, Harmersville, N. J. [Filed Nov. 27, 1875.]

Brief.—Outer and inner endless chains are connected by bars pivoted to each, enable the horses to walk upon a level, and produce the same effect as when walking upon an inclined plane.

1. The combination of the platform-planks Q, the slotted links N, the two sets of cross-rods O I, the connecting-bars P, the toothed links H, and the wheels or rollers J, with the inclined and curved tracks D E F G, and the gear-wheels K attached to the driving-shaft L, substantially as herein shown and described.

2. The combination of the second shaft S, and its gear-wheels R, with the shaft and gear-wheels L K, connected with the toothed links H, substantially as herein shown and described.

171,451. TRUCKS. James Viall, John F. Townsend, and David W. Hill, Akron, Ohio. [Filed Oct. 26, 1875.]

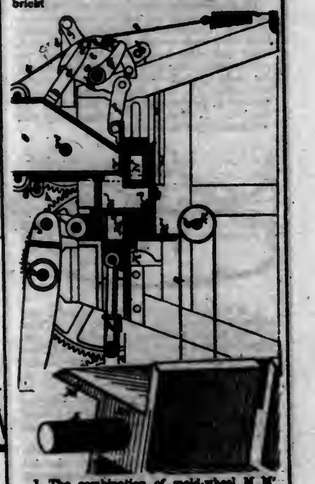


1. In combination with the truck, constructed as herein described, the turn-table consisting of the sides G, ends H, and sheet-metal trough I, substantially in the manner as described, and for the purpose set forth.

2. The combination of the platform of the truck having projecting tongues on the sides, and supporting the pipe-trough, with the side bearers of the truck provided with corresponding grooves, all substantially as and for the purpose described.

171,452. CUTTING AND PUNCHING PRESSES. Matthew Von Culin, Baltimore, Md. [Filed May 20, 1875.]

Brief.—A portion of the slide, into which the bolt screws for adjustment, is removed and a block inserted, which is pressed, by a set-screw, against the bolt to hold it in any desired position.



1. The combination, as herein shown and described, with the slide *c a*, the parts being screw-threaded exteriorly and interiorly, as shown, and the part *c* swiveled in the yoke, of the cap *f*, secured to the part *c*, the block *g*, having a screw-thread to correspond with that on the part *c*, and the set-screw *h*, as and for the purpose set forth.

2. The combination of the slide *a*, having the beveled side, as shown, with the frame of the machine, similarly shaped, and large enough to allow a clear space behind the slide, and the gibs and set-screws, as shown and described, and for the purpose set forth.

171,453. BRICK-MACHINES. R. L. Wagner, St. Louis, Mo. [Filed Sept. 10, 1875.]

Brief.—The receiving-chamber beneath the hopper is shut off at each stroke, from the hopper at one side and the mold at the other, by sliding plates, which regulate the amount of clay required. The molds consist of rectangular tubs turning between plates, which form the housing of the mold-wheel and the ends of the molds. The tubs have wings extending in the planes of their sides, thereby forming a rectangular recess with the next face, which forms two sides of the molds, the other two sides being formed by plungers, which move inward simultaneously upon the brick.

1. The combination of mold-wheel M M' and pressure-blocks G H, substantially as set forth.

2. The combination of the mold-wheel M M', bearing-plates K and plunger P, substantially as set forth.

3. The combination of the hopper *e* and plunger P and cut-off Y, working above the plunger and beneath the hopper, substantially as set forth.

4. In combination with the hopper *e*, plunger P, and cut-off Y, the falling gate X, substantially as and for the purpose set forth.

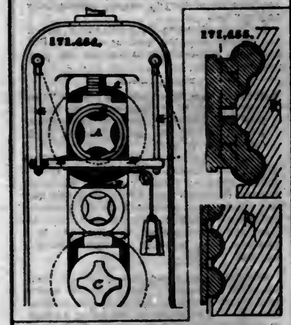
5. The combination of drop-gate X, cords or chains *c*, segments *c*, springs *c*, arms S' on rock-shaft S', spring-catches *g'*, and arms *d* to relieve the catches from arms S', substantially as set forth.

6. The combination of cut-off Y, rods *f*, segments *c*, springs *c*, arms S', catches *g'*, and shaft S', substantially as set forth.

7. The combination of mold-wheel having tangential wings M, ratchet-wheel A, oscillating plate *i* on wheel-shaft *l*, and pawls *l* and *l'*, giving intermittent motion to the mold-wheel.

8. The combination, with the mold-wheel M M', ratchet-wheel A, oscillating plate *i*, and pawls *l l'*, of the oscillating arm *n*, pawls *p r*, and ratchet-wheel *o*, giving motion to the off-bearing belt simultaneously with the movement of the mold-wheel, as set forth.

9. The combination of pressure-block G and plunger P, at opposite sides of mold-wheel, exerting simultaneous pressure at opposite sides of said mold-wheel, substantially as set forth.



171,454. ROLLS FOR ROLLING IRON. Joseph H. Webster, St. Louis, Mo. [Filed Oct. 27, 1875.]

Brief.—The weight causes the beam to partially support the roll on its being raised by the insertion of the iron.

1. The bar B, having an inclined movement, in combination with the roll A, substantially as set forth.

2. The bars B and links G, in combination with the roll A, loose collar *c*, and weight F, substantially as set forth.

3. The bars E and links G, in combination with the roll A and weight F, substantially as set forth.

171,455. MODES OF DECORATING ENAMELED MOLDINGS. Albert G. White, Brooklyn, N. Y. [Filed May 8, 1875.]

Brief.—Enameled moldings are cut from their connecting wood base or backing, and the use of a hand-planer and sandpapering obviated in dressing the same, by placing the moldings in a bed-piece provided with corresponding grooves of equal width and length, and feeding them to a cutter-head provided with adjustable cutters, set to the exact thickness of wood required to be cut off.

The method herein described of dressing or planing off enameled moldings by passing them through a planer seated in correspondingly-grooved bed-pieces, and cutting off the connecting wooden back or base to the exact true base of the moldings, substantially in the manner and for the purpose set forth.

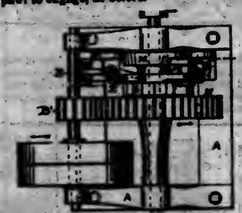
171,456. REFRIGERATORS. Jas. H. Wicher, New York, N. Y. [Filed Nov. 10, 1875.]

Brief.—Draws air from top of the preserving-chamber, and forces through an air-distributer in the center of the ice-chamber, and thence through the ice, and out of it at the bottom into the preserving-chamber.

The combination of the horizontally-zoned chamber A, ice-reservoir B, communicating with the same and located within it, the air-distributer D within said ice-reservoir, and the tubes *c* and *c*, leading from the flue C, and communicating, respectively, with the ice-reservoir and provision-chamber, substantially as described.

171,457. DIES FOR MAKING SPAT-HEELS AND OUTSOLES FOR CARRIAGES. Darius Wilcox, Birmingham, Conn., assignor of one-half his right to Isaac P. Howe, same place. [Filed Dec. 1, 1875.]

Brief.—Preliminary and finishing dies act successively upon the metal edgewise and then flatwise.



1. The combination of the dies *a a b b*, for the formation of stay-ends or offsets by swaging and striking, edgewise and flatwise alternately, substantially as explained.

2. The combination of the preliminary swaging-dies *a a b b* and the final die or dies, for completing the formation of the stay-ends or offsets, in the manner explained.

171,458. LIFTING DEVICES FOR DROP-HAMMERS. C. O. Wilder, Chicago, Ill. [Filed Nov. 3, 1875.]

Brief.—A fixed disk on the counter-shaft carries a small shaft, which is provided at one end with a lifter, and at the other with a pawl. When the weight has been elevated, the lifter comes into contact with a fixed cam-surface, which forces it up and disengages the pawl from the ratchet-wheel upon the sleeve. When the weight falls, the lifter slides off from the cam-surface, and allows the ratchet-wheel and pawl to engage, as before.

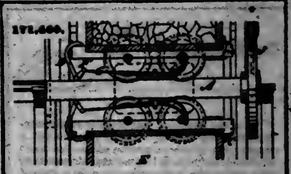
1. The pawl I, lifter F, disk B, and cam M, arranged to operate with the shaft C, and detent-catch N, substantially as and for the purpose specified.

2. The pawl I and lifter F, when carried on the same shaft, and arranged to operate with disk B, cam M, shaft C, crank D, ratchet G, and pinions H and E, and frame A, substantially as and for the purpose specified.

3. The combination, with the disk B, formed with its teeth or recess *c*, of the shaft *c*, lifter F', and pawl I, substantially as herein shown and described.

171,460. MILLSTONE-DRIVERS. Henry Wilhelm, Minerva, Ohio, assignor of one-half his right to Fremont D. Davis, same place. [Filed Aug. 31, 1875.]

Brief.—The bearing-points of the set-screws are nearly on a line with the point on which the balance-rynd is hung, reducing friction, and the side shoulders of the driver prevent the rynd from sliding off when the stone is rotated at unusual speed.



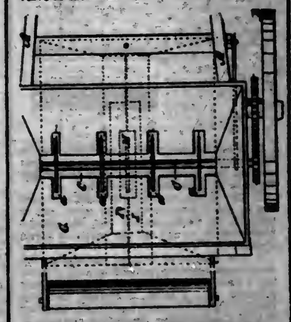
The combination of the driver B, recessed at *b*, and having the raised sides or shoulders D, with the set-screws *c* and ball C, when combined and arranged for operation as herein shown and specified.

171,461. CAR-DUMPING APPARATUS. Jeremiah Wiland, Sr., Myerstown, Pa. [Filed Oct. 20, 1875.]

Brief.—A section of the track has rails on the lower and upper sides. The frame is provided with means for holding a car on each side of said track, which, by half-revolutions, tilts the full car down to empty, and, at the same time brings the previously-emptied car to the upper side for reloading.

171,462. CAR-COUPLERS. George L. Whall, Beverly, N. J. [Filed Oct. 16, 1875.]

1. The combination of a revolving railway-track section, A, having bar C and hooks D for securing a car with a rail-track, substantially as specified.



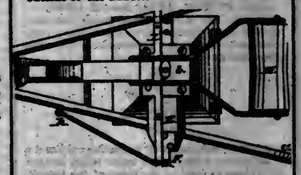
2. The combination of the spring-stops H and lever I, with said revolving section of a rail-track, substantially as specified.

3. The combination of the rotating guides I, with the rotating track-section, substantially as specified.

4. The combination of the rotating guides I and the stationary chute M, with the rotating track-section, substantially as specified.

171,463. DRILLS AND FERTILIZER-DISTRIBUTORS. Alsdon S. Wishart, Lumberton, N. C. [Filed June 7, 1875.]

Brief.—Upon the frame is adjustably attached a hopper provided with a slatted bottom, in which work toothed wheels for drawing out the fertilizer. When the hopper is placed longitudinally on the frame, a single wheel works in the bottom; but when placed transversely, all the wheels on the shaft revolve in the slots.



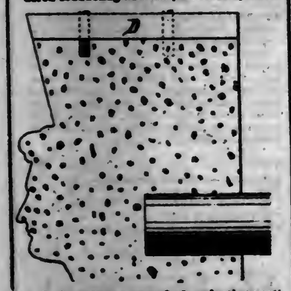
1. The combination, with the revolving shaft C carrying a series of wheels, of a reversible hopper having a slotted bottom, substantially as and for the purpose described.

2. The combination of shaft C carrying a series of wheels, the reversible hopper G having a single longitudinal slot, and also transverse slots *a*, and the adjustable slides I I and J J, substantially as and for the purpose specified.

171,464. CORN-PLANTERS. S. Wishard, Curley's Tank, Ala. [Filed Mar. 8, 1875.]

Brief.—The seed-box is mounted upon the rear end of the beam, and the seed-slide in the bottom of the seed-box is worked by means of a pivoted lever moving horizontally outside of the handle.

In a walking-planter, the combination of the slotted lever F with the slotted lever G, seed-valve H, and handle C, substantially as and for the purpose herein before described and set forth.



171,668.

As a new article of manufacture the herein-described can-opener, which is composed of a single piece of metal, and in which the point of the blade projects beyond the fulcrum-arm, and the latter terminates in a cam-shaped head standing in line with said blade.

171,669. ELECTROPLATING STATUETTES, &c. Wm. H. Worthen and Richd. S. Gillespie, New York, N. Y. [Filed Feb. 19, 1875.]

Brief.—The casting is composed of carbonaceous matter united by a bituminous cement, and having inserted in it a plug of wood for fastening. The recessed portions are first coated with a highly conducting paint, and immersed in the bath until the said parts are covered, when the rest of the figure is rendered conducting and the process completed.

1. A casting composed of conducting particles, united together with a non-absorbent cement, and covered with a close-fitting electroplate shell, as herein specified.

2. The conducting and non-absorbent casting A, in combination with the metal part or parts D, the whole covered with the electroplate shell a, as and for the purposes herein specified.

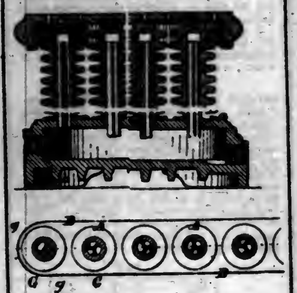
3. The process of forming electroplate figures herein described, consisting, first, of pouring a heated conducting and non-absorbent material into a mold, afterward inserting therein a mass of wood, and finally covering it with a tight-fitting electrotype coating, as herein specified.

4. The within-described process of electroplating figures by first applying only the partial coating M of conducting material, and, after subjecting the article to the bath with said partial coating on only the recessed and most difficult portions, to subsequently apply the coating on the projecting portions, and finally to allow the deposit to be received thereon, as and for the purposes herein specified.

REISSUES.

6,809. NURSING-BOTTLES. Milo S. Burr, Boston, Mass. Patent No. 69,295, dated Aug. 27, 1867. [Filed Nov. 11, 1875.]

Brief.—The mouth-guard has a continuation in both directions, with shoulders upon one end, to hold the suction-tube, and upon the other to hold the nipple.



1. The combination of a mouth-guard and a shoulder for a nipple, the latter being located in a plane in front of the plane of the mouth-guard, and in continuation of the guard, substantially as described.

2. The combination of a mouth-guard, a shoulder for a suction-tube connection, and a shoulder for a nipple-connection, the latter located in a plane in front of the plane of the mouth-guard, and in continuation of the guard, substantially as described.

3. The combination of a mouth-guard, F, a shoulder, E, for a suction-tube, and shoulders *d d*, for nipples of different sizes, located in planes in front of the plane of the mouth-guard, and in continuation of the guard, substantially as described.

6,810. STEAM-RADIATORS. Albert L. Ide, Springfield, Ill. Patent No. 144,061, dated Nov. 25, 1873. [Filed Dec. 2, 1875.]

Brief.—The entering steam rises in two of the vertical passages, and, partially condensed, escapes in the third.

In a steam-radiator, a vertical pipe or column, constructed of cast or wrought metal, and divided exteriorly into three vertical passages, substantially as and for the purpose specified.

6,811. FLY-TRAPS. John Parker, Dubuque, Iowa. Patent No. 109,444, dated Nov. 22, 1870. [Filed Nov. 26, 1875.]

1. The wire-cloth cone A, closed at top and open at bottom, and supported by upright and horizontal stays, and provided with a wire cone, E, having an exit above its base, substantially as and for the purpose herein described.

2. The wire cone E', having an exit above its base, in combination with the wire cone E and wire cone A, supported by upright and horizontal stays, substantially as and for the purpose herein described.

3. The wire cone E, having an exit above its base and fastened to the inner side of the wire cone A, which is supported at its bottom by an annular stay, and from top to bottom by upright stays, substantially as and for the purpose described.

4. The wire-cloth fly trap A and E, provided with narrow extensions B' below the bottom of its outer cone A and its cone E, substantially as and for the purpose described.

5. The wire-cloth fly-trap A and E, the outer cone A having a truncated conical top, with a vertical neck, and provided with a removable cover, which fits over the neck of the top, substantially as and for the purpose described.

6. The wire cloth annulus G, in combination with the wire cone A, and wire cone E, substantially as and for the purpose described.

7. The annulus G', in combination with the annulus G, wire extensions B', cone A, and wire cone E, substantially as and for the purpose described.

6,812. CURE-BEATS FOR VIOLINS. Hiram W. White, Ostaloosa, Iowa, assignor to Lyon & Healey, Chicago, Ill. Patent No. 155,780, dated Oct. 6, 1874. [Filed Nov. 20, 1875.]

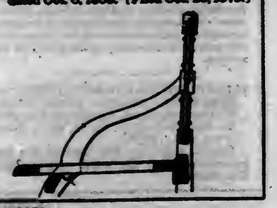
1. A violin chin-rest, provided with a yielding and self-adjustable clamp, for the purpose of thereby retaining the rest upon the instrument, and rendering the same applicable to instruments of varying depth, substantially as described.

2. The combination of the chin rest F, shank G, provided with the head or clamp H, and spring *f*, substantially as and for the purpose specified.

6,813. BARREL-MACHINES. Arculeus Wyckoff, Elmira, N. Y., assignor to the Seamless Keg and Can Company, same place. Patent No. 51,043, dated Dec. 19, 1865. [Filed Mar. 3, 1875.]

Brief.—A cylindrical shell of wood cut from a solid block can be compressed into the ordinary shape of a barrel, and the hoops applied at the same time, by means of two flaring cup-dies, one of which has a reciprocating rectilinear motion, in suitable guideways, toward and from the other, imparted to it by a powerful screw, to which the required force is applied.

The two flaring cup-dies B and B', each composed of two parts hinged together and a suitable guiding and supporting jaw, in combination with a device for imparting a reciprocating rectilinear motion to one die toward and from the other, substantially as and for the purposes set forth.



6,814. BARREL-MACHINES. Arculeus Wyckoff, Elmira, N. Y., assignor to the Seamless Keg and Can Company, same place. Patent No. 51,043, dated Dec. 19, 1865. [Filed Mar. 3, 1875.]

Brief.—The barrel is formed by annularly compressing both ends of its cylindriform portion by two flaring cup-dies, provided with recesses for hoops, so as to produce a progressively-increasing taper from the central portion toward the ends.

As a new article of manufacture, a barrel whose cylindriform part is annularly compressed in variable degrees from its central portion progressively to its ends, substantially as set forth.

6,815. FOLDING CHAIRS. Peter Born, New York, N. Y., assignor, by mesne assignments, to E. W. Vail. Patent No. 62,792, dated Oct. 6, 1866. [Filed Oct. 20, 1875.]

6,816. WEFTGRIPS. Jacob Brinkerhoff, Auburn, N. Y., assignor, by mesne assignments, to himself, Chas. M. Howlet, Elon C. Denio, and John I Brinkerhoff. Patent No. 122,230, dated Dec. 26, 1871; reissue No. 6,218, dated Jan. 7, 1873. [Filed Dec. 16, 1875.]

1. The combination of two rolls and suitable connecting mechanism with a counter-shaft, having a fixed journal at one side of the frame, and a sliding journal at the other.

2. The combination of the rolls C and D, arranged with gearing and sliding boxes and journals, to allow one or both ends of the rolls to be separated without changing the relative position of the gearing.

3. The combination of the train of gears *d e f* with the box B, so that they shall always move together, and consequently be always in gear with each other, while they move up and down with the upper or yielding one of the pair of rolls, substantially as described.

4. In combination with the train of gears and the under roll detached from the box B, the counter-shaft E and gears *h j*, for driving said under roll, substantially as described.

5. The upper roll C, driven from the crank and by a pinion of smaller size than the pinion upon the shaft of roll C, and the lower roll D, driven from the opposite end by suitable connecting mechanism to obtain the required purchase, substantially as and for the purpose set forth.

6. In combination with the rubber rolls C D, the purchase-pinion *d*, located opposite the end of the lower roll D, and revolving independently of said lower roll, with suitable mechanism for imparting motion to the rolls, for the purpose set forth.

7. The combination of the rollers C and D and the purchase-pinion *d*, arranged to accommodate itself to the up-and-down movement of either roll, for the purposes set forth.

6,817. DENTAL HAMMERS. James C. Dean, Chicago, Ill., assignor to Samuel S. White, Philadelphia, Pa. Patent No. 48,706, dated July 11, 1865. [Filed Dec. 2, 1875.]

Brief.—A tubular case containing an actuating-spring, a hammer with an elastic material on its face, and the shank of a tool-holder which is encircled by a spring. The hammer is raised by a lever which is automatically tripped, when the force of the actuating-spring forces it upon the tool-holder.

1. The combination, substantially as hereinbefore set forth, in a dental instrument, of a handle, a tool-holder, and a hammer actuating the tool-holder.

1. In a folding chair, the back and back legs forming one frame, in combination with the front legs extended above the seat and pivoted to the back, substantially as set forth.

2. The back and back legs forming one frame, a folding-seat frame, and front legs connected at their upper ends to the back frame, in combination with stops to hold the seat and front legs in position, when unfolded for use, substantially as set forth.

3. In a folding chair, a back and back legs in one frame, and front legs extending above the seat or seat-frame, and pivoted to the back, in combination with a folding seat and a cross-bar between the front legs that support the seat, substantially as set forth.

4. The combination, with the back legs and back of a folding chair forming one frame, and the front-leg frame connected at its upper end to the back frame, of a seat-frame hinged to the back and folding downwardly, and supports upon the front legs for the seat and for limiting the forward movement of the front legs when in use, substantially as set forth.

5. In a folding chair, the front legs extended upwardly above the seat and forming arm-pieces that are hinged directly to the back frame, substantially as set forth.

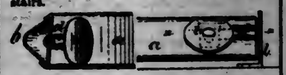
6,818. WEFTGRIPS. Jacob Brinkerhoff, Auburn, N. Y., assignor, by mesne assignments, to himself, Chas. M. Howlet, Elon C. Denio, and John I Brinkerhoff. Patent No. 122,230, dated Dec. 26, 1871; reissue No. 6,218, dated Jan. 7, 1873. [Filed Dec. 16, 1875.]

1. The combination of two rolls and suitable connecting mechanism with a counter-shaft, having a fixed journal at one side of the frame, and a sliding journal at the other.

2. The combination of the rolls C and D, arranged with gearing and sliding boxes and journals, to allow one or both ends of the rolls to be separated without changing the relative position of the gearing.

3. The combination of the train of gears *d e f* with the box B, so that they shall always move together, and consequently be always in gear with each other, while they move up and down with the upper or yielding one of the pair of rolls, substantially as described.

4. In combination with the train of gears and the under roll detached from the box B, the counter-shaft E and gears *h j*, for driving said under roll, substantially as described.



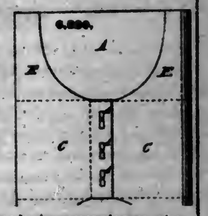
5. The upper roll C, driven from the crank and by a pinion of smaller size than the pinion upon the shaft of roll C, and the lower roll D, driven from the opposite end by suitable connecting mechanism to obtain the required purchase, substantially as and for the purpose set forth.

6. In combination with the rubber rolls C D, the purchase-pinion *d*, located opposite the end of the lower roll D, and revolving independently of said lower roll, with suitable mechanism for imparting motion to the rolls, for the purpose set forth.

7. The combination of the rollers C and D and the purchase-pinion *d*, arranged to accommodate itself to the up-and-down movement of either roll, for the purposes set forth.

6,819. STAIR-RODS. Hans Pearson, New York, N. Y. Patent No. 156,033, dated Sept. 15, 1874. [Filed June 21, 1875.]

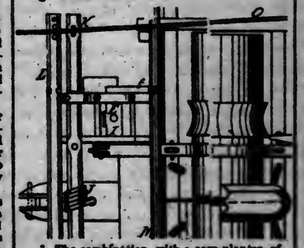
Brief.—A hollow triangular-shaped rod has its face formed of a metal strip, folded backwardly, and the edges connected by the metal back, the edges of the front and rear strips interlocking with each other. There is also a bolt within the end of the stair-rod, and a button-head outside, connected to the bolt by a rivet passing through a mortise in the shoe, the construction giving an endwise-moving bolt, which serves to attach the rod, either to the casing at the sides of the stair or to metal eyes, so that the stair-rod can be, if desired, of even length with the entire width of the stairs.



1. The hollow stair-rod, having a face, *a*, that is formed of a metal strip folded backwardly, and the edges connected by the metal back *b*, substantially as set forth.

2. The bolt *d* within the end of the stair-rod, and a button-head, *f*, outside the rod, connected to the bolt by a rivet passing through a mortise in the bolt, substantially as set forth.

6,820. ENVELOPES. Ralph S. Jennings, Philadelphia, Pa., assignor to himself and N. G. Kellogg. Patent No. 64,870, dated May 21, 1867. [Filed Mar. 13, 1872.]

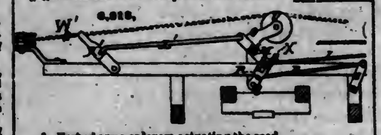


Brief.—By this construction the usual corners or ends beneath the top and bottom flaps are closed by wings or counter folds of the central flaps. Thus the possibility of introducing a wire or other instrument to abstract the contents without destroying the envelope is practically avoided.

An envelope having corner wings or extensions E, adapted for folding inward, substantially as and for the purpose specified.

6,821. CORN-PLANTERS. John Thomson and John Ramsey, Aledo, assignors, by mesne assignments, to Geo. D. Haworth, James W. Haworth, L. L. Haworth, and Mahlon Haworth, Decatur, Ill. Patent No. 44,472, dated Sept. 27, 1864. [Filed Nov. 23, 1875.]

Brief.—A knotted cord stretched from side to side of the field engages with forked arms of a rock-shaft upon the machine, for actuating the seed-slides.



1. The combination, with a corn-planter, of a knotted cord for actuating the seeding devices.

2. In combination with the cord or its equivalent actuating the seeding devices of a corn-planter, guides or pulleys arranged to transfer said cord from one side of the machine to the other in its passage over the same.

6,822. SEED-PLANTERS. Geo. D. Haworth, Decatur, Ill. Patent No. 100,032, dated Feb. 22, 1870. [Filed Nov. 23, 1875.]

Brief.—Seeding devices actuated by a knotted cord stretched across the field, which engages with forked arms upon the machine.

1. Forked arms or levers actuating the seeding devices, in combination with the knotted cord or its equivalent, operating said arms or levers, whereby the cord is made to impart a positive movement in both directions to the seeding-slides.

2. The combination, in a seeding-machine, of forked arms or levers and an actuating-cord for operating the seeding devices, whereby the action of the cord upon one arm is made to set or move another arm into position to be acted upon by the cord.

3. In combination with the knotted cord for actuating the seeding devices, guides or pulleys arranged to direct the cord in its passage across the machine on the same line when moving in opposite directions.

4. Guides or pulleys over which the cord passes in being transferred from one side of the machine to the other, in combination with intermediate arms or levers operated upon by the cord in its passage between the guides or pulleys for actuating the seeding devices.

5. The arrangement of the guides or pulleys for transferring the knotted cord from one side of the machine to the other, and of the forked arms or levers acted upon by said cord relatively to the seeding devices, whereby each knot of the cord is made to deposit the seed in the same transverse row or rows when moving in opposite directions, as described.

6. The combination of the forked arms or levers with the seeding-slides and the intermediate connecting devices, adapting said forked arms to move both before and after the movement of the seeding-slides and also to hold said slides while at rest, substantially as described.

7. The combination of the guiding-pulleys for transferring the knotted cord from one side of the machine to the other, and the forked arms or levers and their connecting devices for actuating the seeding mechanism, with the detachable bar E, or its equivalent, adapting them to be readily applied to or removed from the machine, as specified.

8. The combination of the forked arms or levers K K', rocker-plate M, connecting-rods L L', forked arms P, rod R, crank S, shaft T, and hand-lever D, substantially as specified.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 26. TUESDAY, DECEMBER 28, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1876 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time.

R. H. DUELL, *Commissioner.*

COMMISSIONER'S DECISIONS.

SCLOTTERBECK AND KNEISLEY.—*Interlocutory Appeal.*

[*Appeal from the Principal Examiner in the matter of the application of Sclotterbeck and Kneisley, for letters patent for* "IMPROVEMENT IN BOILER-FURNACE."—*Decided December* 21, 1875.]

Where the original specification, drawing, and model described and showed the improvement as applied to but one kind of boiler furnace: *Held*, That an amendment showing that the apparatus could be adapted to other kinds of boiler-furnaces without making any change therein, except that of position, was not new matter.

DUELL, *Commissioner:*

This appeal is taken from a refusal of the Examiner to allow certain alleged new matter to be introduced into the amended specification.

The only issue, the Examiner says, is the objection made to the following matter attempted for the first time to be introduced into the specification:

We have shown our improvements as applied to an ordinary furnace, and to a two-flue boiler, but they are equally applicable to that type of boilers in which the fire-box forms a part of the same, the only change necessary being that the vertical pipes in the rear corners be caused to ascend within the furnace, instead of within the bridge-wall.

This paragraph, in the opinion of the Examiner, embraces matter opposed to the requirements of Office Rule 32.

The applicants in their drawing, model, and original specification show and describe but one kind of boiler, and this allusion to the adaptation of the invention to another kind of boiler the Examiner regards as an unwarrantable interpolation.

The gist of this invention consists in the combination and arrangement of certain pipes leading from the generator, and extending upward within the walls of the furnace at its four corners above the fire, for conducting steam from the generator to the furnace, and, by the jets of steam issuing from the elongated nozzles of the pipes, to drive the smoke and gases to the central portion of the furnace, where they are consumed—producing thereby additional heat.

The claim, to which the Examiner does not object, is as follows:

Vertical pipes arranged in the corners of a furnace, and having elongated discharge-orifices, two of which are vertical and two horizontal, in combination with supply-pipes, arranged under the grate-bars of a furnace, substantially as and for the purpose set forth.

The requisites of Rule 32 do not require that after an applicant has filed his specification he should allow it to remain in precisely the same condition as when filed, without any change in its language, or any addition thereto, which would make its terms clearer, or which would specify with more particularity certain alternate adaptations of his invention. The only object the Rule has, or can have, is to prevent applicants from making such substantial and material changes in their specifications, drawings, and models which would really amount to a new invention, or an additional improvement, not originally contemplated, and which might properly form the subject of a new application. To limit an applicant to the precise description which he has first adopted, and while the application is open to amendment, would be an arbitrary proceeding not warranted by law or good sense. In this case, the applicant had first made mention of a single kind of furnace to which his invention could be adapted, and that particular kind of furnace was represented by his model and drawing; but it will be seen that without the

slightest material change in the operation of the invention, or arrangement of its parts, the same can be adapted to other furnaces in precisely the same manner, to accomplish precisely the same result. The mere fact that the furnace shown in the model has a bridge-wall, through the chamber of which two of the pipes pass, does not, necessarily, limit him to that style of furnace, if the apparatus without any change in its arrangement can be placed in a boiler-furnace in which the fire-box forms a part of the same. The only difference being that in one case the pipes pass through an empty chamber, and in the other they pass through the water.

In the case of *L. J. Knowles*, (C. D., 1870, p. 161,) upon which the Examiner relies, the Commissioner held that, as a general thing, it was certainly sound practice that the party had no more right to make changes in his specification not based upon what was shown in the drawing and model, than he had to change the drawing itself in particulars not warranted by the model, and *vice versa*. And the Commissioner added that there was a special reason why the Rule should be applied in that case, which was that the amendment was proposed after the application had been pending for a period of more than two years, the presumption being in such case that the modification was material, and an afterthought.

It is not stated in the decision in what the modification consisted, and the case must be construed, in view of the principle here set forth, that the modification amounted to a material change in the invention, or a substantial improvement thereon.

It was stated by the applicant that the modification did not change the principle of the original invention, and the Examiner did not take issue upon this point; neither did the Commissioner comment upon it, but the decision rested alone upon the implication against the applicant arising from the length of time elapsing from the filing of the application and the proposed amendment.

The decision of the Examiner is reversed.

McCULLOUGH *vs.* WATKINS.—*Interference.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the interference between the application of Lewis H. McCullough, filed September 23, 1874, and the application of William B. Watkins, filed November 23, 1872, for Letters Patent for a* "COMBINED FIRE-ALARM AND POLICE TELEGRAPH.—*Decided November 1, 1875.*]

A substantial variance between the preliminary statement and the testimony throws strong suspicion upon the latter.

Sketches produced for the occasion, and in the absence of all contemporaneous tangible evidence of early efforts, of no value, except by way of explanation.

The allegation of one that he conceived the idea of an invention at a certain time, in absence of proof of its completion by him at that time, not sufficient to establish the fact of invention.

To constitute an invention or discovery, as defined by the Office and the courts, the idea must be embodied in a practical form.

SPEAR, *Acting Commissioner:*

Before the invention of the matter now in controversy two separate telegraph-lines were used to convey fire-alarms and messages to police-stations. The parties herein propose to use one wire only for both purposes. To accomplish this there is connected to a main metallic circuit, which includes within its course police-stations, with a single insulated battery and the necessary insulated instruments, and an additional, or, as it is called, an auxiliary battery with an earth-connection. One pole of the auxiliary battery is connected permanently with the earth, and the other with the complete metallic circuit.

Upon branch wires leading from the main circuit, at different points thereon, are located fire-alarm stations, each of which has an earth-connection. The metallic circuit-connection at the police-stations is normally closed, while the earth-connection at the signal-stations is normally open. An alarm of fire struck at any one of the signal-stations is conducted to auxiliary earth-battery at the main station, over that portion of the metallic circuit-wire presenting the least resistance, and without interfering with other messages transmitted over the same wire at the same time, and without regard to the fact whether the main wire is intact or not. A return current between the auxiliary battery and each of its branches is established by their earth-connections. These are the features common to both systems, and which, therefore, constitute the interference.

Considerable dispute has been had in regard to the proper construction of the issue, as declared by the Examiner, but in my opinion it clearly covers the features I have enumerated. The declaration is as follows:

> In combination with the battery and the main metallic circuit, the auxiliary battery connected with the main circuit and with the earth. In combination with the above a series of signaling instruments connected with the main-line circuit, one or more of which has an earth-connection.

In details of operation, and character of instruments employed, there are some differences which it is unnecessary for the purposes of this controversy to consider. Both the Examiner of Interferences and the Board found priority with Watkins. There is nearly two years' difference in the date of filing of the respective applications, Watkins's having been filed November 23, 1872, and McCullough's September 23, 1874.

In his preliminary statement McCullough alleges that he conceived the idea of this invention in November, 1867; that at the same time he exhibited it in practical operation to several persons; that the object of his experiments then was to have the earth-circuit for private messages, so that no operator but the one sending and the one receiving could get the same. Thinking it then impossible to get telegraph companies to adopt it, he says:

> I let the subject drop until September, 1869, when I commenced experimenting with earth-circuit for fire-alarm signals, using the earth-circuit for fire-alarm signals and the metallic circuit for common telegraph.

He concludes as follows:

> The duplex circuit, described and claimed in my application, said to interfere with Watkins's application, and which I use now, is substantially the same as I used experimentally in November, 1867. I explained the working of that duplex circuit, and showed it to a great number of persons.

The first inquiry to be made is, Does the testimony in behalf of McCullough sustain the allegations of his preliminary statement? No wiser rule has ever been adopted by the Office, in my opinion, than that requiring parties to an interference to file at the outset sworn statements setting forth the material facts which they intend to substantiate by proof. It was adopted for the purpose of putting an end to the practice which seems at one time to have prevailed to some extent of striving on each side to learn an opponent's date of invention, only to manufacture such proof as might be necessary to fix an earlier time. (*Schenck* vs. *Rider*, C. D. 1870, p. 135.) Ample time is given to the contesting parties to make these statements, and there is no reason why they should not agree substantially with the testimony subsequently adduced by the same party. A substantial variance, therefore, between the statement thus carefully made, under oath, and the subsequent testimony of the same party, gives rise at once to a strong suspicion of his integrity, and it requires very strong corroborative testimony of disinterested parties to produce conviction of his truthfulness.

Referring now to the testimony of McCullough I agree with the Examiner of Interferences, with whose opinion the Examiners-in-Chief concurred, that it does not sustain the allegations of his preliminary statement. First, as to his experiments in 1867, which he asserts were with substantially the same "duplex circuit" now claimed in his application, and which interferes with the application of Watkins.

On direct examination McCullough testifies that in November, 1867, at Richmond, Ind., he was experimenting with an electric engine for which he obtained a patent, and in using the battery for running the engine found it too weak. He then stretched two wires from the windows of a shop where he was working, and connected their ends to a telegraph wire running along a railroad from Chicago to Richmond, in front of the shop. The telegraph wire was about twenty feet from the shop, and the ends of the branch wire, where joined to the main wire, were about fifteen feet apart.

On cross-examination he makes a diagram showing the arrangement here mentioned, with an addition of a small metallic battery within the shop, and a key and sounder placed on each side of the room. This shop wire, together with the short space of the main Chicago wire, is represented as forming a short complete metallic circuit, and used by McCullough and his assistant, Moffit, in conversing with one another across the room. Finding, he says, on inquiry, that the Chicago line was in constant use the idea occurred to him of sending two circuits over the same wire. If by this he means the present invention, his idea certainly was not embodied in his first experiment made in November, 1867. He clearly admits this himself on cross-examination. There was no earth-connection on the circuit within the shop, and it was impossible to send messages into the shop from the Chicago and Richmond wire, or from the shop to either place. In short, the shop where McCullough was experimenting was not a branch station for any purpose whatever, and what was done there no more resembles the invention in controversy than if a mere metallic circuit had been established within the shop itself. Without the connection of wires from the shop to that along the railroad, the latter was as good a practical illustration of this invention as anything McCullough then did.

McCullough's counsel contends that the circuit established by him, the connection of the shop wires with the main telegraph wire, represents the main insulated metallic circuit as now claimed. The Richmond battery he calls "the battery with one end to the earth and the other in the metallic circuit," and the Chicago end, with its instrument, the "earth branch." This theory is entirely opposed to the requirements of the invention in dispute. It lacks the essential feature of *the same circuit-wire* for both batteries, and the further requisite of a normally open earth-battery in either the metallic circuit or the branch connections. The effect of such an arrangement thus renders the "metallic circuit" entirely independent of the earth-circuit, whereas they are claimed in combination. And if combined with a single wire, and with an open earth-connection within the metallic loop, the testimony of experts clearly shows that when such connection was closed it would destroy all communication between the other two stations.

It is unnecessary to discuss further the nature of McCullough's "Exhibit 1," as it is clearly proved by the testimony on both sides that it fails to show the invention in controversy. It is well here to remark that McCullough offers no contemporaneous tangible evidence of his early experiments. Sketches made at the time of the examination are offered, but sketches and all other similar exhibits produced for the occasion, and not even purporting to be copies of originals whose loss is accounted for, are of no more weight, of course, than oral statements made at the same time, and add nothing whatever to the value of those statements, except by way of explanation.

We have, then, nothing further than McCullough's allegation to show that he even conceived of the idea of this invention in 1867. Admitting that the idea did then occur to him it cannot be regarded as the date of his invention. Merely conceiving that a thing might be done does not constitute "invention" or "discovery," as defined by the Office and the courts in their construction of the statute. It is the embodiment of the idea in a practical form that is required, and in looking for this on the part of McCullough it is necessary to go further than his experiments in 1867.

Upon further cross-examination he testifies that in 1868 he used "substantially the same circuits" as above described in a room at the depot of the Indiana Central Railroad at Richmond, Ind. He is asked to make a diagram of that arrangement, and he accordingly draws another sketch, marked "Exhibit No. 2." But instead of representing "substantially the same experiment" he had previously made, it shows substantially the arrangement now in controversy.

There is some doubt as to the practical working of an arrangement, such as is shown by "Exhibit 2," in the manner now claimed by the parties, but on its face it shows the principal features of the invention, viz: a main metallic circuit, with which is connected an auxiliary battery with an earth-connection, and branches of the earth-circuit are also shown connected to the main metallic circuit. But McCullough refuses to give a positive answer to the question as to whether his "Exhibit 2" shows the identical arrangement he had in operation at the time and place mentioned. He answers that it was substantially the same, but all through his testimony very material changes and essential differences are covered by his use of the phrase "substantially the same." He names five persons whom

he alleges witnessed the operation of his circuit as represented by "Exhibit 2." Two only of these persons are subsequently called upon to testify, and they are entirely silent as to any such occurrence. One of them, (Moffit,) in answer to a question asking him to tell all he knew about McCullough's invention and experiments, testifies that he assisted McCullough in his experiments in 1867, and had seen the latter further experiment "off and on up to 1869;" and that "in September, 1869, he (McCullough) invented his fire-alarm to work with the earth-circuit." Moffit also makes a sketch, and this shows precisely the same arrangement as McCullough's Exhibit No. 1. He is not shown Exhibit No. 2, and makes no mention of having seen any such arrangement.

I agree with the Examiner of Interferences that the testimony of McCullough in regard to the devices represented by his Exhibit No. 2 is inconsistent with his preliminary statement, with his testimony on direct examination, with the testimony of Moffit, is entirely uncorroborated, and if any such experiments took place at the Indiana Central Depot in 1868, as he alleges, they were but a continuation of precisely the same experiments made in the shop in November, 1867. He mentions other experiments made from that time until 1874, and refers to the same persons as before as witnesses, but the witnesses called failed to describe them. He admits that the first public practical exhibition he made of the combined circuits was at the Cincinnati Exposition, in September, 1874. Both in his preliminary statement and in his testimony he states that he thought when he obtained his patent of January 20, 1874, for a fire-alarm telegraph he had covered the whole ground. This assertion, in connection with the lack of evidence as to the completion of the invention in controversy by him up to that time, convinces me that the patent referred to did actually embrace all that he had practically accomplished up to that date. The subject of that patent was a fire-alarm telegraph with ground-connections at the signal-boxes, between which and the main line the circuit was ordinarily closed, by the operation of which the starting of any box broke the continuity of the main line, cutting out all boxes beyond the first, and establishing a short ground-circuit with the battery at the main station.

The independent set of police-signals, and metallic circuit added thereto, make up the present invention; and I cannot believe upon the testimony adduced that the combination was practically made until after the date of said patent. It appears that McCullough exhibited the invention in operation at Cincinnati about the same time he filed his application for a patent. This, as has been shown, was nearly two years after Watkins had filed his application, and, as the evidence in behalf of Watkins shows, nearly three years after the latter had put it in successful practical operation.

I shall adopt as mine the conclusion of the Examiner of Interferences, which is as follows:

Watkins, except in the single item of alleging conception of the idea of invention at a later date than that at which McCullough attempts unsuccessfully to establish an embodiment of the invention in a working apparatus, is superior in diligence, superior in the character of his evidence, superior in the number and practical character of his experiments, and the first to apply for a patent by nearly two years. Priority of invention is, therefore, awarded to Watkins.

The decision of the Examiners-in-Chief is affirmed.

"symbol of a spool of cotton."

3,283.—**Steel Bar, Steel Plate, and Articles Made Therefrom.**—MILLER, METCALF & PARKIN, Pittsburg, Pa. Case A. Application December 13, 1875.
"word 'Crescent.'"

3,284.—**Steel Bar, Steel Plate, and Articles Made Therefrom.**—MILLER, METCALF & PARKIN, Pittsburg, Pa. Case B. Application filed December 13, 1875.
"symbol of a crescent."

3,285.—**Mowing and Reaping Machines and Grain-Binders.**—WALTER A. WOOD MOWING AND REAPING MACHINE COMPANY, Hoosick Falls, N. Y. Application filed December 13, 1875.
"a cut, design, picture, or print of a finger-bar, and of a sickle or cutter bar of a mowing or reaping machine, which said parts may be represented crossing or intersecting each other, and above them the words 'Walter A. Wood.'"

3,286.—**Tobacco and Cigars.**—V. MARTINEZ YBOR & Co., New York, N. Y. Application filed September 24. 1875.
"words and characters as follows, to wit: 'El Principe de Gales de Vicente Martinez Ybor & Co.,' in connection with the British coat of arms."

3,287.—**Cigars and Tobacco.**—V. MARTINEZ YBOR & Co., New York, N. Y. Application filed October 12, 1875.
"words 'EL PRINCIPE DE GALES.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date December 28, 1875.]

455.—Title: "**The Golden Bird Gravel.**"—EDWARD ALDON, Brooklyn, N. Y. Application filed December 18, 1875.

456.—Title: "**Davidson's Instant Tooth-Ache Cure.**"—HENRY M. DAVIDSON, Ogdensburg, N. Y. Application filed December 20, 1875.

457.—Title: "**Extension-Lip Spur Auger Bitts.**"—RUSSELL JENNINGS, Deep River, Conn. Application filed December 18, 1875.

458.—Title: "**Brilliant Signal Oil.**"—E. M. KELLOGG, New York, N. Y. Application filed December 2, 1875.

459.—Title: "**X X Engine and Spindle Oil.**"—E. H. KELLOGG, New York, N. Y. Application filed December 20, 1875.

460.—Title: "**Continental Brace, Manufactured by the Nashawannuck Manufacturing Company.**"—NASHAWANNUCK MANUFACTURING COMPANY, East Hampton, Mass. Application filed December 17, 1875.

461.—Title: "**Two Orphans—Cigar, Manufactured by M. J. O'Brien.**"—M. J. O'BRIEN, Binghamton, N. Y. Application filed November 3, 1875.

462.—Title: "**Mathis' Quarter Dollar Family Liniment.**"—CHARLES B. MATHIS, Tom's River, N. J. Application filed December 20, 1875.

463.—Title: "**T. R. Steel's Celebrated Apple Ginger.**"—THOMAS R. STEEL, Philadelphia, Pa. Application filed December 18, 1875.

464.—Title: "**Double-Sized Sample Sheet of the Byron Weston Premium Linen Record Paper.**"—BYRON WESTON, Dalton, Mass. Application filed December 20, 1875.

THE OFFICIAL GAZETTE.

The OFFICIAL GAZETTE of the United States Patent Office is published weekly by the Patent Office. It is printed by authority of an act of Congress, which provides for its gratuitous distribution to libraries at the rate of eight for each congressional district.

The GAZETTE contains the decisions of the Commissioner of Patents, and such decisions of the courts in patent causes as are believed to possess general interest to inventors and patentees.

The claims of all patents granted are printed in the GAZETTE, bearing the same date as the issue of the patent, accompanied by a brief synopsis of the invention and a portion of the drawing.

The illustrations are photographic reproductions on a reduced scale of the drawings accompanying the original application, and preserve their fidelity. The limited space permitted for each patent prevents, in many cases, an adequate representation, but the prominent feature of invention is usually shown. Disclaimers filed in the Office are nowhere else published.

Changes in the rules of practice of the Office are announced in the GAZETTE, which affords a much readier mode of communication with parties interested than to await a new edition of the Rules of Practice.

Finally, any matter believed to be of interest to inventors in their official intercourse with the Office, will receive in the GAZETTE the attention the subject warrants.

SUBJECT-MATTER INDEX OF JULY 1, 1871.

Aërated liquor apparatus	1	Leather	92
Air and gas engines	2	Locks and latches	93
Amalgamators, ore-mills	3	Locomotives	94
Architecture	4	Looms	95
Artificial limbs, &c	5	Manures	96
Baking	6	Mathematical instruments	97
Baling-presses	7	Medical compounds	98
Baths, closets, &c	8	Metallurgic processes	99
Bee-hives	9	Metal working	100
Bell and brass founding	10	Meteorological instruments	101
Bleaching, dyeing, &c	11	Musical instruments	102
Blowers	12	Nails and spikes	103
Boats	13	Needles, pins, &c	104
Bolts, nuts, rivets	14	Ordnance	105
Bookbinding	15	Organs	106
Boots and shoes	16	Paints and varnishes	107
Braid, thread, &c	17	Paper-making	108
Breech-loaders	18	Paper manufactures	109
Brewing, cider, &c	19	Paving	110
Bricks	20	Photography	111
Bridges	21	Pianos	112
Brushes and brooms	22	Plating	113
Buckles, buttons, &c	23	Plows	114
Builders' hardware	24	Pottery	115
Butchering	25	Poultry, care of	116
Candles, soap, &c	26	Printing	117
Carbureters	27	Pumps	118
Carding and roving	28	Punching and shearing	119
Carpenters' tools	29	Railroads, (the "Way")	120
Carpentry	30	Railroads, (rolling stock,) A	121
Carriages and wagons	31	Railroads, (rolling stock,) B	122
Cartridges and bullets	32	Revolvers	123
Casting	33	Rock drilling and blasting	124
Casting soft metals	34	Rolling metals	125
Chemical processes	35	Roofing	126
Clocks and watches	36	Rope and cordage	127
Cloth-dressing, &c	37	Safes and vaults	128
Clothes-making	38	Salt	129
Coffins	39	Saw-mills	130
Coopering	40	Saws	131
Cotton	41	Scales and weights	132
Counting and registering	42	Seeders and planters	133
Cultivators	43	Sewing-machines	134
Cutlery	44	Sheep, care of	135
Dairy apparatus	45	Sheet metal working	136
Dental instruments	46	Ship-building, (the hull)	137
Distilling and rectifying	47	Ship-building, (masting, &c)	138
Driers	48	Ships, propulsion of	139
Edge tools	49	Silk	140
Electrical apparatus	50	Spades, shovels, &c	141
Excavating and grading	51	Spinning	142
Fences and gates	52	Sports	143
Files and rasps	53	Stabling, stalls, &c	144
Fine arts	54	Starch	145
Fire-arms	55	Stationery	146
Floor-cloths	56	Steam-heaters, &c	147
Flour-mills	57	Steam-boilers, (construction)	148
Food, preservation of	58	Steam-boilers, (furnaces, &c)	149
Food for stock, preparing	59	Steam-engines	150
Forging	60	Steam-pistons, &c	151
Fuel	61	Steam-valves	152
Furniture, &c	62	Stone, lime, and cement	153
Garden and orchard tools	63	Stoves and ranges	154
Gas, distribution of	64	Sugar and molasses	155
Gas-heaters	65	Surgical instruments	156
Gas, manufacture of	66	Surveying and optical instruments	157
Gearing	67	Telegraphs	158
Glass	68	Thrashing, &c	159
Governors	69	Tobacco	160
Grinding and polishing	70	Toilet articles	161
Gunpowder	71	Trunks and satchels	162
Harness and saddlery	72	Tube and wire	163
Harrows, rollers, &c	73	Type and stereotype	164
Harvesters, A	74	Umbrellas, fans, &c	165
Harvesters, B	75	Ventilators	166
Hats and felting	76	Water, distribution of	167
Hay-tedders, &c	77	Water-wheels	168
Hemp and flax	78	Willow and rattan	169
Hoisting machinery	79	Wire-working	170
Hoop-skirts and corsets	80	Wood-screws	171
Hose and belting	81	Wood-lathes	172
Hydraulic engineering	82	Wood-working, (machine-tools)	173
Ice-making	83	Wood-working, (special machinery, A)	174
India rubber	84	Wood-working, (special machinery, B)	175
Iron and steel	85	Wood-working, (special machinery, C)	176
Jewelry	86		
Journals, bearings, &c	87		
Kitchen and table utensils	88		
Knitting, netting, &c	89		
Lamps and lanterns	90		
Laundry apparatus	91		

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 13, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, (not the subject-matter classification elsewhere referred to,) governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS	6,000
BRIDGES; including ferry-guards, girders and columns, piers	408
CARDING, CLOTH, CORDAGE, KNITTING, SILK, SPINNING, WEAVING	4,800
RAILWAYS	3,500
ELECTRICITY	888
TEXTILE	4,800
DRAFTING	169
DRIERS and KILNS	569
HOROLOGY	524
LAMPS, &c.	2,505
MEASURING INSTRUMENTS	1,340
OPTICS	332
STOVES and FURNACES	5,214

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing.

COPIES OF PATENTS ISSUED SINCE JULY 1, 1871.

For the convenience of manufacturers, the various subjects of invention have been classified, (Subject-Matter Index, 1871,) and a list is kept of all the patents issued since July 1, 1871, in the various classes, so that an order given for the patents of a class will be filled as to patents since the above date, and subsequent patents in the same class will be forwarded from week to week, (postage paid,) as they may issue.

Those desiring copies of patents under this arrangement should deposit a sum of money, not less than three dollars, with the Commissioners of Patents; when the deposit is exhausted they will be notified.

In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this Office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by giving the number, name, and date of each patent.

The cheapness of the copies, (ten cents apiece when ordered in quantity or by the whole class,) and the comparatively small number of patents in each of the 176 classes, render an order by class a by no means onerous undertaking.

INDEX OF INVENTIONS PATENTED DECEMBER 28, 1875.

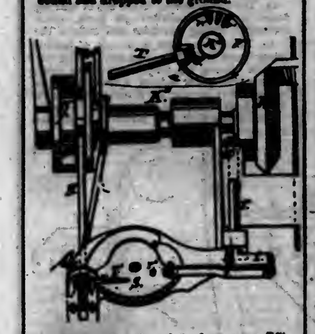
	Class No.	No. of Patent.
Annunciator, electro magnetic, E. Gray, (reissue)	50	6,825
Anti incrustation compound, A. Chavasse	148	171,599
Atomizer, H. R. Spencer	98	171,637
Bale band tightener, cotton, S. H. Gilman	7	171,560
Barrel heater, cooper's, W. N. Moore	154	171,489
Belt, power, S. M. Clark	81	171,505
Blind slats, machine for forming metallic end pieces for, S. M. Sherman	24	171,535
Blind stiles, machine for boring, J. Boe	30	171,546
Bolts, machine for dressing the heads and pointing and threading the shanks of, W. E. Ward	14	171,493
Boot and shoe, W. Biddle	16	171,498
Boot and shoe sewing machine, Keats, Greenwood, and Keats	134	171,622
Boot and shoe wooden shanks, machine for making, W. N. Sprague, (reissue)	16	6,828
Bridle bit, J. Stanley	72	171,567
Brush, dust, L. A. Stoll	22	171,488
Buckle, W. E. Aston	23	171,543
Bungs, machine for turning, E. Gunther	175	171,511
Bungs, machine for turning, E. Gunther	175	171,512
Burner, lamp, F. A. Taber	90	171,638
Butter, preserving, F. H. L. C. Sacc	58	171,532
Cabinet, business, Ransom and Peugh	62	171,530
Car brakes, device for operating, J. Kirby	122	171,518
Car coupling, H. W. Chase	192	171,504
Car, refrigerator, A. Thomas	58	171,591
Car, refrigerator, J. Turner	58	171,491
Car ventilator, G. F. Godley	166	171,611
Cars, runner for railroad, L. O. Root	191	171,581
Cartridge belt, D. Taylor	32	171,639
Chairs, attaching book supports to arm, F. P. Musser	62	171,528
Chairs, head rest for dental, E. T. Starr	62	171,539
Cigar cutter, J. Shepard	160	171,584
Clock striking mechanism, A. Schmidt	36	171,583
Clocks, lock work attachment to, R. T. Andrews	36	171,496
Collar ends, machine for pasting and folding, C. Spofford	109	171,586
Compass, mariner's, E. S. Ritchie, (reissue)	50	6,827
Cork stopper, J. I. Flanagen	1	171,606
Cultivator, J. W. Chase	43	171,503
Door screen, A. A. Carter	62	171,501
Door spring, A. B. Chatfield	24	171,549
Drying wheel, steam, Medbery, Mann, and Drake	46	171,533
Enameling, preparing moldings for, M. A. Owens	68	171,629
Engine, rotary, C. H. Kurtz	150	171,573

	Class No.	No. of Patent.
Engine, rotary steam, C. W. Flocckher	150	171,556
Engine valve gear, steam, C. H. Breed	152	171,500
Excavator, locomotive earth, A. Hawley	51	171,564
Fabrics, measuring packaged, S. C. Talcott, (reissue)	37	6,829
Fats, rendering, H. Halverson	26	171,613
Feather renovator, Ballard and Wirt	62	171,544
Feed water apparatus, B. W. Felthousen	148	171,605
Felly joint clip, D. T. Bowerman	31	171,547
Fence, flood, E. C. Huffaker	32	171,567
Filter, T. R. Sinclaire	167	171,635
Fire arms, extracting shells from revolving, O. F. Cole	123	171,506
Fire extinguisher, S. S. Newton	118	171,698
Fire place, D. Hayes	154	170,585
Fire place heater, W. D. Gaseman	154	171,612
Firemen, helmet for, J. E. Spear, Jr	76	171,636
Flour bolt, W. J. Merritt	57	171,525
Fruit picker, J. Mooney	63	171,492
Furnace, steam boiler, C. E. Robinson	149	171,632
Game tables, waiter for, G. W. Marble	143	171,624
Gas generator, W. McKnight	66	171,578
Gas machine, T. B. Fogarty	27	171,607
Gas stove, H. D. Hawley	65	171,617
Gate, farm, W. J. Hollis	52	171,478
Globe stand, E. G. Durant	146	171,472
Gold washer, J. S. Calvert	3	171,597
Grain binder, J. F. Appleby	74	171,465
Hay loader, G. E. and A. S. Peck	74	171,484
Heater, fire place, W. D. Gaseman	154	171,612
Heel polishing machine, Joint and Dunham	16	171,515
Hook, snap, J. B. Tainter	23	171,590
Horseshoe, A. Moffitt	69	171,626
Horseshoe and swage, S. N. Stephenson	60	171,588
Hydrant, S. Blackie	167	171,499
Implement, combined, L. Schaeffer	29	171,487
Indicator, station, J. P. Rhoades	131	171,531
Kiln, brick, A. Morand	20	171,627
Kiln, fire brick, W. T. Christy	20	171,600
Knitting machine, C. J. Appleton	89	171,466
Lamp, A. French	90	171,608
Lamp, C. F. Spencer	90	171,537
Lamp, G. M. Stevens	90	171,540
Lamps, apparatus for lighting street, Falcon and Isminger	90	171,555
Lance, bomb, P. Cunningham	105	171,553
Land, leveling, T. R. Lowe	51	171,522
Leather rolling machine, Linsley, McCulloch, and Clement	92	171,574
Letter file cabinet, W. A. Amberg	146	171,495
Letter sheet and envelope, combined, R. W. Barnes	146	171,497
Limekiln, Brockman and Stueve	153	171,468
Locomotive earth excavator, A. Hawley	51	171,564
Locomotive signal light, A. Dick, (reissue)	94	6,823
Loom for weaving fringes, C. R. Seatwober	95	171,582
Loom picker fastening, L. J. Labounty	95	171,520
Loom shuttle box mechanism, I. G. Chandlee	95	171,598
Looms, warp beam apron for, L. J. Labounty	95	171,519
Lubricating compound, H. V. P. Draper	87	171,508
Lubricating compound, H. V. P. Draper	87	171,509
Mail bag, G. O. Clark	162	171,469
Mat, table, C. Weber, (reissue)	88	6,830
Mattress and bedstead, combined, J. J. Bowen	62	171,596
Measuring packaged fabrics, S. C. Talcott, (reissue)	37	6,829
Mechanical movement, G. Juengst	87	171,572
Mining machine, A. Crombie	124	171,470
Needle, sailmaker's, H. M. Jenkins	104	171,630
Organ attachment, reed, H. R. Moore	106	171,527
Padlock, G. R. Cuthirth	93	171,471
Pan, frying, B. Morahan	154	171,580
Paper box machine, R. Grimm	109	171,476
Paper collars, machine for cutting, H. J. Medbery	109	171,594
Paper cop tube, J. McCausland	109	171,577
Pavement, W. W. Hubbell, (reissue)	110	6,896
Pavement, wood, S. Houston	110	171,619
Pegging machine, L. Goddu	16	171,609
Pegging machine, L. Goddu	16	171,610
Photographic head rest stand, J. J. Hayes	111	171,614
Picture and letter block, dissected, J. Dennis, Jr	143	171,507
Picture exhibitor, L. H. Sheppard	54	171,585
Pin, safety, N. M. Phillips	86	171,529
Pipes, &c., package for tobacco, I. Demuth	160	171,554
Planing machine, Frank and Spire	173	171,510
Planing machine, L. Houston	173	171,480
Plow, A. Hall	114	171,477
Plow jointer, H. Gale, (reissue)	114	6,824
Plow, steam, B. S. Benson	114	171,595
Potato masher, R. Crane, Jr	88	171,603
Pots, strainer for coffee, R. E. Clark	136	171,601
Press, cider, L. O. Rockwood	19	171,633
Printing presses, registering apparatus for, Schofield and Baker	117	171,534
Pulley, Betts and Howie, (reissue)	87	6,822
Pulmonary diseases, remedy for, J. O. Slemmons	98	171,536
Pump, W. Barnes	118	171,545
Pump, double acting, H. Van Doren	118	171,592
Pumps, piston or plunger for force, G. W. Gilmore	118	171,475
Purifier, middlings, A. Crabtree	57	171,551
Purifier, middlings, J. L. Williford	57	171,542
Railroad bulletin box, W. T. Jacoby	146	171,571
Railroad switch, S. E. Linton	190	171,575
Rice hulling machine, J. Jouet	57	171,516
Roller and marker, land, J. M. and G. R. Hunter	73	171,569
Sash holder, H. T. Milchsack	94	171,626
Sausage machine, H. P. Rankin	95	171,631
Saw mill head block, S. White	130	171,494
Saw teeth, circular, A. F. Dimond	131	171,604
Seeders and cultivators, yielding teeth for, C. P. Hewitt	133	171,566
Separator, seed, Catchpole and Stidolph	150	171,502
Sewing machine, J. E. A. Gibbs	134	171,557
Sewing machine, J. E. A. Gibbs	134	171,558
Sewing machine, J. E. A. Gibbs	134	171,559
Sewing machine, A. Ploss	134	171,485
Sewing machine, boot and shoe, Keats, Greenwood, and Keats	134	171,622
Sewing machine needle, H. M. Jenkins	104	171,631
Signaling device, H. Kinnersley	138	171,517
Skirt adjuster, A. S. Gear	60	171,474
Snow melting machine, J. Cody	147	171,602
Soldering apparatus, L. McMurray	136	171,625
Spark arrester, D. Allard	94	171,594
Spike, G. N. Sanders	103	171,486
Stones, machine for gathering, M. Miller	73	171,579
Stove, S. Wood	154	171,640
Stove gas, M. Q. Hawley	65	171,617
Stove grate, G. R. Moore	154	171,483
Stove polish, C. E. Teets	70	171,490
Straw cutter, J. Grimm	59	171,562
Table leaf support, D. Jackson	62	171,570
Table mat, C. Weber, (reissue)	88	6,830
Thrasher and huller, clover, G. J. Utendorf	159	171,492
Tobacco curer, J. C. Millner	160	171,481
Tobacco pipes, &c., package for, I. Demuth	160	171,554
Toy building block, L. Schmetzer	143	171,533
Trunk, J. A. House	162	171,618
Truss pad, I. N. Foote	156	171,473
Twisting machine, J. Capstack	127	171,548
Umbrella stand, C. A. Laurence	62	171,521
Under garment, L. P. Bonney	38	171,467
Velocipede, G. W. Marble	31	171,623
Veneering, preparing wood for, Spurr and Prang	29	171,538
Violins, chin rest for, H. W. White	102	171,541
Wash board, L. M. Crosby	91	171,552
Wash board, A. J. Hull	91	171,568
Washing machine, W. Goforth	91	171,561
Washing machine, D. Louis	91	171,576
Water closet valve, J. P. Hyde	8	171,514
Well, petroleum, W. L. Hardison	124	171,563
Well, petroleum, W. L. Hardison	124	171,615
Wells, constructing, C. Holtz	51	171,513
Wells, packer for oil, W. L. Hardison	124	171,616
Wells, packer for oil, L. Stewart	124	171,589
Windmill, A. T. Page	118	171,630
Windmill, W. F. Veber	118	171,593
Window, J. A. Holmes	24	171,479
Wire rope, F. W. Roebling	163	171,634
Wrench, screw, J. H. Coes	100	171,550

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED DECEMBER 28, 1875.

	Patent No.
Allard, D., Spark arrester	171,594
Amberg, W. A., Letter file cabinet	171,495
American Cable Screw Wire Company, assignee	171,609, 171,610
Andrews, R. T., Lock work attachment to clocks	171,496
Appleby, J. F., Grain binder	171,465
Appleton, C. J., Knitting machine	171,466
Aston, W. E., Buckle	171,543
Atherton, A. T., assignee	171,519, 171,520
Baker and Schofield	171,534
Ballard, A. W., and D. B. Wirt, Feather renovator	171,544
Barnes, R. W., Combined letter sheet and envelope	171,497
Barnes, W., Pump	171,545
Benson, B. S., Steam plow	171,595
Betts, R. W., and W. Howie, Pulley, (reissue)	6,822
Biddle, W., Boot and shoe	171,498
Blackie, S., Hydrant	171,499
Boe, J., Machine for boring blind stiles	171,546
Bonney, L. P., Under garment	171,467
Bowen, J. J., Combined mattress and bedstead	171,596
Bowerman, D. T., Felly joint clip	171,547
Boynton, J., assignee	171,613
Breed, C. H., Steam engine valve gear	171,500
Brockman, H., and H. Stueve, Lime kiln	171,468
Calvert, J. S., Gold washer	171,597
Capstack, J., Twisting machine	171,548
Carter, A. A., Door screen	171,501
Catchpole, J. L., and G. F. and T. F. Stidolph, Seed separator	171,502
Chandlee, I. G., Loom shuttle box mechanism	171,598
Charles, R., assignee	171,499
Chase, H. W., Car coupling	171,504
Chase, J. W., Cultivator	171,503
Chatfield, A. B., Door spring	171,549
Chavasse, A., Anti incrustation compound	171,599
Christy, W. T., Kiln for fire brick	171,600
Clark, G. O., Mail bag	171,469
Clark, R. E., Coffee pot strainer	171,601
Clark, S. M., Power belt	171,505

	Patent No.
Clarke, L. A., assignee	171,619
Clement, Linsley, and McCulloch	171,574
Cody, J., Snow melting machine	171,602
Coes, J. H., Screw wrench	171,550
Cogan, B., assignee	171,553
Cole, O. F., Extracting shells from revolving fire arms	171,506
Condit, A. S. and H. G., assignees	171,593
Crabtree, A., Middlings purifier	171,551
Crane, R., Jr., Potato masher	171,603
Crombie, A., Mining machine	171,470
Crosby, L. M., Wash board	171,592
Cunningham, P., Bomb lance	171,553
Cutbirth, G. R., Padlock	171,471
Demuth, I., Package for tobbaco pipes, &c	171,554
Dennis, J., Jr., Dissected picture and letter block	171,507
Dewsnapp, G. W., assignee	171,604
Dick, A., Locomotive signal light, (reissue)	6,823
Dimond, A. F., Circular saw teeth	171,604
Drake, Medbery, and Mann	171,523
Draper, H. V. P., Lubricating compound	171,508
Draper, H. V. P., Lubricating compound	171,509
Dunham and Joint	171,515
Durant, E. G., Globe stand	171,472
Elliott, J. G., assignee	171,477
Ewing, T., assignee	171,639
Excelsior Stove Works, assignee	171,640
Falcon, M., and D. H., Isminger, Apparatus for lighting street lamps	171,555
Felthousen, B. W., Feed water apparatus	171,605
Flanagen, J. I., Cork stopper	171,606
Floeckher, C. W., Rotary steam engine	171,556
Fogarty, T. B., Gas machine	171,607
Foote, L. N., Truss pad	171,473
Frank, A. H., and G. Spire, Planing machine	171,510
French, A., Lamp	171,608
French, H. A., assignee	171,513
Gale, H., Plow jointer, (reissue)	6,824
Gale Manufacturing Company, assignee, (reissue)	6,824
Gear, A. S., Skirt adjuster	171,474
Gibbs, J. E. A., Sewing machine	171,557
Gibbs, J. E. A., Sewing machine	171,558
Gibbs, J. E. A., Sewing machine	171,559
Gilman, S. H., Cotton bale band tightener	171,560
Gilmore, G. W., Piston or plunger for force pumps	171,475
Goddu, L., Pegging machine	171,609
Goddu, L., Pegging machine	171,610
Godley, G. F., Car ventilator	171,611
Goforth, W., Washing machine	171,561
Gray, E., Electro magnetic annunciator (reissue)	6,825
Greenwood and Keats	171,622
Grimm, J., Straw cutter	171,562
Grimm, R., Paper box machine	171,476
Groat, P. B., assignee	171,508, 171,509
Gunther, E., Machine for turning bungs	171,511
Gunther, E., Machine for turning bungs	171,512
Guseman, W. D., Fire place heater	171,612
Hall, A., Plow	171,477
Hall, J., assignee, (reissue)	6,823
Halvorson, H., Rendering fats	171,613
Hardison, W. L., Petroleum well	171,563
Hardison, W. L., Petroleum well	171,615
Hardison, W. L., Packer for oil wells	171,616
Hawley, A., Locomotive earth excavator	171,564
Hawley, H. Q., Gas stove	171,617
Hayes, D., Fire place	171,565
Hayes, J. J., Photographic head rest stand	171,614
Healy, P. J., assignee	171,541
Hewitt, C. P., Yielding teeth for seeders and cultivators	171,566
Hoffman, J. H., assignee	171,586
Hollis, W. J., Farm gate	171,478
Holmes, J. A., Window	171,479
Holts, C., Constructing wells	171,513
House, J. A., Trunk	171,618
Houston, L., Planing machine	171,480
Houston, S., Wood pavement	171,619
Howie and Betts, (reissue)	6,822
Hubbell, W. W., Pavement, (reissue)	6,826
Huffaker, E. C., Flood fence	171,567
Hull, A. J., Wash board	171,568
Hunter, J. M. and G. R., Land roller and marker	171,569
Hyde, J. P., Water closet valve	171,514
Isminger and Falcon	171,555
Jackson, D., Table leaf support	171,570
Jacoby, W. T., Railroad bulletin box	171,571
Jenkins, H. M., Sail maker's needle	171,620
Jenkins, H. M., Sewing machine needle	171,621
Joint, W., and G. B. Dunham, Heel polishing machine	171,515
Jouet, J., Rice hulling machine	171,516
Juengst, G., Mechanical movement	171,573
Keats, J., A. Greenwood, and A. Keats, Boot and shoe sewing machine	171,622
Kinnersley, H., Signaling device	171,517
Kirby, J., Device for operating car brakes	171,518
Kurtz, C. H., Rotary engine	171,573
Labounty, L. J., Warp beam apron for looms	171,519
Labounty, L. J., Loom picker fastening	171,520
Lawrence, C. A., Umbrella stand	171,521
Linsley, N., J. McCulloch, and W. Clement, Leather rolling machine	171,574
Linton, S. E., Railroad switch	171,575
Louis, D., Washing machine	171,576
Louisiana Cotton Tie Company, assignee	171,560
Lowe, T. E., Leveling land	171,522
Lyon, G. W., assignee	171,541
Mann, Drake, and Medbery	171,523
Marble, G. W., Velocipede	171,623
Marble, G. W., Waiter for game tables	171,624
McCausland, J., Paper cop tube	171,577
McCulloch, Clement, and Linsley	171,574
McKnight, W., Gas generator	171,578
McMurray, L., Soldering apparatus	171,625
McNab and Harlin Manufacturing Company, assignee	171,514
Medbery, H. J., Machine for cutting paper collars	171,524
Medbery, H. J., H. A. Mann, Jr., and S. H. Drake, Steam drying wheel	171,523
Merritt, W. J., Flour bolt	171,525
Meyer, H., assignee	171,476
Milchsack, H. T., Sash holder	171,526
Miller, M., Machine for gathering stones	171,579
Milliner, J. C., Tobacco curer	171,481
Moffitt, A., Horseshoe	171,626
Mooney, J., Fruit picker	171,482
Moore, G. R., Stove grate	171,483
Moore, H. R., Reed organ attachment	171,527
Moore, W. N., Cooper's barrel heater	171,499
Morahan, B., Frying pan	171,580
Morand, A., Brick kiln	171,627
Muir, W. K., assignee, (reissue)	6,823
Musser, F. P., Attaching book supports to arm chairs	171,528
Newark Tea Tray Company, assignee, (reissue)	6,830
Newton, S. S., Fire extinguisher	171,628
Owens, M. A., Preparing moldings for enameling	171,629
Page, A. T., Windmill	171,630
Peck, G. E. and A. S., Hay loader	171,484
Peugh and Ransom	171,530
Phillips, N. M., Safety pin	171,529
Plosz, A., Sewing machine	171,485
Potter, W. W., assignee, (reissue)	6,828
Prang and Sporr	171,536
Rambouillet, A., assignee	171,599
Rankin, H. P., Sausage machine	171,631
Ransom, D. L., and N. R. Peugh, Business cabinet	171,530
Rhoads, J. P., Station indicator	171,531
Ritchie, E. S., Mariner's compass, (reissue)	6,827
Robinson, C. E., Steam boiler furnace	171,632
Rockwood, L. O., Cider press	171,633
Roebling, F. W., Wire rope	171,634
Roebling, J. A., Sons, assignees	171,634
Root, L. O., Runner for railroad cars	171,581
Russell, E., assignee	171,542
Ryan, A., assignee	171,467
Saatweber, C. R., Loom for weaving fringes	171,582
Sacc, F. H. L. C., Preserving butter	171,532
Sanders, G. N., Spike	171,486
Schaeffer, L., Combined implement	171,487
Schmetzer, L., Toy building block	171,533
Schmidt, A., Clock striking mechanism	171,583
Scholfield, S., and C. E. Baker, Registering apparatus for printing presses	171,534
Sherman, S. M., Machine for forming metallic end pieces for blind slats	171,535
Shepard, J., Cigar cutter	171,584
Sheppard, L. H., Picture exhibiter	171,585
Shoeninger, A., assignee	171,623, 171,624
Simmons, G. W., & Sons, assignees	171,626
Sinclaire Rectifying Machine Company, assignee	171,635
Sinclaire, T. R., Filter	171,635
Slemmons, J. O., Remedy for pulmonary diseases	171,536
Spear, J. E., Jr., Helmet for firemen	171,636
Spencer, C. F., Lamp	171,537
Spencer, H. R., Atomizer	171,637
Spire and Frank	171,510
Spofford, C., Machine for pasting and folding collar ends	171,586
Sprague, W. N., Machine for making boot and shoe wooden shanks, (reissue)	6,828
Spurr, C. W., and L. Prang, Preparing wood veneering	171,538
Stanley, J., Bridle bit	171,587
Starr, E. T., Head rest for dental chairs	171,539
Stephenson, S. N., Horseshoe and swage	171,588
Stevens, G. M., Lamp	171,540
Stewart, L., Packer for oil wells	171,589
Stidolph and Catchpole	171,502
Stoll, L. A., Dust brush	171,488
Strong, W. A., Jr., administrator	171,489
Stueve and Brockman	171,468
Taber, F. A., Lamp burner	171,638
Tainter, J. B., Snap hook	171,590
Talcott, S. C., Measuring packaged fabrics, (reissue)	6,829
Taylor, D., Cartridge belt	171,639
Teeta, C. E., Stove polish	171,490
Thomas, A., Refrigerator car	171,591
Thomas, S., Clock Company, assignee	171,496
Turner, J., Refrigerator car	171,491
Utendorf, G. J., Clover thrasher and huller	171,492
Van Doren, H., Double acting pump	171,592
Veber, W. F., Windmill	171,593
Ward, W. E., Machine for dressing the heads and pointing and threading the shanks of bolts	171,493
Weber, C., Table mat, (reissue)	6,830
White, H. W., Chin rest for violins	171,541
White, S., Saw mill head block	171,494
White, S. S., assignee	171,539
Whitehead, W. E., assignee	171,519, 171,520
Williford, J. L., Middlings purifier	171,542
Wirt and Ballard	171,544
Wood, S., Stove	171,640



TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED DECEMBER 28, 1875.

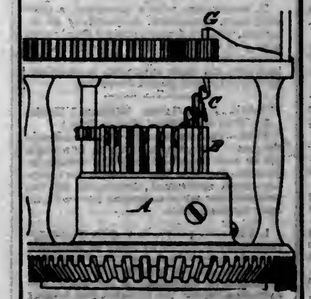
171,466. GRAIN-BINDER. J. F. Appleby, Beloit, Wis. [Filed June 12, 1875.]

Brief.—The cut grain that falls upon the platform is moved backward by an extensible rake attached to the reel, and then by a laterally-moving rake to the binder, where it is bound and dropped to the ground.

1. The combination of the lever arms G'', the right arm G, connections I' F', rake-head H', and cam J, constructed, arranged, and operating substantially as and for the purposes specified.

2. The combination of the crank L upon shaft K'', the pitman L', fork-handle L', fork M m, and pivoted connections L'' L', substantially as and for the purpose specified.

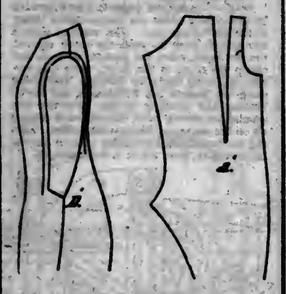
3. The combination and arrangement of the arm E, finger f, tackle f', cord F, spring F', and arm F', and cam G, substantially as and for the purpose specified.



4. The combination of the engaged segment S, having two pins, r' r'', the notched pinion K, and pivoted blade r, substantially as specified.

5. The mechanism for producing an intermittent rotation, consisting of the flanged wheel V, having the teeth v', at which the flanges is cut away, in combination with the flanged pinion U u, substantially as specified and shown.

6. The combination and arrangement of the shaft K'', actuated from the driving-shaft, the flanged wheel V v v', flanged pinion U u, shaft T, crank 4, segment S, and notched pinion E, substantially as specified and shown.

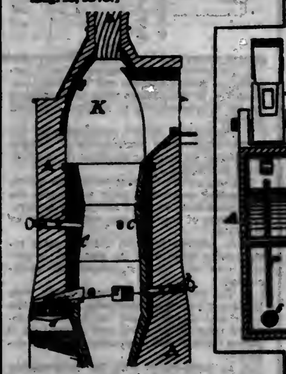


171,469. KNITTING-MACHINE. Charles J. Appleton, Elizabeth, N. J. [Filed Sept. 28, 1875.]

Brief.—The revolving guide carries the yarn in a circle around each needle, giving to each stitch a half-twist to prevent raveling.

The combination of needle-cylinder B, carrier A, needles C C, and revolving yarn-guide G, operating together substantially as and for the purposes described.

171,497. UNION-GARMENT. Lydia P. Bonney, Chicago, Ill., assignor to Agnes Ryan, same place. [Filed Dec. 29, 1874.]

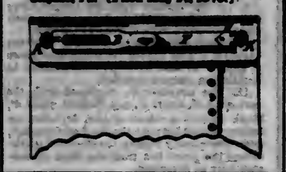


1. The patterns A' B' C', substantially as and for the purpose set forth.

2. The garment D', composed of the pieces A', B', and C', substantially as and for the purpose set forth.

3. The patterns A, B, C, D, and E, substantially as and for the purpose set forth.

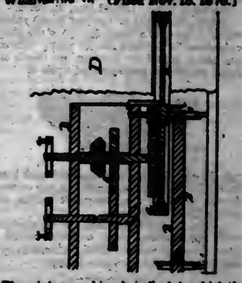
4. The garment F, composed of the pieces A, B, C, D, and E, substantially as and for the purpose set forth.



171,500. LAMP-LIGHTER. Henry Brockmann and Henry Steuve, Cincinnati, Ohio. [Filed Aug. 19, 1875.]

1. In combination with the furnace, the cupola K, and spiral flues L, for carrying the products of combustion spirally out of the kiln, substantially as described.

2. The combination of the furnace A, flues a a, kiln C, the cupola K, and spiral flues L, arranged to operate substantially as described.



171,503. MAN-HAUL. Geo. O. Clark, Philadelphia, Pa. [Filed May 14, 1875.]

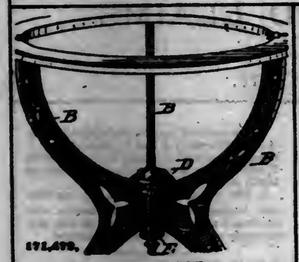
1. The combination, in a mail-bag fastening, of the swivel-studs A and A', buttons a and a', bloated label-case and loop B, leather strap F, and metallic strap and O, substantially as herein shown and described.

2. The swivel-studs A and A', provided with buttons a and a', in combination with openings f and f' in the body of the bag, substantially as herein shown and described.

171,470. MINING-MACHINE. A. Cromlish, Wilmington, Vt. [Filed Nov. 16, 1875.]

The mining-machine described, in which the cutting-wheel a rests on a step, s, in the body of the main frame B, on which it revolves by means of gearing, as shown, and having in combination with it the dust-shield p, all combined and arranged as and for the purposes set forth.

171,471. PADLOCK. George R. Cutbirth, San Francisco, Cal. [Filed June 16, 1875.]



1. The circular bolt, consisting of the rod f, hollow end pieces G H, and spiral springs K, substantially as and for the purpose above described.

2. In combination with the case A the rotating cap Q and series of rotating disks r', each of which is provided with a key-hole, and the whole connected by pins and slots, substantially as above described.

171,472. GLOBE-STAND. Edrid G. Durant, Racine, Wis. [Filed Oct. 21, 1875.]

1. A stand for globes, consisting of the hollow standard A and a series of vertical supports or uprights, B, combined substantially as described, whereby the parts can be readily detached and packed flat for shipment, and be as readily connected again, as set forth.

2. The legs or supports B, provided with the central locking-guide, in combination with the cap D and rotary rod H, or equivalent locking devices, constructed to operate substantially as set forth.

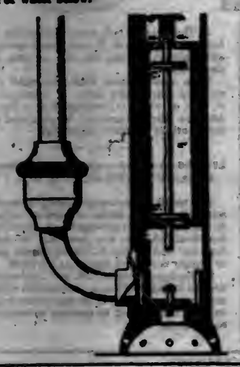
171,470.

171,470. THUMB-PADS. Isaac M. Foote, Middletown, Ohio. [Filed Dec. 21, 1874.]

Brief.—The front of the pad is soft rubber, which, in process of manufacture of the pad, is vulcanized to the hard-rubber back. The soft pad has a recess for holding the shank of a small additional pad mounted upon it.

1. In combination with the solid back *b*, and its flexible adjustable cushion *a*, the orifice *f* for the shank of the removable button, substantially as described.

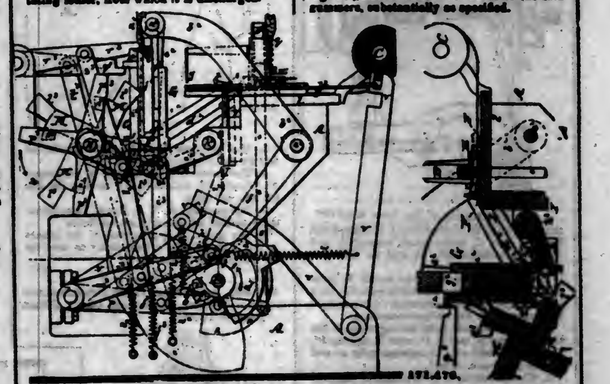
2. The solid-rubber back, in combination with the flexible-rubber cushion, united at their edges by vulcanization, substantially as described, for the purpose specified.



171,474. SKIRT-ADJUSTER. A. S. Gear, Boston, Mass. [Filed Nov. 22, 1875.]

As a new article of manufacture, a skirt-adjuster, consisting of an open flexible spring band to conform to the person, substantially as described and shown, and to nearly encircle the skirt of the wearer, as specified.

171,475. PUMPING OR FORCING FOR FORCE-PUMPS. George W. Gilmore, Webster, Pa. [Filed Apr. 28, 1875.]



Brief.—The air supplied to the spectacle to the boiler plates, by the upper valve thereof, is retained, in the down-stroke, by the closing of said valve, and by the opening of the lower valve operates as an air-spring upon the column of water below.

A piston for force-pumps having the air-chamber F, air-inlets *a a*, openings *b*, and provided with the valves C C', which alternately open and close the said openings by the reciprocation of the piston, substantially as and for the purpose hereinbefore described and set forth.

171,476. PAPER-BOX MACHINES. Richard Grimm, New York, N. Y., assignor to himself and Henry Meyer, same place. [Filed Aug. 30, 1875.]

Brief.—The strip of paper is drawn forward by the grippers under the reciprocating cutter to the conveying-tool. The vertical slide is now raised, so as to press the blank against the conveyor, when the pushers advance and clamp the edges of the sheet, while it is carried to the die ready for folding. This being done, the pushers are withdrawn, and the vibrating and rotating folders form the box around the sleeve, when the sleeve is slipped up on the conveyer, which is then raised, leaving the completed box in the arms of the rotating folder, from which it is discharged.

171,476.

1. The vertically-reciprocating cutter B, carrying the cutting-blade *n* and the pressing-tools *a c*, in combination with the horizontal carrier F, substantially as herein shown and described.

2. The vertical slide I, combined with the horizontally-moving blank-carrier F, to raise the carrier against the conveyor G, substantially as specified.

3. The glue-box E, constructed with the reciprocating perforated viper *m*' beneath the perforated false bottom P and above the regular bottom of the glue-box, substantially as specified.

4. In combination with the perforated reciprocating viper *m*' of the glue-box, the pivoted rod *r*' and clamp *c*', substantially as described.

5. The combination of the glue-box with the loop *l*' suspended therefrom, and with the rod *r*' and clamp *c*', said rod having an inclined edge to be raised and lowered as it passes through said loop, substantially as described.

6. In combination with the reciprocating perforated viper *m*' and vibrating clamp *c*' of a glue-box, the rock-shaft *n*', all arranged for automatic action, substantially as specified.

7. The glue-box E, carrying the reciprocating perforated viper *m*', combined with the steam-jacket *s*', that has the pipes *p*' and *q*', substantially as specified.

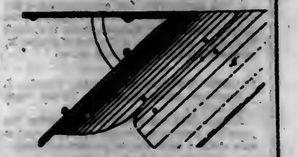
8. The conveyer-blank *p*' of the paper-box-making machine, combined with the endwise-reciprocating sleeve *b*', substantially as herein shown and described.

9. In combination with the reciprocating sleeve *b*' and blank *p*', the reciprocating foot-pieces *f*', arranged to operate as set forth.

10. The combination of the blank *p*' of the conveyer G with the reciprocating side pieces *f*', applied to said blank *p*', substantially as and for the purpose specified.

11. The conveyer G, combined with the rock-shaft *n*', levers *b*', and inclined guide *d*', blank against a sleeve or bar, *b*', which its bottom is held between the die J and blank *p*', and subsequently raising the sleeve *b*' to discharge the paper box from the blank *p*', substantially as described.

12. The combination of the blank-conveyer G with the stationary die J, vibrating folder L, and intermittently-rotating cross-shaped folder M, substantially as herein shown and described.



13. The rotary folder M, made with the upwardly-projecting cars F', and with the outwardly-projecting cars *f*, and arranged in the form of a cross, for constituting a combined folder and box-retainer, substantially as herein shown and described.

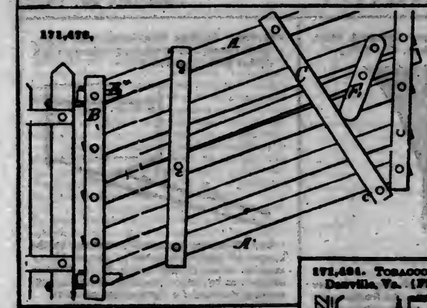
14. The improvement in the art of making paper boxes hereinbefore set forth, which consists in folding the sides and ends of the

15. The improvement in the art of making paper boxes hereinbefore set forth, which consists in placing the segmented paper blank against the under side of a conveyer, G, in subsequently moving the grommets *m*' *m*' over the ends of said blank, and in finally clamping the grommeted ends of the blank to the said conveyer, substantially as specified.

171,477. PLOWS. Asa Hall, Rockford, Ill., assignor to himself, John G. Elliott, and Edward D. Hall, same place. [Filed Sept. 13, 1875.]

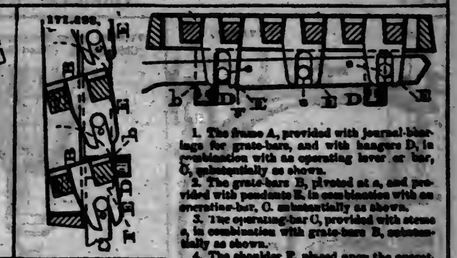
Brief.—A reversible mold-board fitted to a fixed share.

In combination with a plow-share, a plow mold-board constructed substantially as described, with its opposite edges *d* fitted to the edge *f*' of share *A*, and its opposite edges *g* made to form a slide line with the face of the land-side, and made reversible, as described, for the purpose of greater durability.



171,478. FARM-GATES. William J. Hollis, De Witt, Mo. [Filed May 3, 1875.]

Brief.—The hinges preserve their relation to the post. The gate is held thereto by a single pin for each hinge, admitting of a variable inclination, the rails flexible within the clamping-hinge, maintained horizontal by two perpendicular strips embracing the whole, all upon the same pivot.



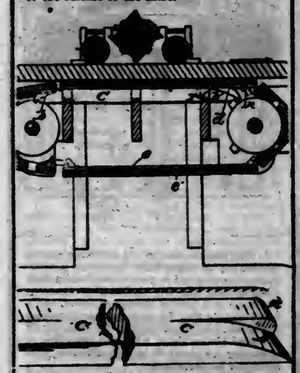
1. The combination, in a gate, of the upright strips B, jointed by pins *c* to horizontal strips A, and metal yokes or clamps D', embracing the strips A, fixing recesses in the strips B, perforated for the passage of the pins *c*', and extending beyond the uprights, and forming the loops of the hinges, all as set forth.

2. The combination, with the gate constructed as described, of the rods *r*, connected to the bolt O O, pivoted to the upper bar, and united below the lower bar, as set forth.

171,479.

171,482.

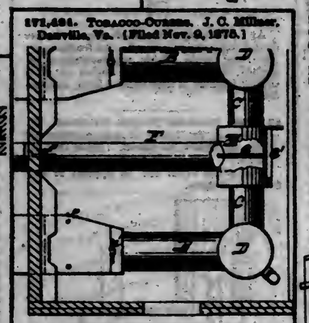
171,479. WINDOWS. Jan A. Holmes, Centerbrigport, Mass. [Filed May 1, 1875.]



1. The combination, with a window-frame, B, constructed with a chamber O B and a rim or projection, *b*', extending across the sill thereof, of a sash, B, provided with extensions F', grooves *f*, guard A, and a weather guard or protector, *b*', and a sash, D, having extensions F', and a ventilator, G, all constructed and operating substantially as shown and described.

2. The combination, with a window-frame, constructed with a chamber, B, of a sash, B, having extensions F', guard A, and a weather guard or protector, *b*', constructed and operating substantially as shown and described.

171,480. FLEMING-MACHINES. L. Houston, Montgomery, Pa. [Filed Nov. 6, 1875.]

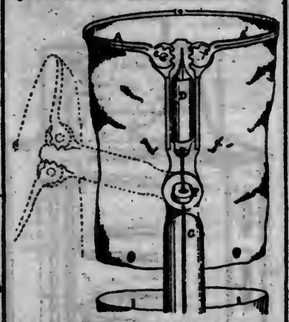


Brief.—Under the bed are rigid rests for the legs to slide upon. These bed-sliders are, at each end, divided longitudinally into two separate inclines. The under faces of each leg are provided at each end with a divided projection, which lifts the leg bodily horizontally, when the bed brings it to the level of the lumber, thus preventing any marring of the surface of the same.

1. The combination, in a pinning-machine, of the legs *a*, provided with the projections *a*', and the ways C, provided with the inclines *b c*, or their equivalents, said parts being constructed to operate substantially as and for the purpose set forth.

2. An endless-bed pinning-machine having the legs which compose its moving bed constructed and arranged to operate substantially as described, whereby they will assume a horizontal position before arriving at their highest point, and so that their edges or corners shall not come in contact with the lumber while turning to the horizontal position, as set forth.

171,481. TOBACCO-CUTTERS. J. C. Milner, Danville, Va. [Filed Nov. 6, 1875.]



1. In combination with the graduated heaters B C F, the drums D D and E and furnaces A A, substantially as and for the purpose set forth.

2. In combination with the heaters B C F, the furnaces A A, drums D D and E, having the partition *c*, for equally distributing the heat from the several drums to the return-heater F, substantially as and for the purpose set forth.

171,482. FRUIT-PICKERS. John Mooney, Providence, R. I. [Filed Sept. 27, 1875.]

Brief.—A pair of semicircular jaws are mounted upon a staff, one end of each jaw being provided with pinion-teeth, and between them is placed a double sliding rack, which is caused to move up and down by means of a cord or rod running down the staff. A sack or bag to contain the fruit is attached to the jaws around their circumference.

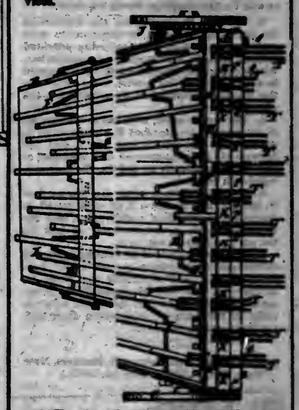
In a fruit-picker, the combination of the jaws A A', having the cogged ends *a a*', with the sliding rack D, meshing with the cogged ends of said jaws, substantially as described and shown.

171,483. STOVE-GRATES. George R. Moore, Philadelphia, Pa. [Filed Dec. 6, 1875.]

Brief.—The grate-bars are pivoted at one side of their longitudinal center, and can be either shaken or dumped. When shaken their motion is limited by the cotch or projection on the shaking-bar.

1. The frame A, provided with journal-bearings for grate-bars, and with hangers D, in combination with an operating lever or bar, G, substantially as shown.

2. The grate-bars B, pivoted at *a*, and provided with pendants E, in combination with an oscillating-bar, C, substantially as shown.



3. The operating-bar C, provided with stems *a*, in combination with grate-bars B, substantially as shown.

4. The shoulder F, placed upon the operating-bar C, and adjusted to shake its motion, substantially as and for the purpose herein set forth.

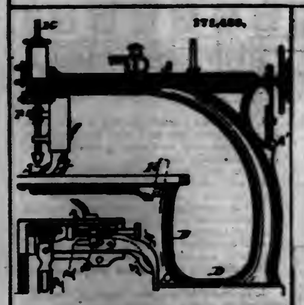
5. In combination, the frame A, bars B, pivoted as shown, operating-bar C, arranged to operate substantially as shown.

171,484. HAY-LOADERS. George H. Peck and Albert S. Peck, Geneva, Ill. [Filed Apr. 6, 1875.]

Brief.—Tipping bed with converging rakes working thereon. Improved gathering devices.

1. The pivoted rake-teeth K, provided with arms H projecting upward above the rake-head, substantially as and for the purposes set forth.

2. The combination of the gathering-rake and the toothed extension-pieces T, attached to the elevating-rakes I and projecting back between the teeth of the gathering-rake, substantially as and for the purposes set forth.



3. The sliding bar P, in combination with the springs O and pivoted rake-teeth, provided with arms H, substantially as described.

4. The tooth-roller U, in combination with the rake-teeth K, toothed pieces T, and elevating-platform A, as and for the purposes specified.

5. The combination of the shafts F, G, H, with the tipping platform A, the shafts F and H being bent at right angles to the side pieces of the platform, substantially as and for the purposes set forth.

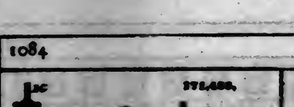
171,485. SEWING-MACHINES. Adam Flom, Menomonee Falls, Wis. [Filed Oct. 6, 1875.]

Brief.—The table of the machine, provided with a longitudinal slot, is supported by the standard, and is hinged thereto, whereby it can be swung down out of the way, when it is desired to sew tubular articles on the projecting arm. The feeding-lever is actuated by mechanism contained in a box that swings about the needle-bar. The feeding-arm has a vertical and lateral motion. These motions are produced by a combination of levers with the needle-bar, as set forth in the claims. The needle-carrier is actuated by a rock and pinion, in combination with a crank-lever and an adjustable bent lever, all being operated from the driving-shaft by an eccentric.

171,689.

1. The combination, with the frame or stand A C D E, of the hinged work-table H, operated in the manner and for the purposes substantially as hereinbefore set forth.

2. The combination of the elongated hollow arm or box G, containing the shuttle, and the slotted top or table H, surrounding the same, and capable of being let down, substantially as and for the purposes herein set forth.

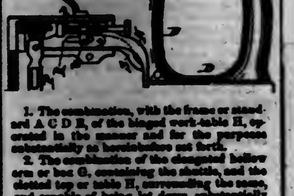


3. The box E, containing the mechanism for actuating the feed, in combination with cam I and hand E, said box being provided with an arm, K, surrounding the needle-bar, whereby the entire feed mechanism is adapted to swing around the needle, substantially in the manner hereinbefore described, for the purposes set forth.

4. The combination, with the needle-bar K, of the lever F, presser-foot F, slotted lever E, with pin *p*, feed-arm S, with pin *s*, and the fulcrum-pin *c*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

5. The combination, with the presser-foot F, lever E, and feed-arm S, all constructed as described, of the slide *t* with pin *s*, and the adjusting-screw *p*, substantially as and for the purposes herein set forth.

6. The combination of the centrally-pivoted shuttle-carrier C', pinion *c'*, rack-bar D', bell-crank lever B', and adjustable boat lever A', all operated from the driving-shaft by an eccentric and rod connected to said shaft, substantially in the manner hereinbefore described, for the purposes set forth.



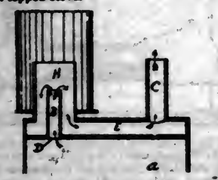
171,688. SPIKE. George H. Sanders, New York, N. Y. (Filed May 10, 1875.)

The improved spike A, herein described and shown.

171,687. COMBINED IMPLEMENTS. Levi Schaffer, Philadelphia, Pa. (Filed June 7, 1875.)

Brief.—The implement is cast in one piece, the body of which is provided with longitudinally-tapered slots, to act as a wrench, and having at one end a tack-extractor, and at the other a plate and lid-lifter, a reverse hook, lancetter, and can-opener.

The implement herein described, consisting of the handle A, provided with slots *b b*, plate and lid lifter B, reverse hook C, tack-extractor D, ice-cutter and can-opener E, having steps *e e* and inward curve *f*, constructed to operate as shown and set forth.



171,690. DOOR-SPRINGS. Lyman A. Stoll, Chicago, Ill. (Filed Sept. 27, 1875.)

As a new article of manufacture, a feather duster composed of a handle, the feathers prepared and made pliable, substantially as described, and a covering of ostrich or other similar feathers in their natural form, as specified.

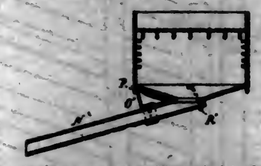
171,691. COOPERS' BARREL-HEATERS. W. A. Strong, Jr., Joliet, Ill., administrator of Wm. H. Moore, deceased. (Filed Dec. 11, 1875.)

Brief.—The drum can be applied to any flat-topped stove.

The combination of the drum B, ring G, flues B C D E, and fire-box *a*, arranged substantially as and for the purposes set forth.

171,692. STOVE-POLISHES. Chas. H. Torts, New York, N. Y. (Filed Nov. 10, 1875.)

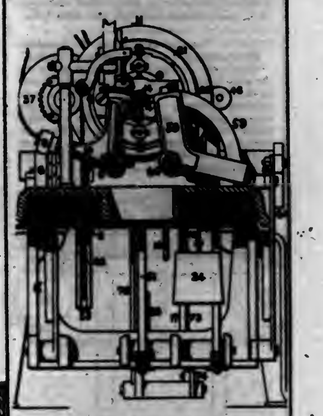
A paste stove-polish composed of hard soap, plumbago, resin, and varnish, as described.



171,693. REFRIGERATOR-CARS. James Turner, Chicago, Ill. (Filed Dec. 1, 1875.)

Brief.—The drip cools the conduit for descending air, and, being retained in its coil by the final upward bend, directly aids in cooling the feed-chamber.

In a refrigerator, the ice-chamber D, and air-passages E, F, and *a*, in combination with the trough *c* and tube *f*, bent upward nearly or quite to the ceiling, all constructed substantially as and for the purposes specified.



171,694. CLOVER THRASHERS AND HULLERS. Garet Jos. Utendorf, Ottawa, Ohio. (Filed Nov. 27, 1874.)

The discharge-trough N', attached to the hopper N² below the shoes by means of a triangular brace, O', and hook P' P, thereby adapted to be turned in other directions, substantially as and for the purposes set forth.

171,695. MACHINES FOR DRESSING THE HEADS AND POINTING AND THREADING THE SHANKS OF BOLTS. Wm. R. Ward, Port Chester, N. Y. (Filed Aug. 9, 1875.)

Brief.—A vibrating holder for receiving the blank from the railway-guide, and a follower-rod for pushing said blank out of the holder through a spring scroll-guide, (which rotates it axially, so as to insure the proper position of the squared portion under the head,) and into the revolving griping-jaws. Mechanism for closing said jaws upon the blank, and mechanism for automatically operating the holder, which carries the pointing and threading dies, so as to bring each of said dies into coincidence with the axis of the same at the proper time. A vibratory laterally-yielding stop between the head of the blank to project sufficiently to allow the shaving-tool to operate upon it. The finished bolt is discharged from the machine by a rod which works through the hollow spindle of the die-holder.

1. The combination of the following instrumentalities or organisms: revolving jaws or clamps constructed to receive and hold a bolt-blank so that both the head and the shank of the blank will project beyond the jaws, suitable threading-dies for cutting the thread on the shank, and a shaving-tool for dressing off the head of the blank while the operation of threading the shank is being performed, substantially as described.

2. Revolving jaws or clamps suitable for holding a bolt-blank, in combination with a pointing-tool and threading-dies mounted in the same holder, and arranged to be brought successively into coincidence with the axis of the blank, so as to first point and then thread the blank, substantially as described.

3. The combination of the following instrumentalities or organisms: revolving jaws or clamps constructed to receive and hold a bolt-blank, as described, a tool for pointing the end of the blank, dies for threading the shank, and a shaving-tool for dressing off the head concurrently with the operations of pointing or threading, or both, substantially as described.

4. The combination of a guide adapted to hold and conduct a row of blanks, a vibrating table, 3, and holder 4, as described, and a spring-check operating to cut off the undermost blank from the column of blanks in the guide by the movement of the vibrating table as the holder is about to receive a blank, the column of blanks at other times being sustained by the table, substantially as specified.

5. The combination of a blank-holder, 4, a follower-rod for pushing the blank into the holding-jaws, and a spring-scroll guide for turning the blank on its axis as it is entering the jaws, substantially as described.

6. In combination with the revolving holder in which the griping-jaws of a bolt-threading machine are mounted a ring, 21, or its equivalent, carrying a spring-pawl, and suitable mechanism for causing such pawl to engage with the holder and partially rotate the same to always bring the jaws to a given position.

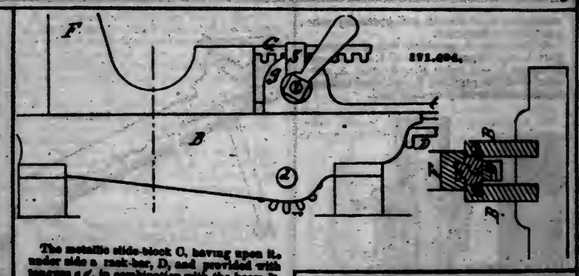
7. The combination of revolving griping-jaws, adjustable to position, as described, with the mechanism substantially as described, for causing the bolt-blank to be rotated axially, as set forth.

8. In combination with revolving griping-jaws a vibratory gage, 27, to determine the distance measured from the under side of the head of the bolt-blank to which the latter shall project from the face of the jaws, substantially as specified.

9. The combination of a follower-rod for pushing the bolt-blank into the griping-jaws, with revolving griping-jaws for holding such blank, and a gage, 27, constructed to yield laterally to the thrust of the follower-rod, and recover itself as the follower retreats, substantially as described.

10. The combination of a burring-tool, 38, for pointing the end of the blank, and threading-die 37, for cutting the thread on the shank, when the same are mounted in a common holder, and arranged to be brought successively into coincidence with the axis of the blank, substantially as described.

11. The combination of the following-named organisms: machinery, substantially as described, for giving a forward movement to, with yielding pressure upon, the spindle, which carries the holder containing the burring-tool and the threading-dies; machinery, substantially as described, for causing the said threading-dies to be brought into the plane previously occupied by the burring-tool, and machinery, substantially as described, for causing the common holder for the burring-tool and threading-dies to retreat from the blank after the blank has been pointed and before the change in the relation of such tools to the blank to bring the threading-dies into action has been made, substantially as specified.

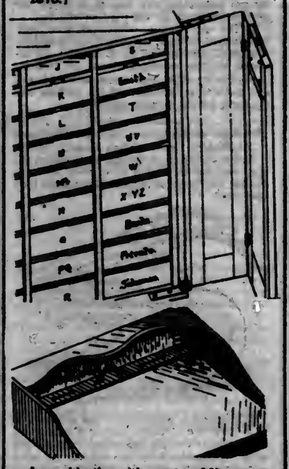


12. The combination of the spindle 23, a common holder, 2, for the burring-tool 38, and threading-dies 37, with the vibrating hinged journal-support for the same, substantially as described.

13. The combination of the longitudinally-moving spindle 23, the wiper-arm 46, and the expelling-rod 70, whereby the said spindle and its holder for the cutting-tools are made to perform the office of operating the expelling-rod from bunching when acting to expel the finished bolt from the holding-jaws, substantially as described.

14. The combination of a suitably-arranged spring-operated bolt-shipper bar, the vibrating table 3, and blank-holder 4, and the vibrating holder 50 for the head-dressing tool, substantially as described, for tripping the holding-latch of the bolt-shipper bar for stopping the machine.

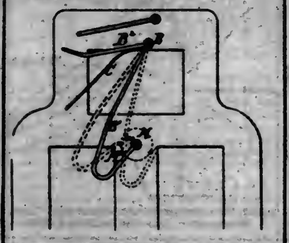
171,696. HEAD-BLOCKS FOR SAW-MILLS. Samuel White, Eau Claire, Wis. (Filed Feb. 6, 1875.)



Brief.—The log can be adjusted so that a board of equal thickness throughout its length can be cut, or one with tapering or converging flat surfaces of any degree of variation from the parallel cut, by means of a metallic slide-block, provided upon its under side with a rack-bar, and having formed upon its edges tongues fitting in grooves in the beams or tracks of the carriage, and upon its upper front portion a dovetail tongue, adapted to a correspondingly-shaped longitudinal groove in the under side of the set-block, which is adjustable upon the slide-block by a suitable lever and pinion, and a rack-bar attached to the upper rear part of the slide-block, and held against vertical displacement by a U-shaped strap.

171,694.

The metallic slide-block C, having upon its under side a rack-bar, D, and provided with tongues *c c*, in combination with the beam B, provided with grooves A, the sliding dovetail set-block F, provided with the rack-bar G, and pinions I and E, all constructed to operate substantially as described, and for the purposes set forth.

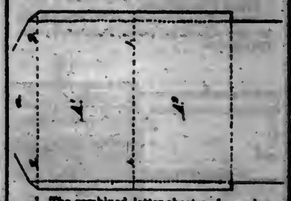


171,694. LETTER-FILE CABINETS. William A. Amberg, Chicago, Ill. (Filed July 24, 1875.)

In combination with a series of file cases or boxes, severally containing a self-indexing series of sheets, a cabinet adapted for the reception of such cases, and within which they are arranged in alphabetical or similar order, in accordance with any of the within-described systems.

171,695. LOCK-WORK ATTACHMENTS TO CLOCKS. Randal T. Andrews, Thomaston, Conn., assignor to the Seth Thomas Clock Company, same place. (Filed Dec. 7, 1875.)

Brief.—When the hands are turned backward a recess in the shaft receives the lifting-lever, thus releasing it from the action of the locking-pin.



1. The shaft M, formed with a recess, *n*, in combination with the lifting-hook N', and lifting-piece P' and its connections, and arranged to serve relatively thereto, as herein specified.

2. The spring C, in combination with the lifting-piece P' and its connections, arranged and operated relatively to the recessed shaft M *n*, and to the lifting-hook M', as and for the purposes herein specified.

In testimony whereof I have hereunto set my hand this 4th day of December, 1875, in the presence of two subscribing witnesses.

171,697. COMBINED LETTER-SHEETS AND ENVELOPES. Richard W. Barnes, Brooklyn, N. Y. (Filed May 21, 1875.)

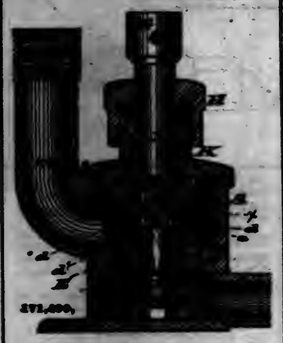
1. The combined letter-sheet and envelope A' A², consisting of a rectangular sheet, having a folding sealing-flap across one end, and having its two opposite sides or edges gummed and perforated, all substantially as described.

2. The combined letter-sheet and envelope A' A², consisting of a rectangular sheet, having a folding sealing-flap across one end, and having its two opposite sides or edges gummed and perforated with additional narrower fold or folds A², all substantially as described.

171,698. BOOTS AND SHOES. Wm. Biddle, Corvallis, Oreg. (Filed June 10, 1875.)

1. A boot or shoe having the rearwardly-projecting sheet-metal heel-spring C and toe-spring D, constructed substantially in the manner and for the purposes specified.

2. The combination, with the spring D and plate E, of the heel and sheet-metal cone *a a*, having notches *x* and projection *y*, as described, the loop or staple *d*, and cone-lever A, all substantially as and for the purposes herein set forth.

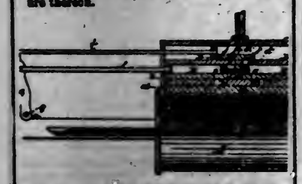


171,699. HYDRANTS. Stephen Hinkle, St. Louis, Mo., assignor to Robert Charles, same place. (Filed Oct. 9, 1875.)

Brief.—The working parts may be readily removed. The valve-seat can be removed, when desirable, without disturbing the adjacent portion. When the square portion of the stem is sufficiently elevated the waste-port becomes uncovered.

1. The valve-chest A, provided with the chamber *a*, pipe M, cap C, stem G, provided with the square I and round part J, and

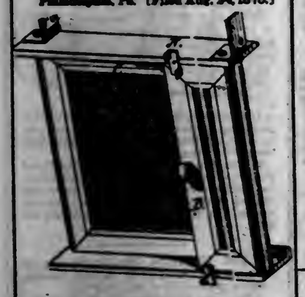
waste-port K, combined and operating substantially as described.



2. The steam C, provided with the square port L, cap C, port D, ties d d, fast, detachable seat R, and valve F, and chest A, provided with the partition E, combined and co-acting substantially as described.

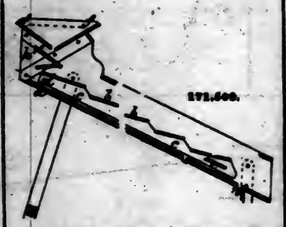
171,600.

171,600.—VALVE-GEARS FOR STEAM-ENGINES. Charles H. Braid, Massillon, Ohio. [Filed June 28, 1875.]



Brief.—Valve is constructed to admit steam to either side of the piston, to equalize pressure thereon.

1. In a valve-box, the combination of horizontal partitions D, having ports *d' d''*, bottom D', provided with ports and grooves, as described, slides E E', having ports *e e'*, and connected through the partition *d*, and slide I, having port *i* and grooves *j j'*, arranged to alternately coincide with escape-ports *e e'*, substantially as shown.



2. The valve E, having port *e*, in combination with bottom D', having ports *b c*, arranged to each receive half the flow of steam from port *a*, substantially as described.

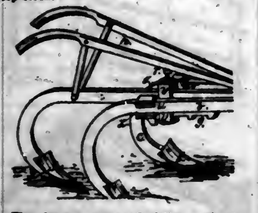
171,601.—DOOR-SCREENS. Alvt. A. Carter, Philadelphia, Pa. [Filed Aug. 24, 1875.]

The hinged overlapping screen-frames B and C, combined with the cap E, as and for the purposes set forth.

171,602.—SAW-SWAGERS. Jno. L. Ostrander, Framingham, and Geo. F. Shldolph and Thomas F. Shldolph, Woodbridge, Great Britain. [Filed Sept. 20, 1875.]

171,602.

---

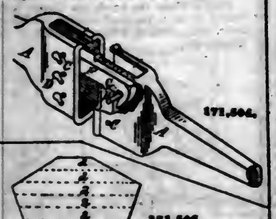


1. The combination, substantially as set forth, of the case, its inclined bottom, and the inclined shelves, arranged, as described, in a step-like series above the bottom of the case, and having vertical spaces between them, communicating with an inclined passage-way formed beneath the shelves upon the bottom, for the purposes specified.

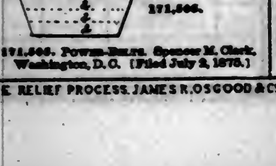
2. The combination, substantially as hereinbefore set forth, of the hopper, the case, its inclined bottom, the inclined shelves, and the hinged adjustable side boards, to which the shelves are fixed, for the purposes specified.

3. The combination, substantially as hereinbefore set forth, of the case, its inclined bottom, perforated toward its lower end, the inclined shelves, arranged above the bottom, one below the other, with spaces between them, and the stop projecting from the bottom into the case, for the purpose specified.

171,603.—CULTIVATORS. Joseph W. Chase, Middleport, Ohio. [Filed June 26, 1875.]



Brief.—A clamp in two parts, to adjust the width of the cultivator by sliding upon the beams, and permits vertical adjustment by a step-block.

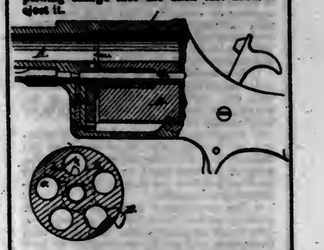


The clamp *c*, composed of the upper plate *c*, having the mortised lugs *w v w*, and the lower plate *c'*, having the central mortised lug *x*, in combination with the gib *g*, the set-screw *e*, and the plow-beams, as and for the purposes set forth.

171,604.—GAR-COUPLINGS. H. W. Chase, Sumner, Me. [Filed Oct. 7, 1875.]

The improved car-coupler described, consisting of the coupling-rod F, provided with the hooks G and the draw-bars A A, provided with the heads B, the series of holes C, buttons D, pins H, and elongated slots *s s*, all constructed and arranged to operate substantially as set forth and specified.

171,604.



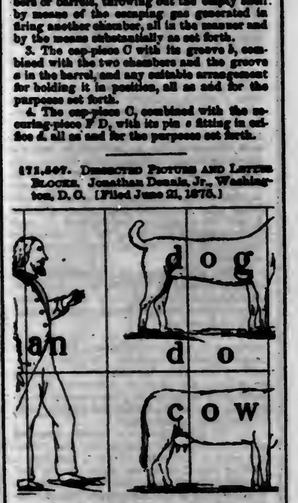
171,605.

171,605.—POWER-BELTS. Spencer M. Clark, Washington, D.C. [Filed July 2, 1875.]

A belt constructed of successive layers of belting material of different widths, which decrease in width from its widest point downward, forming an angle to fit the pulley, and from the same point upward to form a re-enforce or backing for the belt when under working tension, substantially as shown and described.

171,606.—EXTRACTING SHELLS FROM REVOLVING FIRE-ARMS. Otis F. Cole, Norwich, Conn. [Filed Nov. 20, 1875.]

Brief.—A shield or cover in front of the chamber containing a shell has a small groove in its face, which conducts gas from an exploding charge into the shell last fired, to eject it.



1. In a fire-arm having a plurality of chambers or barrels, throwing out the empty shell by firing another chamber, all in the manner and by the means substantially as set forth.

2. In a fire-arm having a plurality of chambers or barrels, throwing out the empty shell by means of the escaping gas generated in firing another chamber, all in the manner and by the means substantially as set forth.

3. The cap-piece C with its groove *b*, combined with the two chambers and the groove *a* in the barrel, and any suitable arrangement for holding it in position, all as and for the purposes set forth.

4. The cap-piece C, combined with the securing-piece F D, with its pin *e* fitting in orifice *d*, all as and for the purposes set forth.

171,607.—DISSECTED PICTURE AND LETTER BLOCKS. Jonathan Dennis, Jr., Washington, D.C. [Filed June 21, 1875.]

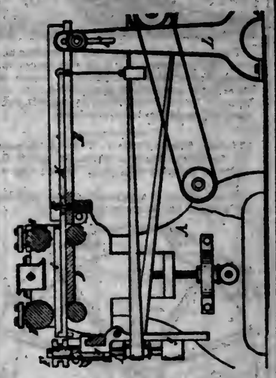
1. The dissected picture-blocks, having on each block a portion of the picture, and also a portion of the name of the object represented by the picture, substantially as and for the purpose described.

2. The dissected picture-blocks, having the letters which spell the name of the object represented placed or arranged within or across the face of the picture, substantially as described.

171,608.—LUBRICATING COMPOUNDS. Henry V. P. Draper, Hannibal, Mo., assignor of one-half his right to Peter B. Grout, same place. [Filed Oct. 4, 1875.]

1. The herein-described lubricating compound, consisting of petroleum, animal fat, and lime-water, substantially as described.

2. The herein-described process of manufacturing a lubricating compound from petroleum, animal fat, and lime-water, substantially as described.



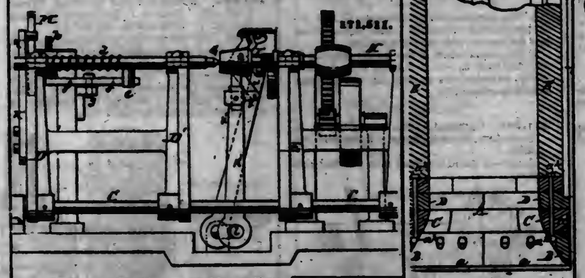
171,609.—LUBRICATING COMPOUNDS. Henry V. P. Draper, Hannibal, Mo., assignor of one-half his right to Peter B. Grout, same place. [Filed Aug. 26, 1875.]

1. The herein-described lubricant, consisting of petroleum and lime-water combined, substantially as described.

2. The herein-described process of manufacturing a lubricating compound by adding lime-water to petroleum, substantially as and for the purposes set forth.

171,610.—FLAMING-MACHINES. Andrew H. Frank and George Spire, Buffalo, N. Y. [Filed Feb. 10, 1876.]

Brief.—The bed and feed-table are hinged together and made vertically adjustable, to adapt them to lumber of different thicknesses.



1. The combination, with the bearing of the adjustable matcher-cutterhead, provided with slot *a'*, of the weighted pressure-lever M, provided with stop-pin *a*, substantially as and for the purpose hereinbefore set forth.

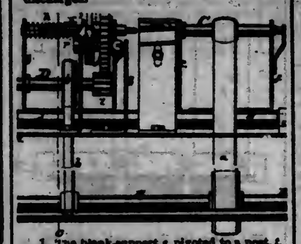
2. The combination, with the cutter-head A, feed-rollers B B, and vertically-adjustable bed D, of the feed-table E, hinged thereto, standards L, and adjustable connecting-bolt *l*, substantially as and for the purpose herein before set forth.

171,611.—MACHINES FOR TURNING BUNGS. Edward Gunther, New York, N. Y. [Filed Oct. 26, 1875.]

Brief.—The tool which finishes the bung is given a circular movement, so as to round the corners.

1. The center slide F, supported by oscillating head-stocks, in combination with an oscillating lever, *f*, and a cam, M, said parts operating in respect to the spindle H, and stock B, as described, for the purpose of automatically centering and securing the blanks to be operated upon, and to release the same when the head-stocks are in line with the axis of the blank, substantially as herein described.

2. In a machine for turning bungs, the lever-bar *b* (upon the shaft) operated by the cam *n*, in combination with the slide F G and spindle H supported upon head-stocks, substantially as and for the purpose specified.



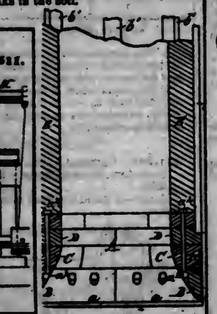
3. In a machine for turning bungs, the combination of a rounding-knife, *j*, with a beveling-knife, *i*, when the same operate upon the bung-blank secured between a slide and a spindle mounted in oscillating stocks D D' E E', substantially as and for the purpose described.

4. The cam M, provided with the sections *e f g*, as described, in combination with the tapper-lever K and beveling-knife *i*, substantially as described.

5. The slide F, provided with a retaining spring, *d*, and with a stud, *c*, in combination with the oscillating lever *f* and the stud *h*, as herein shown, for the purpose specified.

171,612.—MACHINES FOR TURNING BUNGS. Edward Gunther, New York, N. Y. [Filed July 31, 1875.]

Brief.—The bung-blank is automatically grasped by and centered between two spindles, and by them brought into contact with the cutters, and, when finished, automatically discharged.



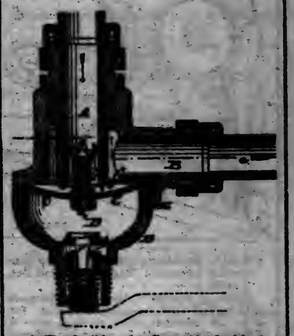
1. The blank-support *s*, pivoted to a post, *t*, and combined with the friction-spring *u*, to operate in combination with the shafts C and E, substantially as herein shown and described.

2. The vibrating posts *f f* and *g g* combined with the vibrating shafts C D E, support *s*, and stationary cutter *r*, substantially as herein shown and described.

3. The sleeve *i*, made in one piece with the wheel *j*, cam *n*, and cam-projection *p*, and fitted upon the reciprocating shaft E, which has the pin *q*, and combined with the spring *u*, all to operate substantially as specified.

171,613.—CONSTRUCTING WELLS. C. Holtz, St. Louis, Mo., assignor to H. A. French. [Filed May 26, 1875.]

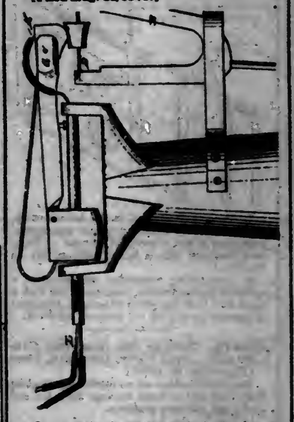
Brief.—The wall is constructed with an earth-box, consisting of separate layers bolted together, and having a cutting-edge, and connected to upright strips, which permit the bricks laid upon the earth-box to keep clear from the earth. The bricks are laid on the box as it sinks in the soil.



1. The uprights or strips *b'*, in combination with the offset *b*, of an earth-box, by means whereof the masonry is kept clear from the surrounding earth during the sinking of the well, and as herein shown and described.

2. The earth-box A to consist of separate layers B, C, D, &c., and formed with a cutting-edge, *a*, and bonded by rods *a'* and nuts *a''*, in combination with the upright strips *b'*, by means whereof the sinking of wells is done by the weight of masonry built top of said earth-box, substantially in the manner as herein shown and described.

171,614.—WATER-CLOSET VALVES. James P. Hyde, New York, N. Y., assignor to McMab & Martin Manufacturing Company, same place. [Filed Dec. 2, 1875.]

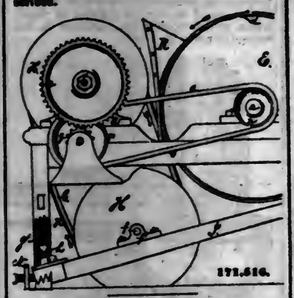


Brief.—When the valve in the cap is opened the water discharges, and the flexible valve is opened by pressure of water upon its face, and is closed by counter-pressure of water, which passes through the aperture in the valve and refills the cup.

1. The flexible valve C combined with the pipes A B and with the cup D, which has a discharge-opening below said valve, substantially as herein shown and described.

2. The combination of the valve F with the cup D, valve C, and pipes A and E, substantially as specified.

171,615.—HEEL-POLISHING MACHINES. Wm. Joint and George B. Dunham, Lynn, Mass. [Filed Aug. 31, 1875.]

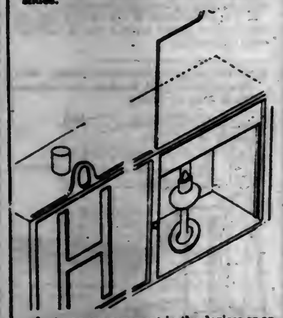


In a machine for polishing the heels of boots and shoes, the combination of a hollow rocking-shaft and polishing-tool with the steam-pipes L and K passing through the shaft and into the tool, as shown, for the purpose described.

171,616.—RICE-HULLING MACHINES. Joseph Jonet, New Orleans, La. [Filed Feb. 12, 1875.]

Brief.—The toothed steel bands are revolved in close proximity to the toothed drum, each division of which is fed from a division of the hopper. The tension of the bands is regulated by the adjusting-frame.

1. The drum B, having steel bands *d d*, having teeth secured around its periphery by means of steel rings *c c*, and the steel bands F F', endless belt G, pulleys H H', and hopper R, the whole being constructed, combined, and arranged to operate substantially as described.

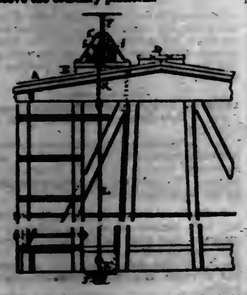


2. The drum B, having steel bands *d d*, provided with teeth secured around its periphery by means of steel rings *e e*, and the steel bands F F, having teeth, as shown, endless belt G, pulleys H H', and the adjusting-frame I, the whole being constructed, combined, and arranged to operate substantially as described.

171,516.

171,517. SIGNALING DEVICES. Henry Kinnersley, Liverpool, England. (Filed Oct. 6, 1875.)

Brief.—A number of transparent slides are used, each of which has a separate letter. The slides are interchangeable, so as to allow of different arrangements for conveying different signals. In day-time flags with letters on them may be substituted for the transparent slides.

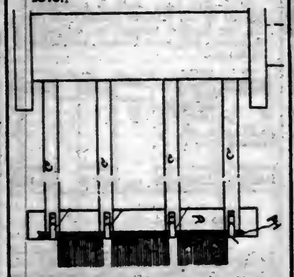


1. As an improvement in the devices or apparatus used for signaling in the commercial code used at sea, a series of screens or flags, each provided with a letter, substantially as described.

2. A signaling apparatus consisting of a series of compartments, each provided with a light, and with the slides or screens, arranged to operate as and for the purpose set forth.

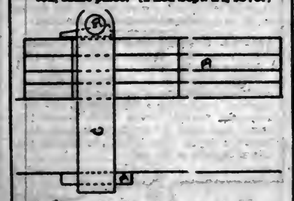
171,518. DEVICES FOR OPERATING CAR-BRAKES. John Kirby, Cleveland, Ohio. (Filed Nov. 15, 1875.)

Brief.—Windlass set on platform projecting from roof, and at same distance from the end above the ordinary platform.



1. The platform B, in combination with a brake-windlass, F, secured thereto in position on the roof of the car some distance from the end, substantially as and for the purpose specified.

2. The combination of platform B, brake-windlass F, chains K K', pulleys J J', and rod L, substantially as and for the purpose specified.

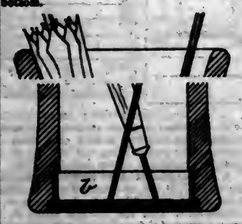


3. The platform D, in combination with the brake-windlass F, located on the roof of the car some distance from the end, substantially as and for the purpose specified.

171,519. WARP-BEAM APRONS FOR LOOMS. Leonard J. Labounty, Lowell, Mass., assignor to William E. Whitehead and Abel T. Atherton, same place. (Filed Oct. 21, 1875.)

The clamp-rod F, in combination with an apron or bands, C C C C, attached to the warp-beam of a loom for weaving textile fabrics, substantially as and for the purpose herein specified.

171,520. LOOM-PICKER FASTENINGS. Leonard J. Labounty, Lowell, Mass., assignor to Wm. E. Whitehead and Abel T. Atherton, same place. (Filed Sept. 24, 1875.)



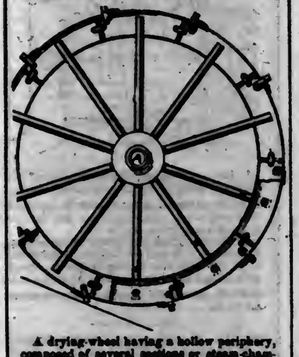
1. The combination of the strap C and eccentric D with the staff A and picker B, as and for the purpose herein specified.

2. The combination of the elastic packing E with the staff A, picker B, strap C, and eccentric D, substantially as and for the purpose herein specified.

171,521. UMBRELLA-STANDS. Charles A. Lawrence, Beverly, Mass. (Filed Nov. 20, 1875.)

Brief.—A stand provided with a detachable bottom.

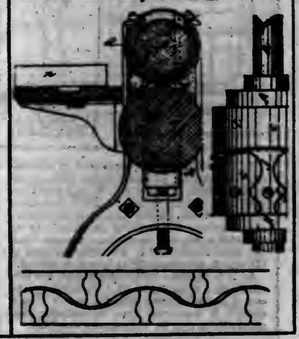
In combination with the umbrella-stand A, the detachable bottom b, as and for the purpose herein shown and described.



171,522. PROCESSES FOR LEVELING LAND. Thomas S. Lowe, Centreville, Cal. (Filed June 22, 1875.)

The process herein described of leveling uneven land and preparing it for easy irrigation, consisting of the application of a stream of water under pressure, in combination with the levees B, boxes C, and stationary gates D, substantially as herein beforedescribed.

171,523. STEAM DRYING-WHEELS. Horace J. Medbery, Henry A. Mann, Jr., and S. H. Drake, Ballston Spa, N. Y. (Filed July 8, 1875.)



Brief.—There is a pipe-connection between the sections and valve in each.

A drying-wheel having a hollow periphery, composed of several sections or steam-chambers, substantially as and for the purpose described.

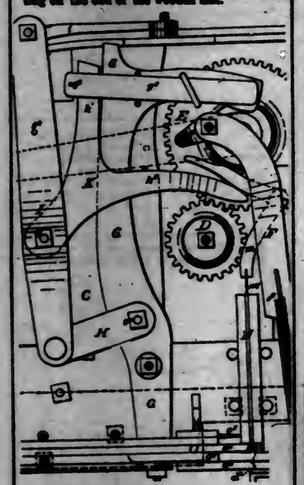
171,524. MACHINES FOR CUTTING PAPER COLLARS. Horace J. Medbery, Ballston Spa, N. Y. (Filed Nov. 22, 1875.)

Brief.—By the peculiar arrangement of the knives upon the detachable sleeves, two complete collar-blanks are cut out of the strip at each revolution of roll or drum, upon which the sleeves are secured. The knives, in cutting, act against a covered roll mounted in the frame immediately below them.

1. The mode of cutting collars, cuffs, cuffs, cuffs

The toy block, provided with equidistant projecting quadrangular prisms *d d*, which are formed by two sets of grooves, *c* and *b*, crossing each other at right angles, the grooves and prisms being of substantially the same width, as set forth.

171,636. REGISTERING APPARATUS FOR PRINTING-PRESSES. Reuben Sisco-wood, Providence, R. I., and Charles H. Bebee, Mont Clair, N. J. (Filed Sept. 9, 1875.)



Brief.—The sheet is laid over the grooves in the table, and the pad is gradually dropped onto it and drawn back until the last drops down at the edge of the sheet, when the friction between the rubber pad and the surface of the paper serves to bring the sheet into proper position for the gripers of the press.

A pad, G, constructed to operate upon a sheet of paper, substantially as described, combined with a protecting head, arranged to drop at the edge of the sheet, in order that the pad may thereafter cause the paper to be moved to the point desired.

171,685. MACHINERY FOR FORMING METALLIC HEAD PIECES FOR BLIND-SLATS. Seeley M. Sherman, Fort Dodge, Iowa. (Filed Mar. 23, 1875.)

Brief.—A cutting-block having a tenon-like former at the end and an internal ejector. A bifurcated reciprocating cutting and bending device, and a swinging die or former hinged to the frame. The strip of metal is fed through a guide and projected into the end of the cutting-block. The cutting and bending device then moves up, cutting off a blank, and bending its edge down against swinging die, while the part of said device which is bifurcated, and passes outside over the former, bends the opposite edge of the blank, and bends the corners down against the swinging die. On the side of the table are two cutters, for cutting off the end of the wooden slat.

1. In a machine, substantially as described, the combination of a series of knives having a swinging motion, with a series of knives and punches having a reciprocating motion, substantially as described.

2. In a machine, substantially as described, the combination of a series of knives having a swinging motion, and a series of knives and punches having a reciprocating motion, with a stationary die, substantially as described.

3. The combination, with the stationary die, of the ejector *m'*, substantially as described and shown.

4. The combination, with the series of swinging knives, of the guide *S'*, for the purpose set forth.

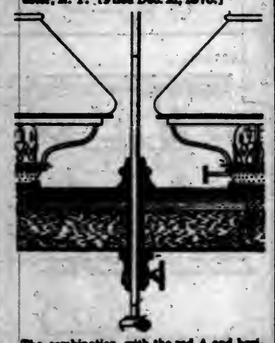
5. The combination, with the series of swinging knives and punches, pivoted at a point, *S*, of the cog-wheel E, having a stud, *s'*, and a lever, *F*, for the purpose set forth.

6. The combination, with the reciprocating knives and punches O, of the cog-wheel E, having a stud, *s'*, and lever G, for the purpose set forth.

7. The combination, with the cog-wheel E, having a stud, *s'*, a V-shaped lever, K, and L-shaped lever G, and a strap, *f'*, for the purpose set forth.

8. The combination, with a lever, G, a lever, H, lever I, and rod *i*, for operating the knife *S'*, as described.

9. The combination with the cog-wheel E, having a stud, *s'*, a lever, M, having an arm, *m*, and an ejector, *m'*, for the purposes set forth.



10. The combination, with the side *S'*, of the knives, the platform *l*, having stop P and spring *P*, having an arm, *P'*, operated as described.

11. The combination, with the swinging knives *d S' S*, carrying the guide-plate *S'*, of the reciprocating knives O and die N, having the ejector *m'*, substantially as described and shown.

171,686. REMEDIES FOR PULMONARY DISEASES. John O. Shoemaker, Pittsburg, Pa. (Filed Feb. 24, 1875.)

A medical composition composed of a mixture of oil of sassafras, oil of hemlock, alcohol, No. 6, tincture of lobelia, tincture of bloodroot, molasses, and water, with oil of anise and balsam-fir, substantially in the proportions and for the purposes set forth.

171,687. LAMPS. Chas. F. Spencer, Rochester, N. Y. (Filed Dec. 22, 1875.)

The combination, with the rod A and horizontal oil-reservoir, provided at each end with a burner, of the adjustable collar and its thumb-nut for holding the reservoir in any desired position on the rod, substantially as described.

171,688. PROCESSES OF PREPARING WOOD VENEERINGS. G. W. Spurr and Louis Prang, Boston, Mass. (Filed Oct. 28, 1875.)

The process of preparing wood veneering, backed or to be backed with paper, such process consisting in treating it with acid and glycerine, printing or painting upon it, and fixing it with shellac or other varnish, substantially as and for the purpose set forth.

171,689. HEAD-REST FOR DENTAL CHAIRS. Jill T. Starr, Philadelphia, Pa., assignor to Samuel S. White, same place. (Filed Nov. 6, 1875.)

Brief.—The bar attached to the head-piece is passed through a pin contained in the clamp-head, the latter being adjustable upon a bar rigidly secured to the chair. Both the pin and the clamp-head have a central bore, in which are fitted three pins—one bearing against the bar supporting the head-piece, and the two others clamping the bar on which the clamp slides. A turn of the screw forces the two latter together, and against the third, locking the head-rest firmly in place.

1. A head-rest mounted upon a supporting-bar, secured upon one side of its longitudinal center and rocking in a turning-post, whereby the head-rest is rendered reversible and a wide range of motion imparted to it, substantially as set forth.

2. The sectional adjusting-frame hereinbefore described, consisting of a lower section, a turning-post mounted thereon, and a clamp-screw, these members being constructed and operating in combination, substantially as hereinbefore set forth.

171,690. LAMPS. Granville M. Stevens, Deering, Me. (Filed Nov. 22, 1875.)

Brief.—The oil-receptacle and cover are removable.

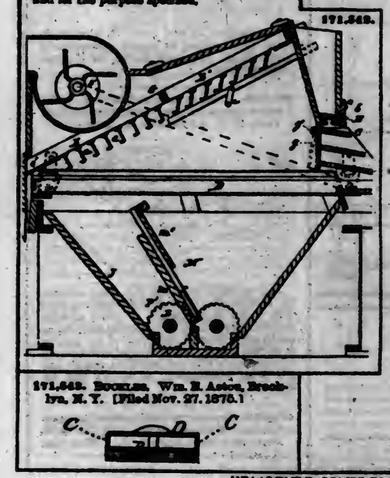
A lamp made as described, and composed of the base *A*, stock *A*, the wooden cup or bowl *f*, the annular top *h*, and metal receptacle *c*, the said receptacle *c* being attached to the cover or top *b* by the metallic neck *a*, held suspended in the cup *f* from said wooden cover *b*, and removable from the cup *f* with said top, as herein set forth.

171,691. CHEST-REST FOR VIOLINS. Hiram W. White, Cedardown, Iowa, assignor to Geo. W. Lyon and Patrick J. Healy, Chicago, Ill. (Filed Nov. 20, 1875.)

In combination with the rest-plate A and chest-hook C, the chest R, provided with the corrugations a a, substantially as and for the purposes specified.

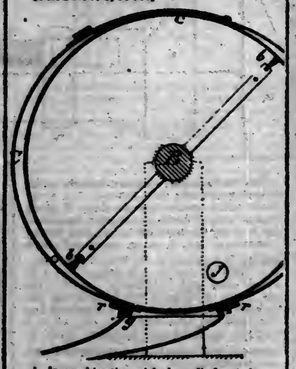
171,692. MIDDLINGS-PURIFIERS. Joseph L. Williford, Minneapolis, Minn., Assignee of one-half his right to Reuben Russell, same place. (Filed Oct. 6, 1875.)

Brief.—An middlings-post from hopper, having reciprocating bottom, over a series of overlapping reciprocating shelves to the screen, they are subjected to an exhaust-blast, which is deflected and regulated by a series of adjustable swinging valves. A cut-off between the two transverse conveyors is made in two parts, sliding together, to adapt it to different inclinations.



1. The combination, with the shaker D and suction-fan F, of the valves *c*, in two sections, E E', operated as described, and arranged at an angle, or inclined toward the tail of the shaker, substantially as and for the purpose specified.

2. The combination, with the shaker D and inclined overlapping shelves C, of the operating mechanism, consisting of the pivoted hangers *d*, rods *d'*, pivoted between the ends of frames *d'*, and eccentrics *e* on fan-shaft, all being arranged to operate in the manner substantially as shown and described.

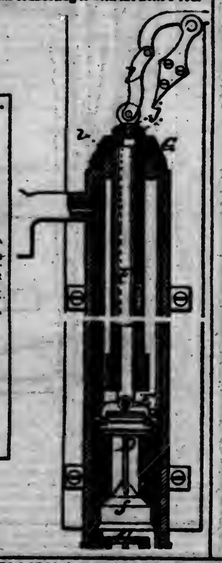


3. The combination, with shaker D and overlapping shelves C, of the transverse reciprocating bottom B of the hopper, operated through the medium of the shaker D, angular lever *b*, and connecting-rod *b'*, substantially as described.

4. The combination, with the transverse conveyors L L and shaker D, of the adjustable cut-off M, formed in two parts, *a* and *a'*, sliding together in the manner substantially as and for the purpose specified.

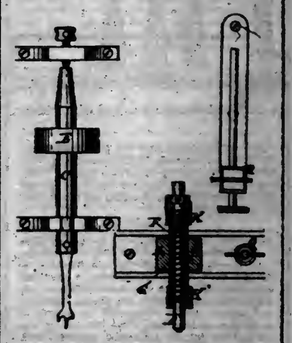
171,693. BUCKLES. Wm. B. Aston, Brooklyn, N. Y. (Filed Nov. 27, 1875.)

171,694. FEATHER-RENOVATORS. Alfred W. Ballard and Dan B. Wirt, Macon, Mo. (Filed Nov. 6, 1875.)



1. In combination with the cylinder A, having drying-chambers U C and a steam-inlet, J, the revolving shaft B, provided with brushes *b*, which serve a twofold purpose—to wit, to stir up the feathers and clean out the cylinder—substantially as described.

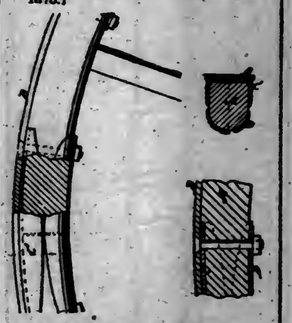
2. The combination, with a feather-renovator, of the flaring flange *p*, strips *r*, and keys *s*, substantially as and for the purpose herein described.



171,695. PUMPS. Wilson Barnes, Magnolia, Iowa. (Filed Sept. 11, 1875.)

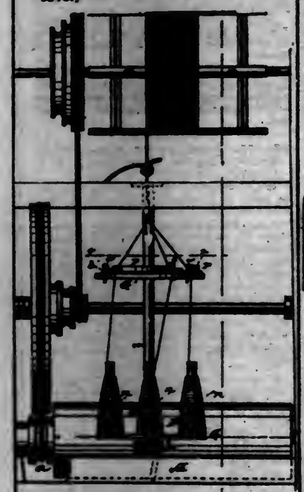
Brief.—The operating-rod is made large and hollow, with a small vent at the top, the effect of which is to maintain constancy of flow. Action of the plunger is rendered free by a gimbal-joint connecting it with the hollow rod.

171,696. MACHINERY FOR BORING BLIND-SLATS. John Dee, Mount Vernon, N. Y. (Filed Oct. 13, 1875.)



Brief.—In boring blind-slats the holes can be bored at a uniform distance apart from each other, and at an equal distance between the gage and the boring-bit, and the space between the holes varied at will by means of a laterally and longitudinally adjustable spring-gage, consisting of a pin having its lower end tapered, provided upon its rear end with an adjustable collar, and arranged in a tube, the ends of which are closed by flanged nuts, which serve as stops to determine the depth of hole desired, and containing a spiral spring, which controls the pin, in connection with a suitable boring-tool and its operating mechanism.

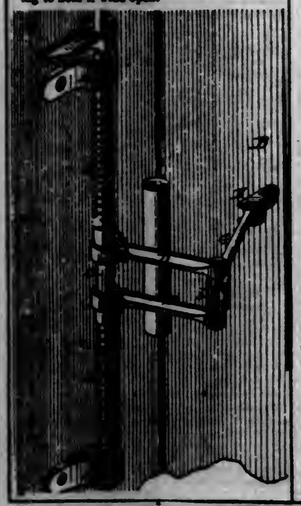
1. The combination of the spring-gage F, arranged as described, in the tube G, with a boring-bit, substantially as set forth.



2. The combination of the spring-gage F, the adjustable tube G, having a stop, K, at its forward end, the stop F', and a boring-tool, substantially as described.

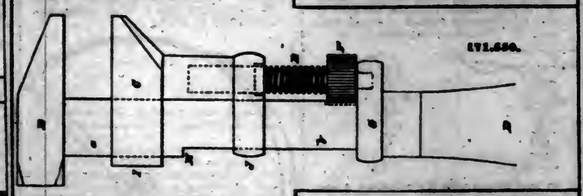
171,697. FELLY-JOINT CLIPS. D. T. Bowman, Middletown, N. Y. (Filed Oct. 2, 1875.)

The felly-joint support consisting of the upper clip C, having right-angular flanges overlapping each side of the felly-joint, the lower clip D, provided with overlapping flanges, and the two bolts *a a*, passing through the tire, felly, and clips, substantially as and for the purpose set forth.



171,548. TWISTING-MACHINES. Jonathan Copeland, Barnville, Ohio. [Filed May 17, 1875.]

In a spinning-machine the tension-regulating device herein described, consisting of the rubber shoe *a*, spring *p*, pivoted plate or lever *t*, and button *n*, arranged as described, to operate on the thread in the slots *s y* of the disk G', as set forth.

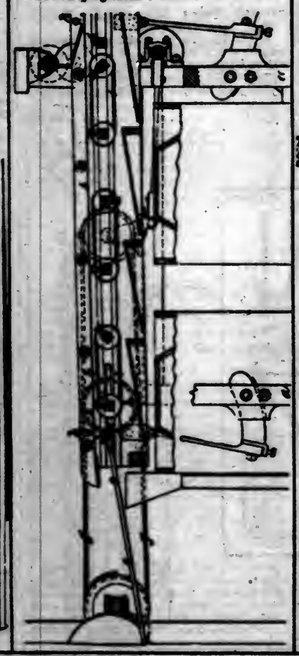


171,549. DRILL-STRINGS. A. B. Chambers, Anamosa, Iowa. [Filed July 10, 1875.]

Brief.—A spring-controlled rod, attached at its two ends to the door-frame, is provided near the middle with two loosely-fitting arms, which extend laterally over jointed handles, and connect with a bifurcated bar hinged to a bracket on the door. The two coil-springs around the rod are connected one with each of the parallel arms, and suitable means for buying up the same provided, the construction tending to hold the door normally closed, but the folding in of the bar between the parallel arms, when the door is opened, serving to hold it wide open.

The combination of the rod G, stationary in the boxes *a a*, loose arms D D, with connecting-bar *b*, springs *d d*, bar G, and bracket H, all constructed and arranged to operate substantially as and for the purposes herein set forth.

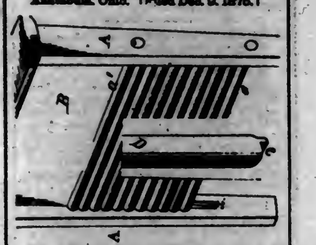
171,550. SCREW-WRENCHES. J. H. Coes, Worcester, Mass. [Filed June 15, 1871.]



171,550.

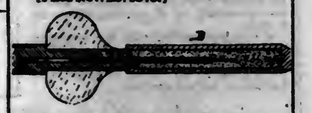
The combination, in a screw-wrench, of the following elements, viz: a wrench-bar recessed on its back to form an offset, H, along that portion, *a*, over which the front clasp-bearing I of the movable jaw slides, and having a stationary jaw, B, on its front end, and a handle, D, attached to its rear end, the movable jaw C having clasp-bearings I and J, to fit and work upon the portions *a* and *b* of the bar, while the sides of the nook of the jaw between the clasp-bearings are supported and slide upon the front side of the bar, which is straight, the stationary operating-screw E, rounds F, and ferrule G, substantially as shown and described.

171,551. MIDDLINGS-PURIFIERS. Abraham Crabtree, Bacup, Great Britain. [Filed June 11, 1875.]



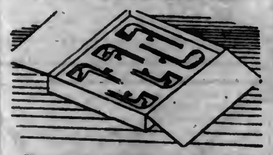
Brief.—The endless band which drives the sieve takes one turn around a pulley keyed on the axis of one of the brushes, which drives the rest, so that the brushes are rotated without interfering with the reciprocation of the frame carrying them.

1. The combination of the reciprocating carriage *d*, in which rotate a series of cleaning-brushes, *c*, communicating motion to each other, with the operating-pulley *h*, keyed on the axis of one of these brushes, substantially as described.



2. The combination of a cleaning-brush, *c*, rotating in the reciprocating carriage *d*, with the pulley *h*, driven by an endless band, *p*, making one turn round its periphery, as set forth.

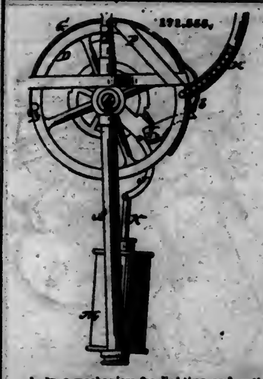
171,552. WASH-BOARDS. Lewis M. Crosby, Ashtabula, Ohio. [Filed Dec. 9, 1875.]



The combination of the side pieces A A, having longitudinal grooves *x*, the lower stationary round *c*, the movable rounds D, having tenons *e*, the upper stationary round *c'*, having grooves *y*, and the board B, all constructed and arranged substantially as set forth.

171,553. BOMB-LANCES. Patrick Cummingham, Newark, N. J., assignee of one-half his right to Bernard Cogan, same place. [Filed Nov. 20, 1875.]

A cartridge, A, and bomb B, when combined and arranged to operate substantially as herein set forth and shown, for the purposes specified.



171,554. PACKAGES FOR TOBACCO-PIPES AND OTHER ARTICLES. Isaac Daniels, New York, N. Y. [Filed Nov. 18, 1875.]

In a package for pipes and other articles, the combination of a slotted receiving-plate with a box of pasteboard or other suitable material, the slots in the receiving-plate being cut to correspond to the shape of the articles to be packed, and being provided with tongues for supporting said articles when placed into the slots, substantially as shown and described.

171,555. APPARATUS FOR LIGHTING STREET-LAMPS. Matthew Palmer and David H. Ingalsbee, Bloomington, Ill. [Filed Dec. 8, 1875.]

171,556.

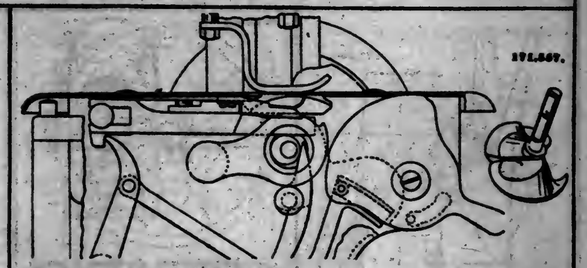
1. In a mechanism for lighting and extinguishing gas-lights by an increased pressure upon the gas in the pipes, a piston operating in a cylinder into which the gas is admitted, and the piston connected with the operating mechanism, substantially as herein set forth.

2. The combination of the burner B, with gas-cock G, wheel D, with chambers *y y*, and the roughened plate P, substantially as and for the purposes herein set forth.

3. The combination of the wheel D, with chambers *y y*, guard G, tubular chamber H, spring-pin *b*, and arm I, substantially as and for the purposes herein set forth.

4. The combination, with the gas-cock G, of the wheel D, rotary-wheel R, arm I, with spring-pawl *d*, connecting-link *d*, pinion-rod K, and pinion L, substantially as and for the purposes herein set forth.

171,556. ROTARY STEAM-ENGINES. Charles W. Fleeshler, Washington, D. C. [Filed Nov. 30, 1875.]



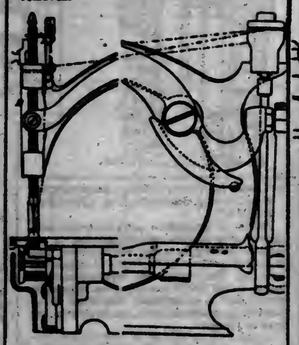
The sliding abutment D, having two steam-ports, *d d'*, and an auxiliary reversing-valve, E, arranged on its upper face, in combination with the drum B and its abutments O O' and the exterior cylinder A and steam-chest F, substantially as and for the purposes herein set forth.

171,557. SEWING-MACHINES. James R. A. Gibbs, Steele's Tavern, Va. [Filed May 26, 1875.]

Brief.—The receiving hook is formed with an enlarged groove in its rear, extending from the center of the same to its elevated point, and the rear side of this hook, from its point to the said groove, is beveled off from the supporting-stem to the periphery of the said hook, where, with the beveled edge of the front side, it forms a thin edge, so that the loop, after having been taken from the needle, instead of being carried around the hook in a revolution, as heretofore, is allowed to pass in front and rear of the same, maintaining a position diametrically across the said hook, or nearly so, during its entire revolution, and until the said loop is discharged therefrom. The bobbin-holder is pivoted to the frame of the machine in such a manner that, by means of a cam formed on the pusher and a spring on the pivot, it will be caused to move toward or away from the bobbin as the said holder is revolved either in the one direction or in the other.

171,557.

1. A bobbin containing hook rigidly mounted upon a revolving shaft, and constructed substantially as herein described, so as to carry the loop over the face and rear of the body of the hook that incloses the bobbin.



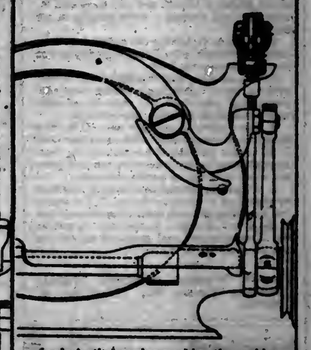
2. A bobbin containing hook rigidly mounted upon a revolving shaft, and constructed substantially as described, so that the loop taken from the needle shall be carried by the hook, while in the act of revolution, diametrically across the body of the hook, and held thereon thus diametrically until released by and upon completion of the revolution of the hook, as set forth.

3. The combination, with the rotary hook and bobbin, of a self holding and adjusting bobbin-holder pivoted to the body of the machine, substantially as set forth.

4. A bobbin-holder pivoted to the body of the machine, and combined with mechanism substantially as described, whereby simultaneously with its movement upon its pivot it is caused to move bodily toward or away from the face of the bobbin, substantially as set forth.

171,558. SEWING-MACHINES. James R. A. Gibbs, Steele's Tavern, Va. [Filed May 26, 1875.]

Brief.—On the upper end of the needle-bar, and projecting from its rear side, are two arms, in which are formed suitable eyes for the passage of the needle-thread. Between these eyes, and projecting from the head of the machine, is a vertical bar, having an offset on its rear side, in which is formed a narrow groove or slot, with a delicate spring arranged therein, so that as the thread is carried upward by the needle-bar in the act of the same, it (the thread) is carried into the said slot or groove, where, by the action of the said spring, it is held until the operation of needle-bar, when it is momentarily released, and on the descent of the needle-bar the thread instantly re-enters under the spring, where it is retained until the point of the needle reaches the surface of the cloth, when the thread is entirely withdrawn from the groove or slot, and the friction on the same thereby removed.



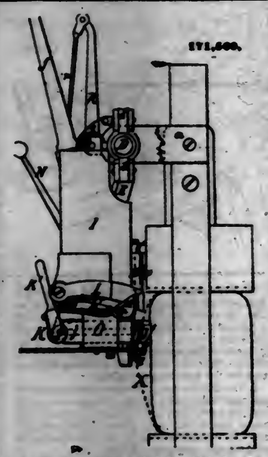
1. The combination, for the purpose of controlling the slack of the needle-thread, of a stationary auxiliary tension or friction pad and a thread-carrier which moves in unison with the needle, and operates to carry the thread into and withdraws it from said tension at the times and in the manner substantially as set forth.

2. The needle-thread controller or friction-pad tension, having a double intermittent action, by which the thread is controlled during a part of the descent of the needle, and is left perfectly free both during the latter part of the descent of the needle, and at the termination of the extreme upward stroke, substantially as and for the purposes described.

3. The friction-pad, constructed substantially as described, in combination with the needle-bar and the two thread-eyes thereon, arranged to move one on each side of the friction-pad during the reciprocations of the needle-bar, as and for the purposes set forth.

171,559. SEWING-MACHINES. James R. A. Gibbs, Steele's Tavern, Va. [Filed May 26, 1875.]

Brief.—A tension device similar to that shown in the patent to Wilson & Carleton, No. 116,221, is applied to a look-stitch sewing-machine, and is so timed with respect to the stitch-forming mechanism that the thread is held rightly until the needle has nearly reached the end of its upstroke, and until the under thread is drawn up into the cloth to the proper position to complete the stitch, when the said tension device releases the thread, allowing a sufficient amount of thread to be withdrawn from the spool to complete the succeeding stitch.



In a look-stitch sewing-machine, the combination, with the mechanism for delivery and interlocking the two threads, of a tension arranged to act on the under thread through the intermediary of the upper thread, at the times and in the manner set forth.

171,560. COTTON-BALE-BAND TIGHTENERS. Samuel K. Gilman, New Orleans, La., assignor to Louisiana Cotton-Tie Company. [Filed Dec. 14, 1875.]

Brief.—A frame descends from a shaft placed across the front of the press, along which it is adapted to slide. At its bottom another shaft is partially revolved by a lever at one end, to operate a disk at the other, working in two guide-frames that have adjustable clamps attached, the frames being forced apart and closed by rods on the disk acting as a toggle-joint. The lock being put on one end, the band is passed around the bale, and both ends clamped and drawn in opposite directions.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

171,560.

1. The jaws L M and J J', which, by the operation of the lever *f* are simultaneously moved apart or together, substantially as and for the purposes set forth.

2. The sliding plates H and I, interlocked so as to form mutual and firm guides for perpendicular motion, constructed and operating substantially as and for the purposes described.

3. The sliding plates H and I, and flanges *h' i'*, whereby the operating crank-plate G and the connecting-rods *g g* are fastened, and prevent any lateral movement of the same, substantially as hereinbefore set forth.

4. The jaws L and M, constructed with re-verse directions, and arranged and operating as set forth.

5. The plate H, provided with the fixed jaw J, the movable jaw J', and the lever-arm K, combined and operating substantially as set forth.

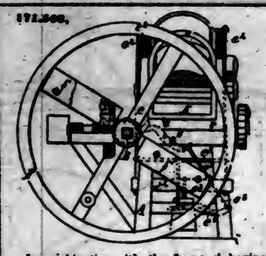
6. The shoe O, having the flange *o*, in combination with the lever F, substantially as and for the purposes set forth.

7. The revolving and swinging frame E, carrying a band-tightening machine, and supported and guided on the shaft D, substantially as and for the purposes set forth.

8. The vertically-movable shoe O, having flanges *o*, to assemble-rollers with the upper jaws L M, for the purpose of preventing the band from slipping on the bale while the said jaws are being released, as herein set forth.

9. A band tightening and locking machine composed of a traversing frame, B, the eccentric operating-plate G, the sliding plates H and I, the jaws L M and J J', the shoe O, and lever F, constructed and operated as and for the purposes set forth.

171,561. WASHING-MACHINE. William Goforth, Windsor, Mo. [Filed Nov. 4, 1875.]



The combination of the box A with frame B, rollers *a*, and rings F, the frame C C C, having rubber D, cloth D, and rollers G G, and the pivoted bars H H, connected to the plate O by the springs H, all constructed substantially as set forth.

171,562. SEWER-OUTFALL. John Grimm, St. Louis, Mo. [Filed July 13, 1875.]

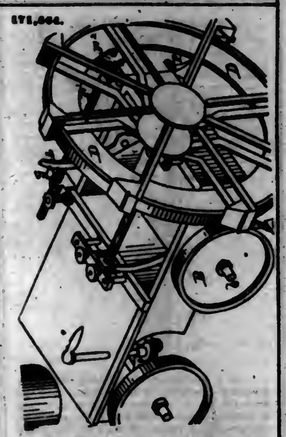
Brief.—A passive combination of a reservoir, counting-rods, and buoys, which brings a pressure upon the sewer at the moment the tide sets.

171,563.

In combination with the frame *c'*, having the return-spring *c⁵*, the connecting-rod *c⁶*, vibrating rod *c⁷*, rod *c⁸*, vibrating arm *c⁹*, and tappet *c¹⁰*, as described.

171,564. PETROLEUM-WELLS. Wallace L. Hardison, St. Petersburg, Pa. [Filed Nov. 23, 1875.]

Brief.—The object is to obviate the offset of paraffine deposit, and the action of steam on the slate-rock. The pumping-tube, the steam-pipe, protecting-jacket, and the steam or gas escape pipe are arranged as shown.

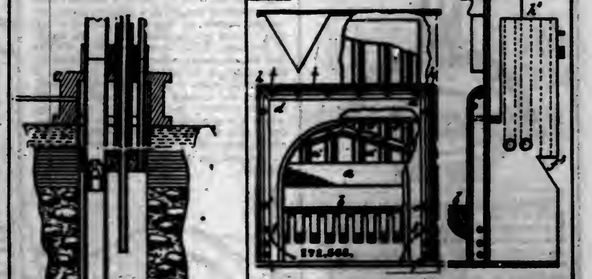


1. In a petroleum-well, the combination of a pumping-tube, a tube through which steam is admitted to the lower part of the well, a tube through which gas and steam may escape from the well, and a packer surrounding these tubes, substantially as set forth.

2. In a petroleum-well, the combination of a pumping-tube, a tube through which steam is introduced into the lower part of the well, and a protecting-tube, which surrounds the steam-tube, substantially as set forth.

3. In a petroleum-well, the combination of a pumping-tube, a tube through which steam is introduced into the lower part of the well, a protecting-tube, which excludes the water from the steam-tube, and a packer which surrounds the pumping and steam tubes, substantially as set forth.

4. In a petroleum-well, the combination of pumping-tube, a packer, a steam-tube, and a protecting-tube, all of which tubes extend through the packer, substantially as set forth.



171,565.

2. The adjustable shaft E and its pinions F F', in combination with the driving-wheels B B, whereby either one of said wheels may be rotated alone, or both at the same time, at the will of an operator, substantially in the manner hereinbefore described, for the purposes set forth.

3. The adjustable driving-shaft F and its pinion F', in combination with the bering-wheel D, whereby said pinion is thrown in and out of gear with the bering-wheel, and adjusted to mesh into the gearing on said wheel at the varying elevations of the wheel, all substantially in the manner hereinbefore described, for the purposes set forth.

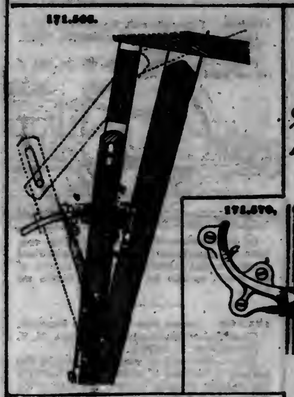
171,566. FIRE-PLACES. David Hagen, Chicago, Ill. [Filed Mar. 27, 1875.]

In a fire-place heater, the chamber provided with the cold-air openings *f f'* at its lower end, and heated-air tubes *h h*, in combination with the air-tubes *a' a'*, inclined air-tube *a*, and open fire-place *b*, having an inclined back, *c*, substantially as described, and for the purpose set forth.

171,567. LOCOMOTIVE EARTH-EXCAVATORS. Abel Hawley, Galveston, Tex. [Filed Dec. 9, 1875.]

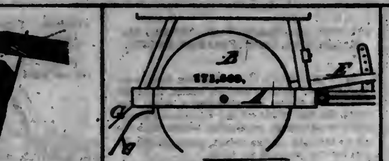
Brief.—A locomotive earth-excavator consisting of a traction-engine, carrying in adjustable bearings a rotary bering-wheel, having radial cutters on its face and peripheral buckets. The cutting-face revolves at right angles to the line of traction. An adjustable plane shaft is so arranged that either one of the driving-wheels, or both, can be thrown into gear at pleasure.

1. A locomotive earth-excavator consisting of a traction-engine of any approved form, having mounted thereon, in adjustable bearings, a rotary bering-wheel carrying radial cutters and peripheral buckets, all arranged and operating substantially in the manner hereinbefore described, for the purposes set forth.



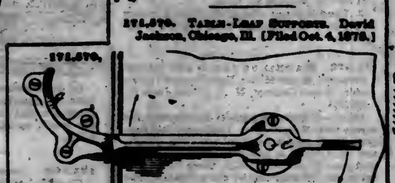
171,568. TELEGRAPHIC TRIPLEX SIGNALS AND ODUPLEXERS. Corydon P. Horwitz, Kingston, Wis. [Filed June 30, 1875.]

Brief.—The spring and toggle-arms are connected together by a sliding pivoted connection. Through the spring-arm passes a screw-bolt having two nuts—one above and the other below the arm—for adjusting the pitch of the teeth.



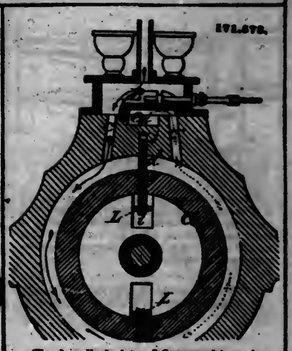
1. The spring-arm B and toggle-arm F, having a sliding pivoted connection, and adapted to be pivoted, respectively, to the beam-plate and standard, substantially as specified.

2. The combination, with the foregoing-described sliding pivoted arms B F, of the screw-bolt *c* and double nuts, one above and the other below the arm B, as and for the purpose set forth.

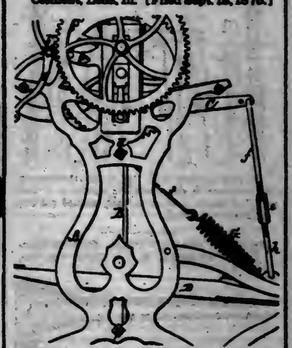


171,569.

171,570.



171,570. TABLE-LEAF SUPPORTER. David Jackson, Chicago, Ill. [Filed Oct. 4, 1875.]



In combination with a table provided with a swinging leaf, the lever C, swiveled to a barrel, D, adapted to be attached to the under side of the leaf, and containing a convolute spring, connected to said lever, and provided with the segmental recess *d*, the pin *d'*, and curved hanger G, attached to the under side of the table, the whole constructed and arranged to operate substantially as described.

171,571.

The described pieces J J, secured to swing-follower rods L L, in combination with the cam-grooves *k*, substantially as described.

171,572. LEATHER-ROLLING MACHINES. Newton Linsley, John McCulloch, and W. Clement, Lena, Ill. [Filed Sept. 18, 1875.]

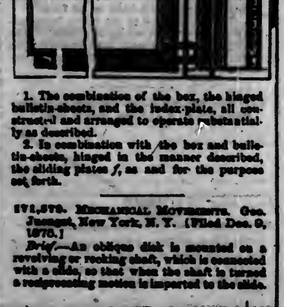
1. The combination of the side plates A A, having legs *a a* formed on their inner sides, the center-piece B, formed with slotted legs *b b*, and the bolts *d*, whereby the frame can be readily taken apart, all substantially as and for the purposes herein set forth.

2. The combination, with the levers C C and treadle-casting D', of the rods *f f*, hooked into the ends of the levers, the bent rod I, passing through the casting, and the elongated slots *e e*, connecting the rods, substantially as and for the purposes herein set forth.

3. The casting D', provided with a center, *r*, for securing the end of the treadle, and connected by the screw *s* and bolt *p*, as set forth.

4. The crank I, having the pinion *b'* formed thereon, and provided with a groove on the inner face, in combination with the perforated shaft *a'*, the pin *d'*, which passes through the shaft and lies in the groove in the pinion, and the nut *c'*, all as and for the purposes set forth.

5. The combination of the shaft *a'*, with shoulder *i'* and pin *b'*, the grooved pinion *f'*, balance-wheel J, having grooved hub, and the nut *b'*, all substantially as and for the purposes herein set forth.

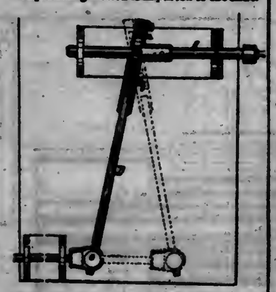


6. The combination of the slotted conveyer arm A' and the conveyer bar L, adjusted and fastened thereon, for supporting and adjusting the shaft *a'*, for the purposes herein set forth.

171,573. WASH-BOARDS. Aaron J. Hall, Sterling, Ill. [Filed Dec. 3, 1875.]

A rest-board of sheet metal formed with a series of raised diamond-shaped projections, B, and a series of narrow diagonal grooves, b, between the projections which cross each other, substantially as set forth.

171,574. RAILROAD BULLETIN-BOARD. W. T. Jacoby, Uniontown, Pa. [Filed Nov. 10, 1875.]

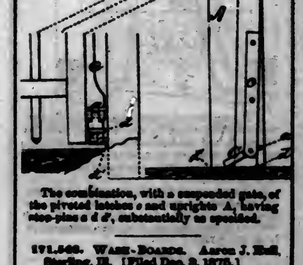


1. The combination of the box, the hinged bulletin-sheets, and the index-plate, all constructed and arranged to operate substantially as described.

2. In combination with the box and bulletin-sheets, hinged in the manner described, the sliding plates *f*, as and for the purpose set forth.

171,575. MECHANICAL MOVEMENTS. Geo. Jumpelt, New York, N. Y. [Filed Dec. 9, 1875.]

Brief.—An oblique disk is mounted on a revolving or rocking shaft, which is connected with a slide, so that when the shaft is turned a reciprocating motion is imparted to the slide.



The combination of the shaft A, oblique disk B, lever D, slide E, and fulcrum-pin *c*, in which the lever D slides, substantially as set forth.

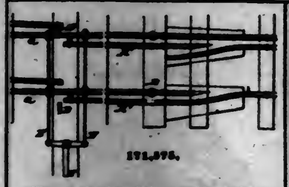
171,576. RAILROAD-SWITCHES. Samuel R. Linton, Charlotte, N. C. [Filed Sept. 11, 1875.]

Brief.—By a simultaneous movement in opposite directions, a double set of sliding rails are made to approximate at their adjacent ends, and form a continuous main line. By a contrary movement the same rails are brought into alignment with the siding, and also with the main line, thus avoiding discontinuity of main line in all positions of switch.

171,577. BOTANY BOXES. O. H. Kurtz, South Danville, N. Y. [Filed July 31, 1875.]

171,578. COMBINED WRENCH AND SCREW-DRIVER. Jonathan Lee, Jr., Bridgeport, Conn. [Filed Nov. 15, 1875.]

The combination, with a suspended gate, of the pivoted latches *c* and uprights A, having case-pins *c d d'*, substantially as specified.

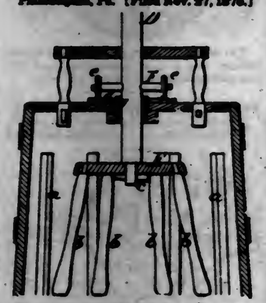


171,579. WASH-BOARDS. Aaron J. Hall, Sterling, Ill. [Filed Dec. 3, 1875.]

A rest-board of sheet metal formed with a series of raised diamond-shaped projections, B, and a series of narrow diagonal grooves, b, between the projections which cross each other, substantially as set forth.

171,580. LAMP MOLDERS AND MACHINES. James M. Hunter and George R. Hunter, Glenwood, Iowa. [Filed Oct. 2, 1875.]

Brief.—Three benches, carrying matrix-rollers, are rigidly attached to the rear beam of the roller-frame. An arm extends forward over the tongue from the forward beam. The tongue is pivoted to the frame, and a hopper rises from the tongue, and by means of a pin locks the arm at any desired position, thus causing the matrixes to press heavily or lightly upon the ground.



The frame A, carrying the band-rollers B and separate matrixes *f*, in combination with the arm E and standard *e*, whereby the matrixes are caused to press heavily on the ground, or raised above it, the roller operating as a lever, substantially as described.

171,576.

The combination of the movable sections *a a'*, swiveled to the main trunk of the road, and operated by the switch-rods E E, working in opposite directions, with the stationary side rails H and H', the whole arranged to operate substantially as described.

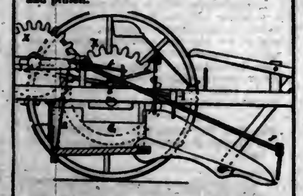
171,576. WASHING-MACHINE. D. Louis, Philadelphia, Pa. [Filed Nov. 27, 1876.]

In combination with the shaft D, carrying beater-arms b, the shaft F, wheels *c c*, and plug or sleeve J, substantially as and for the purposes described.

171,577. PAPER CUP-TUBE. John McCausland, Providence, R. I. [Filed Oct. 22, 1875.]

1. A tapered paper cup-tube, provided with a metal flanged base built up from or attached to the tube, substantially as described.

2. A tapered paper cup-tube, having an internally-constructed lip, substantially as described.



171,578. GAS-GENERATOR. William McKnight, Troy, Ohio. [Filed Sept. 10, 1875.]

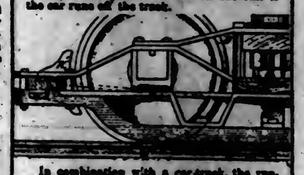
1. A gas-retort, C, having the horizontal partition or shelf, *c*, and an outlet, E, below the closed end of the partition *c*, which contains the removable oil-pan F, in combination with an automatic mechanism which feeds the oil to the pan in the retort, substantially as and for the purposes set forth.

2. The condenser consisting of case I, sleeve K, pipes W P, and coal-box M, divided as described.

171,579. MACHINES FOR GATHERING STONES. Moses Miller, East Orange Township, Essex County, N. J. [Filed June 11, 1875.]

Brief.—Adjustable parallel fingers raise the stones from the ground. The frame that supports the fingers is mounted upon two wheels, and each wheel is provided with a cog-gear, that puts in motion a rake, there being two rakes, one on each side of the machine. The rakes haul the stones into a receptacle, each rake being put in motion by a separate crank and pinion.

1. The combination, in a stone-gatherer, of a pusher, A', receptacle G, and two independent rakes, each operated from one of the wheels, moving forward over the pusher, descending suddenly in front thereof, and traversing the pusher in moving backward, as set forth.

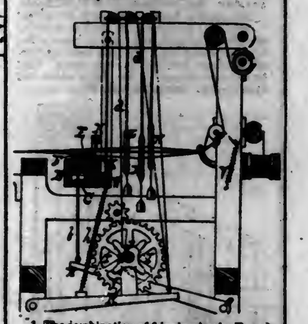


2. The combination of the rakes, independent crank-shafts carried by the frame of the machine, and cog-wheels K K, gearing with similar wheels on the crank-shafts, and adjustable, as set forth.

171,580. FRINGE-PADS. Bernard Morahan, Brooklyn, N. Y. [Filed June 3, 1875.]

The brass D, formed by a continuation of the handle down to the plane of the bottom of the pan, to form a firm bearing or fulcrum between the pan and handle, for the purposes set forth.

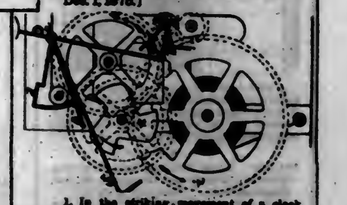
171,581. RUNNERS FOR RAILROAD-CARS. Lawrence O. Root, Minneapolis, Minn. [Filed Nov. 8, 1875.]



Brief.—The groove catches on the rail if the car runs off the track.

In combination with a car-truck, the runners A, constructed with the longitudinal groove *a*, and extending from end to end of the truck, as and for the object herein set forth.

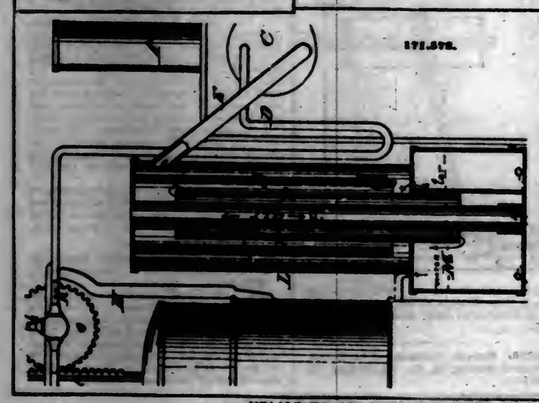
171,582. LOCKS FOR WEAVING PURPOSES. Chas. Robert Sautermeister, New York, N. Y. [Filed Nov. 10, 1875.]



Brief.—The bullion warp is pleased by the harness in the path of a hook, which draws it the required distance to form the loop of the fringe, and a vertically-reciprocating lifter releases the warp from the hook.

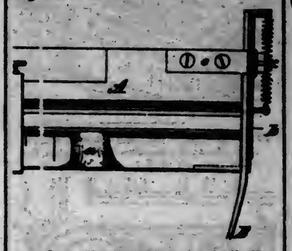
1. The combination of fringing-hooks E, and reciprocating lifters X, (one or more,) with the batten B, and the harness L M N, each fringing-hook adapted to receive a reciprocating motion transversely to the warp, substantially as described.

2. The tension-spring V, in combination with the spool which carries the bullion with the fringing-hooks, the reciprocating lifters X, and the batten, and harness of a loom, substantially as set forth.



171,583. CLOCK STRIKING MECHANISM. Albert Schmidt, Brooklyn, N. Y. [Filed Dec. 1, 1875.]

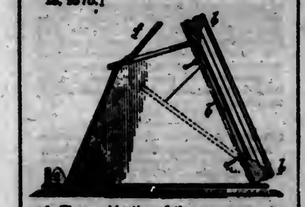
1. In the striking-movement of a clock, the combination of a pin, *f*, secured in one of the arbors or wheels of the hand-movement, with the stop-pin *g*, the releasing-pin *e*, and with levers *b d e f*, substantially as shown and described, whereby the resting-power of the striking-movement, between the time of warning and striking, acts on the hand-movement in the direction of the motion of the hands.



2. In the striking-movement of a clock, the combination of the levers *b d e f*, all connecting from one and the same rock-shaft *a*, with the pins *e f g* and wheels or plates *h i k*, all constructed and operating substantially as herein set forth.

171,572.

171,584. CHAIR-CUTTERS. Jackson Shepard, Allegheny, Pa. [Filed Nov. 15, 1875.]

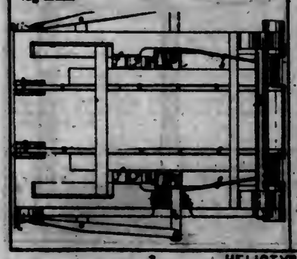


Brief.—The lever that operates the cutter is turned to one side, in front of the bed, to be operated by the same hand that holds the cigar to be cut.

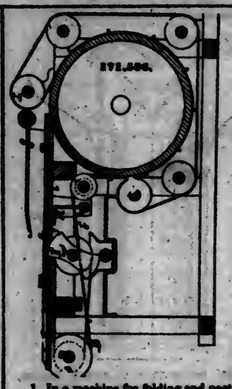
1. In combination with the longitudinally-grooved base A and support *a*, the knife D, having its upper end curved to form a cutting-blade, and its shank slotted, the operating-lever E, having its short arm connected to said slotted shank, and its long arm projecting forward and laterally toward the bed, substantially as shown, whereby the hand that holds the cigar, or the wrist thereof, may manipulate the lever, as set forth.

2. The bed-block A of a cigar-cutting machine, having the recessed thumb-hole *a* and longitudinal cigar-channel, substantially as shown, and for the purpose specified.

171,585. PICTURE-REMOVERS. Lydia H. Sheppard, Philadelphia, Pa. [Filed Nov. 18, 1875.]



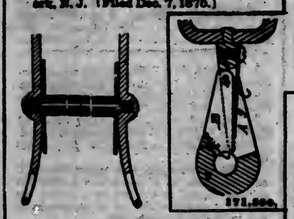
1. The combination of the case or receptacle B, arranged to turn on a support, A, with an exhibiting picture-frame, *f*, attached to said case, substantially as described.



2. The combination of the case or receptacle B, having a hinged door, *f*, with the exhibiting picture-frame *b* and its hinged hook *b'*, as and for the purpose set forth.

171,586. MACHINES FOR LASTING AND FOLDING COLLAR-RIMS. Charles Spofford, Boston, Mass., assignor to James H. Hoffman, New York, N. Y. [Filed Nov. 4, 1875.]

Brief.—Improvement on applicant's Patent No. 161,533, dated April 6, 1875. The collars are placed crosswise the table, and fed along by chain-belts in and beneath guide-strips. When their ends are seized with paste by a roll beneath the table, struck down at right angles by a reciprocating arm above the table, and then pressed inward longitudinally to their body portion by a laterally-reciprocating arm beneath the table, after which they are fed between compressing-rolls and a heating-drum.



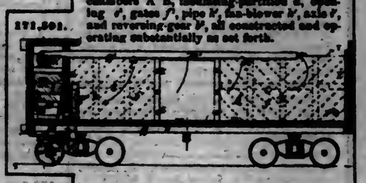
171,586.

1. In a machine for folding and pasting the ends of collars and other articles, the combination, with a folding-table, a paste-roller, and one or more carrying-chains, of a reciprocating depressor and a reciprocating folder, constructed and operating substantially as shown and described.

2. The combination, with a folding-table, a paste-roller, one or more carrying-chains, and a folding mechanism, of compressing-rollers, and a heating-drum, all constructed and operating substantially as set forth.

171,587. BRIDLE-BITS. Jos. Stanley, Newark, N. J. [Filed Dec. 7, 1875.]

171,588.

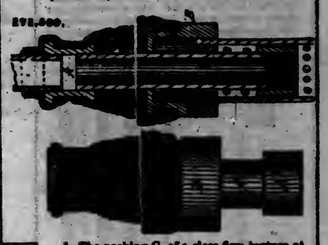


1. A bit for horses composed of a tubular mouth-piece and cheek-pieces combined therewith, and forming one solid piece, substantially as and for the purposes set forth and described.

2. A tubular mouth-piece and cheek-pieces combined, in combination with an adjustable bit, substantially as and for the purposes set forth and shown.

171,589. HORSESHOES AND SWAGES. Squire M. Stephenson, Richmond, Tenn. [Filed Aug. 6, 1875.]

171,591.



1. A horseshoe, having the edge *b* outside of the nail-groove thicker and heavier than the edge *a* inside said groove, by reason of an inclination and depression on the face toward the inner edge, substantially as described.

2. The horseshoe-swage B, having the groove *c'*, the ridge for forming the nail-hole groove, and the inclined part *b'*, substantially as and for the purpose described.

171,590. PACKERS FOR OIL-WELLS. Lyman Stewart, Titusville, Pa. [Filed Dec. 1, 1875.]

Brief.—The packer is woven tight at the ends and loosely in the middle. The tube and anchor-section form a telescopic joint. The packer may be inserted or withdrawn through a casing much smaller than the space desired to be packed. When the tube is to be used as a flowing-tube, the tube and anchor are perforated, as seen.

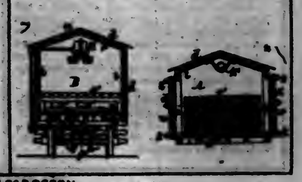
171,590.

1. The packing C, of a close firm texture at the ends, and loose in texture in the center, substantially as set forth.

2. The combination of the tube A and anchor B, united by a telescopic joint with the fibrous packing C, substantially as set forth.

3. The anchor B, provided with the perforations *b'*, in combination with the perforated tube A, substantially as set forth.

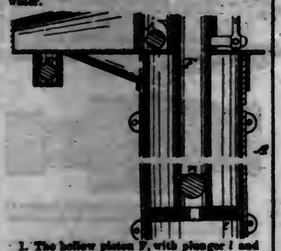
171,592. SNAP-HOOKS. J. B. Tainter, Menomonee, Wis. [Filed May 1, 1875.]



The snap-hook having the deep-slotted shank A and the inclined spring-seat *c*, forming an angle therewith, the straight spring C, having its tongue lying within the slot of said shank, and the broad sector-shaped plate-tongue B, having a beveled border, *b*, for the groove of the bank, a circular border, *i*, adapted to complete the circular eye, to substantially hold the ring in place thereon, and a straight border, *c*, lying wholly within said slot of the shank, as specified.

171,593. REFRIGERATOR-CARS. A. Thomas, Hoboken, N. J. [Filed Dec. 9, 1875.]

Brief.—A peculiar non-conducting wall or partition, outside painted a light color. Fan operated and reversed by gear attached to axle of car. Air is drawn from ice-chamber, forced out through perforated pipe into food-chamber, and thence is drawn through grated charcoal-box into ice-chamber. By ventilator food-chamber, closes between outflow of ice-chamber, and opens communication between ice-chamber and outer air and food-chamber and outer air. Drives the fan and sends a current of fresh air through ice-chamber and food-chamber.

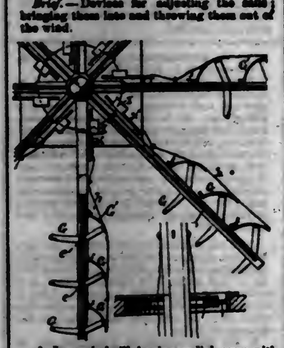


1. A non-conducting structure for the tops, bottoms, sides, or partitions of refrigerating apparatus, consisting of boards *d*, coated with an air and water tight varnish, a layer, *c*, of water and air tight paper, a layer, *f*, of felt, a layer, *f*, of boards, coated on both sides with water-glass, all combined substantially in the manner set forth.

2. The combination, in a railroad-car, of chambers A B, insulating-partition *a*, opening *a'*, gates *f'*, pipe *h'*, fan-blower *h'*, axle *l'*, and reversing-gear *k'*, all constructed and operating substantially as set forth.

171,592. DOUBLE-ACTING PUMP. Henry Van Doren, South Branch, N. J. (Filed Nov. 4, 1875.)

Brief.—The upper portion, comprising the double discharge and induction-chamber, is attached to a bottom plate provided with a downwardly-projecting flange, which fits upon (like a cover) the main cylinder. The induction-chamber on one side, and containing one of the induct-valves, prevents its acting as any impediment to the upward-discharging water.

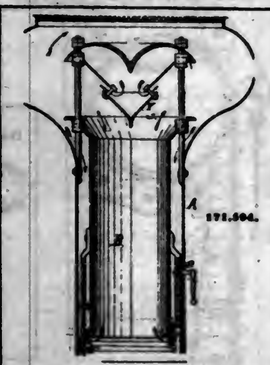


1. The hollow piston F, with plunger I and valve a, and the cylinder A, formed with opening h, in combination with tube D and cylinder E, and horizontal cylinder or water-passage C, with valve c, said passage or cylinder having opening g, the same forming a charger or supply for the main cylinder A, substantially as and for the purposes specified.

2. The base-plate B, with its water-passages C D E, said plate having formed thereon a downwardly-projecting collar or flange, f, for securely connecting the base-plate to the cylinder A, substantially as and for the purpose set forth.

171,593. WINDMILL. William F. Veber, Perrysburg, Ohio. (Filed Nov. 26, 1875.)

Brief.—Devices for adjusting the sails; bringing them into and throwing them out of the wind.



1. In a windmill having radial arms with vertical wings pivoted between them, the combination, with the wings E, of the levers G, having cross-bars G' with lips f, the connecting-cord h, and the elbow-lever H with adjustable weight I, substantially as and for the purposes herein set forth.

2. The combination of the wind-wheel shaft B, circular plates b A, with journaled rollers d between them, and the ring a in the tower-top C, substantially as and for the purposes herein set forth.

171,594. SPARK-ARRESTER. D. Allard, St. Albans, Vt. (Filed Mar. 8, 1875.)

Brief.—The > shaped ring attached to the lower end of the adjustable tube prevents exhaust steam and sparks in their ascent from entering the annular space between said pipe and the casing, and in the descent of the sparks in said annular space directs them upward through the inner pipe.

The combination, with the casing A and the vertically-adjustable tube B, having parallel sides, and the beveled ring F, attached to the latter, so that it may be adjusted therewith, as shown and described.

171,594.

1. A rotary plow, D, having the rotary vertical end-cutting edge d, and at right angles thereto a bottom-cutting edge, d', oblique to the axis of motion, as shown and described.

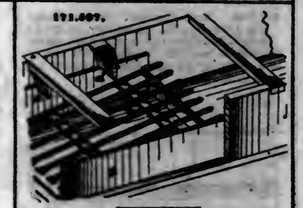
2. The combination, with rotary plows, of fingers B E, arranged behind each plow, and on the same shaft, as and for the purpose set forth.

3. The combination, with rotary plows F and receptacle H, of rotary bars g, arranged at intervals and in concave form behind the pickers and below the top of receptacle, as and for the purpose specified.

4. The wheel-frame N, laterally adjustable with respect to trunk, as and for the purpose described.

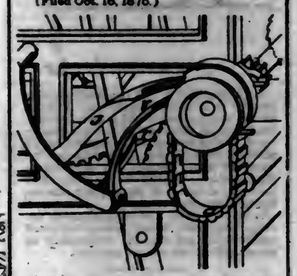
171,595. COMBINED MATTRESSES AND BEDSTEADS. John J. Bowen, Richmond, Va. (Filed Aug. 24, 1875.)

1. The mattress, shortened the width of the bolster and having a bolster attached thereto upon a level with its upper surface, in combination with the bedstead, having an elevated bolster-support, as and for the purpose described.



2. The combination, in a bedstead, of the cross-slats D', with the notched inclined bars C, arranged on the side boards above the level of slats and near the head of bedstead, as and for the purpose described.

171,597. GOLD-WASHING. John S. Calvert, Denver, Colo. (Filed July 9, 1875.)

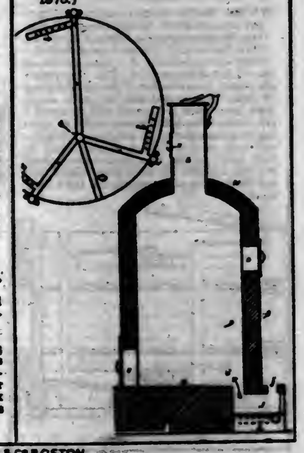


Brief.—The usual sluice-box is provided with wings to deflect the current and suspended gold through the riffle-bars.

The combination of the sluice-boxes A and C, the quicksilver-box B, having vertical sides b and an end piece, c; the inclined grate D resting upon the end piece c, and the flanges or projections e attached to the sides of the box A, and arranged above the quicksilver-box, as and for the purpose described.

171,597.

171,598. LOOM SHUTTLE-BOX MECHANISM. Isaac G. Chandlee, Philadelphia, Pa. (Filed Oct. 16, 1875.)



1. In combination with the shuttle-box of a loom, a chain having one or more of its links of greater length than the others, operated by mechanism, substantially as shown, to produce an intermittent movement of the chain, substantially as and for the purposes set forth.

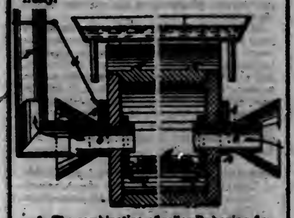
2. In combination with a shuttle-box chain, constructed as described, driving-pawls J and V, gear-wheel E", pins S, and cam T, all arranged and operating together substantially as described.

171,599. ANTI-INCRUSTATION COMPOUNDS. Augusto Chevreau, Montreal, Canada, assignor of one-half his right to A. Rambouillet, same place. (Filed Nov. 10, 1875.)

A composition for removing boiler-scale composed of molasses of sugar, extract of cedar bark, and the whites of eggs, prepared and mixed in the proportions and for the purpose specified.

171,600. KILNS FOR FIRE-BRICK. William T. Christy, St. Louis, Mo. (Filed Sept. 10, 1875.)

The combination, in a fire-brick kiln, substantially as described, of a fire-brick lined metallic shell, with the arrangement of the blast-pipes passing under the heated kiln-bottom, with cock a regulating steam-valve for tempering the blast, and having also a many-perforated pipe under each fire-chamber for blowing air upward between the grate-bars, together with the up-draft and the cover-opening for the unimpeded passage of the consumed and exhausted air and gases.

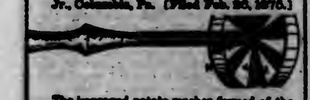


171,601. STRAINERS FOR COFFEE-POTS. E. H. Clark, Rossville, N. Y. (Filed Dec. 7, 1875.)

The implement for straining and extracting, consisting of the casing A, constructed with the chamber d, and provided with the removable perforated plate B, the hinged bail C, perforated bottom a, and rim b, all constructed substantially as and for the purposes set forth.

171,602. SNOW-MELTING MACHINES. John Cody, New York, N. Y. (Filed June 8, 1875.)

Brief.—The journals are cooled by dripping water. The flaring cups prevent snow entering the roller. The ribs elevate the roller slightly, as that the melted snow may run off freely.



1. The combination of roller B, having grate suspended thereto, with open-ended journals b' b' and snake-chain F, as and for the purposes specified.

2. The vessel E, combined with roller B, and with end pipes opening downwardly and directly over the journals b' b', as and for the purposes described.

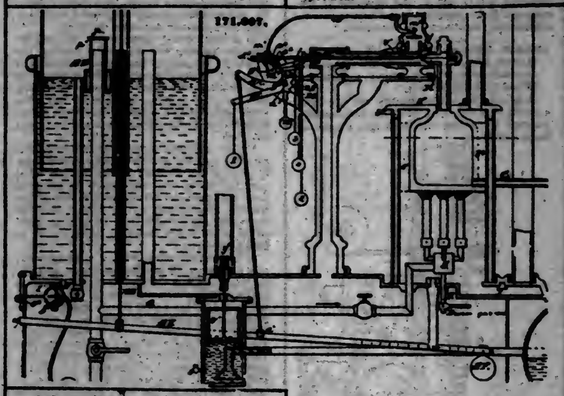
3. The combination, with roller B, of open-end journals b', provided with flaring cups H, as and for the purposes set forth.

4. A hollow snow-melting roll, B, having ribs b' b' on the outside thereof, as and for the purposes specified.

171,603. POTATO-MASHERS. Robert Crane, Jr., Columbia, Pa. (Filed Feb. 26, 1875.)

The improved potato-masher formed of the ring B, oblique cutting-blades A, and handle H, said parts being rigidly connected, as shown and described, to admit of the operation specified.

171,604. CIRCULAR-SAW TEETH. Albon F. Diamond, Pittsburg, Pa., assignor of one-half his right to Geo. W. Dowmeyer, same place. (Filed Dec. 20, 1874.)

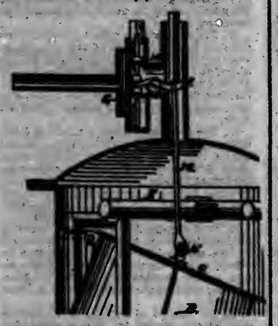


Brief.—An insertible saw-tooth is provided with two cutting portions, pointing in opposite directions, and operating in a grooved segment insertable in the body of the saw.

171,604.

The stopple A, the same consisting of the ordinary cork-wood body, the double sheet c' c' of the wire pull-loop C, and the disks c' c", the said parts being secured permanently together simply by bending the ears c' c' up against the lower disk c", substantially as described, for the purpose hereinbefore specified.

171,607.



1. In combination with a circular saw a double reversible tooth, operating substantially as described.

2. As a new article of manufacture a reversible saw-tooth, for the purpose specified.

3. The combination of the double reversible tooth C, jaw-plate B, rivet-pins a a with the plate A, arranged and operating as described.

171,605. FEED-WATER APPARATUS. B. W. Feltheusen, Milwaukee, Wis. (Filed Sept. 14, 1875.)

Brief.—When the trap becomes filled with water of condensation, steam from the boiler is admitted, which forces the water through the siphon into the boiler. The tilter operates the valve in the steam-pipe.

1. Tilter B, water-spreader F, siphon C, rod M, stop K, lever I, and valves G and H, all in combination, substantially as specified.

2. Trap A, tilter B, siphon C, and water-spreader F, all in combination, substantially as specified.

171,606. CORK STOPPERS. J. I. Flanagan, Philadelphia, Pa. (Filed Nov. 30, 1875.)

Brief.—A stopple having its body made of the ordinary bark of cork-wood, combined with a wire stem bent and secured in said body.

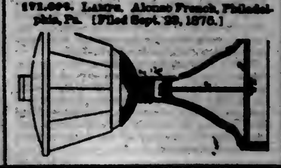
171,607. GAS-MACHINES. T. B. Fogarty, New York, N. Y. (Filed Nov. 10, 1875.)

Brief.—The hydrocarbon oil is forced by air-pressure into the retort, where it is vaporized. The vapor, under pressure, escapes through the nozzle c of an injector-valve, and induces a current of air, which mixes with it, and the product passes to the holder. The injector-valve is operated by a novel system of weighted levers, having cams and projections, which permit their conjoined and consecutive operation. One of them is connected by a rod to a weighted horizontal bar, and this by a rod to the rising and falling gas-holder. Below the holder a carburetting drip-box is placed, provided with a float and valve. This box catches any condensed vapors, and, by forcing air through it, the first gas is here generated for supplying the burners under the retort, to start the machine. The retort and burners are inclosed in an air-tight case, supplied with air through a pipe leading to the outside of the building.

1. In automatically-working gas-machines, two weighted levers, B C and S, alternately opening and closing the vapor-valve A C and the air-valve a' a' of such machines, substantially as described.

2. A lever, A' H, furnished with one or more testers or cams, S', and one or more spurs, B D, and also with one or arms, a, substantially as described.

3. The combination of the levers B C S and A H with the gas-holder, of automatically-working gas-machines, substantially as described.



4. The combination of a weighted detent, a, and lever B C, substantially as described.

5. The combination of a weighted arm, f', with a lever, A H, and bracket, substantially as described.

6. The combination of the arm f', lever A H, and bracket a with a lever, S', substantially as described.

7. In automatically-working gas-machines, the combination of the carbureting-drip V, float f', and valve f', substantially as described.

171,608. LAMPS. Alcuin French, Philadelphia, Pa. (Filed Sept. 28, 1875.)

1. The combination of an intermittent vertically-moving wire-carrying spindle, and mechanism, with which it co-operates to cut and insert screws with solid heads from a continuous length of wire, for uniting the soles to the uppers of boots and shoes, with a rotating work-supporting horn, or other support, substantially as herein set forth.

2. In an organized machine, the combination of mechanism which cuts and inserts screws with solid heads from a continuous length of wire, for uniting the soles to boots and shoes, with an automatic vertically-adjusting work-supporting horn or work-support, substantially as herein set forth.

3. The combination of mechanism in a machine which cuts and inserts screws from a continuous length of wire with solid heads, for uniting the soles to the uppers of boots and shoes, with a rotating work-supporting horn, having an automatically-operating intermittent cutter for clipping off the inner ends of the inserted screws.

4. The combination of an automatically vertically-adjusting work-support, with an interior cutter operating automatically to clip the inner ends of the screws at whatever height or position the support may be with respect to the head, substantially as herein set forth.

5. The combination of a revolving wire-carrying spindle, D, with a continuously griping and holding device for the wire carried thereby, and an automatically-adjustable work-support, substantially as herein set forth.

6. A continuously griping and holding device for turning the wire while cutting the thread and inserting the screw, consisting of rolls *d d*, having annular seizing-edges, in combination with a continuously-revolving wire-carrying spindle, D, whereby the wire, while being griped, is free to be moved in the direction of its length, substantially as herein set forth.

7. The combination, with a work-support, of a wire-carrying spindle, having an automatic revolving and vertical movement, and a feeding device, of mechanism for determining the length of the screw by the descent of the spindle, substantially as herein set forth.

8. The combination, with a work-support and a revolving wire-carrying spindle, provided with a feeding device, of a yielding wire-passage extension, I, of the spindle D, and a stop-gage, K, with which it co-operates to effect the feed of the wire, substantially as herein set forth.

10. The combination, with a rotating work-supporting horn, and a revolving wire-carrying spindle, provided with a yielding extension, I, for operating the feed device, of an adjustable stop-gage, K, whereby screws of different lengths, without arresting the movement of the machine, may be inserted in the work, substantially as herein set forth.

11. The combination, with a wire-carrying spindle having both a rotating and vertical movement, and carrying the wire griping and holding device at its lower end, of a feed device at its upper end, consisting of a yielding wire-passage extension *l*, working by cog-connection *l'* and pawl-lever *i'*, and feed-rolls *d d*, operated thereby, whereby the wire is fed by the descent of each cogged extension, and left unaffected by its recent, substantially as herein set forth.

12. The combination, with a revolving wire-carrying spindle, its feeding and griping devices for cutting and inserting varying lengths of screws from a continuous length of wire, of automatically opening and closing arms N', carrying the screw-chaser N, and a wire support, substantially in the manner herein set forth.

13. The combination, with a revolving work-supporting horn and a wire-carrying spindle having both a revolving and vertical movement, of screw-chasing and wire-supporting devices, and the automatically-operating wire-severing knives L, co-operating to form and finish the screw, and cut it from the main length, substantially as herein set forth.

14. In a machine for cutting and inserting solid-headed screws from a continuous length of wire, the combination, with mechanism for effecting these results, of a work-feeding device, and an automatically vertically-adjustable and work support, substantially as herein set forth.

15. The method of forming and inserting solid-headed screws cut from a continuous length of wire by the intermittent vertical motion of the wire-carrying spindle and the co-operation therewith of intermittently chasing and severing devices, whereby the wire is fed forward at proper intervals, a screw-thread cut of proper length, a head formed, and the screw severed and inserted into the stock, substantially as herein set forth.

16. The process of uniting the uppers to the soles of boots and shoes by means of solid-headed screws automatically formed, cut and inserted successively from a continuous length of wire, substantially as described.

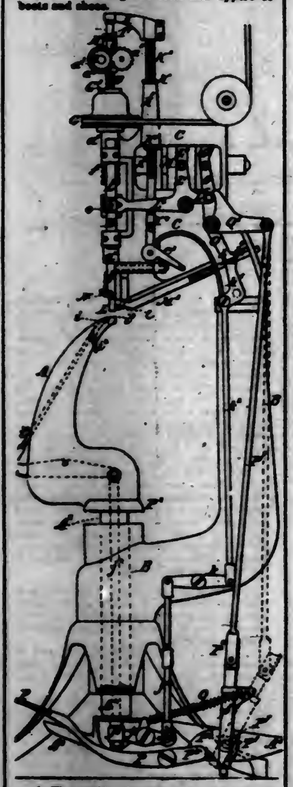
17. The combination, in a machine for uniting the uppers to the soles of boots and shoes, of mechanism adapted to form solid-headed screws, cut from a continuous length of wire, with knives L, which sever the inserted screw from the main length carried by the head, and a cutter for clipping the inner end thereof, substantially as herein set forth.

18. The curved horn-cutter *i*, provided with cogs, in combination with the cogged connection *l'*, the pivoted arm *j*, the central rod *f* and the device for operating the severing-knives L, with which the central rod is connected, and co-operates with mechanism for cutting and inserting screws with cut-*d* heads cut from a continuous length of wire, substantially as herein set forth.

19. The combination, with the treadle A', for supporting the rotating horn, of an auxiliary treadle, P, pivoted to the main treadle, and a knee-joint connection, l^{pc}, with mechanism for increasing the upward pressure of the horn.

20. The combination, with the rotating work-supporting horn, and the cutter carried thereby, of the connected pivoted arm *f'*, having its pivot-connection *f'*, with the cutter-operating devices coincident with the pivot P^{p} of the main treadle A', whereby the action of the horn cutter is kept wholly independent and unaffected by the vertical movement of the horn.

21. The combination, with the auxiliary treadle P, pivoted to the main treadle A', as described, of the pivoted socket-arm P^{s}, containing the spring-cushion P^{c} and the flexing knee-joint P^{pc}, operated by said treadle, whereby to effect the full descent of the horn.



22. In a machine for uniting the uppers to the soles of boots and shoes from a continuous length of wire, the combination, with a spindle having a revolving and vertical movement, and carrying a wire-griping device, which has a continuous hold upon said wire, of a rotating work-supporting horn, having a nose-opening, *e*, in line with the inserted screw, and a cutter, *i*, to clip the screw end extending below the face of the horn-support.

23. The combination, in a machine for uniting the uppers to the soles of boots and shoes from a continuous length of wire fed through a spindle having an intermittent vertical movement, of a screw-chaser, N, and a wire-support, N', operated to close upon the wire and be carried therefrom by simultaneous movements produced in the manner herein set forth.

24. In a machine for uniting the uppers to soles of boots and shoes from a continuous length of wire, the combination of a spindle having a revolving and vertical movement, and in which the wire is continuously griped to turn it therewith, with a spool, E, for the wire, revolving to unreel the wire, and turned with and in the direction of the spindle, whereby the wire is prevented from being twisted, although the spool is separated from the machine.

171,610. PEGGING-MACHINE. Louis Godde, Boston, Mass., assignor to the American Cable-Screw-Wire Company, same place. [Filed Nov. 22, 1875.]

Brief.—Solid-headed screws are cut from a continuous length of wire, and successively inserted in uniting the soles and uppers of boots and shoes.

1. The combination of an intermittent vertically-moving wire-carrying spindle, and mechanism, with which it co-operates to cut and insert screws with solid heads from a continuous length of wire, for uniting the soles to the uppers of boots and shoes, with a rotating work-supporting horn, or other support, substantially as herein set forth.

2. In an organized machine, the combination of mechanism which cuts and inserts screws with solid heads from a continuous length of wire, for uniting the soles to boots and shoes, with an automatic vertically-adjusting work-supporting horn or work-support, substantially as herein set forth.

3. The combination of mechanism in a machine which cuts and inserts screws from a continuous length of wire with solid heads, for uniting the soles to the uppers of boots and shoes, with a rotating work-supporting horn, having an automatically-operating intermittent cutter for clipping off the inner ends of the inserted screws.

171,611. PEGGING-MACHINE. Louis Godde, Boston, Mass., assignor to the American Cable-Screw-Wire Company, same place. [Filed Nov. 22, 1875.]

Brief.—The uppers and soles are united by means of continuous screw-threaded wire. The head of the machine, which carries the wire feeding and inserting mechanism, has an independent vertical movement and an automatic lateral movement, in unison with a work-supporting horn, which latter movement constitutes the work-feeding movement.

1. In a machine for uniting the uppers to the soles of boots and shoes, the combination, with mechanism for feeding, holding, and inserting screws and severing them from a continuous wire, of a work-supporting horn, having a compound rotating and automatic laterally-reciprocating movement, substantially as and for the purpose herein set forth.

2. The combination, in a machine which inserts and cuts screws from a continuous wire, of a rotating work-support, having a compound rotating and automatic laterally-reciprocating movement, with a head carrying the feeding, holding, and screw-severing mechanisms, and having an automatic vertical and lateral movement, substantially as herein set forth.

3. The combination, in a machine for uniting the uppers to the soles of boots and shoes by screws cut from a continuous wire, of an automatically perfectly vertical adjusting head, E, with a rotating work-support, N, having an automatic lateral movement, and in which the vertical movement of the head is independent of the work-support, substantially as herein set forth.

4. The combination of mechanism by which screws are cut from a continuous wire and inserted in the stock of a heel, and a work-support having a simultaneous and equal automatic laterally-reciprocating movement, substantially as herein set forth.

5. The combination of a head which carries mechanism adapted to insert screws cut from a continuous length of wire with a horn carried thereby, and free to rotate on its axis at any point in its lateral movements with the head, substantially as herein set forth.

6. The combination, with a work-support, of an intermittent-griping device for the screw-threaded wire, whereby said device has a continuous feeding-grasp upon the threaded wire during the operation of the machine, substantially as herein set forth.

7. The combination, with a work-support, of a revolving wire-carrying spindle, D, having a vertical movement equal to that of the head, substantially as herein set forth.

8. The combination, with a work-support, of a revolving wire-carrying spindle, D, and an automatically-regulated slide-segment, J, for operating the intermittent pressing and griping device with the spindle, substantially as herein set forth.

9. The combination, with the wire-carrying spindle D, of feeding and griping rolls H, having annular screw-threaded recesses and projections *h i*, corresponding with the threads of the wire for receiving the same, and allowing the wire to pass between them in the direction of its length, so that pressure may be applied to grasp and feed the wire without injuring its threaded surface.

10. A pair of rolls for seizing and feeding screw-threaded wire, one or both of which has annular projecting screw-threaded edges *i i*, adapted to the threads of the wire, and into which they enter in passing between the rolls, whereby pressure is made upon the core or body of the wire at two or more separate and distinct points.

11. The combination, with the wire-carrying spindle D and its automatically-operating vertical slide-segment J, with its annular grooved guard-pinions *f*, the pawl *i*, and the ratchet *h*, whereby the descent of the slide-segment causes the feed-rolls to revolve, and feed the wire, while allowing the said slide-segment to move upward without giving motion to the feed-rolls.

12. The combination, with the revolving wire-carrying spindle D, of feeding and griping rolls H, constructed substantially as herein described, for feeding screw-threaded wire, with a rotating work-supporting horn.

13. A revolving wire-carrying spind'e, D, provided with a nose, D^{p}, in combination with the cutter-supporting arms *i*, between which it enters, and the rotating work-supporting horn, whereby the wire is supported at the point of the severance of the screw therefrom.

14. In combination with an automatic vertically-adjusting head, E, carrying the feeding, inserting, and severing devices, and a work-support, of an automatic vertically-adjusting edge-guide, o, for the work, substantially as herein set forth.

15. In combination with an automatic vertically-adjusting head, E, carrying the feeding, inserting, and wire-severing devices, of an edge-guide, o, for the work, having an intermediate vertical adjustment, and an adjustment at right angles to the line of the work, substantially as and for the purpose herein set forth.

16. The combination, with the revolving wire-carrying spindle D and an automatically-adjusting head, E, of a wire-coil-carrying reel, F, carried by said head and revolving with the spindle to deliver the wire thereto.

17. The wire-coil-carrying reel F, provided with pivoted curved fingers *n'*, whereby they may be folded to put on the coil and turned outward to hold it in place.

18. The combination, with a revolving wire-carrying spindle having an automatically-operating slide-segment, J, revolving therewith to operate the feeding and griping devices and a work-support, of means for automatically determining the proper feed of the wire for the varying thickness of the work by governing the movement of said slide-segment.

19. The combination, with a wire-carrying spindle having a slide, J, revolving therewith for operating the feeding and griping devices, of the vertical rod *a*, adjustable gage-stop *a*, lever K, operated by a cam, L, and a spring, *p*, acting upon said lever, whereby the relative height of the fixed stop, when it has compressed the stock, automatically determines the feed of the wire.

20. The combination, with the revolving spindle D and means for automatically determining the feed of the wire, of means for throwing out of action the feeding mechanism without arresting the revolving motion of the spindle, and without releasing the grasp of the feed-rolls upon the wire.

21. In a machine for inserting screws in the manufacture of boots and shoes, the combination, with an automatic vertically-adjusting head and a work-support, of means for holding the head at any point corresponding to the thickness of the work while inserting the screw.

22. In a machine for inserting screws in the manufacture of boots and shoes, the combination, with an automatic vertically-adjusting head, E, a revolving wire-carrying spindle, and a work-support, of means for automatically raising the head a definite height from the work, whether thick or thin, substantially as herein described.

23. In a machine for inserting screws cut from a continuous wire in the manufacture of boots and shoes, the combination, with an automatic vertically-adjusting head, E, and a work-support, of a looking device, which constitutes the medium through which the head is both raised and kept from being raised.

24. The combination, in a machine for inserting screws in the manufacture of boots and shoes, of a looking device, one end of which is attached to the head E, and the other end connected to a lever, V, operated by the cam V', whereby the looking device is brought in and out of action.

25. The combination, in a machine for inserting screws in the manufacture of boots and shoes, of a looking device for the head and a rod, T', connecting such device with the head, and having a yielding connection therewith, whereby the head is allowed to rise when the looking device is in force.

26. The looking device consisting of a fixed pin, T, pivoted clamping-blocks *s*, and a movable carrier, T', operating to clamp the pin T by the depression or elevation of either end of the clamp-carrier by the action of the operating-cam V', as described.

27. In combination with a rotating work-supporting horn and the looking device for the head, E, of an adjustable lever device, H V' *s'*, whereby the head is caused to be lifted more or less by the lever V, as described.

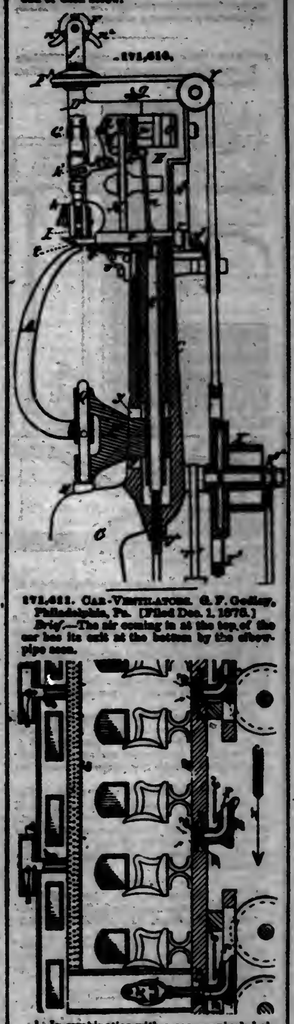
28. The combination, with the work-support and the vertically-movable head E, of an auxiliary yielding rod, W, connecting the head with the standard to increase the pressure of the head upon the stock to bring the work both together, substantially as herein set forth.

29. A revolving wire-carrying spindle with its feeding and intermittent griping-rolls and a vertically-moving slide-segment, J, for feeding screw-threaded wire, in combination with the worm G, operating the cam-shaft by the direct revolving motion of the spindle.

30. The combination, in a machine for inserting screws cut from a continuous wire in the manufacture of boots and shoes, of a treadle, R, for lifting the head E, with the automatically-moving work-support to place and remove the work.

31. The combination, in a machine for inserting screws cut from a continuous length of wire in the manufacture of boots and shoes, of a friction device operated by a treadle, T, with the vertically-adjustable head, substantially as described, for controlling the speed of the machine.

32. The combination, in a screw-inserting machine, of a vertically-adjusting head, which carries the driving-pulley for the spindle, and a driving-pulley, T^{p}, carried by the standard, with a take-up follower for making uniform the driving-power of the belt during the vertical movement of the head.



33. In a machine for inserting screws in the soles of boots and shoes cut from continuous screw-threaded wire, the combination of the following instrumentalities, viz: a revolving wire-carrying spindle, having the automatic feed device, the automatically operating screw-threaded griping-rolls for holding screw-threaded wire while being fed, a device for severing the wire close to the work, a work-support, and an edge-guide for the sole, which rises and falls with the wire-severing device, substantially as herein set forth.

34. The combination with a vertically-adjusting head, in a machine for inserting screws cut from a continuous length of screw wire, of a bracket, P, secured to the head above and surrounding a pivot-support, Q, for the work-support, such bracket having freedom for vertical movement with the head over the pivot-pin Q, and without disturbing the work-support, as herein set forth.

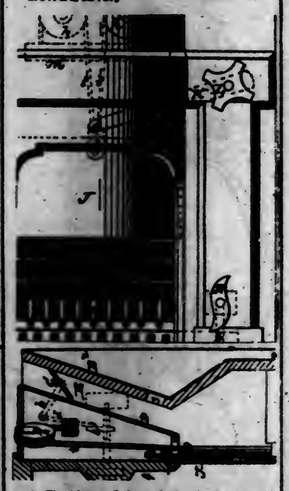
35. In a machine for inserting screws in the soles of boots and shoes to unite them to the uppers, the combination of a revolving wire-carrying spindle, uninterrupted griping-rolls, a wire-feeding mechanism, and a work-support with cutters having their cutting-edges approaching to oblique lines, whereby the wire is severed with a cutting-edge on the entering end of each screw.

171,612. CAR-VENTILATORS. G. F. Godley, Philadelphia, Pa. [Filed Dec. 1, 1875.]

Brief.—The air coming in at the top of the car has its exit at the bottom by the elbow-pipe seen.

1. In combination with a car, a swiveled elbow-pipe depending from the floor, as shown and described, whereby, through the motion produced by a moving train, said elbow-pipe will receive and expel the vitiated air from the interior of the car, substantially as set forth.

2. In combination with the car-door, having an opening or recess, D, the swiveled elbow-pipe B, having the collar or flange *c*, substantially as described and shown.



3. In combination with the swiveled elbow-pipe B, applied substantially as shown, an automatically opening and closing valve, *c'*, substantially as shown and described.

4. In combination with an air-pipe placed below the floor of a car, an automatically open-

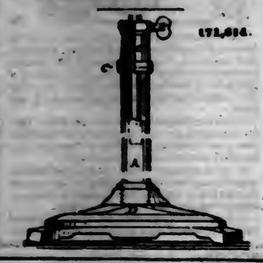
ing and closing valve or valves, substantially as shown and described.

5. In combination with a perforated pipe, O, for admitting air to the air in the upper section, a pipe or tube for drawing off the vitiated atmosphere through the floor or sides, substantially as shown and described.

171,610. FIRE-PLACE HEATERS. William D. Cummins, Morgantown, W. Va. [Filed Nov. 24, 1875.]

1. The blower J, formed of a single sheet of metal, and curved from a horizontal line, counterbalanced by means of a weight, M, and operated by a lever, K, and knob I in front of the heater-frame, substantially as and for the purposes herein set forth.

2. The pulleys h h, set at an angle, as shown and described, in combination with the wire cords i, blower J, and counterbalancing-weight M, substantially as and for the purposes herein set forth.



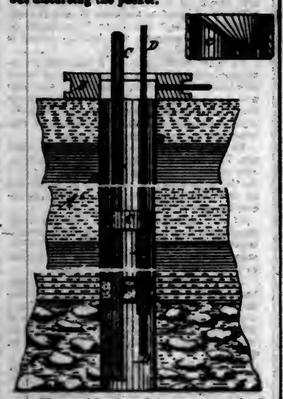
3. The combination of the inclined throat or flue B, centrally-pivoted damper O, with arm or crank h, connecting-rod d, arm e, shaft f, and knob I, all constructed and arranged substantially as and for the purposes herein set forth.

4. The combination, in a fire-place heater having a heater-frame, A, and open grate in the same, of the register P, under the grate and in front of the dust-door, operated by the knob R on the end of a shaft extending through the fire-place, substantially as and for the purposes herein set forth.

171,611. BREWING FARM. Halver Halverson, Cambridge, assignor to Joseph Boynton, Boston, Mass. [Filed June 8, 1875.]

The improved process of utilizing "scrap" described, consisting in treating the same with perchloride of iron, substantially as and for the purposes specified.

171,614.



171,616. PHOTOGRAPHIC HEAD-REST STANDS. John J. Hayes, Green Point, N. Y. [Filed Oct. 11, 1875.]

In a photographic head-rest stand, the combination, with a base, D, of the tubular standard A, made of wrought-iron, provided at its lower end with a screw-thread, and at its upper end with a tip, C, of cast or other suitable metal, having a thumb-screw, E, for holding the sliding rod B at different heights, all constructed and arranged substantially as described.

171,615. PETROLEUM-WELLS. Wallace L. Wardlaw, St. Petersburg, Pa. [Filed Nov. 10, 1875.]

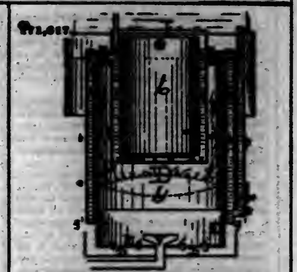
Brief.—The steam-pipe and protecting-tube are supported upon the pumping-tube by the device case, said device having a guide-flange for the interior of the protecting-tube and steam-pipe. The heat from the steam is confined below the packer, as the water above it would condense any that might pass up the tube. The steam-pipe can be withdrawn without disturbing the packer.

1. The combination of the pumping-tube C, the steam-tube D, and the protecting-tube E, supported upon the pumping-tube, substantially as set forth.

2. The combination of the guiding-flange C' with the protecting-tube E, substantially as set forth.

171,616. PACKERS FOR OIL-WELLS. Wallace L. Hardison, St. Petersburg, Pa. [Filed Dec. 3, 1875.]

Brief.—The cylinder and anchor-section form a telescopic joint. The flexible packer has tapering ends, and will not double back, so as to interfere with a proper condensation about the cylinder, because of the shape and thickness of the bag.



1. The cylinder C and tube D or tubes D D', sliding within the section B of the packer, in combination with a flexible packing compressed between the cylinder and the wall of the well, substantially as set forth.

2. The packing-bag E E, having its ends made tapering, in combination with the anchor B and the sliding cylinder C, substantially as set forth.

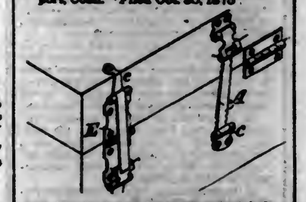
3. The cylinder I, Fig. 4, made in one piece, and provided with ribs i i, and a passage or passages, F, for the oil or oil and gas, substantially as set forth.

171,617. GAS-STOVES. Henry G. Hawley, Albany, N. Y., assignor to Gideon Hawley, same place. [Filed June 11, 1875.]

171,617

1. In a gas heating or cooking furnace, the combustion-chamber B, in combination with the double grates G, all constructed and operating substantially as set forth.

2. In a gas heating or cooking furnace, the combination of the plate d with the chamber B and double grates G, constructed and operating substantially as and for the purpose set forth.



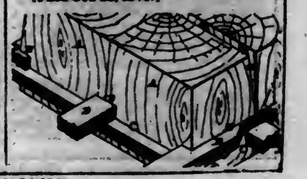
3. In a gas heating-furnace used for boiling water or generating steam, and having the combustion-chamber B and double grates G, the boiler placed within said chamber in the manner described, so that it will throw back the heat against the grates.

4. In the apparatus herein described, the hood H, constructed and operating substantially as and for the purposes set forth.

5. The double bottom E D, in a gas heating or cooking furnace, in which air is mixed with gas before combustion for the purpose of heating the air before it is so mixed.

6. In a gas heating or cooking furnace, the double grates arranged in a double curved form, substantially as described, for the purpose set forth.

171,618. TRUSSES. Jas. A. Rogers, Bridgeport, Conn. [Filed Oct. 30, 1875.]



1. The back-stay for trunks, hereinbefore described, composed of a long and a short section, united by a hinge to form a joint near one end thereof, and provided with hinges at its ends, and adapted to be applied to the back of a trunk body and lid, with its long section crossing the joint between the two ...

2. The combination of the trunk-hinge and the jointed stay, pivoted at its ends to the hinge, substantially as set forth.

3. The combination of the trunk-body, its hinged lid, and the jointed hinged stay, composed of sections of different lengths, these members being constructed and adapted to hold the lid in position, substantially as set forth.

4. The combination of a trunk-body and its lid or cover with the hinge, provided with the pivoted back-stay, substantially as and for the purpose described.

171,619. WOOD PAVEMENTS. Saml. Houston, St. Louis, Mo., assignor of one-fourth his right to Lewis A. Clarke, same place. [Filed Oct. 28, 1875.]

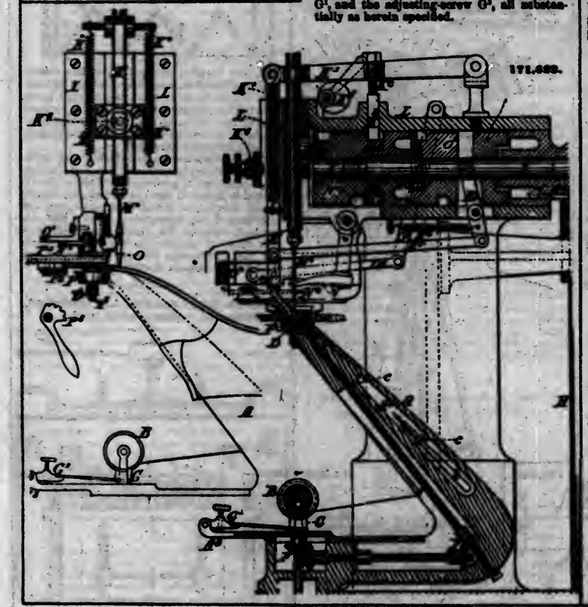
The blocks A, fitting firmly together for some distance upward from the bottom, and beveled from that point upward, to form, when placed together, a recess transverse to the street, for the reception of cement, and to afford a hold for the feet of horses, in combination with the frame, consisting of longitudinal and transverse bars let into the sides of the blocks so deeply as to allow the blocks to stand closely together, substantially as set forth.

171,620. SALE-MAKERS' NEEDLES. Henry M. Jenkins, New York, N. Y. [Filed Dec. 9, 1875.]

1. A cast-maker's needle, having its head formed with a ridge, c, corresponding with the front ridge c of the line, for the purposes herein set forth.

2. In a sail-maker's needle, the head a, constructed with the side grooves d d and top bevel f, substantially as shown and described.

171,621. SEWING-MACHINE NEEDLES. H. M. Jenkins, New York, N. Y. [Filed Dec. 7, 1875.]



Brief.—From the bottom of the eye a slot extends downward in an oblique direction a short distance, and then at right angles to the outer edge of the needle. The sides of the slit extending downward from the slit abut against each other to give strength to the needle, and are sprung apart by the pressure of the thread in threading.

An eye-pointed needle, A, having a diagonal slit, *b*, cut from one side, at the bottom, of the eye *a* to a point, *x*, and a slit, *d*, cut from said point through the side of the needle, substantially as shown and described, and for the purposes herein set forth.

171,622. BOOT AND SHOE SEWING MACHINES. John Keats, Newcastle, Arthur Greenwood, Leeds, and Alphonso Keats, Newcastle, England. [Filed May 17, 1875.]

Brief.—The shoe rests on the horn, carrying a whirl rotating from left to right, winding the thread around the needle in the opposite direction to the usual mode, and on the up-stroke of the needle the shuttle carries its thread through the needle-loop, which has been opened by the spreader, and a twist or tied effect is made.

171,622.

1. In a sewing-machine arranged and organized for uniting the soles and uppers of boots and shoes by means of two wax-threads, making a stock-stitch, the combination, with a swivel arm or horn, A, of the following specially-timed instruments, viz: the hooked needle M', the whirl D, the shuttle O, the loop opener or divider N, the spreader N', and the bar K, which performs both the pressing and the feeding operations while sewing, all substantially as herein described.

2. The combination of the traversing cam M', the rotary cams N' O', and the sliding cam O', for giving a suitably-timed motion to the hook M, the divider N, the shuttle O, and the spreader N', the whole operating substantially as herein described, for the purpose set forth.

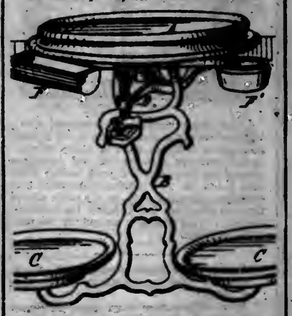
3. The horizontal guide-roller P, mounted on a vertical spindle supported by a spring, so as to be self-adjustable vertically, in combination with a notched cam-lever, P', and coiled spring P', substantially as herein described, whereby it may be adjusted horizontally to gage the required distance of the sewing from the edge of the inner sole, and of adapting itself to the inequalities of the material, and allowing also a definite margin on the welt-sole, as is usual in hand-made boots, to receive the outer sole.

4. The combination, in sole-sewing machines using two waxed threads, of the adjustable bar K, which performs the double office of holding and feeding the lever K', (which is capable of adjustment, by means of the screw K', to suit work of different thicknesses,) and arm K', with the rock-lever K', arm K', link K', substantially as herein described, for the purpose of holding firm the work against the pull of the hook, and feeding the same forward for the completion of the stitches, as set forth.

5. In combination with the bobbin E, arranged horizontally upon the swivel arm or horn, the brake-block G, bearing on both flanges of the bobbin, the spring G', the tipping-piece G', and the adjusting-screw G', all substantially as herein specified.

171,623. VELOCIPEDES. Geo W Marble, Chicago, Ill., assignor of one-half his right to Adolph Shoeninger, same place. [Filed Nov. 22, 1875.]

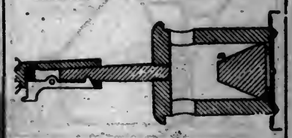
1. In a velocipede, substantially as described, the axle A, crank B, and collar C, cast in one piece, and the combination therewith of the loose collar C' and nut b, as and for the purpose set forth.



2. The castings G, G', G', and G', forming a connection for the top of the standard, the tiller, and a means for coupling the reach, substantially as set forth.

3. The combination of the socket-pieces I I, adapted to inclose and hold firmly together the ends of the reach-rods, the hooks d d on such pieces, and the castings G G' G', forming a connection between the reach-rods and the standard, all constructed and arranged substantially as described and shown.

4. A velocipede of the class described, having the reach and standard constructed of round rods, joined together by metallic plates, substantially as described and shown.



171,624. WAITERS FOR GAME-TABLES. G. W. Marble, Chicago, Ill., assignor of one-half his right to A. Shoeninger, same place. [Filed Nov. 22, 1875.]

Brief.—A device capable of being clamped to the side of a card-table, containing match-safe, wine-cup rest, &c.

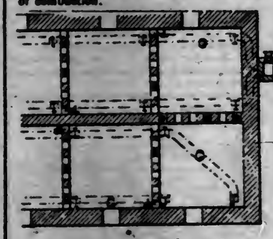
The combination, with the plate A, of the pendent frame B, plates C C, lever D, curve E, box F, and cup F', substantially as and for the purpose set forth.

171,625. SOLDERING APPARATUS. Louis McMurrey, Baltimore, Md. [Filed Aug. 14, 1875.]

The combination of a cylindrical or hollow soldering-iron with a separate and inclosed weight, for steadying the one-cup during and after the melting of the solder, substantially as specified.

171,626. HORSE-RACKS. Alexander Moffit, Washington, D. C. [Filed Dec. 13, 1875.]

Brief.—The rocking plate is pivoted at or near the middle portion of the fixed plate.

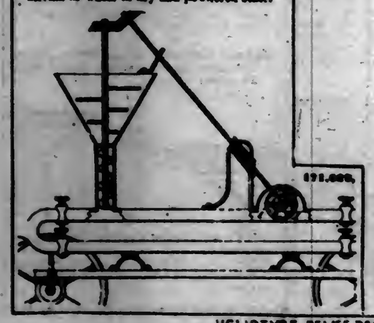


1. A horse-rack made in two parts, A and B, the former fastened to the roof and the latter pivoted to the stationary part, so as to form a rocking shoe, for the purposes herein set forth.

2. In a rocking horse-rack, made in two parts, as described, rubber or other springs inserted between the two parts, for the purposes herein set forth.

3. In a rocking horse-rack, made in two parts, as described, the inner or yielding part fastened to rubber, substantially as and for the purposes herein set forth.

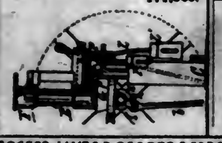
171,627. BRICK-KILNS. Augustus Morand, Germantown, Pa. [Filed Dec. 2, 1875.]



Brief.—The location of the draft-openings in the coal chambers, as shown, secures a more equally distributed passage of the products of combustion.

In a drying or burning kiln composed of two longitudinal series of chambers, A and B, communicating with each other by means of transverse apertures between the coal chambers thereof, the main flues G G, each having openings J J in the two diagonally-opposite coal chambers, arranged both on the same side of the coal chambers and opposite the draft-apertures *i i*, substantially as and for the purposes set forth.

171,628. FIRE-EXTINGUISHERS. Stephen S. Wooton, Binghamton, N. Y. [Filed Sept. 6, 1875.]



Brief.—The soda or other agent, after passing through the feeder, enters the passing stream of water in dry and powdered state.

171,629.

171,630.

In a fire-extinguisher, the combination, with the pipe through which a stream of water passes, of an apparatus adapted to inject into the flowing water bicarbonate of soda, or other similar material, in a substantially dry, pulverized condition, and adapted to be dissolved and diffused throughout the water and discharged upon the fire, substantially in the manner and for the purposes set forth.

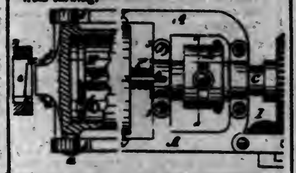
171,630. PROCESSES OF PREPARING MOLDINGS FOR ENAMELING. Michael A Owens, Brooklyn, N. Y. [Filed July 1, 1875.]

1. The method herein described of preparing enameled molding by forming a recess or undercut under the lower edges of the same, leaving said moldings attached to the wood from which they are formed by a sheet to allow the moldings to be separated by cutting the sheet without defacing or cutting through the enamel, substantially as herein set forth and shown.

2. In moldings for enameling, the undercuts *b* on the strip below the grooves *d*, which separate the parallel rows, said undercuts extending underneath the base edges of the moldings, substantially as and for the purposes herein described.

171,631. WINDMILLS. Arthur T. Page, Germantown Prairie, Ill. [Filed Mar. 16, 1875.]

Brief.—Supplemental fan-blades connected by vertical pivots, for deflecting the wheel from the direct action of the wind, are made use of in combination with the racks and weighted arms, and eccentrically-located pivotal standard.

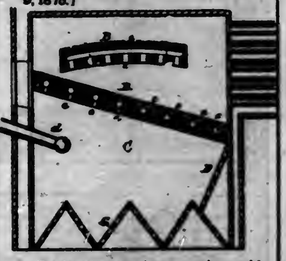


1. The supplemental fan-blades m, connected with the vertical pivot F, for deflecting the wheel from the direct action of the wind as the force of the latter is increased, in combination with the racks *f f* and weighted arm L, substantially as and for the purpose set forth.

2. The angular weighted lever P, in combination with the weighted arm L, arranged and operating substantially as described.

3. The combination, with the eccentrically-located pivotal standard C, of the weighted arm S and friction-roller *b'*, arranged and operating as described.

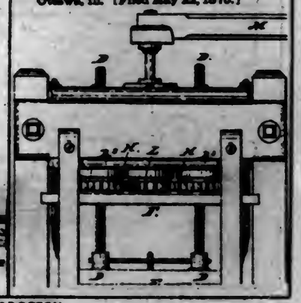
171,632. SAUSAGE-MACHINES. Hugh P. Rankin, Allegheny, Pa. [Filed June 12, 1876.]



Brief.—By turning the sleeve a connection is thrown into and out of gear with the screw-thread cut on the piston-rod. When in gear the piston is driven home by means of the gear-wheels and revolving sleeve; when out of gear the piston is withdrawn by hand. A stud is attached to the frame-work, which works in a slot and prevents the piston-rod from turning.

1. The combination, in a sausage-stuffer, with a screw-threaded piston-rod, of a revolving sleeve and an adjustable connection, for gearing together or disengaging the same, as and for the purposes set forth.

2. The combination of the screw-threaded piston-rod, having a groove, *g*, the projection *h*, the revolving sleeve G, the threaded segment K, the eccentric collar L, and the gear-wheels, substantially as described, and for the purpose set forth.



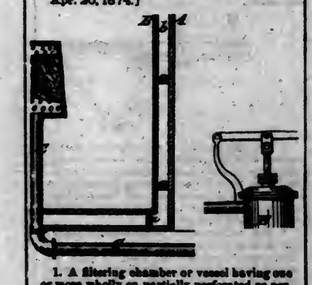
171,633. STEAM-BOILER FURNACES. Chas. H. Robinson, Brooklyn, N. Y. [Filed Dec 9, 1875.]

1. For burning petroleum-gas, the combination of the following elements: the furnace-box C, having no air-inlet save at the bottom thereof, the foraminous diaphragm E, extending across the same, and the steamer *d*, introduced or located beneath said diaphragm, all as shown and described.

2. The combination, in a furnace for burning petroleum-gas, of the bottom F of the fire-box, composed of perforated inclined plates G, joined together at top and bottom, the foraminous diaphragm E above the same, and the steamer *d*, all arranged as shown and described, whereby the gas is introduced into the space or chamber to which atmospheric air has access only through said bottom, as and for the purpose specified.

171,634. OIL-FURNACES. L. O. Rockwood, Ottawa, Ill. [Filed May 22, 1876.]

The vertical shaft F, to which the sweep is attached, in combination with the spur-pinion L, the spur-geared cam H, the flanged washers I, and the pressure-screws D, substantially as described, and for the purpose specified.



171,635. WIRE-ROPE. Ferdinand W. Roebling, Trenton, N. J., assignor to John A. Roebling's Sons. [Filed Oct. 12, 1875.]

Brief.—To prevent ropes used in mining, &c., from twisting or untwisting.

As an article of manufacture a wire rope, composed of strands, one or more of which strands have a right-hand twist, and the remainder a left-hand twist, said strands being laid up into a rope, in the manner and for the purposes set forth.

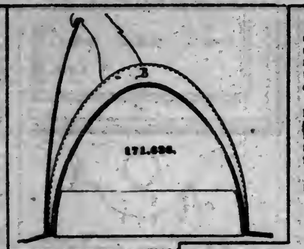
171,636. FILTERS. Thos. R. Sinclaire, New York, N. Y., assignor to Sinclaire Rectifying-Machine Company, same place. [Filed Apr. 20, 1874.]

1. A filtering chamber or vessel having one or more wholly or partially perforated or permeable side or lateral wall or walls, with wholly or partially perforated or permeable top and bottom walls, either or both, substantially as described.

2. The combination of a filtering-chamber or vessel having one or more wholly or partially perforated or permeable side or lateral wall or walls, with wholly or partially perforated or permeable top and bottom walls, either or both, and a distributer, all with or without an outer vessel, and with or without a forcing apparatus, substantially as described.

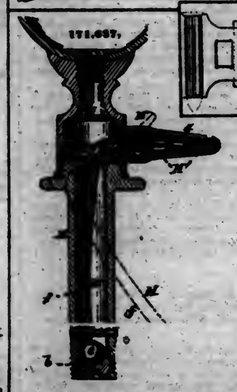
3. The combination of a filtering-chamber or vessel for containing charcoal or other filtering material, having wholly or partially perforated or permeable side or lateral wall or walls, provided with a permeable lining or covering, with or without wholly or partially perforated permeable top and bottom walls, either or both, the same being with or without a lining or covering, substantially as described.

4. The combination of an inner filtering-chamber, an outer vessel, and the side or lateral studs or projections, with or without the bottom or end studs or projections, substantially as described.



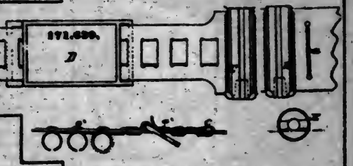
5. The vessel A, the wholly or partially perforated or permeable side, top, and bottom walls, the distributer D, the pipe C, the outlet F, space b, and a force-pump, B, all combined and arranged substantially as described.

171,637. HELMETS FOR FIREMEN. James B. Spear, Jr., Melrose, Mass., assignor to George W. Simmons & Son. [Filed Nov. 10, 1875.]



Brief.—The crown and brim are made of one piece of felt cemented with japan asphaltum, or like substance. The ribs are attached by cement or rivets to the crown.

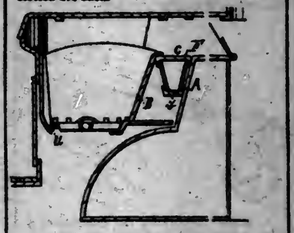
1. A fireman's helmet with the crown made whole, and having the ribs B attached to it, substantially as described.



2. The improved helmet above described, having the rim and crown in one piece, and the ribs B attached to it, substantially as described.

171,637.

171,638.



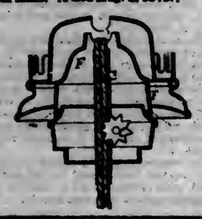
1. A cartridge-belt divided into sections, between which are made button-holes *c*, as and for the purpose described.

2. The combination, with reversed strap C and buckle D, of a belt provided with slots *c'*, loops *c'*, and clips E, as and for the purpose set forth.

3. The combination, with holding-strap, of clip E, having cuts *e* to give a better bearing for the cartridge.

171,639. STOVES. Samuel Wood, Quincy, Ill., assignor to Excelsior Stove-Works, same place. [Filed June 23, 1875.]

Brief.—The partition in the air-chamber prevents circulation of air entirely through it longitudinally. Air is discharged through apertures into the space in the rear of the slotted fire-back.

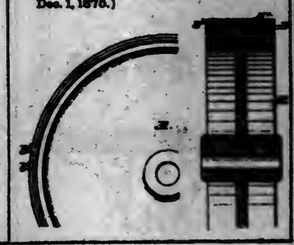


1. The air-chamber C, having the apertures *b*, partition H, and covering F, substantially as specified.

2. The fire-plate B, having the slots *i* and bars *n*, in combination with the air-chamber C, as described.

3. The combination of the air-chamber C, fire-plate B, and grate-rest N, as set forth.

171,640. LAMP-BURNERS. F. A. Taber, Boston, Mass. [Filed Aug. 9, 1876.]

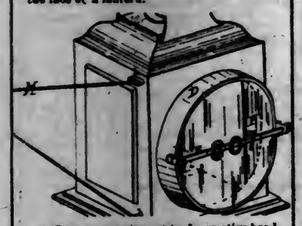


1. In a lamp-burner, the combination, with a slotted deflector and a flat wick-tube, of a sleeve whose sides extend a short distance above the wick-tube, and whose ends at the top are notched to permit expansion or spread of the flame, substantially as set forth.

2. The sleeve F, provided with air-admitting perforations, and having its sides extended a short distance above the wick-tube, in combination with the flat wick-tube and slotted deflector of a lamp-burner, substantially as set forth.

171,641. CARTRIDGE-BELTS. David Taylor, (U. S. A.,) Leavenworth, Kans., assignor to himself and Thos. Ewing, Tucson, Ariz. [Filed Aug. 30, 1875.]

REISSUES.

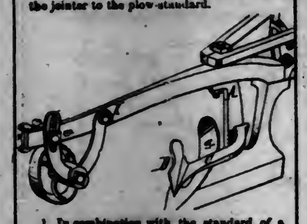


4,992. PULLEYS. Robert W. Bete and William Howie, Brooklyn, N. Y. Patent No. 169,702, dated Oct. 11, 1875. [Filed Dec. 1, 1875.]

A lining or covering of paper, applied, cemented, or glued to the drawing-surface of a pulley, for the purpose of keeping it from slipping and increasing its driving-power.

6,926. SIGNAL-LIGHTS FOR LOCOMOTIVES. Andrew Dick, Hamilton, Canada, assignor to himself, John Hall, and Wm. K. Muir. Patent No. 129,707, dated July 23, 1872. (Filed July 20, 1874.)

Brief.—The signal, which may be a number or any suitable device, is hung to a bar across the face of a lantern.



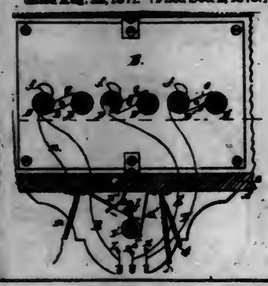
1. The combination, with a locomotive head light, of a stationary detachable signal, arranged at the front thereof, to indicate the name and number of the train, substantially as described.

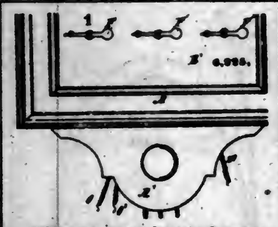
2. The combination, with a locomotive headlight, of a movable or flashing cautionary signal, substantially as described.

3. In combination with a signal-lamp, a stationary signal to indicate the name or number of the train, and a removable cautionary signal, substantially as set forth.

6,927. PLOW-JOINTERS. Horatio Gale, Albion, Mich., assignor to the Gale Manufacturing Company. Patent No. 147,920, dated Feb. 17, 1874. (Filed Dec. 6, 1875.)

Brief.—A horizontal curved arm connects the jointer to the plow-standard.





1. In combination with the standard of a plow, a horizontally-projecting arm carrying a jointer, for the purposes set forth.

2. In combination with a curved standard, A, the curved arm C, carrying the jointer D, substantially as and for the purposes set forth.

3. The combination, with a plow-standard, of the jointer D, having arm C, and vertically adjustable upon said standard, substantially as described.

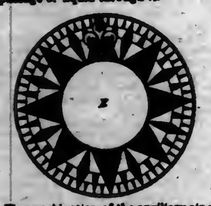
6,928. ELECTRO-MAGNETIC ANNUNCIATORS. H. Gray, Chicago, Ill. Patent No. 119,261, dated Aug. 22, 1871. (Filed Dec. 2, 1875.)

1. The arrangement of circuits for operating the needle or armature s either forward or backward by the electrical current, substantially as and for the purpose set forth.

2. The commutator J of an electro magnetic annunciator, constructed and arranged to operate substantially as and for the purpose specified.

3. The springs G G', H H', and wires R S T, in combination with rings I and I' of the commutator J, the whole arranged substantially as and for the purpose described.

4. The spring h, in combination with points l, M, and N, arranged as described, whereby the electrical current is reversed, substantially as and for the purpose specified.



5. The combination, substantially as described, of a dial, bearing numbers or other characters corresponding to the designations of different rooms in a building, and movable indicating-pointers corresponding to the characters upon the dial, as and for the purposes set forth.

6,929. PAVEMENTS. William W. Hubbell, Philadelphia, Pa. Patent No. 159,410, dated Jan. 5, 1870. (Filed Oct. 27, 1875.)

The street-paving composition consisting of hydraulic cement and lime, with coal-cokes or sand, fine stone or gravel, or either, and tar or bitumen, with fine and coarse stone underneath, forming the most effectively-hardened concrete wearing-surfaced pavement, substantially as described.

6,930. MARINERS' COMPASSES. Edward S. Ritchie, Brookline, Mass. Patent No. 39,126, dated Apr. 7, 1863; reissue No. 6,607, dated Aug. 24, 1875. (Filed Oct. 5, 1875.)

Brief.—Compass-card perforated to allow free passage of liquid through it.

1. The combination of the auxiliary air-vessel or indicator E and the connecting-rod B with the magnet or magnets g, or the same and its or their air-tight or buoyant case D, the whole being arranged within the vessel or case A, to contain water or other proper fluid, and so as to operate together substantially as above specified.

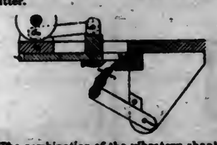
2. The combination of either or both the buoyant air-vessels D E with their shaft or rod E by means of gimbals A, the shaft or rod B being arranged and supported within a case, A, substantially in manner and so as to operate as described.

3. The combination of an auxiliary buoyant vessel, c, with the rod or connector B, the magnet, or the same and its buoyant case D, and the auxiliary case or vessel A, containing water or other suitable fluid, so as to operate therein substantially as herein before specified.

4. The compass-card, having the cardinal divisions marked upon it, affixed to the external periphery of the float E, substantially as specified.

5. The combination of a hollow globe, F, open at top and bottom, and its supporting-gimbals, with the water case or vessel c, and the magnet buoyant air-vessel thereto.

6. The magnet air vessel, as made of an elongated form, and as having its magnet or magnets arranged lengthwise within it, substantially as represented in Figs. 6, 7, and 8 of Sheet 2, and as herein before specified.

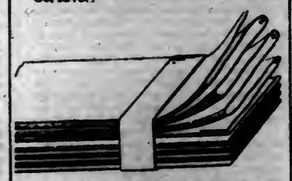


7. The combination of two or more buoyant radial floats or arms, c' c', with the elongated magnet-vessel, the said arms being for the purpose herein before stated.

8. The combination of a graduating-ring, f', with the radial-armed float E, its connecting-rod B, and the magnet-float D, when arranged and combined within a water-vessel, A, in manner and so as to operate substantially as described.

9. In or for a mariner's liquid compass, the card or indicator, perforated for the passage of the liquid of the bowl through it, in order to facilitate the settling of the card, as specified.

6,931. MACHINES FOR MAKING WOODEN SHANKS FOR BOOTS AND SHOES. Watson N. Sprague, South Framingham, assignor, by mesne assignments, to himself and W. W. Potter, Boston, Mass. Patent No. 157,424, dated Dec. 1, 1874. (Filed Nov. 16, 1875.)



Brief.—The material from which the shank is made is held upon an inclined table, and subjected to the action of a curved reciprocating cutter.

1. The combination of the vibratory shank-holder with the cutting-blade, (having its cutting-edge curved in two directions, as specified,) and with the bed slanting or inclined to the plane of motion of the said blade, all being constructed and to operate substantially as shown and explained.

2. For supporting a shank-stiffener blank, and cutting it from its upper to its lower surface, concave and beveling along its edge, the combination of a bed, substantially as represented, with a knife curved in two directions on its cutting-edge, as described, and provided with mechanism to cause it to cut through the blank, down to and at an inclination to the blank-supporting surface of the bed without going through such bed, all being essentially as explained.

6,932. MEASURING PACKAGED FABRICS. S. C. Talcott, Ashtabula, Ohio. Patent No. 166,121, dated June 29, 1875. (Filed Sept. 30, 1875.)

1. The preparation of fabrics for sale and inventory by measuring, graduation, notation, and packaging, substantially as described.

2. In combination with the graduation and notation, transverse guide-lines, to facilitate the folding or severance of the fabric without bias, substantially as described.

6,933. TABLE-MATS. Charles Weber, West Meriden, Conn., assignor to the Newark Tea-Tray Company. Patent No. 55,402, dated June 9, 1866. (Filed Apr. 20, 1875.)

The heat-shield described, having the metal rim B, inclosing the edge of the round or oval body A, and extending smoothly inward on both faces, substantially as and for the purposes specified.

HELIOTYPE RELIEF PROCESS JAMES R. OSGOOD & Co. BOSTON.

DIGEST OF DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND

DECISIONS OF UNITED STATES COURTS

IN THE MATTER OF

PATENTS AND TRADE-MARKS.

OFFICIAL GAZETTE—July—December, 1875.

DIGEST OF DECISIONS.

[The names of court cases are designated by an asterisk, (*).]

ABANDONED APPLICATIONS.

1. The abandonment of an *application* for a patent, as provided for by sec. 4894 of the Revised Statutes, is a different thing from the abandonment of an *invention* to the public.

[W. H. Golding, 141.

2. When an *invention* becomes abandoned to the public it is no longer patentable. But an *application* for a patent being a legal proceeding to secure an alleged right, the abandonment of that proceeding does not necessarily amount to a surrender of the alleged right.

[Ibid., 141.

3. Where an applicant has abandoned an application for a patent by failure to prosecute it within two years after an action thereon, of which he was duly notified, he is not by that fact alone debarred from prosecuting a new application for patent for the same invention.

[Ibid., 141.

4. It having been decided by the courts that abandoned applications are no bar to the issue of a patent, they cannot delay that issue, and are not to be regarded at all.

[Casilear and McIntire, 474.

5. The statute and the decisions of the courts being sufficient notice to rejected applicants, they and not the Office must be held responsible for any injury resulting from the abandonment of their applications.

[Ibid., 474.

(See Construction of Statutes 1; Practice in Patent Office, 2, 9.)

ABANDONMENT OF INVENTION.

1. Although long neglect to file or prosecute an application may be a link in a chain of evidence going to prove abandonment of an invention, it is not sufficient for that purpose unless accompanied by proof of express acts of dedication, or by a clear acquiescence in the acts of others amounting to the same thing.

[W. H. Golding, 141.

2. Abandonment of an invention by sale for more than two years prior to the filing of an application for a patent not established by inferences or presumptions arising on the testimony in the absence of clear and explicit proof as to dates.

[Massey vs. Sawyer, 557.

(See Abandonment of Applications, 1, 2.)

APPLICATIONS.

(See Abandoned Applications; Division of Applications; Joint Applications; Joint Inventions, 3; Practice in Patent Office, 2, 3, 8; Reissues.)

APPEALS.

(See Practice in Patent Office, 10.)

ASSIGNEES.

(See Assignments, 1, 3, 4, 5, 7, 8.)

ARTICLES OF MANUFACTURE.

(See Construction of Claims, 5; Invention, 2.)

ASSIGNMENTS.

1. An *assignee*, under the patent act of 1836, is one who has transferred to him in writing the whole interest of the patent, or an undivided part of such whole interest, in every portion of the United States.

[*Meyer *et al* vs. Bailey *et al*., 437.

2. A *grantee* is one who has transferred to him in writing the exclusive right under the patent to make and use, and to grant to others to make and use, the thing patented, within and throughout some specified portion of the United States.

[*Ibid., 437.

3. If a part of the whole patent has been vested in another, so as to constitute him an assignee within the meaning of the statute, an efficacious surrender can be made only by the concurrence of both of the owners of the patent; but this may be manifested by the assignee by his direct co-operation in the surrender, or his subsequent ratification of it.

[*Ibid., 437.

4. The owner of an exclusive territorial right under a patent may ratify a reissue thereof in which he did not join, by making an assignment under such reissue.

[*Ibid., 437.

5. It is not essential to the validity of a reissued patent that a transferee of an interest in the original patent, who is not an assignee within the meaning of the statute, concur in the surrender.

[*Ibid., 437.

6. Nor is it necessary to aver in a bill brought under a reissued patent that the grantee of a territorial right acted with the patentee in the surrender of the original patent or concurred in the reissue thereof.

[*Ibid., 437.

7. M., the patentee, assigned the State of Pennsylvania to B., and afterward reissued the patent. Subsequently to the reissue B. assigned his title to an interest in the State of Pennsylvania, except as to certain counties, under the *reissued* patent, to the complainants, who, under the title thus acquired, filed a bill in equity against the defendants. Defendants demurred on the ground that B.'s interest was outstanding at the time of the surrender, and that he did not appear to have been a party to or to have assented to or approved of the surrender and therefore the reissue was void: *Held*, that B. was not an assignee within the meaning of the statute, and therefore it was not necessary for him to concur in the surrender in order to give validity to the reissue.

[*Ibid., 437.

8. The bill sets out complainant's title to the exclusive right, title, and interest under the patent, to the State of Pennsylvania, excepting certain counties, and then avers that the defendants "are *now* constructing, using, and vending" the infringing goods * * * "in the western district of Pennsylvania," concluding the averment as follows: "All of which acts and doings are in violation of the exclusive rights and privileges, *so as aforesaid* vested in your orators, under and by virtue of the said recited reissued letters patent." *Held*, that these averments, taken in connection with statement of complainants' title, necessarily import a charge of infringement *after the grant to the complainants*; and, also, *within* the *territory covered by the grant*.

[*Ibid., 437.

9. R. agreed with M. to apply for an extension of his patent, and to assign the same when procured to M. M. sold his interest in this contract to the U. P. B. Mach. Co. R. dying before the extension was had, his wife was appointed executrix of his will, applied for and procured the extension, and assigned the same to the U. P. B. Mach. Co., but the assignment described herself as "administratrix," &c. The assignment was duly recorded. Subsequently the widow resigned her trust as executrix, and L. was appointed administrator with the will annexed. L. executed an assignment of the extended term of the patent to N., and N. brought suit for infringement: *Held*, that the recorded assignment to the U. P. B. Mach. Co., notwithstanding the erroneous description of the party executing it, was constructive notice to N. of the claim of an adverse title in the patent, the nature of which he should have ascertained by inquiry; and that this alone was sufficient to defeat complainants title: *Held*, further, that, in fact, the assignment to the U. P. B. Mach. Co. was valid, notwithstanding the erroneous description of the representative character of the executrix.

[*Newell *et al*. vs. West *et al*., 508.

ATTACHMENTS.

(See Pleadings and Practice, 2.)

BOARD OF EXAMINERS-IN-CHIEF.

(See Practice in Patent Office, 10.)

CASES COMMENTED UPON.

1. Gorham Company *vs.* White, 14 Wall., 524.
[*Niedringhaus, 279.

2. Godillot, OFFICIAL GAZETTE, Vol., VI, p. 641.
[Orcutt and Son, 277.

3. Rouse and Stoddard, 7 O. G., 169.
[Casilear and McIntire, 474.

4. *Merrill and Carleton.
[Paris *vs* Bussey, 859.

CLAIMS.

1. The rule that it is admissible under proper restrictions for parties to put their claims in different forms, to prevent misconstruction of them by the public or the courts, reiterated and approved.
[I. Hahn, 597.

2. Broad claims give rise to the appearance of indefiniteness, but regard must be had to the specification as to their scope.
[Ibid., 597.

3. The doctrine of Perry *vs.* Lay, (C. D., 1869, p. 3,) that it is admissible under proper restrictions for parties to put their claims in different forms to prevent misconstruction, again approved.
[E. W. Shippen, 727.

4. Parts which, though shown as concerned in an operation, may be rendered unnecessary by a ready substitute, need not be explicitly cited in a combination claim.
[O. E. McMurray, 943.

(See Construction of Claims; Functional Claims.)

COMBINATION.

1. The third claim was for the combination of the shell-holder, the canister, and a ramming device. As these also were especially adapted to each other, all co-operated to produce a certain result, and the use of each was necessary to that result: *Held*, that they constituted a legitimate combination.
[Noyes, W., 612.

See Construction of Claims, 3, 13; Joint Invention, 1, 3 Reissues, 2.)

COMMISSIONER OF PATENTS.

See Mandamus, 1; Construction of Specifications and Patents, 2.)

COMPOSITION.

(See Patentability, 3)

CONSTRUCTION OF CLAIMS.

1. The new arrangement of the carbureter was patentable, and the claim—viz: "The arrangement of the carbureter with a motor-wheel, said wheel being driven by a descending weight or other equivalent mechanical power, applied to force the air through the carbureter to the burners, said carbureter being placed within a vault by itself, separate from the building to be lighted, the whole arranged and connected with pipes, substantially as herein described and set forth."—is valid.
*[Gilbert and Barker Manufacturing Co., *vs.* Tirrell, 2.

2. The claim of the patent—"The application to a shade-roller, provided with a spiral spring for automatically raising or rolling up the shade, of a pawl and a ratchet or a notched hub, so arranged that the former will engage with the latter at any point or height of the shade by simply checking the rotation of the roller and the upward movement of the shade under the influences of the spring, substantially as set forth" so construed as to include the use of a loose pin, which falls into the notch of the roller-hub by the force of gravity when the roller is revolved slowly, but which is raised from the notch and held up by *centrifugal force* when the roller is revolved rapidly, while the pawl of the patented device is raised and held up by a portion of the periphery of the hub.
[*Hartshorn *vs.* Almy *et al.*, 94.

3. The claim in the patent of George E. King, issued February 26, 1867, and reissued June 23, 1868, for an improvement in fluting-machines, which is for "the guide E, constructed with one or more curved or arched portions, *a'*, in combination with suitable fluting-rollers, substantially as herein set forth, for the purpose specified," construed.
[*Kursheedt *vs.* Werner, 146.

4. Where the word "barrier" was employed in a claim—referring to small wires to intercept and break up sound-waves: *Held*, that the propriety of its use depended on the fact of their accomplishing the result claimed for them.
[Carleck, W. B., 191.

5. The claim of letters patent for an "improvement in head-linings for barrels," granted to George A. Reed, May 14, 1872 viz: "As a new article of manufacture, barrel-head linings prepared in the manner specified, when bundled as shown and described"—is invalid.
[*Reed *vs.* Reed and Felts, 193.

6. The twelfth claim of the patent granted Otis Tufts, August 9, 1859, for improvement in elevators and hoisting apparatus for hotels, &c.—viz: "Passing the shipping-rods and the cord or rod that operates the friction-brake through the car or platform, for the object and purposes set forth"—if construed broadly as a claim for passing any rod or cord, by means of which the appropriate mechanism is operated to move the car up and down, or hold it at rest, *through the car or platform*, is void for want of novelty.
In view of the prior elevator of Hecker, in which a single chain passing through the car furnished the means for lifting a gravity-brake and operating a friction-clutch, the claim can only be sustained by giving it a construction strictly in accordance with the language used—viz., "passing *the* shipping-rods *and* the cord or rod," &c.
[*Tufts *et al. vs.* The Boston Machine Co., 239.

7. The first claim of the patent granted to Otis Tufts, May 22, 1861, for improvment in elevators—viz: "Constructing an elevator or hoisting apparatus with a series of two or more hoisting ropes or chains having independent attachments, and winding simultaneously upon the hoisting-drum for greater safety," &c.—is void for want of novelty.
The second claim of the patent being for "equalizing the strain upon the series of ropes or chains *x x x x* by automatic adjustment," &c., where it appeared that defendants used a different means of automatic adjustment from that described in the patent: *Held*, that, in the absence of proof that the device used by the defendants was, at the date of the patent, a known substitute for the devices described therein, the claim cannot be regarded as infringed.
[*Tufts *et al.*, *vs.* The Boston Machine Co., 2 9.

8. The claim of reissued letters patent No. 3,001, for "improvement in fluted puffing," granted Geo. E. King, June 23, 1868, (original February 26, 1867,) namely, "the within-described puffing as a new article of manufacture, the same being formed by crinkling, gathering, or irregularly waving one portion of the strip of muslin or other material simultaneously with fluting it along the edges of such portion, as at *g*, and forming flattened borders or portions *h* outside of the flutes, or between two next adjacent rows of them, to receive stitching, substantially as specified," claims the puffing without reference to whether it be made by hand, or by machinery, or how otherwise, and the claim held void in view of the prior existence of a puffing known as the Pipo puffing formed on a sewing-machine.
[*King *vs.* Werner, 362

9. The only proper construction of the word "simultaneously" in this claim is merely that, in the finished article, one portion is seen to be crinkled, and at the same time the parts at the edges of such portion are seen to be fluted, and the portions outside of the flutes are seen to be flattened borders.
To regard the word as referring to the idea that, in any given cross-section, the crinkled portion, the fluted portions, and the flattened borders are formed at one and the same time, is to introduce an element which has regard to something beyond the conformation, shape, and structure of the puffing as an article of manufacture, and which has to do with the process of making it. This would make the claim repugnant to the subject-matter of the patent.
[*King *vs.* Werner, 361.

10. The fact that the flutes of the Pipo puffing being made by the process of gathering were not as regular and uniform as are flutes made by fluting-rollers, raises a question of degree and of appearance, and not of conformation.
[*Ibid., 361.

11. The claim of reissued letters patent No. 3,000 for "improvement in fluting-machines," granted to George E. King, June 23, 1868, (original February 26, 1867,) namely, "the guide E, constructed with one or more curved or arched portions, *a'*, in combination with suitable fluting rollers, substantially as herein set forth, for the purpose specified, presents, as the main feature of the machine, the device for pulling away the fabric before the fluting-rollers grasp it too firmly, so as to get an increased width of fabric opposite the pair of plain zones, such device being an arched guide, the arch of which raises up the fabric, so that the fabric rides over it, and so is pulled away from the fluted parts of the rollers.
[*Ibid., 361.

12. The Werner machine uses a detent or finger and a platform opposite the plain zones of the rollers, the fabric being held back from the fluting-rollers by the pressure of the detent upon the platform. The detent and the platform form the two surfaces of a guide, between which the fabric passes, and they divert the fabric from what would otherwise be its course, so as thereby to pull out an extra width. The variation of construction is merely mechanical and not substantial.
[*Ibid., 361.

13. The interference being on the following claims of one of the joint parties: First, the combination of ascending and descending flues placed on the rear side of a stove, illuminating windows or doors in the draft-chamber, base-section, and the free open space R between the top surface of the grate or fire bed and the base of the fire-pot or combustion-chamber proper; and, third, the grate-frame constructed with legs, supported upon and in combination with a flange or projections upon the side wall of the draft-chamber base-section, substantially as described: *Held*, that, considered apart from the question of novelty, the claims were for two combinations of elements intimately related, accomplishing a new result when so combined, and forming an essential part of one complete organization. The case on this point distinguished from *Potter and Wilson*, (2 Flah., 102) and *Birdsell* vs. *McDonald et al.* (6 O. G., 682) cited in support.
[Carter and Dwyer *vs.* Perry and Dickey, 518.

14. The third claim of the patent of H. D. Stover—improvement in planing-machines, July 23, 1861—viz., "the arrangement of matching-cutters to be adjusted both laterally with each other and vertically upon the bed-piece, essentially as described, in combination with the platen, so that the planing and matching of the piece may both proceed at the same time, or either the planing or matching may be done separately, whether the platen be made movable with the piece secured thereupon, or the platen be fixed and the piece be made to move thereon," held valid.
[*Stover *et al.*, *vs.* Halsted and Merritt, 558.

15. The claim, though not expressed with accuracy, should be construed *ut res magis valeat quam pereat*.
The inventor intended to claim a surfacing and matching machine, in which the matching-cutters were adjusted laterally and vertically, in combination with the platen, and were so adjustable vertically that the matching mechanism could be mechanically dropped below the platen when surfacing alone was to be done.
[*Ibid., 558.

16. The movable or fixed character of the platen is not a necessary part of the improvement to which the third claim relates, and might have been omitted therefrom.
[*Ibid., 558.

17. The term "matching-cutters" in the claim signifies "matching mechanism;" and the claim is infringed by the Merriam machine, in which the matching-*spindles* alone are dropped below the bed, the heads with the cutting-blades having been first removed.
[*Ibid., 558.

18. A claim for "the improvement in the art of manufacturing wooden shoes by machinery, hereinbefore set forth, which consists in cutting, shaping, and boring the blank by submitting it successively to the operation of mechanism, substantially such as set forth," distinguished from a claim for a function, and construed as a certain well-defined order of mechanical operations, all adapted to each other, and, although requiring a peculiar set of instruments for their operation, yet the order of their performance is not inherent in the machinery.
[Shippen, E. W., 727.

19. The claim in this case is for "the catgut" or other cord E, partially or fully embedded, or otherwise attached at the angle a of the rubber cushion C, so as to protect said cushion against the impact of the ball, substantially as herein shown and described, and for the purposes set forth.
The manufacture and use by Winant, prior to the alleged date of invention by Decker of his device, of a strip of spring steel, or equivalent material, with holes in its lower edge, through which wires were passed and fastened to the under side of the rail, said strip being placed in a crease or groove out in the upper face of the rubber near the angle thereof, and the manufacture by Stevens, prior to 1864, of the India-rubber cushions for billiard-tables having a French clock spring placed in a slot in the upper face of the rubber, parallel to and near the inner face of the rubber, bringing the upper edge of the spring near the upper corner of the rubber, are substantially the same arrangements of devices used by Decker.
[*Decker *vs.* Griffith & Co., *et al.*, 944.

(See Claims, 1, 2, 3; Combination, 1; Functional Claims, 1, 2; Infringements, 1; Novelty, 5.)

CONSTRUCTION OF SPECIFICATIONS AND PATENTS.

1. The apparatus described in letters patent granted to Allen L. Wood, December 7, 1869, for an "improved apparatus for treating diseases by mechanical movement," is an infringement of the first, second, and fifth claims of Letters Patent No. 75,212, granted to George H. Taylor, March 3, 1868, for an "apparatus for exercise," and of the first and fourth claims of Letters Patent No. 77,933, granted to said Taylor, May 12, 1868, for an "oscillating rubbing-machine for medical uses," and of the first claim of Letters Patent No. 75,217, granted to said Taylor, March 3, 1868, for an "apparatus for exercise."
[*Taylor *vs.* Wood, 90.

(See Claims, 2; Construction of Claims, Infringements, Inventions, 1, 2.)

2. The bottle-stopper-fastening covered by the Putnam reissue of January 19, 1864, which consists of a piece of *wire* of U form with the ends *returned* and connected to the bottle, (in order that the pressure on the cork or stopper may cause the fastener to hold more securely,) is not anticipated by the *sheet-metal* U-shaped yoke of the Allender fastening of 1855.
The *wire* embeds in the cork, under pressure from within, and thus prevents the fastener from "tripping;" it also presents a change of form, which permits the fastener to be pressed off without injury to the thumbs of the operator or to the cork.
Consideration given to the fact that the Commissioner of Patents, in both granting and extending the patent, was aware of the nature of the Allender device, but held that the Putnam fastener contained something more than the mere substitution of a wire U-shaped yoke for a sheet-metal U-shaped yoke.
[*Putnam *vs.* Weatherbee, 330.

3. The process covered by the patent of John W. Jones, assignee of Isaac Winslow, May 13, 1862, for preserving corn in its green state, involves three distinct features, each of which is essential to the result: First, separating the kernels from the cob; second, placing them in their natural juices in cans; third, sealing the cans hermetically and subjecting them to heat by water or steam until the kernels are thoroughly cooked.
[*Jones *et al. vs.* Merrill, Soule *et al.*, 401.

CONSTRUCTION OF STATUTES.

1. Section 4894 of the Revised Statutes, (sec. 32, patent act of 1870:) *Held*, to comprehend the abandonment of applications only. It does not apply to the same class of cases, does not contain the same limitation, and has not the same effect as sec. 35 of the act of 1870.
*[W. H. Golding, 141.

2. The words in section 4937 of the Revised Statutes, "the class of merchandise and the particular description of goods comprised in that class," construed.
[F. Boehm & Co., 319.

3. Section 4918 of the Revised Statutes of the United States in respect of *interfering patents* construed, and held to vest the power in the circuit court to adjudge *either* of the interfering patents void in whole or in part, and upon proper issues and proof to authorize a decree that *both* patents are void.
[*Foster *vs.* Lindsay, 1032.

(See Abandoned Applications, 1; Designs, 3; Trade-Marks, 1, 6, 10.)

CONSTRUCTIVE NOTICE.

(See Assignments, 9)

CONTRACTS.

The inchoate right of an inventor to an extension of his patent may be the subject of a contract of sale, and such a contract may be enforced by a bill for specific performance.
[*Newall *et al. vs.* West *et al.*, 398.

(See Pleadings and Practice, 5.)

COPYRIGHT.

1. The rights and duties of compilers of books which are not original in their character, but are compilations of facts from common and universal sources of information, of which books, directories, maps, guide-books, road-books, statistical tables, &c., are the most familiar examples, are well settled.
No compiler of such a book has a monopoly of the subject of which the book treats. Any other person is permitted to enter that department and make a similar book; but the subsequent investigator must do so for himself from the original sources, which are open to all. He cannot use the labors of a previous compiler, "*animo furandi*," and save his own time by copying the results of the previous compiler's study.
[*Banks *et al. vs.* McDivett *et al.*, 860.

DAMAGES.

1. When a patentee claims and recovers, not only the actual gains and profits of the manufacture and sale of the infringing

machine, but all the damages which he has sustained therefrom, it is at least to be presumed that such recovery embraces all the profit which the patentee would have received had he made and sold the machine with the incidental and consequential right to use it.

[*Gilbert and Barker Manufacturing Co., *vs.* Bussing, 144.

2. The rule is settled that when the patent is for an improvement upon a machine, the damages for the infringement of such patent are confined to the profits made by the use of the improvement only, and not by the manufacture of the whole instrument.

The complainants, at the accounting, proved the expenses of making and selling the infringing pumps; that they were prepared and ready to fill the orders taken by the defendants, and the prices at which the pumps were sold by the defendants, and the master took the difference between such expenses and such prices (being $47.71 on each pump) as the measure of damages: *Held*, that as the patented invention was merely an *improvement* in pumps, being only a special construction of the side chamber, whereby the same is adapted to use with the valve-casings bolted on the outside, and constituting but a small part of the aggregate mechanism, this rule was erroneous, and that the damages could not exceed the profits upon such improvement.

[*The Gould's Manufacturing Co. *vs.* Cowing *et al.*, 277.

3. The burden of proof, to show the amount of damages or profits, is upon the plaintiff. Where he fails to show the profits or damages arising from the use of the patented improvement, as distinguished from the profits on the entire machine, nominal damages only can be recovered.

[*Ibid.*, 277.

(See Injunctions, 9; Pleadings and Practice, 5.)

DESIGNS.

1. A design consisting in a mere mottled appearance to be given to enameled iron ware is not patentable.

[*Niedringhaus, 279.

2. Mere exhibition of skill on the part of workers in enamel, in giving beautiful forms and colors to their productions, when they are the common efforts of persons ordinarily skilled in the art, is not the invention which is protected by the law.

[*Ibid., 279.

3. The use of an old design is clearly excluded from patent by the statute, and mere change "or double use" cannot receive its protection.

[*Ibid., 279.

4. The same degree of originality is required in both design and functional patents—that is, the claim must not comprehend what is already in existence.

[*Ibid., 279.

5. A beautiful appearance is not of itself entitled to a design patent. The design must also be new and original, and the result of invention and genius.

[*Ibid., 279.

DIVISION OF APPLICATIONS.

1. In the division of an application the various prerequisites cannot be dispensed with; *ergo*, a new oath must accompany the divisional portion of an application the same as if it were an original application. Case of *Whiteley* vs. *Swayne*, (4 Fisher, 117,) referred to.

[Heginbotham, 237.

2. The dictum that separate independent inventions must be the subjects of separate patents is not a mere Office rule, but is in consonance with the law.

[Ibid., 237.

3. It is the duty of the Office at the outset, in requiring the division of an application, to indicate clearly the nature and extent of the division required.

[Knott, 238.

4. Each part of this series of machines without the others, or some equivalents of the others, would be absolutely useless, and since the invention lies mainly in the series as a complete set, and not in an improvement upon separate parts of an old set, they ought to be allowed in one application, and in one only.

[Shippen, E. W., 727.

5. Where the subject-matter of an application consisted of a set of devices for charging cartridge cases, and the first claim was for a cartridge-shell holder, and the second for a canister: *Held*, that as the devices covered by these claims were in their operation especially adapted to each other, belonged to the same class of inventions, and were used in connection to subserve a common end, they formed an exception to the general rule that separate inventions should form the subject of separate applications.

[Noyes, W., 818.

6. In a submarine torpedo-boat, of the construction described, the lighting and ventilating devices constituted necessary elements in the production of the result, and without which the boat would be inoperative: *Held*, therefore, that these devices need not be the subjects of separate applications.

[Jopling, J., 1032.

DOUBLE USE.

(See Novelty, 1; Designs, 3.)

DRAWINGS.

(See Pleadings and Practice, 3; Practice in Patent Office, 6.)

ESTOPPEL.

The plaintiffs file their bill for an account and discovery under an agreement, contract, or license, granted by them to, and made with, the defendants, the latter admitting the validity of the patents owned by plaintiffs: *Held*, that defendants are estopped from denying the truth of their admissions, unless such agreement was obtained by fraud, surprise, or imposition.

[*Magic Ruffle Co. *vs.* Elm City Co., 773.

(See Injunctions, 7, 8, 9; License, 1.)

EVIDENCE.

1. An objection to a question based upon a patent which was not first introduced in evidence, nor a certified copy thereof, sustained.

[Chapman *vs.* Morrison, 1031.

2. Where testimony was taken by the defence to show that their opponents had not "manufactured, sold, or used" the invention during a certain time while the witness was employed at their establishment, on which point no testimony had been taken by the latter parties in their testimony-in-chief: *Held*, That testimony taken in rebuttal to show use of the invention at another place than at the establishment during the time mentioned was properly rebutting and not direct, evidence.

[Ibid., 1031.

3. Objections to questions not made at the time considered as waived.

The Office, however, reserves the privilege of considering what testimony is or is not material to the issue.

[Ibid., 1031.

4. The common law rules of evidence will be continued to be applied strictly in all practice before the Office.

[Ibid., 1031.

5. A substantial variance between the preliminary statement and the testimony throws strong suspicion upon the latter.

[McCulloch *vs.* Watkins, 1074.

6. Sketches produced for the occasion, and in the absence of all contemporaneous tangible evidence of early efforts, of no value, except by way of explanation.

[Ibid., 1074.

7. The allegation of one that he conceived the idea of an invention at a certain time, in absence of proof of its completion by him at that time, not sufficient to establish the fact of invention.

[Ibid., 1074.

(See Abandonment of Inventions, 1, 2; Damages, 3; Estoppel; Experimental Use; Injunctions, 5, 6, 7, 8; Novelty, 6; Priority of Invention, 1.

EXTENSIONS.

1. The wheel of applicant having fallen into the hands of another person, who added improvements of his own, the "statement" of the value of the invention should have distinguished how much of the value was due to the portions patented by applicant.

2. A general statement that *the* wheel "added one-twelfth to the power of former wheels," is not sufficiently definite when the merits due to the devices of the applicant, and those of the subsequent patentee, are not definitely ascertained.

3. Examination of the specific points of each, and the apparent disuse of some of the applicant's devices, considered as bearing upon the questions of novelty and of value to the public.

[Haseltine, 45.

(See Assignments, 9; Contracts, 1.)

EXPERIMENTAL USE.

A patent cannot be defeated by a single experimental machine, when the recollection of the mechanism that constituted it has passed away from the mind of the witness, who deposes to its existence thirty-five years before, so that it cannot from such recollection be reconstructed, and there being no other record of it.

[*Taylor *vs.* Wood, 90.

FORFEITED APPLICATIONS.

(See Abandoned Applications.)

FUNCTIONAL CLAIMS.

1. A functional claim is one that has for its subject the performance of an act merely, and not the means by which that act is executed. It is not for a substantive thing, but for a *result* which that thing accomplishes. Its language is usually in the participial form.

[I. Hahn, 597.

2. A claim for "The combination of two carriers, each capable of revolution around a central axis, and both capable of lateral movement in the main frame substantially as and for the purpose specified," held not to be functional, but as a claim for a particular arrangement of certain devices; and not for the motions of which they are capable when so arranged, nor for the subordinate means by which such motions are produced.

[Ibid., 597.

(See Construction of Claims, 18.)

GRANT AND GRANTEE.

(See Assignments, 2, 3, 6.)

INCHOATE RIGHTS.

(See Contracts, 1.)

INFRINGEMENTS.

1. Although in Patent No. 77,933 the "rubber" is described and claimed as having an external surface of corrugated India-rubber, the patent is infringed by a rubber the external surface of which is of cloth or leather, but corrugated, and which is stuffed so as to be but slightly elastic.

Both are more or less adhesive, and they are applied similarly and with substantially the same object.

[*Taylor *vs.* Wood, 90.

2. Although in Patent No. 75,218 the handle and the foot-holder are described as having an *oscillating* or *vibrating* motion communicated to them, the return movement being in the same path as the outward movement, yet the to-and-fro motion in defendant's machine, in view of the action on the hub, is equally oscillating or vibrating, although the parts describe an ellipse or a circle in passing out and returning.

[*Ibid., 90.

3. Where it appeared that the defendants subjected their corn to the direct action of steam, or otherwise "cooked" it, before canning it, but heated it again in a steam-bath after canning, a preliminary injunction under the Winslow patent was denied, although grave doubts were entertained as to whether that part of the defendants' process which was adopted prior to the canning was anything more than a colorable departure from the patented process.

[*Jones *et al. vs.* Merrill, Soule *et al.*, 401.

4. This patent would not be infringed by a process in which the corn, whether on the ear or removed therefrom, is thoroughly cooked by the direct application of steam before it is canned.

[*Ibid., 401.

5. The invention disclosed in letters patent for bale ties granted to Chas. G. Johnson as assignee of Charles Swett, October 23, 1866, held not to be substantially the same as that embodied in the "Eureka" tie, and that the making, using, and selling of the "Eureka" tie is no infringement of any exclusive privilege legally vested in the patentee by the reissue of said patent as made May 7, 1872.

[*Johnson *vs.* Board, 435.

(See Construction of Claims, 17; Injunctions, 1, 2; Interlocutory Decrees, 1; Pleadings and Practice, 6, 8.)

INJUNCTIONS.

1. A patentee cannot take compensation for an infringement, including manufacture, sale, and use, and thereafter enjoin that use for which he has taken compensation.

[*Gilbert and Barker Manufacturing Co. *vs.* Bussing, 144.

2. Where the complainants had obtained an interlocutory decree for an accounting of gains, profits, and damages against the manufacturer of the infringing machines, an unqualified injunction *pendente lite* against the purchaser and user of one of the machines was refused. The defendant, however, was put under bonds.

[*Ibid., 144.

3. On final hearing the complainants might become entitled to a perpetual injunction against such defendant, as they cannot be compelled, against their will, to permit the defendant to use their invention.

[*Ibid., 144.

4. Where a patent has been a long time in existence, has been renewed by the Patent Office after the expiration of the original term and in the face of opposition, and has been sustained by the adjudications of several of the federal courts, the patentee is entitled to protection by a preliminary injunction, at least until the adjudication of some tribunal shall decide the patent invalid.

[*Putnam *vs.* Weatherbee, 320.

5. An adjudication in favor of a patent at final hearing, after full consideration, must be held controlling upon an application for a preliminary injunction, unless cogent evidence is presented in addition to that which was found insufficient upon the final hearing.

[*Jones *vs.* Merrill, Soule *et al.*, 401.

6. While the fact that the defendant has obtained a patent for his process is not controlling in proceedings for an injunction, it is entitled to some weight.

[*Ibid., 401.

7. Where defendants claimed to cook their corn in the ear thoroughly before subjecting it to heat in the sealed cans, but the printed label on their cans, prepared when they had no interest to warp the facts, stated that the corn was "cut from the cob while fresh *and sealed at once*, and then prepared by an entirely new process," &c.: *Held*, that in proceedings for an injunction the defendants must be concluded by the statement they thus published to the world.

[*Jones *et al. vs.* Merrill, Soule *et al.*, 401.

8. Where complainants were chargeable with knowledge of defendants' acts, but permitted them to continue their manufacture, and in response to an inquiry as to whether they regarded defendants' process to be an infringement, returned an answer that led defendants to believe that they did not, an injunction was refused.

[*Ibid., 401.

9. It is a general principle of equity jurisprudence that the court will not lend its extraordinary aid, by way of preliminary injunction, to any claimant who has encouraged or acquiesced in an infringement of his right, or unreasonably delayed in prosecuting for its violation.

Compensation for damages accrued and protection from future damages is all such a complainant is entitled to. This provided for by a bond.

[*Ibid., 401.

10. A preliminary injunction will not be granted where defendants have manufactured under the sanction of a patent of prior date to those held by complainants, which prior patent has expired, and no proceedings having at any time been instituted by complainants to secure or protect their rights under their patents.

[*Whitney *vs.* Rollstone Works, 908.

(See License, 1; Pleadings and Practice, 1, 2, 6.)

INTERFERENCES.

1. Where an interference had been declared between an application for a reissue of a patent granted in 1873, and a patent of a subsequent date: *Held*, that the interference was without authority of law, and should be dissolved.

[Becker *vs.* Throop, 1.

2. The decision of the Supreme Court of the District of Columbia in *ex parte* Mayall in effect abrogates the last paragraph of Rule 51 of the Rules of Practice of the Patent Office; and hereafter Rule 51 may be regarded as amended, so that applications for reissue will, under no circumstance, be put in interference with patents granted subsequently to the date of original patents sought to be reissued.

[Ibid., 1.

3. An interference may be dissolved for reasons stated in rule 59, but should not be allowed to terminate by the abandonment of his application by one of the parties to the controversy, when the other party desires a decision upon the merits.

[Adler *vs.* Van Wagoner, 728.

4. It having been previously judicially determined that an interference cannot be legally declared between an application for reissue and a subsequent patent, (*Mayall ex parte* Supt., Ct. D. C.:) *Held*, that the same rule applies to an application for the

reissue of a prior patent and an application for the reissue of a subsequent patent.

The nature of the case is not affected by the attitude of the subsequent parties, whether simply as patentees or as applicants for reissue.

Case of *Merrill* and *Carleton* Sup. Ct. D. C. commented on.

[Paris *vs.* Bussey, 839.

(See Joint Invention, 1; Practice in Patent Office, 1, 3; Priority, 1.)

INTERFERING PATENTS.

(See Construction of Statutes, 3; Judgments and Decrees, 1.)

INTERLOCUTORY DECREES.

A mere interlocutory decree for gains, profits, and damages against the manufacturer of infringing machines, cannot operate as any defense in behalf of the purchaser of one of such machines.

[*Gilbert and Barker Manufacturing Co. *vs.* Bussing, 144.

(See Injunctions.)

INVENTION.

1. The chief feature of the improvement set forth in the patent granted to J. F. Barker and C. N. Gilbert, August 3, 1869, for an "improved apparatus for carbureting air," is the placing of the carbureter under ground in a vault separate from the building to be lighted, at any desired or convenient distance therefrom, while the power and the motor, by means of which atmospheric air is forced through pipes leading into the carbureter, are placed in an apartment in the building, or near thereto, conveniently accessible with or without a light, as occasion may require, whenever, for adjusting the motive power or the machinery thereof, it is desirable to do so.

Such isolation of the carbureter under ground prevents danger from explosion, secures an even, regular supply of the gas, unaffected by changes of temperature above ground, and effects a preliminary condensation of the gas before it enters the distributing-pipes.

This is more than a mere change in the location of an old device. By the new arrangement the patentees bring into contributory and effective co-operation, with a carbureter and the machinery for supplying air thereto, the earth and its even temperature below. This is more than merely making use of the natural state of the ground or the natural laws, which, operating below the surface, make such new location desirable, as a matter of mere judgment. It brings into conjoint operation new elements, working both actively and passively to produce the result, and to produce the ultimate and final result in a better manner—in a manner which combines safety with convenience and utility, as had never before been done.

[*Gilbert and Barker Manufacturing Co., *vs.* Tirrell, 2.

2. As both head-linings and hoops had been made by machinery, and were articles of trade, and as hoops had also been crimped by machinery, the patentee merely produced an article which was the result of more mechanical skill and care in its manufacture than that previously sold and used; but this result did not involve the faculty of invention.

[*Reed *vs.* Reed and Folts, 193.

3. Where an applicant avails himself of a portion of a plan and mechanism used to make one article, and supplies to it the steps necessary to constitute a complete and novel process for making another article, a patent should be granted.

[McMurray, L., 473.

4. To constitute an invention or discovery, as defined by the Office and the courts, the idea must be embodied in a practical form.

[*McCulloch *vs.* Watkins, 1074.

(See Construction of Claims, Construction of Patents and Specifications, Designs, 2, 3, 4, 5; Evidence, 7; Joint Invention, 1, 2, 3; Novelty, 1, 4, 5; Patentability.)

JOINT APPLICATIONS.

Rules relating to the right of parties to make a joint application will not be enforced more rigidly by the Office than by the courts. The oath, therefore, of the joint applicants will be considered as strong presumptive proof in their favor, and they will be given the benefit of all doubts.

[Carter and Dwyer *vs.* Perry and Dickey, 518.

(See Joint Invention, 1, 2, 3.)

JOINT INVENTION.

1. In a claim for a combination of devices, the only novel element therein being entirely separate and distinct from the others, and accomplishing in itself an entirely independent result: *Held*, that as this feature was not the joint invention of either of the respective joint parties to the record, neither party was entitled to a patent, and the interference must therefore be dissolved.

[Waters *et al. vs.* Yost and Wallace, 517.

2. It is well settled that if two inventors are on equal terms in respect to the invention, such as partners in the business, and both contribute to the essential parts of the organization regarded as a whole, the patent would be invalid if issued to one of them.

[Carter and Dwyer *vs.* Perry and Dickey, 518.

3. These combinations being the product of the mutual suggestions and joint efforts of the respective joint applicants, the origin of each of their mental conceptions, or the order of them in time, has no material weight, and their applications held to have been properly made.

[Ibid., 518.

(See Applications, 1; Construction of Claims, 13.)

JOINDER OF INVENTIONS.

(See Construction of Claims, 13; Division of Applications, 2, 4, 5, 6; Joint Applications; Joint Invention.)

JUDGMENTS AND DECREES.

Reissued Patent No. 5,328 to Wm. T. Garratt, issued March 18, 1873, for "improvement in lubricators," declared void by reason of their interference with Patent No. 111,881, issued to Nicholas Siebert, February 14, 1871.

[*Siebert *vs.* Garratt, 600.

(See Contracts, 1; Interlocutory Decrees, 1; Injunctions, 4, 5; Pleadings and Practice, 2.)

LABELS.

The superscription being in its main elements a *label*, the fact that it contains matter which, taken separately, might constitute a *trade-mark* is not fatal to its registration. (Case of *A. Godillot*, OFFICIAL GAZETTE, Vol. VI, p. 641, commented on.)

[Orcutt and Son, 277.

LICENSE.

W., the assignee of the extended term of the patent, entered into an agreement in writing, under seal, with T. & W., which recited that T. & W. were "desirous of obtaining a license to use the improvement secured by said letters patent, to the extent of the use of binders necessary to their business," and which granted to them for a nominal sum, as a "personal privilege," and "for and in consideration of, and in case of, the due and faithful keeping and performing of each and all of the conditions," &c., the license "to use the said improvement, to the said extent, for and during the space of one year," at their specified place of business, "and not longer, otherwise or elsewhere, without written permission of" W.; said agreement further providing that W. might revoke the license on the failure of T. & W. to perform any of the conditions therein contained, "in which case this license and all rights and privileges hereunder shall forever cease and determine."

After the expiration of the one year, T. & W. continued to use nineteen of the patented machines, claiming that they had them lawfully in use at the end of the first term of the patent, and that by virtue of section 67 of the act of July 8, 1870, they had a right to continue the use of them so long as they remained capable of use. On application for injunction to restrain such use: *Held*, that, whatever rights, in respect to the further use of the patented machines the defendants had when they took the license, they waived and surrendered by taking the license containing the conditions it did; and that, although the term of the license had expired, the defendants were bound and estopped by the recitals and covenants in it.

[*Wooster *vs.* Taylor and Woodbury, 644.

MANDAMUS.

On a rehearing, the doctrine is again affirmed that this court will not compel the Commissioner of Patents to issue a patent even in a case where the Examiners-in-Chief have rendered a decision in favor of the applicant.

[*Hull *vs.* Commissioner of Patents, 46.

MECHANICAL PROCESS.

Where the operation of a machine or a series of machines is supplemented by some new and useful method of operation not contemplated in the construction of the machine, and not the inevitable result of its operation, it may amount to a patentable process. Such was the process claimed in the *Voelter* patent sustained by the court, (5 Fish., 340.)

[Shippen, E. W., 727.

(See Construction of Claims, 9, 12.)

MODELS.

(See Pleadings and Practice, 3; Practice in Patent Office, 6.)

NEW APPLICATIONS.

(See Abandoned Applications, 3; Practice in Patent Office, 2, 3.)

NEW MATTER.

1. It is only those changes that effect the substance or materiality of an invention that are objectionable as new matter.

[Carlock, W. B., 191.

2. The rule in regard to new matter construed more strictly as to reissue applications than as to original ones. In the former case new matter is expressly forbidden by law to be introduced into a specification, while in the latter case the question is left to the discretion of the Commissioner.

[R. Bragg, 985.

3. Where an inventor in his patent had stated the object of his invention to be "to provide a novel attachment, principally valuable and applicable to fire-engine houses," and had restricted his specification, drawing, and model to that one object: *Held*, that it was new matter to describe in the reissue application various other uses to which the attachment could be put, especially as those uses suggested something more than an equivalent arrangement and operation.

[Ibid., 985.

4. Where the original specification, drawing and model described and showed in the improvement as applied to but one kind of boiler-furnace: *Held*, that an amendment showing that the apparatus could be adapted to other kinds of boiler-furnaces without making any change therein, except that of position, was not new matter.

[Sclotterbeck and Knelsley, 107.

(See Reissues, 1, 2.)

NOVELTY.

1. The change from a round to an oval cross section at different portions of a rake-tooth, compared with a similar construction in a hay-fork tooth. The construction and purpose being the same, the different use of the tool is immaterial.

[Holmes, J., 1.

2. Mere differences in the mode of constructing the carbureter held not to avoid the patent, so long as the moderate temperature of the earth and the underground passage of the gas are availed of.

[*Gilbert and Barker Manufacturing Co. *vs.* Tirrell, 2.

3. The claim of a patent held to be anticipated by a clear description in an English provisional specification which had been printed by Eyre & Spottiswoode.

[*Tufts *et al. vs.* The Boston Machine Co., 239.

4. A device used for fastening together sheets of paper, pamphlets, and other documents, is anticipation of a like device used for securing together the leaves of a book in lieu of the ordinary binder's stitching. The mere application of the device to books in the process of binding does not make it patentable.

[E. D. Averell, 400.

5. A claim covering the manufacture of solder-wire by cutting a cord from the periphery of a solder-disk, and compressing it into finished form between rollers, is not anticipated by a patent for manufacturing zinc wire, by cutting a cord from a zinc disk, rounding its corners by compressing-rollers, and then drawing it out through a draw-plate, because solder-wire could not be made by the zinc-wire process.

[McMurray, L., 473.

6. In order to defeat a patent on the ground of want of novelty, the proof of prior use or previous knowledge must be such as to establish the fact clearly and satisfactorily and beyond a reasonable doubt.

Where the proofs are contradictory, *mere* preponderance is not sufficient to sustain the allegation. The preponderance in such case must be such as to remove all reasonable doubt. * * *

To doubt in such a case is to solve the question in the negative.

Letters Patent No. 63,889, for a new and useful "hotel-register," granted to Charles L. Hawes, April 16, 1867, sustained.

[*Hawes *vs.* Antisdel, 685.

7. A corn-covering wheel having raised rims occupying a portion of its periphery, and serving on hard ground to fill the seed-furrow, while in softer ground the plain surface of the wheel prevents the wheel from sinking too deeply into the soil: *Held*, not to be anticipated by a concave-faced wheel, which, by the addition of "supplementary rings" filling the concavity, might be converted into a plain-faced wheel.

[Galt and Tracy, 907.

8. Baking-pans, having been made with closely-fitting covers, and griddles having been made double and hinged, it is yet: *Held*, that a baking-pan made in two parts, which are hinged together so as to form one covered pan, or two uncovered pans, which equally rest upon the bottom of the oven, is a patentable invention.

[Wm. Wachs, 907.

(See Construction of Claims, 6, 7, 8, 19; Invention, 1, 2; Patentability, 3.)

OATH.

(Division of Applications, 1; Joint Applications; Practice in Patent Office, 4.)

PATENTABILITY.

1. Although the crimped machine made head linings are an improvement upon the article used prior to their introduction, and, as such, have secured the approval of the trade, and become a valuable commodity of manufacture and sale, the improvement is not the proper subject of a patent.

[*Reed *vs.* Reed and Folts, 193.

2. The sole merit of *bundling* the head-linings is, that it renders the commodity more attractive to purchasers, and more convenient for the purposes of sale. There is nothing in this result that is patentable.

[*Ibid., 193.

3. A preserve compound consisting of old ingredients arranged in a new manner, and possessing the superior qualities of transportability, cheapness, economy, and convenience in use, and imperishability: *Held*, to be patentable.

[Heide and Wirts, 817.

(See Construction of Claims, 5, 14; Designs, 1; Invention, 3; Novelty, 4.)

PLEADINGS AND PRACTICE.

1. Where a motion for an injunction was heard outside the district where the suit was pending, the order withheld until the court should be sitting within the District.

[*Putnam *vs.* Weatherbee, 320.

2. A final decree in an equity suit awarded a recovery in favor of the complainants for a specified amount, and then proceeded to decree that the defendants pay to the master the sum of $500 allowed to him as his compensation, less such sum as the defendants had already paid him, and that the complainants have execution for the sum awarded to them.

The defendants appealed from the whole of the decree, giving to the complainants a bond to respond for the amount which the decree awards to the complainants as a recovery, and a citation was issued and served. The defendants, having previously paid the master $35, refused to pay more; and the master applied for an attachment against them for $465: *Held*, that the provision for the payment of the master was not subject to be stayed in its operation by proceedings such as are employed to stay the execution of a decree *inter partes*. The attachment was granted.

[*Myers *vs.* Dunbar and Hopper, 321.

3. Where it appeared that the drawing of a patent had been changed at the time of the reissue thereof, and the complainant in a suit under the reissue had introduced a duplicate of the Patent-Office model which conformed to the drawing of the reissue: *Held*, that the defendant ought to be permitted to show the condition of the model at the time when it was filed in the Patent Office and at the date of the original patent.

A motion to reopen a case for the introduction of such proofs, it being alleged that the testimony was newly discovered, was entertained at final hearing, and was allowed.

[*Johnsen *vs.* Beard, 433.

4. The corporate character of a corporation complainant being averred under oath in the bill of complaint, and the same not being denied in the answer, but simply proof thereof being called for: *Held*, that the fact of incorporation was in effect admitted by the pleadings.

[*Stover *et al. vs.* Halsted and Merritt, 558.

5. In this case it was competent for the complainants to take either one of the two remedies for the alleged injuries growing out of a violation of the agreement or license. They could bring a bill alleging an injury to their exclusive rights, or could bring a proper suit, setting up the breach of contract as the *gravamen* of their action.

Although the suit is upon the contract, the damage to complainants, if any, is the damage sustained from the injury to their patent rights.

[Magic Ruffle Co. *vs.* The Elm City Co., 773.

6. Upon bill filed, charging defendants with infringement of reissued letters patent, and praying for an injunction, and account of gains and profits made by defendants: *Held*, that a subpœna *duces tecum* might be issued, requiring defendants to produce before the Examiner all books, papers, and documents whatsoever, that will show the number of "skates" made or delivered by the defendants, or their employes, since the date of the reissue of letters patent, and until the commencement of the suit.

[*Turrell *vs.* Spaeth and Guelicker, 986.

7. Nor is it necessary to aver in a bill brought under a reissued patent that the grantee of a territorial right acted with the patentee in the surrender of the original patent or concurred in the reissue thereof.

[*Meyer *et al. vs.* Bailey, 437.

8. The bill sets out complainant's title to the exclusive right, title, and interest under the patent, to the State of Pennsylvania, excepting certain counties, and then avers that the defendants "are *now* constructing, using, and vending" the infringing goods * * * "in the western district of Pennsylvania," concluding the averment as follows: "All of which acts and doings are in violation of the exclusive rights and privileges *so as aforesaid* vested in your orators, under and by virtue of the said recited reissued letters patent." *Held*, that these averments, taken in connection with statement of complainants' title, necessarily import a charge of infringement *after the grant to the complainants;* and, also, *within* the *territory covered by the grant.*

[*Ibid., 437.

(See Contracts, 1; Construction of Statutes, 3; Damages; Injunctions; Interlocutory Decrees; Judgments and Decrees; Mandamus.)

PRACTICE IN THE PATENT OFFICE.

1. The Commissioner of Patents must be governed, in regulating the practice of the Patent Office, by the decisions of the United States courts, so far as they apply.

[Becker *vs.* Throop, 1.

2. The actual intention indicated by an applicant to sever the two proceedings, where he has abandoned one application and filed another in its stead, it is to be regarded, and notice will be taken only of his last application.

[W. H. Golding, 141.

3. Where, intermediate the two applications, another party has filed an application for patent for the same invention, the proper practice is to institute an interference between the second application and that of such other party.

[Ibid., 141.

4. The requirement of the statute that an applicant for the registration of a trade-mark shall make oath "*to the effect*" that he and no other has the right to use it, "either in the identical form *or having such near resemblance thereto as might be calculated to deceive*," is properly complied with by a declaration under oath that no other has a right to the use of said trade-mark, "*or of one substantially the same.*"

The statute does not require that the oath shall be in the exact words of the section, but only "*to the effect*," &c.

[Vidvard & Sheehan, 143.

5. When an error in the form of a certificate of registration occurs, solely on the part of the Office, it will be corrected without expense to the registrants.

[Ibid., 143.

6. That part which constitutes the improvement on a former machine must be shown by model and drawing; but an applicant for a patent need not furnish model and drawing of the whole of the machine which he claims to have improved, provided the machine is well known to the public, or a description of it readily accessible.

[C. C. Tracy, 141.

7. By neglecting to settle questions in their proper order when they arise, as the Office rules require, great confusion is caused, forming just ground for complaint.

[Carlock, W. B., 191.

8. In certain cases the signature to a petition by an applicant's attorneys may be received. *Vetter's* case (Commissioner's Decisions, 1870, page 84,) referred to.

[Heginbotham, 237.

9. The practice established in the Rouse and Stoddard case (7 OFFICIAL GAZETTE, 169) of suspending action upon an application, when that application is found to cover subject-matter embraced by a prior and rejected application, for the purpose of obtaining evidence from the prior applicant, if possible, of the abandonment of the invention by him by reason of public use or sale, abolished.

[Casllear and McIntire, 473.

10. The Board of Examiners-in-Chief is the judge of the sufficiency of the "reason of appeal."

The Primary Examiner may traverse or controvert, but cannot ignore them.

The "reasons of appeal" must form the basis of subsequent arguments submitted to the board, which will determine as well upon the pertinence as upon the validity of the arguments submitted.

[C. L. Young, 643.

(See Applications, 1; Abandoned Applications, 3, 4, 5; Claims, 1, 2, 3; Division of Applications; Extensions; Evidence; Interferences; Joint Invention; Labels; New Matter; Trade-Marks.)

PRELIMINARY STATEMENTS.

(See Evidence, 5.)

PRINTED PUBLICATIONS.

(See Novelty, 3.)

PRIORITY OF INVENTION.

The burden of proof is on the defendant to show a prior invention, and, if the evidence is too vague and unsatisfactory to establish affirmatively, as against the patent, that the patentee was later in time of invention, the patent must stand.

[*Taylor *vs.* Wood, 90.

PUBLIC USE.

(See Abandonment, 2; Novelty, 6.

REISSUES.

1. Where a patent covered a hermetically sealed vessel composed of two parts, the interior one of paper supported by internal hoops and the exterior one of wooden staves and heads, for the transportation of volatile liquids: *Held*, that the patentee could not lawfully modify his patent upon reissue by omitting the words "hermetically sealed," dispense with the exterior casing, and reform his drawings accordingly.

[Elisha Waters, 399.

2. A patent which covers merely the combination of a tight paper vessel and its casing cannot properly be expanded upon reissue to embrace paper barrels and vessels generally, with or without exterior coverings; nor can it be made to embrace paper packages "of any suitable shape or configuration."

The case of *Carlton* vs. *Bokee* (17 Wall, 463) cited.

[Ibid., 399.

3. If a part of the whole patent has been vested in another, so as to constitute him an assignee within the meaning of the statute, an efficacious surrender can be made only by the concurrence of both of the owners of the patent; but this may be manifested by the assignee by his direct co-operation in the surrender, or his subsequent ratification of it.

[*Meyer *et al. vs.* Bailey, 437.

4. The owner of an exclusive territorial right under a patent may ratify a reissue thereof in which he did not join, by making an assignment under such reissue.

[Ibid., 437.

5 It is not essential to the validity of a reissued patent that a transferee of an interest in the original patent, who is not an assignee within the meaning of the statute, concur in the surrender.

[Ibid., 437.

(See Assignments, 7; Interferences, 1, 4; New Matter, 1, 3; Pleadings and Practice, 3.)

REJECTED APPLICATIONS.

(See Abandoned Applications.)

RENEWED APPLICATIONS.

(See Abandoned Applications, 3; Practice in Patent Office, 2, 3.)

SALES.

(See Abandonment, 2; Contracts, 1; Injunctions, 1, 10; Pleadings and Practice, 6.)

TRADE-MARKS.

1. A carpet-cleaner is not, in the strict sense of the term, either a merchant or a manufacturer, and a mark used by him upon wagons with which he transports carpets back and forth, upon tags attached to the carpets, and upon his business-cards, circulars, bill-heads, &c., is not a trade-mark.

As carpets in the hands of a cleaner are not, as respects him and his purposes, merchandise or manufactures within the meaning of the statute, he cannot comply with the statutory requirements for registration. (*Smith* vs. *Reynolds*, 3 OFFICIAL GAZETTE, cited and followed.)

[Hankinson, 89.

2. Although he may have a proprietary interest in his mark for the particular use to which he has appropriated it, which the courts will protect, it does not follow that it is a trade-mark registerable in the Patent Office.

[Ibid., 89.

3. To be entitled to registration, the applicant must comply specifically with all the requirements of the statute.

[Ibid., 89.

4. A clear, full, and accurate description of a trade-mark, which distinguishes between essentials and non-essentials in the mark, is necessary before a trade-mark can properly be registered.

[Volta Belt Co., 144.

5. The word "centennial" was sought to be registered as a trade-mark, to be applied to that "class of merchandise containing alcoholic spirits," and it was held that it was not required that the trade-mark should be registered for each of these articles of the general class of alcoholic spirits.

[Boehm & Co., 319.

6. There appears to be nothing in the statute to prevent an applicant for registration of a trade-mark from including in his specification either a whole class of merchandise or several specified descriptions thereof. *Smith et al.* vs. *Reynolds and Jacobs*, (3 OFFICIAL GAZETTE, p. 214,) cited in support.

[Ibid., 319.

7. It is no objection to a mark sought to be registered as a trade-mark that it is appropriate to the article to which it is to be applied, or suggestive of good qualities, or peculiarly fit in any such way.

[Glines, G. E., 435.

8. The words "German Sirup" held to be a lawful trade-mark.

As a rule a geographical name cannot be a lawful trade-mark, but may become so when not descriptive, and when arbitrarily chosen and applied for lack of a better term.

[L. N. Green, 729.

9. While the rule obtains that no trade-mark may consist of the mere name of a person, place, or article, or a word indicating kind or quality, which any person might employ with equal justice, it is not intended that the name or mark should be a new creation, or require invention.

It is sufficient that it should have an original and distinctive signification as appertaining to the article.

[India Rubber Comb Co., 905.

10. *Held*, That Congress intended no new definition of a trade-mark.

[Ibid., 905.

11. When a court of competent jurisdiction has declared that a name first adopted by a firm, and used to denote the origin of ownership of a particular article, is a lawful trade-mark, and has enjoined its use by others, even though the name be unaccompanied by other distinguishing mark—this Office is concluded in its action.

[Ibid., 905.

12. Under the circumstances of the case, and various cases cited, the words "The India Rubber Comb Company" constitute a lawful trade-mark.

[Ibid., 905.

(See Construction of Statutes, 2; Practice in the Patent Office, 4, 5.)
